Timely and critical

A persuasive and scholarly expose of the economic drivers of the climate crisis. Many insights here into how commonly embraced methods for amelioration of the climate crisis are, in themselves, harmful. For instance, deforestation contributes significantly to global warming, yet the authors here suggest that “reforestation” as a practice is not without its drawbacks (“time and market uncertainties are significant obstacles to the business promises of reforestation”). Interesting comments about “Mindsponge Theory” and its relationship to quantum mechanics, and how such theory impacts the economy. I would have enjoyed a little more discussion on the information (disinformation) economy, even though this project might be better suited to other branches of the social sciences rather than to economics. Nicely argued discussions throughout, with choice quotes, excellent graphs, and a comprehensive bibliography. Well written, and extremely relevant work.

Good One!

I especially appreciated how approachable the content was—no overwhelming jargon or theoretical fluff. Instead, it’s filled with real-life examples, journaling prompts, and strategies that genuinely resonate. The sections on setting boundaries and cultivating empathy were particularly impactful for me, as they helped me understand and transform my interactions with others in ways I never thought possible.
