Keywords

inference to the best explanation – abduction – skepticism – principle of indifference – explanatory virtues – Bayesianism

1. Introduction

This much-anticipated volume, edited by Kevin McCain and Ted Poston, comprises sixteen new essays by epistemologists and philosophers of science about the nature, epistemic status, and potential applications of “inference to the best explanation” (IBE). Also discussed under the heading of “abduction” or “explanatory reasoning,” IBE is a form of non-demonstrative inference according to which a hypothesis H can be rationally justified by showing how well H would, if true, explain some set of facts. That H would explain these facts better than its competitors is taken to justify belief that H is true. Typically, H 's “explanatory goodness” is said

1
2
3
4 to depend on how well H does with respect to certain explanatory virtues, e.g., *simplicity*,
5
6 *unification*, *coherence*, etc.
7
8

9 A wide variety of audiences will find this volume to be of interest. According to Douven
10 (2011), our use of IBE in everyday life is extremely common, being “so routine and automatic
11 that it easily goes unnoticed,” and so the traditional epistemologist, it seems, should care about
12 IBE. In addition, it is often maintained that prominent historical cases of exemplary scientific
13 reasoning should be regarded as instances of IBE (e.g., Thagard 1978, Lipton 2004), and so the
14 philosopher of science, it seems, should also care about IBE. Finally, it’s becoming increasingly
15 common in meta-philosophical discussions to defend IBE as an indispensable tool for
16 philosophical theorizing (e.g., Williamson 2016, Biggs and Wilson 2017), and so perhaps every
17 philosopher should care about IBE! But for those especially motivated to refute one of the
18 various forms of skepticism on offer, e.g. external world skepticism, the problem of other minds,
19 etc., this volume will be of particular interest, as one might also appeal to IBE to meet such
20 skeptical challenges.

38 The collection is divided up into five parts: “Part I. Inference to the Best Explanation”;
39 “Part II. The Fundamentality of Inference to the Best Explanation”; “Part III. Justifying
40 Inference to the Best Explanation”; “Part IV. Inference to the Best Explanation and Skepticism”;
41 and “Part V. Applications of Inference to the Best Explanation.” Despite the division of the
42 essays into distinct sections, it is worth noting that the boundaries are rather fluid. Some essays
43 found in one section are directly relevant to essays found in another, e.g. those attempts to justify
44 IBE in Part II are clearly relevant to whether IBE succeeds as a response to the external world
45 skeptic. In light of the venue of this review and the fact that many of the essays consider multiple
46 questions about the nature of IBE, I will focus primarily on the essays that comprise Part IV,
47 bringing into discussion other chapters whenever those are relevant.

7 **2. The IBE Response to Skepticism and Skepticism about IBE**
8

9 *2a. James Beebe's "Does Skepticism Presuppose Explanationism?"*
10

11 In his contribution, James Beebe is primarily concerned with critiquing the way in which
12 skeptical challenges are typically formulated. The traditional way of raising skeptical challenges
13 consists in what Beebe calls the "quasi-logical approach" (175), arguably the most important
14 commitment of which is the following: if some skeptical hypothesis SK undermines some
15 subject S's knowledge-claim that *p*, then SK and *p* must be logically incompatible. While this
16 condition holds of many skeptical challenges, as Beebe convincingly argues, dreaming skeptical
17 hypotheses do not fit this mold. It is logically possible to be standing up and also to be dreaming
18 that one is standing up. Since dreaming skeptical hypotheses count as skeptical challenges, the
19 quasi-logical approach is mistaken. Instead, Beebe defends an alternative "explanationist
20 approach" to skeptical challenges, according to which a skeptical hypothesis SK must: (i) explain
21 S's evidence for *p*, (ii) explain how S can believe that *p* on the basis of the evidence without
22 knowing that *p*, and (iii) provide an explanation that competes with available commonsense
23 explanations of "S's belief on which S knows that *p*" (183). Accordingly, in order for S to know
24 that *p*, S must be able to rule out any SK known by S to satisfy conditions (i–iii).

39
40
41
42
43
44

45 After laying out the explanationist approach to skeptical challenges, Beebe goes on to
46 argue in technical detail for its merits. To do so, he attempts to show that the explanationist
47 approach can explain the skeptical force of dreaming hypotheses without entailing the
48 implausibly demanding KK principle (i.e., the claim that if S knows that *p*, then S knows that S
49 knows that *p*)—something which the quasi-logical approach fails to do. In the end, Beebe
50 concludes with a general defense of the viability of the explanationist response to skepticism.

1
2
3
4 Given the failure of the quasi-logical approach, it seems that one must appeal to some form of
5
6 explanationism in order to make sense of the normative force of skeptical challenges in a
7
8 complete and unified way. For this reason, “skepticism presupposes explanationism,” and so on
9
10 Beebe’s view, a *wholesale* suspicion of the IBE response to skepticism is impossible for those
11
12 who wish to take the problem of skepticism seriously.

14
15
16
17
18

19 *2b. Ruth Weintraub’s “Skepticism about Inference to the Best Explanation”*

20
21 Of course, even if Beebe is right, one might still want to consider directly the question of
22
23 whether IBE is indeed a justified mode of inference. In the next contribution to Part IV, Ruth
24
25 Weintraub addresses this question. But before engaging with the skeptic of IBE, Weintraub first
26
27 defends the position that IBE has an ineliminable place in our cognitive lives. Against the view
28
29 long defended by Richard Fumerton—and once more in his contribution in Part II (“Reasoning
30
31 to the Best Explanation”)—Weintraub argues that IBE cannot be reduced to a form of simple
32
33 induction. This is primarily because IBE is often employed to defend the existence of
34
35 unobservable entities, especially novel ones. A simple inductive argument (e.g., one of the form
36
37 “The majority of observed Fs are Gs; therefore, all Fs are Gs”) can never have as its conclusion
38
39 that some unobservable entity (e.g., quarks, electrons, blackholes, or even beliefs or desires)
40
41 exists. Thus, induction can’t play the epistemological role that IBE appears to play. As further
42
43 ammunition for Weintraub’s anti-eliminativism about IBE, one might also appeal to the final
44
45 essay of the volume by Elizabeth Fricker (“Inference to the Best Explanation and the Receipt of
46
47 Testimony: Testimonial Reductionism Vindicated”), which defends at length the view that
48
49 simple induction cannot make sense of human language acquisition or testimonial justification—
50
51 both of which are best explicated by appeal to explanatory reasoning. However, for a novel and
52
53
54
55
56
57
58
59
60
61
62
63
64
65

1
2
3
4 sophisticated defense of the reductionist position, one should turn to the contribution by Khalifa,
5
6 Millson, & Risjord, (“Inference to the Best Explanation: Fundamentalism’s Failures”).
7
8

9 After having argued for the indispensability of IBE in our inferential practices, Weintraub
10 then evaluates five skeptical arguments against IBE, the first two of which consist of traditional
11 arguments against induction slightly reworked so as to apply to IBE. The first argument takes its
12 inspiration from Berkeley’s critique of materialism, and attempts to undermine the rationality of
13 IBE by pointing out that there is no necessary connection between the premises of an IBE
14 argument and the conclusion. The second argument consists of a variant of the epistemic regress
15 problem: if an inference rule must be justifiably believed to be reliable on the basis of another
16 inference rule in order to be justifiably deployed, then one is ultimately left with a justificatory
17 chain that is (a) infinite, (b) circular, or (c) terminal, all of which are illegitimate, thus
18 undermining the rationality of IBE.
19
20
21
22
23
24
25
26
27
28
29
30
31
32

33 Clearly, the first of these two arguments should be less worrisome to explanationists than
34 the second. The first argument flatly denies the very possibility of non-demonstrative reasoning,
35 but as Weintraub points out, the obvious response to this argument is simply to adopt fallibilism
36 about justification. Along with every other non-deductive inference rule, IBE does not
37 deductively guarantee its conclusion, but that seems hardly a good reason to reject IBE. The
38 skeptic needs to provide some independent grounds for rejecting the very idea of non-deductive
39 reasoning; otherwise, the first argument simply begs the question against the explanationist.
40
41
42
43
44
45
46
47
48
49

50 As regards the second argument, although Weintraub does not seek to rebut it, she does
51 point out some classic strategies that might be employed by the explanationist. For example, one
52 might reject the epistemological internalism presupposed by the argument, requiring only that an
53 inference method, in actual fact, reliably lead to true beliefs sufficiently often. Indeed, in his
54 defense of IBE, Psillos (1999) adopts precisely this externalist reliabilist strategy. Alternatively,
55
56
57
58
59
60
61

1
2
3
4 one might retain epistemological internalism and instead argue that at least one of the three
5 possible structures of justificatory chains is legitimate. Of the three options, Weintraub devotes
6 the most space to the possibility that a set of inference rules might form a circular chain of
7 justification, having little sympathy for the infinitist strategy or the idea that IBE might be the
8 terminating link in a justificatory chain (although see Hasan’s contribution in Part III, “In
9 Defense of Rationalism about Abductive Inference,” for a defense of the view that IBE is
10 justified on *a priori* grounds).

11
12
13
14
15
16
17
18
19
20
21 With regard to the circularity strategy, one might think that perhaps IBE is justified by
22 appealing to IBE itself: maybe the best explanation of the success of IBE is that IBE is a justified
23 inference rule. Or alternatively, perhaps IBE can be justified by appeal to induction, and then
24 induction is justified on the basis of its own past success. Weintraub goes on to raise two
25 standing challenges to the circularity strategy. The first challenge is that rule circular arguments
26 are “insufficiently discriminating” (197)—one can very well construct a rule-circular argument
27 for “counter-induction” (i.e., “All observed As are Bs; therefore, the next A will *not* be a B”), by
28 pointing out that many instances of counter-induction have *not* been successful. The second
29 challenge is that we cannot justify IBE by way of induction because we cannot check to see if
30 IBE has been successful, as IBE is used to infer the existence of unobservable entities.

31
32
33
34
35
36
37
38
39
40
41
42
43
44
45
46 Of particular relevance to the success of the circularity strategy considered by Weintraub
47 is the contribution by Carter & Prichard (C&P) in Part II (“Inference to the Best Explanation and
48 Epistemic Circularity”). There C&P helpfully distinguish between “narrow rule-circularity,”
49 whereby one uses an inference rule to justify that very inference rule, and “wide rule-circularity,”
50 whereby one uses an inference rule X to justify another inference rule Y, where both X and Y are
51 part of the same “epistemic framework.” According to C&P, whereas arguments that manifest
52 narrow rule-circularity always have a “defective justificatory structure,” arguments that manifest
53
54
55
56
57
58
59
60
61

1
2
3
4 wide rule-circularity need not necessarily be defective in this way, although some wide rule-
5
6 circular arguments are nevertheless “dialectically ineffective” (144). An argument for the
7
8 legitimacy of IBE that employs explanatory reasoning is an instance of narrow rule-circularity,
9
10 and thus intrinsically defective, but an argument for IBE that employs induction is not obviously
11
12 intrinsically defective. As it happens, though, C&P agree with Weintraub that there are serious
13
14 challenges for the project to justifying IBE by way of induction, but for distinct reasons. As C&P
15
16 suggest, such an argument, though wide rule-circular, will nevertheless prove dialectically
17
18 ineffective, primarily because explanatory considerations, in their view, “play at least an implicit
19
20 role in inductive inferences” (147)—a view shared by McCain & Poston in their chapter (“The
21
22 Evidential Impact of Explanatory Considerations”).
23
24
25
26
27

28 The next three arguments that Weintraub considers are familiar arguments against IBE.
29
30 The third argument is van Fraassen’s (1989) famous “Bad Lot” objection, according to which we
31
32 are not licensed to believe that the best available explanation of the phenomena is true because
33
34 we have no reason to think that the true theory is included in the list of explanations under
35
36 consideration. The fourth argument, another which is due to van Fraassen (1989), is a variant of
37
38 the Bad Lot objection, and states that IBE is unreliable because, given how large the space of
39
40 possible explanations is, it is *a priori* highly probable that there are unconsidered explanations
41
42 that are equally good or better than the currently favored explanation. Finally, the fifth argument
43
44 against IBE—the “argument from unconceived alternatives” due to Stanford (2006)—claims that
45
46 based on the historical record, we have good inductive reason to believe that there are always
47
48 rival theories, unconceived by present scientists, which explain our available evidence equally
49
50 well as the best available explanation. All three arguments, if sound, would undercut the
51
52 rationality of employing IBE.
53
54
55
56
57
58
59
60
61
62
63
64
65

1
2
3
4 Of these last three arguments, Weintraub devotes the most space to the Bad Lot
5
6 objection, reviewing some traditional responses, and suggesting again that an appeal to
7
8 epistemological externalism might serve as another possible response. As regards the fourth and
9
10 fifth argument, Weintraub’s treatment is rather brief. However, she makes the important point
11
12 that, unlike the first two arguments, these last three arguments targeting only IBE “have no
13
14 inductive analogues” (201). For this reason, Weintraub concludes that if such arguments cannot
15
16 be refuted, then IBE may be more susceptible to skeptical attack than enumerative induction.

18
19
20
21
22

23
24 *2c. Susanna Rinard’s “External World Skepticism and Inference to the Best Explanation”*

25
26 The last contribution in Part IV by Susanna Rinard engages the most with the details of the IBE
27
28 response to skepticism. Rinard considers three problems for explanationists, the last of which is
29
30 what she takes to be the “central flaw in IBE responses to skepticism” (203). In Rinard’s
31
32 formulation of the skeptical challenge—which is an instance of Beebe’s so-called “quasi-logical
33
34 approach”—the skeptic relies on the key premise that our sensory experience of how the external
35
36 world appears does not evidentially discriminate between “the real-world hypothesis” (RWH)
37
38 and “the brain-in-a-vat hypothesis” (BVH). However, it is precisely the premise that RWH and
39
40 BVH are equally supported by the evidence that the IBE response to skepticism denies.
41
42 According to one popular version of this response—what Rinard calls “the Continuity View”—
43
44 RWH is the better explanation of our sensory experience because RWH best explains the
45
46 “continuity and regularities” of our sensory experience *over time*.
47
48
49
50
51
52

53 The first problem that Rinard raises is that the skeptic might deny we have justified
54
55 beliefs about the past—e.g., perhaps we all have false memories of the past implanted in us—in
56
57 which case the Continuity View begs the question against the skeptic. As a response on behalf of
58
59 the explanationist, Rinard considers slight variations on the Continuity View, which seem to fare
60
61
62
63
64
65

1
2
3
4 better. Helpfully, she distinguishes between the continuity of experience *over time* and continuity
5
6 of experience *at a single time*. The skeptic might deny that we have justified beliefs about the
7
8 continuity and regularity of our past experiences, but the skeptic cannot deny that our present
9
10 experience, regarded as a single time-slice, exhibits remarkable continuities and regularities. In
11
12 addition, the skeptic cannot deny that it at least *seems* as though we have had past experiences
13
14 that are strikingly continuous with our present experience. Perhaps, Rinard suggests, RWH is the
15
16 best explanation of such synchronic continuities and the fact that it seems as though our
17
18 experience exhibits diachronic continuities.
19
20
21
22

23
24 The second problem for the IBE response to skepticism that Rinard raises is that, even if
25
26 it is granted that explanatoriness is truth-indicative, it is not clear that RWH is the best
27
28 explanation of our sensory experience. Almost invariably, *simplicity* or *parsimony* is upheld as
29
30 an explanatory virtue and, what's more, it is not uncommon to regard the apparent simplicity of
31
32 RWH, when compared to hypotheses like BVH, as a reason to prefer RWH. However, Rinard
33
34 points out the intriguing possibility that an even simpler explanation is available, namely some
35
36 alternative idealist explanation. Whereas RWH posits a new realm of physical objects to account
37
38 for the regularities of experience, and therewith governing laws of nature to account for the
39
40 regularities manifested by physical objects, the idealist takes the realm of experience as basic,
41
42 and posits "laws of experience" to account for the continuities and regularities of the experiential
43
44 realm. According to Rinard, the idealist alternative is "both quantitatively and qualitatively
45
46 ontologically simpler" (208), positing both fewer things and fewer kinds of things. Moreover, the
47
48 idealist alternative has the further advantage of being "nomologically simpler," doing away with
49
50 the need for laws connecting the goings-on in the physical realm to the goings-on in the
51
52 experiential realm. In this contest between commonsense realism and idealism, much in the end
53
54 turns on what exactly simplicity consists in and which kinds of simplicity are epistemically
55
56
57
58
59
60
61
62
63
64
65

1
2
3
4 relevant. If Lewis (1973: 87) is right and only *qualitative* parsimony matters, then the gap
5
6 between RWH and the idealist alternative closes considerably. Even so, Rinard shows that the
7
8 possibility of idealism poses a serious obstacle to a fully successful explanationist defense of
9
10 commonsense realism.
11
12

13
14 The last and most important problem for the IBE response to skepticism challenges the
15
16 assumption hitherto granted, that explanatory goodness tracks truth. Rinard's argument here
17
18 relies heavily on a version of the principle of indifference (POI). According to Rinard's version
19
20 of the POI: "If P is a finite natural partition over the space of epistemic possibilities (i.e.
21
22 possibilities compatible with what you know with certainty), then you should assign an equal
23
24 credence to each cell of P" (210). So, for instance, if all one knows is that a ball in an urn is
25
26 either red, blue, or green, then, according to the POI, one's degree of belief in each possibility
27
28 ought to be 1/3. After formulating and motivating her version of the POI by appeal to a number
29
30 of examples, Rinard applies the principle to the question of external world skepticism. To be
31
32 sure, it is difficult to come up with a natural partition, one of whose members is RWH and the
33
34 rest of which are of all the possible skeptical hypotheses. Still, the crucial point, argues Rinard, is
35
36 that "there are more ways for the world to be such that my experiences are non-veridical than
37
38 veridical," and that therefore, one ought to be "more confident that things are *not* the way they
39
40 seem than that they are" (213).
41
42
43
44
45
46
47

48 As a result, even if RWH is the best explanation of our sensory experience, by being
49
50 more explanatorily virtuous than its rivals, we "should not be more confident that it's true than
51
52 false—and so, these explanatory virtues are not guides to truth" (214). It is worth noting, then,
53
54 that Rinard's main argument—which has affinities with the fourth argument considered by
55
56 Weintraub—if sound, undermines the reliability of IBE in general. Ultimately, Rinard concludes
57
58 that the skeptic is correct: our beliefs about the external world cannot be justified on the basis of
59
60
61
62
63
64
65

1
2
3
4 our available evidence. In Rinard’s view, the proper response to the skeptical challenge is to
5
6 maintain that our beliefs about the external world are justified on pragmatic and moral grounds
7
8 (although this conclusion might sound dismal to explanationists: see the contribution by Misak,
9
10 “Peirce and Ramsey: Truth Pragmatism, and Inference to the Best Explanation,” for a thoroughly
11
12 pragmatist account of IBE).
13
14

15
16 Despite Rinard’s admirable defense of the much-maligned POI, it is my suspicion that
17
18 even explanationists who accept the POI will have much to object to in Rinard’s argument. For
19
20 one thing, some might simply reject the POI, a possibility Rinard readily acknowledge (203).
21
22 Typically, those who reject the POI do so because often there seems to be many equally good
23
24 ways to divide up the space of possibilities, which threatens to deliver contradictory verdicts
25
26 regarding the probability of a single proposition (Sober 2002). In an attempt to avoid such
27
28 problems, Rinard insists that any partition of the space of possibilities must be “natural,” and
29
30 moreover, if there are multiple natural partitions available in a given case, then the POI should
31
32 not be applied. However, recently some philosophers have argued that the best way to determine
33
34 the appropriate, or “natural,” partition of the space of possibilities is precisely by appealing to
35
36 explanatory factors (Weisberg 2009, Huemer 2009). For example, Huemer argues that the POI
37
38 must be applied to the partition that is at the “most explanatorily basic level” (2009: 355). Thus,
39
40 it might be the case that the POI presupposes explanationism, in which case one cannot
41
42 coherently appeal to the POI to undermine IBE.
43
44
45
46
47
48
49

50
51 Finally, if one thinks that explanatory virtues, such as *simplicity, unification, coherence,*
52
53 etc. can be used to determine prior probabilities (e.g., Okasha 2000, Lipton 2004, Weisberg
54
55 2009, Poston 2014), then one will not, I think, grant Rinard’s application of the POI here. It is
56
57 crucial to bear in mind the caveat that the POI applies to a set of alternatives “whenever one
58
59 lacks reason for favoring one [alternative] over the other” (Huemer 2009: 349). In applying the
60
61
62
63
64
65

1
2
3
4 POI to the partition that contains RWH and all possible skeptical hypotheses, Rinard concludes
5
6 that all hypotheses in the partition should receive the same prior probability, which has the result
7
8 that $\Pr(\sim\text{RWH}) > \Pr(\text{RWH})$. However, this application of the POI is not something that I think
9
10 explanationists will grant, since they will plausibly argue that there *is* reason to favor RWH over
11
12 the skeptical alternatives, namely that RWH is simpler, more unified, more coherent, etc.
13
14 Because RWH is more explanatorily virtuous than the skeptical alternatives, one should not
15
16 simply apply the POI to the relevant partition. Rather, one ought to assign the RWH a much
17
18 higher prior probability. Unless we show independently that the explanatory virtues are not truth-
19
20 tracking, or that the proposal to have the explanatory virtues constrain prior probabilities is
21
22 misguided, then it is not clear that the POI is a threat to explanationism or to the IBE response to
23
24 skepticism.

33 **3. Concluding Remarks**

34
35
36 To conclude, it is worth remarking upon an important theme of this volume that Rinard's essay
37
38 clearly highlights, that is, the increasing encroachment of formal epistemology in discussions of
39
40 IBE. Of the sixteen essays included in the collection, eight (those of Douven, Schupbach, Bird,
41
42 McCain & Poston, Hasan, Roche, McGrew, and Henderson) feature substantial discussion of the
43
44 relationship between IBE and Bayesianism, e.g., whether the two frameworks are compatible,
45
46 whether the one serves as the justification of the other, etc. This is, in my view, a welcome
47
48 development. It is hard to disagree with Douven's contention in his contribution, ("Inference to
49
50 the Best Explanation: What Is It? And Why Should We Care?"), that traditional formulations of
51
52 IBE have "none of the precision—not even remotely" of Bayesianism, IBE's chief rival (9). It
53
54 stands to reason then that IBE could greatly benefit by its being considered in the light of precise,
55
56

60
61
62
63
64
65

1
2
3
4 formal frameworks such as Bayesian confirmation theory—and perhaps even the reverse is true
5
6 as well. This volume is sure to inspire further work on the nature and epistemic status of IBE,
7
8 which will of course bear on the ultimate success of explanationist responses to skepticism.
