1: Placebo effect sometimes plausibly has powerful effects.

2: Buddhism philosophy holds that every living animal is sentient, and has a consciousness and killing them is bad for the killer and freeing them is good somehow. Consciousness may involve some aspects of quantum mechanism as Roger Penrose's Orch OR' theory of consciousness pointed out.

3: Although previous studies show that there is no “demonstrable effects of distant intercessory prayer. Anecdotal cases of a special kind of Buddhist activity of freeing captive animals in huge amount seem to have powerful therapeutic effects on severe and terminal patients. We want to test it experimentally.

4: The cunning point that exceeds previous studies is, it's reasonable to consider there may be collective and superpositional effects of this activity due to the likely quantum mechanism of consciousness, and it may play as a sort of magnifying glass that shows a discernible placebo effect.
