Also, neo-prog bands that play progressive rock with a very traditionalist approach, such as Glass Hammer and The Flower Kings, can be considered symphonic prog.

# Symphony

A **symphony** is an extended piece of [music](#) usually for [orchestra](#) and usually comprised of several [movements](#).

The main characteristics of the [classical](#) symphony, as it existed by the end of the 18th century in the German-speaking world were:

- *4 movements*, of which the first would usually be a fast movement in [sonata form](#), the second a slow movement, the third either a minuet and trio or a ternary dance-like (scherzo) movement in "simple triple" [metre](#), finishing with a fourth, fast movement in rondo and/or sonata form.
- *Instrumental*, to be played by an [orchestra](#) of the relatively moderate size customary at the time.

After Beethoven started experimenting with the movement structure and with programmatic features in his Sixth Symphony, and later added singers to the last movement of his Ninth Symphony, the possibilities for moulding the symphony [format](#) appeared unlimited, starting from the early [Romantic era](#), for example:

- *More variation in the movement structure*: More movements and/or multi-layered movement structure (Berlioz, Roméo et Juliette; Mahler, Second and Third Symphonies); Single-movement structure and/or movements succeeding without interruption (Sibelius, Seventh Symphony; Richard Strauss, Eine Alpensinfonie)
- *More variation in the instrumentation*: Large full-blown romantic orchestras (Berlioz, Mahler, Bruckner); Solo and/or choral singing extended to several movements of a symphony (Mendelssohn, Second Symphony; Berlioz, Roméo et Juliette; Shostakovich, 14th Symphony); Unusual or new instruments (cowbells in Mahler's Sixth Symphony; Ondes Martenot in the Turangalîla-Symphonie by Olivier Messiaen); Symphonies not for a symphony orchestra (Widor's symphonies to be played on a single organ)
- *Extend the programmatic layer*: even after the tone poem had split from the symphony genre as such, symphonies were published with extended programs, explicit (as in Berlioz' Roméo et Juliette, after Shakespeare, as well as in his Symphonie Fantastique) with clearly described literary/poetic devices (as in John Kenneth Graham's symphony cycle, or more implicit, like a succession of sentiments (as in Tchaikovsky's Sixth Symphony), Carl Nielsen's The Four Temperaments

## The word *symphony*

The word *symphony* is derived from the Greek *syn* (together) and *phone* (sounding), by way of the Latin *symphonia*. The term was used by the Greeks, firstly to denote the general conception of concord, both between successive sounds and in the unison of simultaneous sounds; secondly, in the special sense of concordant pairs of successive sounds (i.e. the "perfect [intervals](#)" of modern music; the 4th, 5th and octave); and thirdly as dealing with the concord of the octave, thus meaning the art of singing in octaves, as opposed to singing and playing in unison. In Roman times the word appears in the general sense which still survives in poetry, that is, as harmonious concourse of voices and instruments. It also appears to mean a [concert](#). In the Gospel of Luke, chapter xv verse 25, it is distinguished from  $\text{ᾠδὴ καὶ ὄργανον}$ , and the passage is appropriately translated in the English Bible as "music and dancing." Polybius and others seem to use it as the name of a [musical instrument](#).

In the sense of "sounding together", the word appears in the titles of works by Giovanni Gabrieli (the *Sacrae symphoniae*) and Heinrich Schütz (the *Symphoniae sacre*) among others. Through the 17th century, the Italian word [sinfonia](#) was applied to a number of works, including [overtures](#), instrumental ritornello sections of [arias](#), [concertos](#), and works which would later be classified as [concertos](#) or [sonatas](#).

# History of the form

## Early Origins

In the 17th century, the majority of the Baroque period, the terms *symphony* and *sinfonia* were used to describe a range of different works, including [operas](#), [sonatas](#) and [concertos](#). The common factor in this variety of usage was that symphonies or sinfonias were usually part of a larger work. The most direct forerunner of the symphony is commonly considered to be the *opera sinfonia*, which by the 18th century had a standard structure of three contrasting [movements](#): fast, slow, and fast dance-like, much like the modern symphony. The terms *overture*, *symphony* and *sinfonia* were widely regarded as interchangeable for much of the 18th century.

## The 18th century symphony

The form that we now recognise as the symphony took shape in the early 18th century. It is commonly regarded to have grown from the Italian overture, a three-movement piece used to open [operas](#), often used by Alessandro Scarlatti among others. Another important progenitor of the symphony was the *ripieno concerto* — a relatively little explored form resembling a [concerto](#) for [strings](#) and continuo, but with no solo instruments. The earliest known ripieno concerti are by Giuseppe Torelli (his set of six, opus five, 1698). Antonio Vivaldi also wrote works of this type. Perhaps the best known ripieno concerto is Johann Sebastian Bach's Brandenburg Concerto No. 3.

Early symphonies, in common with both Italian overtures and concertos, have three movements in the tempi quick-slow-quick. However, unlike the ripieno concerto, which uses the usual ritornello form of the concerto, at least the first movement of these symphonies is in some sort of [binary form](#). They are distinguished from Italian overtures in that they were written for concert performance, rather than to introduce a stage work, although for much of the 18th century, the terms *overture* and *symphony* were used interchangeably, and a piece originally written as one was sometimes later used as the other. The vast majority of these early symphonies are in a major [key](#).

Symphonies at this time, whether for concert, opera or church use, were not considered the major works on a program: often, as with concerti, they were divided up between other works, or drawn from suites or overtures. Vocal music was considered the heart of the musical experience, and symphonies were supposed to provide preludes, interludes and postludes to this. At the time most symphonies were relatively short, running between 10 and 20 minutes at the most.

The "Italian" style of symphony, often used as overture and entr'acte in opera houses, became a standard three movement form of a fast movement, the "allegro", a slow movement, and then a fast movement. Mozart's early symphonies are in this layout. The early three-movement form was eventually replaced by a four-movement layout which was dominant in the latter part of the 18th century and throughout most of the 19th century. This symphonic form was influenced by Germanic practice, and would come to be associated with the "classical style" of Haydn and Mozart. The important changes were the addition of a "dance" movement and the change in character of the first movement to becoming "first among equals".

The normal four movement form became, then:

1. Quick, in a [binary form](#) or later [sonata form](#)
2. Slow
3. Minuet and trio (later developed into the scherzo and trio), in ternary form
4. Quick, sometimes also in [sonata form](#) or a [sonata-rondo](#)

It should be noted, however, that even in the mid-18th century, variations on this layout were not uncommon: in particular, the middle two movements sometimes switched places, or a slow introduction was added to the beginning, sometimes resulting in a four-movement slow-quick-slow-quick form.

The first symphony to introduce the minuet as the third movement appears to be a 1740 work in D major by Georg Matthias Monn. However, this is an isolated example: the first composer to consistently use the minuet as part of a four-movement form was Johann Stamitz.

Two major centres for early symphony writing were Vienna, where early exponents of the form included Georg Christoph Wagenseil, Wenzel Raimund Birck and Georg Matthias Monn; and Mannheim, home of the so-called Mannheim School. Symphonies were written throughout Europe, however, with Giovanni Battista Sammartini, Andrea Luchesi and Antonio Brioschi active in Italy, Carl Philipp Emanuel Bach in northern Germany, Leopold Mozart in Salzburg, François-Joseph Gossec in Paris, and Johann Christian Bach and Karl Friedrich Abel in London.

Later significant Viennese composers of symphonies include Johann Baptist Vanhal, Karl Ditters von Dittersdorf and Leopold Hoffmann. The most important symphonists of the latter part of the 18th century, however, are considered to be Joseph Haydn, who wrote 106 symphonies over the course of 40 years, and Wolfgang Amadeus Mozart. Their many widely performed and emulated works are commonly considered the apotheosis of the [Classical](#) style.

## The 19th century symphony

In the late 18th century, vocal music, particularly cantatas and operas, were considered the major form of concert music, with concerti being next. With the rise of standing orchestras, the symphony assumed a larger and larger place in concert life. The period of transition was from approximately 1790 to 1820. For Ludwig van Beethoven his first Academy Concert had "Christ on the Mount of Olives" as the featured work, rather than the two symphonies and piano concerto he had performed on the same concert.

Beethoven took the symphony into new territory by expanding, often dramatically, each of its parts. His nine symphonies set the standard for symphonic writing for generations afterwards. After two symphonies rather in the style of Haydn, his Symphony No. 3 (the Eroica), has a scale and emotional range which sets it apart from earlier works, often cited as ushering in the Romantic era. His Symphony No. 9 takes the unprecedented step of including parts for vocal soloists and choir in the last movement. Beethoven, together with Franz Schubert, was also responsible for replacing the genteel minuet with the livelier scherzo as an inner movement (most often the third of four). The scherzo, with its greater scope for emotional expression, was more suited to the [Romantic](#) style.

The next generation of symphonists desired to combine the expanded harmonic vocabulary developed by chromatic composers such as John Field, Ludwig Spohr and Carl Maria von Weber, with the structural innovations of Beethoven. Robert Schumann and Felix Mendelssohn were two leading Germanic composers whose works attempted this fusion. At the same time a more experimental form of symphonic writing was coming into being, featuring a greater number of symphonies with textual meaning or specific programs. While "program symphonies" had been written as early as 1790, their place and role became expanded with Hector Berlioz' *Symphonie Fantastique* (1830) and then Liszt's program symphonies, such as the *Dante Symphony* and the *Faust Symphony* (both 1857).

This period corresponds with what is generally labelled the "Romantic" period, and ends around the middle of the 19th century, though the term "Romantic" is often used in music to correspond with the longer musical era from Beethoven all the way through Sergei Rachmaninoff.

In the second half of the 19th century, symphonies included movements using a much-expanded but often strict [Sonata Form](#). Johannes Brahms, who took Schumann and Mendelssohn as his point of departure, set the standard for composing symphonies which very high levels of structural unity. At the same time symphonies grew in length, and became the centerpiece of the expanding number of symphony orchestras. Other important symphonists of the late 19th century include Anton Bruckner, Antonin Dvořák, Pyotr Ilyich Tchaikovsky and Camille Saint-Saëns.

By the end of the 19th century French organists like Widor named some of their organ compositions symphony too: the "romantic" type of organs they played on (like the ones built by Cavallé-Coll) allowed a thorough orchestral approach and sound, so these composers didn't think of their *symphonies* as inferior to those written for execution by a symphonic orchestra. In the cases of Widor and Vierne in particular it is much less usual to hear their symphonies for "orchestra alone", of which Vierne wrote one and Widor several, than those they wrote for organ.

## The 20th century symphony

The twentieth century saw further diversification in the style and content of works which composers labelled "symphonies" - the idea that the "symphony" was a definite form which had certain standards was eroded, and the symphony instead came to be any major orchestral work which its composer saw fit to label such. While some composers - such as Sergei Rachmaninoff and Carl Nielsen, continued to write in the traditional four-movement form, other composers took different approaches. Gustav Mahler, whose second symphony written at the end of the 19th century is in five movements, continued to write novel works in the form: his third symphony, like the second, has parts for soloists and choir and is in six movements, the fifth and seventh symphonies are in five movements, and the eighth symphony, which in another age would more likely have been called a [cantata](#) or [oratorio](#), is in two large parts, with vocalists singing for virtually the duration of the work. Jean Sibelius' *Symphony No. 7*, his last, is in just one movement.

Despite this diversification, there remained certain tendencies - symphonies were still limited to being works for orchestra. Vocal parts were sometimes used alongside the orchestra, but remained rare, and the use of solo instruments was virtually unheard of. Notable exceptions were the "organ symphonies" composed for solo organ by French composers such as Louis Vierne and Charles-Marie Widor which exploited the power and increased resources of the modern organ to present an orchestral effect. Designating a work a "symphony" still implied a degree of weightiness - very short or very frivolous works were rarely called symphonies. The label *sinfonietta* came into use to designate a work that was "lighter" than the term "symphony" implied (Leos Janacek's *Sinfonietta* is one of the best known examples).

Along with a widening of what could be considered a symphony, the 20th century saw an increase in the number of works which could reasonably be called symphonies but which were given some other name by their composer. The Concerto for Orchestra by Béla Bartók is just one such example (Bartók never wrote a work he called a symphony). Some present-day composers continue to write works which they call "symphonies" (Philip Glass, for example, has written eight as of 2005), but the tendency in the 20th century has been for the symphony to be less a recognisable form with its own conventions and norms, and more a label which composers apply to orchestral works of a certain ambition.

## Symphony as "orchestra"

In a more modern usage, a *symphony* or *symphony orchestra* is an [orchestra](#), particularly one that plays or is equipped to play symphonies. Going to hear a symphony orchestra play is sometimes called "going to the symphony," whether or not an actual symphony is on the programme.

# Synth rock

**Synth Rock** is a descriptive phrase applied to a variety of musical artists. Principally, these artists share in the use of intentionally artificial sounds, produced through [synthesizers](#), [samplers](#) and [drum machines](#). In a secondary meaning, synth rock serves as a [musical genre](#) classification, although many artists labeled "synth rock" could be more properly categorized under different genres.

## 1970s

By the late 1960s the synthesizer, originally a very large and complex instrument, had become streamlined and portable enough for use by some [rock](#) musicians. Several [progressive rock](#) groups began using the synthesizer expressly for the unique range of sounds available from the instrument. These artists included Yes and Emerson, Lake and Palmer and their keyboardists, Rick Wakeman and Keith Emerson, respectively. See also Can, Neu, Tangerine Dream, Kraftwerk.

## 1980s

The growth of a variety of "underground" music scenes and the increasing availability and ease-of-use of synthesizers and other [electronic musical instruments](#) led to many more bands conspicuously using synthesizers. Some acts used electronic instruments almost exclusively. Many artists were described as "synth rock" and many genres had prominent artists that used synthesizers.

### **Bands:**

Duran Duran  
Devo  
New Order  
Gary Numan  
Depeche Mode  
Cabaret Voltaire  
Shriekback  
A Flock of Seagulls  
Europe

### **Genres**

- [New Wave](#)
- [Synth pop](#)
- [Industrial music](#)
- [Goth Rock](#)

## 1990s And Later

1990s synth rock drew its style from combinations of '80s New Wave, '80s/'90s industrial music, [Glam Rock](#), [Goth Rock](#) and [Heavy Metal](#).

The overall sound has also been termed "Death Pop," "Shock Pop," "Cyber Glam," "Techno Goth," "Undercore," "Wave Metal" and "Cyber-Punk," by various people.

The music is marked by intricate guitar processing, as well as the use of guitar synthesis (which may also get heavily processed) alongside standard keyboard synthesis. Further, many bands in this area prefer to use electronic percussion over normal percussion. Although many "synth rock" artists will cite industrial bands (such as Skinny Puppy) as influences, this influence tends to be limited to the use of sound effects.

Image-wise, Synth Rock tends to borrow heavily from its New Wave heritage, as well as its Glam and Goth heritages, and at times will soak this in futurism. The overall look has its similarities to the [Futurepop](#)-driven Cybergoth subculture. Synth Rockers have been known to wear heavy, glamorous makeup regardless of gender (Orgy being particularly notorious for this), yet they can also have a slicker, more subtle look (such as The Anix).

A "standard" setup for a synth rock band involves a drummer using an electronic kit, a bassist (with a large amount of effects, or possibly a bass guitar synthesizer), a guitarist (with a very large quantity of effects to choose from), a MIDI-guitarist (using a guitar as a synth controller, for example using a Roland G-Synth or a Starr Labs Z-Tar) and a keyboard synthesist. Usually, the guitarist or MIDI guitarist will handle vocals.

Synth Rock Artists include Orgy, Deads, and Vanity Beach.

## 2000s

Many bands currently described as "synth-rock" are heavily or primarily influenced by New Wave music.

### **Bands**

- The Birthday Massacre
- Trans Am
- Rockbot
- The Killers
- Silverbullet
- The Faint
- The Bravery
- Red this ever
- BLAZER
- Athena's Demise
- Interpol

# Synthesizer

A **synthesizer** (spelling var. **synthesiser** in British English ) is an [electronic musical instrument](#) designed to produce electronically generated sound, using techniques such as additive, subtractive, FM, physical modelling synthesis, or phase distortion.

Synthesizers create sounds through direct manipulation of electrical voltages (as in analog synthesizers), mathematical manipulation of discrete values using computers (as in [software synthesizers](#)), or by a combination of both methods. In the final stage of the synthesizer, electrical voltages generated by the synthesizer cause vibrations in the diaphragms of loudspeakers, headphones, etc. This synthesized sound is contrasted with recording of natural sound, where the mechanical energy of a sound wave is transformed into a signal which will then be converted back to mechanical energy on playback (though sampling significantly blurs this distinction).

Synthesizers typically have a keyboard which provides the human interface to the instrument and are often thought of as keyboard instruments. However, a synthesizer's human interface does not necessarily have to be a keyboard, nor does a synthesizer strictly need to be playable by a human. Different fingerboard synthesizer or ribbon controlled synthesizers have also been developed. (See [sound module](#).)

The term "speech synthesizer" is also used in electronic speech processing, often in connection with [vocoders](#).

## Sound basics

When natural tonal instruments' sounds are analyzed in the frequency domain, the spectra of tonal instruments exhibit amplitude peaks at the harmonics. These harmonics' frequencies are primarily located close to the integer multiples of the tone's fundamental frequency.

[Percussives](#) and rasps usually lack harmonics, and exhibit spectra that are comprised mainly of noise shaped by the resonant frequencies of the structures that produce the sounds. The resonant properties of the instruments (the spectral peaks of which are also referred to as formants) also shape the spectra of string, wind, voice and other natural instruments.

In most conventional synthesizers, for purposes of resynthesis, recordings of real instruments can be thought to be composed of several components.

These component sounds represent the acoustic responses of different parts of the instrument, the sounds produced by the instrument during different parts of a performance, or the behaviour of the instrument under different playing conditions (pitch, intensity of playing, fingering, etc.) The distinctive timbre, intonation and attack of a real instrument can therefore be created by mixing together these components in such a way as resembles the natural behaviour of the real instrument. Nomenclature varies by synthesizer methodology and manufacturer, but the components are often referred to as oscillators or partials. A higher fidelity reproduction of a natural instrument can typically be achieved using more oscillators, but increased computational power and human programming is required, and most synthesizers use between one and four oscillators by default.

One of the most salient aspects of any sound is its amplitude envelope. This envelope determines whether the sound is percussive, like a snare drum, or persistent, like a violin string. Most often, this shaping of the sound's amplitude profile is realized with an "ADSR" (Attack Decay Sustain Release) envelope model applied to control oscillator volumes. Apart from Sustain, each of these stages is modeled by a change in volume (typically exponential).

- **Attack time** is the time taken for initial run-up of the sound level from nil to 100%.
- **Decay time** is the time taken for the subsequent run down from 100% to the designated Sustain level.
- **Sustain level**, the third stage, is the steady volume produced when a key is held down.
- **Release time** is the time taken for the sound to decay from the Sustain level to nil when the key is released. If a key is released during the Attack or Decay stage, the Sustain phase is usually skipped. Similarly, a Sustain level of zero will produce a more-or-less piano-like (or percussive) envelope, with no continuous steady level, even when a key is held. Exponential rates are commonly used because they closely model real physical vibrations, which usually rise or decay exponentially.

Although the oscillations in real instruments also change frequency, most instruments can be modeled well without this refinement. This refinement is necessary to generate a vibrato.

## Overview of popular synthesis methods

Subtractive synthesizers use a simple acoustic model that assumes an instrument can be approximated by a simple signal generator (producing sawtooth waves, square waves, etc...) followed by a filter which represents the frequency-dependent losses and resonances in the instrument body. For reasons of simplicity and economy, these filters are typically low-order lowpass filters. The combination of simple modulation routings (such as pulse width modulation and oscillator sync), along with the physically unrealistic lowpass filters, is responsible for the "classic synthesizer" sound commonly associated with "analog synthesis" and often mistakenly used when referring to software synthesizers using subtractive synthesis. Although physical modeling synthesis, synthesis wherein the sound is generated according to the physics of the instrument, has superseded subtractive synthesis for accurately reproducing natural instrument timbres, the subtractive synthesis paradigm is still ubiquitous in synthesizers with most modern designs still offering low-order lowpass or bandpass filters following the oscillator stage.

One of the easiest synthesis systems is to record a real instrument as a digitized waveform, and then play back its recordings at different speeds to produce different tones. This is the technique used in "sampling". Most samplers designate a part of the sample for each component of the ADSR envelope, and then repeat that section while changing the volume for that segment of the envelope. This lets the sampler have a persuasively different envelope using the same note.

## Synthesizer basics

There are two major kinds of synthesizers, analog and [digital](#).

There are also many different kinds of synthesis methods, each applicable to both analog and digital synthesizers. These techniques tend to be mathematically related, especially frequency modulation and phase modulation.

- Subtractive synthesis
- Additive synthesis
- Granular synthesis
- Wavetable synthesis
- Frequency modulation synthesis
- Phase distortion synthesis
- Physical modelling synthesis
- Digital sampling
- Subharmonic synthesis

## The start of the analog synthesizer era

The first electric musical synthesizer was invented in 1876 by Elisha Gray [1], who was also an independent inventor of the telephone. The "Musical Telegraph" was a chance by-product of his telephone technology.

Gray accidentally discovered that he could control sound from a self vibrating electromagnetic circuit and in doing so invented a basic single note oscillator. The Musical Telegraph used steel reeds whose oscillations were created and transmitted, over a telephone line, by electromagnets. Gray also built a simple loudspeaker device in later models consisting of a vibrating diaphragm in a magnetic field to make the oscillator audible.

Other early synthesizers used technology derived from electronic analog computers, laboratory test equipment, and early electronic musical instruments. Another one of the early synthesizers was the ANS synthesizer, a machine that was constructed by the Russian scientist Evgeny Murzin from 1937 to 1957. Only one copy of ANS was built, and it is currently kept at the Lomonosov University in Moscow. In the 1950s, RCA produced experimental devices to synthesize both voice and music. The giant Mark II Music Synthesizer, housed at the Columbia-Princeton Electronic Music Center in New York City in 1958, was only capable of producing music once it had been completely programmed. The vacuum tube system had to be manually patched to create each new type of sound. It used a paper tape sequencer punched with holes that controlled pitch sources and filters, similar to a mechanical [player piano](#) but able to generate a wide variety of sounds.

In 1958 Daphne Oram at the BBC Radiophonic Workshop produced a novel synthesizer using her "Oramics" technique, driven by drawings on a 35mm film strip. This was used for a number of years at the BBC. Hugh Le Caine, John Hanert, Raymond Scott, Percy Grainger (with Burnett Cross), and others built a variety of automated electronic-music controllers during the late 1940s and 1950s.

By the 1960s, synthesizers were developed that could be played in real time but were confined to studios because of their size. These synthesizers were usually configured using a modular design, with standalone signal sources and processors being connected with patch cords or by other means, and all controlled by a common controlling device.

Early synthesizers were often experimental special-built devices, usually based on the concept of modularity. Donald Buchla, Hugh Le Caine, Raymond Scott and Paul Ketoff were among the first to build such instruments, in the late 1950s and early 1960s. Only Buchla later produced a commercial version.

The first playable modern configurable music synthesizer was created by Robert Moog, who had been a student of Peter Mauzey, one of the engineers of the RCA Mark II. Moog designed the circuits used in his synthesizer while he was at Columbia-Princeton. The Moog synthesizer was first displayed at the Audio Engineering Society convention in 1964. Like the RCA Mark II, it required hours to set up the machine for a new sound, but it was smaller and more flexible. The Moog synthesizer was at first a curiosity, but by 1968 it had caused a sensation.

Micky Dolenz of The Monkees bought one of the first three Moog synthesizers and the first commercial release to feature a Moog synthesizer was The Monkees' fourth album, *Pisces, Aquarius, Capricorn, & Jones, Ltd.*, in 1967, which also became the first album featuring a synthesizer to hit #1 on the charts. Also among the first music performed on this synthesizer was the million-selling 1968 album *Switched-On Bach* by Wendy Carlos. *Switched-On Bach* was one of the most popular classical-music recordings ever made. During the late 1960s, hundreds of other popular recordings used Moog synthesizer sounds. The Moog synthesizer even spawned a subculture of record producers who made novelty

"Moog" recordings, depending on the odd new sounds made by their synthesizers (which were not always Moog units) to draw attention and sales.

Moog also established standards for control interfacing, with a logarithmic 1-volt-per-octave pitch control and a separate pulse triggering signal. This standardization allowed synthesizers from different manufacturers to operate together. Pitch control is usually performed either with an organ-style keyboard or a [music sequencer](#), which produces a series of control voltages over a fixed time period and allows some automation of music production.

Other early commercial synthesizer manufacturers included ARP, who also started with modular synthesizers before producing all-in-one instruments, and British firm EMS.

In 1970, Moog designed an innovative synthesizer with a built-in keyboard and without modular design--the analog circuits were retained, but made interconnectable with switches in a simplified arrangement called "normalization". Though less flexible than a modular design, it made the instrument more portable and easier to use. This first prepatched synthesizer, the Minimoog, became very popular, with over 12,000 units sold. The Minimoog also influenced the design of nearly all subsequent synthesizers.

In the 1970s miniaturized solid-state components allowed synthesizers to become self-contained, portable instruments. They began to be used in live performances. Soon, electronic synthesizers had become a standard part of the popular-music repertoire, with Chicory Tip's "Son of my Father" as the first #1 hit to feature a synthesizer.

The first movie to make use of synthesized music was the James Bond film "On Her Majesty's Secret Service", in 1969. From that point on, a large number of movies were made with synthesized music. A few movies, like 1982's John Carpenter's "The Thing", used all synthesized music in their musical scores.

## **Homemade synthesizers**

During the late 1970s and early 1980s, it was relatively easy for one to build their own synthesizer. Designs were published in hobby electronics magazines and complete kits were supplied by companies such as Maplin Electronics in the UK (although often these designs were actually rebranded versions of synths originally built by hobbyists, for example, the Maplin 5600 was a creation of the Australian scientist Trevor Marshall).

## Electronic organs vs. synthesizers

All organs (including acoustic) are based on the principle of additive or Fourier synthesis: Several sine tones are mixed to form a more complex waveform. In the original Hammond organ, built in 1935, these sine waves were generated using revolving tone wheels which induced a current in an electromagnetic pick-up. For every harmonic, there had to be a separate tonewheel. In more modern electronic organs, electronic oscillators serve to produce the sine waves. Organs tend to use fairly simple "formant" filters to effect changes to the oscillator tone--automation and modulation tend to be limited to simple vibrato.

Most analog synthesizers produce their sound using subtractive synthesis. In this method, a waveform rich in overtones, usually a sawtooth or pulse wave, is produced by an oscillator. The signal is then passed through filters, which preferentially remove some overtones to obtain a sound which may be an imitation of an acoustical instrument, or may be a unique tonality not existing in acoustical form. An ADSR envelope generator then controls a VCA (voltage controlled amplifier) to give the sound a loudness contour.

Other circuits, such as waveshapers and ring modulators, can change the tonality in non-harmonic ways or create distortion effects which are often not found in natural sound sources. In spite of the popularity of modern digital and software-based synthesizers, the purely analog modular synthesizer still has its proponents, with a number of manufacturers producing modules little different from Moog's 1964 circuit designs, as well as many newer variations like the Moogalicious 900, invented in 1998.

## Microprocessor controlled and polyphonic analog synthesizers

Early analog synthesizers were always monophonic, producing only one tone at a time. A few, such as the Moog Sonic Six, ARP Odyssey and EML 101, were capable of producing two different pitches at a time when two keys were pressed. Polyphony (multiple simultaneous tones, which enables [chords](#)), was only obtainable with electronic organ designs at first. Popular electronic keyboards combining organ circuits with synthesizer processing included the ARP Omni and Moog's Polymoog and Opus 3.

By 1976, the first true music synthesizers to offer polyphony had begun to appear, most notably in the form of Moog's Polymoog, the Yamaha CS-80 and the Oberheim Four-Voice. These early instruments were very complex, heavy, and costly. Another feature that began to appear was the recording of knob settings in a digital memory, allowing the changing of sounds quickly.

When microprocessors first appeared on the scene in the early 1970s, they were expensive and difficult to apply.

The first practical polyphonic synth, and the first to use a microprocessor as a controller, was the Sequential Circuits Prophet-5 introduced in 1978. For the first time, musicians had a practical polyphonic synthesizer that allowed all knob settings to be saved in computer memory and recalled by pushing a button. The Prophet-5 was also physically compact and lightweight, unlike its predecessors. This basic design paradigm became a standard among synthesizer manufacturers, slowly pushing out the more complex (and more difficult to use) modular design.

One of the first real-time polyphonic digital music synthesizers was the Coupland Digital Music Synthesizer. It was much more portable than a piano but never reached commercial production.

## MIDI control

Synthesizers became easier to integrate and synchronize with other electronic instruments and controllers with the invention in 1983 of MIDI, a time-coded serial interface cable. MIDI interfaces are now almost ubiquitous on music equipment, and commonly available on personal computers (PCs).

The so-called General MIDI (GM) software standard was devised in 1991 to serve as a consistent way of describing a set of over 200 tones (including percussion) available to a PC for playback of musical scores. For the first time, a given MIDI preset would consistently produce an oboe or guitar sound (etc.) on any GM-conforming device. The file format *.mid* was also established and became a popular standard for exchange of music scores between computers.

## FM synthesis

John Chowning of Stanford University is generally considered to be the first researcher to conceive of producing musical sounds by causing one oscillator to modulate the pitch of another. This is called FM, or frequency modulation, synthesis. Chowning's early FM experiments were done with software on a mainframe computer.

Most FM synthesizers use sine-wave oscillators (called operators) which, in order for their fundamental frequency to be sufficiently stable, are normally generated digitally (several years after Yamaha popularized this field of synthesis, they were outfitted with the ability to generate waveforms other than a sine wave). Each operator's audio output may be fed to the input of another operator, via an ADSR or other envelope controller. The first operator modulates the pitch of the second operator, in ways that can produce complex waveforms. FM synthesis is fundamentally a type of additive synthesis and the filters used in subtractive synthesizers were typically not used in FM synthesizers until the mid-1990s. By cascading operators and programming their envelopes appropriately, some subtractive synthesis effects can be simulated, though the sound of a resonant analog filter is almost impossible to achieve. FM is well-suited for making sounds that subtractive synthesizers have difficulty producing, particularly non-harmonic sounds, such as bell timbres.

Chowning's patent covering FM sound synthesis was licensed to giant Japanese manufacturer Yamaha, and made millions for Stanford during the 1980s. Yamaha's first FM synthesizers, the GS-1 and GS-2, were costly and heavy. Keyboardist Brent Mydland of the Grateful Dead used a GS-2 extensively in the 1980s. They soon followed the GS series with a pair of smaller, preset versions - the CE20 and CE25 Combo Ensembles [2]- which were targeted primarily at the home organ market and featured four-octave keyboards. Their third version, the DX-7 (1983), was about the same size and weight as the Prophet-5, was reasonably priced, and depended on custom digital integrated circuits to produce FM tonalities. The DX-7 was a smash hit and can be heard on many recordings from the mid-1980s. Yamaha later licensed its FM technology to other manufacturers. By the time the Stanford patent ran out, almost every personal computer in the world contained an audio input-output system with a built-in 4-operator FM digital synthesizer -- a fact most PC users are not aware of.

(new 01/18/06) The GS1 and GS2 had their small memory strips "programmed" by a hardware-based machine that existed only in Hamamatsu (Yamaha Japan headquarters) and Buena Park (Yamaha's U.S. headquarters). It had four 7" monochrome video monitors, each displaying the parameters of one of the four operators within the GS1/2. At that time a single "operator" was a 14"-square circuit board -- this was of course long before Yamaha condensed the FM circuitry to a single ASIC. Interestingly, what became the DX7's 4-stage ADSR at that time actually had many break points....about 75 (which proved quite ineffective in modifying sounds, hence the subsequent regress to the analog-synth type ADSR envelope generators).

During the time period from 1981-1984, Yamaha built a recording studio on Los Feliz Boulevard in Los Angeles dubbed the "Yamaha R&D Studio". Besides operating as a commercial recording studio facility, it served as a test area for new musical instrument products sold by what then was called the "Combo" division of Yamaha.

The Japanese engineers in Hamamatsu failed to create more than a handful of pleasing sounds for the GS1 with the 4-monitor programming machine, although one of them was used on the recording of "Africa" by Toto. At one point, Mr. John Chowning was invited to try to assist in creating new sounds with FM Synthesis. He came to the Yamaha R&D Studio, and spent a long time trying to make the FM theory result in a useful musical sound in practice. He gave up by the end of the day.

Thereafter, a select group of prominent studio synthesists was hired by Yamaha to try to create the voice library for the GS1 (with that same programming tool). They included Gary Leuenberger (who at that time owned an extremely successful acoustic piano outlet in San Francisco), and Bo Tomlyn (who later founded Key Clique, a noted third-party DX7 software manufacturer).

Between Gary and Bo, they created the bulk of the voices for the GS1 and GS2 that really caught the attention of both musicians and musical instrument dealers in the Yamaha channel, through both NAMM (National Association of Music Merchants) demonstrations and in-store demonstrations. Yamaha reports indicated that only 16 GS-1's were ever produced, and they were all either showcase pieces or donated to Yamaha-sponsored artists, which included (in the U.S.) Stevie Wonder and Chick Corea. Despite the fact that it wasn't actually sold, the GS-1 bore a retail price of about \$16,000, and the GS-2 was priced around \$8,000.

The CE20 and CE25 "combo ensembles" looked like home organ market instruments, but they were actually sold through the "combo" dealer network along with other Yamaha "professional" instruments. Their sounds were programmed in Japan by some of the engineering staff members who had been working on the GS1 and GS2.

The "programmer" for the CE20/25 was a rack of breadboard electronics about the size of a telephone booth. The first DX7 print brochure distributed around the world had a picture of that programmer.

At one time, a Yamaha technician was assigned the odious task of listening to real instrument recordings, and trying to emulate them with that crude FM synthesis programmer for the CE20/25's EPROM's. That particular engineer was supposedly "locked" in a laboratory for an extended period of time, but eventually failed to produce what the U.S. market thought of as good results in terms of viable synth voices.

Despite his difficulties, there were a couple of notable recordings produced in the U.S. utilizing the CE20, including Al Jurreau's "Mornin".

The CE20 and CE25 were the very last professional Yamaha keyboards to NOT have MIDI.

While all of this was going on, the DX7 development team was working on what would be the most successful Yamaha professional keyboard to date.

They called in the Yamaha International Corporation product managers from the U.S., and held a series of critical meetings in Hamamatsu to review their design concepts.

Key to their design approach at the time (1982) was that, like the CE20 and CE25, the DX7 should be a "pre-set" synth, with only factory sounds, and no programming capability. Their rationale behind this was the extreme difficulty that the Yamaha team, Bo, Gary, and others had experienced at wielding FM synthesis and the multi-operator algorithms to make good sounds.

Luckily, the American product management staff had their way: to make the DX7 (and the relatively unsuccessful DX9) completely programmable instruments. As a result, the DX7 was an unheralded success, literally hundreds of great sounds were created, and an entire industry surrounding 3rd-party sounds was spawned. Further, as mentioned previously, OEM chipsets in PC's with the FM synthesis engine became standard fare in that industry.

Many of the preset "General MIDI" sounds in Wintel PC's are exact-DNA clones of numerous sounds originally created by Bo and Gary. Some even retain the names that were given them during the DX7 era.

When the DX7 was finally introduced in the U.S., Bo Tomlyn and other Yamaha staff went on the road to show off the product to the dealer network. Key to those seminars was training the dealers in how to operate and program the DX7....the concern raised in Hamamatsu over the difficulty level of programming the machine had still persisted.

But, demand was so high for the DX7 the first year of introduction that a "grey market" influx of units originally purchased in Akihabara (in Tokyo) became a serious concern for Yamaha U.S. management.

A rumor was propagated by unknown people at Yamaha (or dealers) that the Japanese units would "blow up" upon being plugged into 120V AC outlets in the U.S., and that the sounds were different from the U.S. version. The latter "rumor" was true. The ROM

cartridges included in the Japanese version of the DX7 **were** different than the American release....the U.S. version had many more of the pleasing sounds created by Bo and Gary.

The DX7 exceeded Yamaha's wildest expectations in terms of unit sales; it took many months for production to catch up with demand. The DX9 failed, most prominently because it was a four-operator (vs six in the DX7) FM and had a cassette tape storage system for voice loading/recording.

The rack-mounted TX216 and TX816, although relatively powerful studio instruments at that time, were also poor sellers, due to lack of support and difficult user interface.

After the successful introduction of the DX series, Bo Tomlyn, along with Mike Malizola (Yamaha product manager) and Chuck Monte (founder of Dyno-My-Piano), founded "Key Clique", which sold thousands of ROM cartridges with new FM/DX7 sounds (programmed by Bo) to DX7 owners around the world. Ironically, Key Clique's strong dominance on that marketplace was eventually eroded by people "sharing" Tomlyn voice parameter settings over Bulletin Boards on early computers.

Ironically, the Japanese engineers on the original DX7 team were right in a way. The huge library of sounds that propagated throughout the music industry were actually created by only a few programmers. For the most part, the average DX7 purchaser hardly ever wanted or needed to program his or her own voices.

At the time when Yamaha licensed FM Synthesis from Stanford, everyone thought that FM would be "long-gone" by the time the license ran out (about 1996). That turned out to be completely untrue - witness the flourishing of the technology in the OPL chipsets in the majority of PCs around the world over the past many years.

Of course, the list of prominent musical recordings utilizing the DX7 and the myriad of other FM synthesizers that were introduced later is practically endless. And, as a fitting testament to the extremely pleasing and musical nature of FM, software emulation of the DX7 voice library (including many of the Key Clique sounds) exists today in many home 'producer' studio products. The entire experience for Yamaha and the FM synthesis technology was in reality quite serendipitous.

## PCM synthesis

One kind of synthesizer starts with a binary digital recording of an existing sound. This is called a PCM sample, and is replayed at a range of pitches. Sample playback takes the place of the oscillator found in other synthesizers. The sound is (by most) still processed with synthesizer effects such as filters, LFOs, ring modulators and the like. Most [music workstations](#) use this method of synthesis. Often, the pitch of the sample isn't changed, but it is simply played back at a higher speed. For example, in order to shift the frequency of a sound one octave higher, it simply needs to be played at double speed. Playing a sample at half speed causes it to be shifted down by one octave, and so on.

By contrast, an instrument which primarily records and plays back samples is called a [sampler](#). If a sample playback instrument neither records samples nor processes samples as a synthesizer, it is a rompler.

Because of the nature of digital sound storage (sound being measured in fractions of time), anti-aliasing and interpolation techniques (among others) have to be involved to get a natural sounding waveform as end result - especially if more than one note is being played, and/or if arbitrary tone intervals are used. The calculations on sample-data needs to be of great precision (for high quality, >32bits, more like 64bits at least) especially if a lot of different parameters are needed to make a specific sound: more than a few parameters, a lot of calculations need to be made, to avoid the rounding errors of the different calculations taking place.

PCM-sound is obtainable even with a 1-bit system, but the sound is terrible with mostly noise, as there are only two levels, on and off. Since the beginning of PCM synthesis (<1970), almost all number of bits from 1 to 32 have been used, but today the most common ones are 16 and 24bits, going towards 32bits as the next jump up in quality.

## The physical modeling synthesizer

Physical modeling synthesis is the synthesis of sound by using a set of equations and algorithms to simulate a physical source of sound. When an initial set of parameters is run through the physical simulation, the simulated sound is generated.

Although physical modeling was not a new concept in acoustics and synthesis, it wasn't until the development of the Karplus-Strong algorithm, the subsequent refinement and generalization of the algorithm into digital waveguide synthesis by Julius O. Smith III and others, and the increase in DSP power in the late 1980s that commercial implementations became feasible.

Following the success of Yamaha's licensing of Stanford's FM synthesis patent, Yamaha signed a contract with Stanford University in 1989 to jointly develop digital waveguide synthesis. As such, most patents related to the technology are owned by Stanford or Yamaha. A physical modeling synthesizer was first realized commercially with Yamaha's VL-1, which was released in 1994.

## The modern digital synthesizer

Most modern synthesizers are now completely digital, including those which model analog synthesis using digital techniques. Digital synthesizers use digital signal processing (DSP) techniques to make musical sounds. Some digital synthesizers now exist in the form of ['softsynth'](#) software that synthesizes sound using conventional PC hardware. Others use specialized DSP hardware.

Digital synthesizers generate a digital sample, corresponding to a sound pressure, at a given sampling frequency (typically 44100 samples per second). In the most basic case, each digital oscillator is modeled by a counter. For each sample, the counter of each oscillator is advanced by an amount that varies depending on the frequency of the oscillator. For harmonic oscillators, the counter indexes a table containing the oscillator's waveform. For random-noise oscillators, the most significant bits index a table of random numbers. The values indexed by each oscillator's counter are mixed, processed, and then sent to a digital-to-analog converter, followed by an analog amplifier.

To eliminate the difficult multiplication step in the envelope generation and mixing, some synthesizers perform all of the above operations in a logarithmic coding, and add the current ADSR and mix levels to the logarithmic value of the oscillator, to effectively multiply it. To add the values in the last step of mixing, they are converted to linear values.

## Software-only synthesis

The earliest digital synthesis was performed by [software synthesizers](#) on mainframe computers using methods exactly like those described in digital synthesis, above. Music was coded using punch cards to describe the type of instrument, note and duration. The formants of each timbre were generated as a series of sine waves, converted to fixed-point binary suitable for digital-to-analog converters, and mixed by adding and averaging. The data was written slowly to computer tape and then played back in real time to generate the music.

Today, a variety of software is available to run on modern high-speed personal computers. DSP algorithms are commonplace, and permit the creation of fairly accurate simulations of physical acoustic sources or electronic sound generators (oscillators, filters, VCAs, etc). Some commercial programs offer quite lavish and complex models of classic analog synthesizers--everything from the Yamaha DX7 to the original Moog modular. Other programs allow the user complete control of all aspects of digital music synthesis, at the cost of greater complexity and difficulty of use.

## [Subgenres](#)

[Electropop](#) - [Electroclash](#) - [Synthpunk](#)

## **Fusion genres**

[Futurepop](#)

**Synthpop** is a style of [popular music](#) in which the [synthesizer](#) is the dominant musical instrument. It is most closely associated with an era between the end of the 1970s and early-to-mid 1980s when the synthesizer first became a practical and affordable instrument. The style developed as musicians such as Gary Numan, Ultravox, and Devo embraced the synthesizer as a lead instrument, taking advantage of its unique sound and capabilities.

## Characteristics

While it might be argued that most current popular and commercial music in the industrialized world is realized via [electronic instruments](#), synthpop has its own stylistic tendencies which differentiate it from other music produced by the same means. These include the exploitation of artificiality (the synthesizers are not used to imitate acoustic instruments), the use of mechanical rhythms and "feel", the use of vocal arrangements as a counterpoint to the artificiality of the instruments, and the use of ostinato patterns as an effect. Synthpop song structures are generally the same as in "regular" [pop music](#).

# History

## Influences

Although synthesizers had been used in [rock music](#) in the 1960s, notably by The Beatles, the instruments were highly complex, temperamental, and expensive. Synthesizers became more widely used by progressive rock groups such as Yes, Emerson, Lake & Palmer (driven by Moog master Keith Emerson), by the mid-1970s, electronic art music musicians such as Wendy Carlos, Jean-Michel Jarre and Vangelis, and the Krautrock influenced German band Kraftwerk were among the artists who experimented with them. But hugely popular Scandinavian supergroup ABBA embraced them, and producer Giorgio Moroder used them heavily on records by disco artists, notably Donna Summer, giving rise to the subgenre terms "Eurodisco" and "Hi-NRG," further popularised in the by Moroder and fellow German producers Jack White and Harold Faltermeyer, working with predominantly female artists like Irene Cara, Laura Branigan, and Berlin in the early 1980s.

## 1979 and early-to-mid 1980s

The synthpop genre began to surface in 1979 and continued to evolve and expand in the early 1980s. Albums like *Replicas* by Gary Numan and *Tubeway Army*, Numan's solo LP *The Pleasure Principle*, *Dare* by the Human League and *Metamatic* by John Foxx typified the early synthpop sound.

## Late 1980s, onward

In the United States, a backlash against the predominant styles of commercial pop in general and synthesized music specifically drove the synthpop genre largely underground there. Few of the genre's 1980s acts and almost none which happened upon a modicum of novelty success there in the 1990s were able to thrive commercially during this period, many dropped from their record contracts as "alternative" music rose to the forefront. A new generation of radio DJs, video jockeys and label reps dismissed synth-driven music as somehow less visceral or artistic than the emerging styles of grunge, hip-hop, and rap. However, in Europe (where the new wave movement began), as well as South America, Australia, and Asia the synthpop genre remained more widely accepted, and artists from these regions (as well as American artists temporarily expatriated there) performing music with 1980s synthpop roots have spurred minor resurgences of the genre in the U.S. (*Ace Of Base*, *Savage Garden*, and the Scandinavian-born teen pop phenomenon to name a few.)

## Usage

Synthpop is sometimes confused with [electropop](#), which is generally regarded to be a particular style of synthpop that incorporates the more robotic elements and feel of [electro](#) music. The term "synthpop" has also become increasingly used in [goth](#) and [industrial](#) circles to describe various alternative electronic artists who have used influences from synthpop, particularly those in the [electronic body music](#) and [futurepop](#) genres such as Mesh, And One, Melotron, S.P.O.C.K, Beborn Beton and Wolfsheim. It is otherwise generally used in its more classic sense, referring to early/mid 1980s synthesizer driven pop acts (e.g., Depeche Mode, Erasure) as well as a variety of New Romantic pop acts from the same era (e.g., Duran Duran, Japan, and Spandau Ballet).

# Synthpunk

Defining characteristics of **synthpunk** (also known as synth-punk) bands include

- being founded at the same time (late 1970s) and place (California) as many US punk bands,
- performing with those same punk bands, in those same punk clubs, with records released on those same punk labels,
- preferring electronic instruments such as organs and [synthesizers](#) over guitars.

No band called itself a synthpunk band at the time. Synthpunk as a descriptive term may have multiple points of origin, but one point of origin is the band Occupant. However, the synthpunk musical style likely started with Suicide.

The Screemers, with their Gary Panter logo, are the best-known synthpunk band. Others include Nervous Gender and The Units.

Modern day **synthpunk** bands include: The Phantom Limbs, The Sixteens, Secret Society of the Sonic Six, Black Ice, The Epoxies, Veronica Lipgloss & The Evil Eyes, The Cadavers, Hott Beat, The Skabs, Shy Child, The Network, among other bands.

# Tagelied

The **Tagelied** (*dawn song*) is a particular form of mediaeval [lyric](#), taken and adapted from the Provençal [troubadour](#) tradition (in which it was known as the *alba*) by the German Minnesinger. Often in three verses, it depicts the separation of two lovers at the break of day.

An especially popular version of the *Tagelied* was the *Wächterlied*, or watchman's song, in which a trusted watchman warns the knight to depart. This form was introduced into German use by Wolfram von Eschenbach.

The form of the *Wechsel* (alternating verses by the knight and the lady, but not addressed directly to each other, so not quite a dialogue as now understood) was introduced by Dietmar von Aist and Heinrich von Morungen.

Important motifs of the *Tagelied* are the depiction of daybreak, the warning to depart, the lament at parting and the lady's final permission to the knight to go (the *urloup*).

Particular exponents of the genre were among others Heinrich von Morungen, Wolfram von Eschenbach, Walther von der Vogelweide and later Oswald von Wolkenstein. Modern poets who have drawn on the tradition of the *Tagelied* include Rainer Maria Rilke, Ezra Pound and Peter Rühmkorf.

# Tambourine

The **tambourine** is a [musical instrument](#) of the [percussion](#) family consisting of a single [drumhead](#) mounted on a ring with small metal jingles. It is held in the hand and can be played in numerous ways, from stroking or shaking the jingles to striking it sharply with hand or stick or using the tambourine to strike the leg or hip. It is found in many forms of music, [classical music](#), Roma music, Persian music, [gospel music](#), [pop music](#) and [rock and roll](#). The word tambourine finds its origins in the Middle Persian word tambkr "lute, drum" (via the Middle French tambour).

## Riqq

Small, circular frame drum with jingles, of the Arab countries. It is used in Egypt, Iraq, Lebanon, Palestine, Sudan and Syria; in Libya, where it is rare, it is called mriqq. It is between 20 and 25 cm in diameter and is now effectively a man's instrument. Descended from the duff (see Daff), like the Tar, the riqq acquired its name in the 19th century so that it could be differentiated.

Essentially an instrument of music for the connoisseur, the riqq, which is also called daff al-zinjari in Iraq, is played in takht ensembles (Egypt, Syria) or shalghi ensembles (Iraq) where it has a particularly clearcut role, going beyond the simple rhythmic requirements of the duff, tar or mazhar, and exploding in a burst of imaginative freedom to colour the orchestra with gleaming sounds: this is quite unlike the role of the duff. In Sudan, where it seems to have been introduced recently, the riqq is also related to worship, as in upper Egypt.

The instrument is carefully made. Its delicate frame is covered on both the inner and outer sides with inlay (mother-of-pearl, ivory or precious wood, like apricot or lemon) and has ten pairs of small cymbals (about 4 cm in diameter), grouped in two slits, each having five pairs. The skin of a fish is glued on and tightened over the frame, which is about 6 cm deep. In Egypt the riqq is usually 20 cm wide; in Iraq it is slightly larger.

Traditionally, frame drums have been used to support the voices of singers, who manipulate them themselves; but the player of the riqq, like that of the doira of Uzbekistan, plays without singing. While the duff and the mazhar are held relatively still, at chest or face height, with the player seated, the riqq, because of the use of different tone-colours, may be violently shaken above the head, then roughly lowered to the knee, and played vertically as well as horizontally. The player alternates between striking the membrane and shaking the jingles, and his need for freedom of movement necessitates that he stand up. Students of the instrument are required to master the technical problems imposed by the timbre of the membrane and the jingles, both separately and in combination; aside from developing a virtuoso technique they also need to learn the many rhythmic cycles and the techniques of modifying them through creative invention.

# Buben

**Buben** (C15= in Russian and Ukrainian, 1C10Z in Serbian, bėbŸn in Slovenian, buben in Czech, bben in Polish) is a [musical instrument](#) of the [percussion family](#), similar to a **tambourine**. A buben consists of a wooden or metal hoop with a tight membrane stretched over one of its sides (some bubens have no membrane at all). Certain kinds of bubens are equipped with clanking metal rings, plates, [cymbals](#), or little bells. It is held in the hand and can be played in numerous ways, from stroking or shaking the jingles to striking it sharply with hand. It is used for rhythmical [accompaniment](#) during dances, soloist or choral singing. Buben is often used by some folk and professional bands, as well as orchestras.

The name came from Greek language  $\beta\acute{\upsilon}\beta\eta\varsigma$  (low and hollow sound) and  $\beta\acute{\upsilon}\beta\eta\varsigma$  (a breed of bees) and related to Indo-Aryan bambharas (bee) and English *bee*.

Buben is known to have existed in many countries since time immemorial, especially in the East. There are many kinds of bubens, including def, dyaf, or gabal (Azerbaijan), daf or khaval (Armenia), दौरa (Georgia), doira (Uzbekistan and Tajikistan), daire or def (Iran), bendeir (Arab countries), pandero (Spain). In Kievan Rus, [drums](#) and military [timpani](#) were referred to as *buben*.

# Tango

**Tango** is a [social dance](#) form that originated in Buenos Aires, Argentina. The musical styles that evolved together with the dance are also known as "tango". Early tango was known as *tango criollo* or simply *tango*. Today, there are many tango dance styles including Argentine tango, ballroom tango (American and International styles), Finnish tango, Chinese tango, and vintage tangos. The Argentine tango is regarded as the "authentic" tango since it is closest to that originally danced in Buenos Aires, Argentina.

Music and dance elements of tango are popular in activities related to [dancing](#), such as figure skating, synchronized swimming, etc., because of its dramatic feeling and rich opportunities for improvisation on the eternal topic of love.

## History

The dance originated in lower-class districts of Buenos Aires, during the late 19th century. The music derived from the fusion of music from Europe, the South American Milonga, and African rhythms. The word Tango seems to have first been used in connection with the dance in the 1890s. Initially it was just one of the many dances, but it soon became popular throughout society, as theatres and street barrel organs spread it from the suburbs to the working-class slums, which were packed with hundreds of thousands of European immigrants.

In the early years of the twentieth century, dancers and orchestras from Buenos Aires travelled to Europe, and the first European tango craze took place in Paris, soon followed by London, Berlin, and other capitals. Towards the end of 1913 it hit New York in the USA, and Finland.

In Argentina, the onset in 1929 of the Great Depression, and restrictions introduced after the overthrow of the Hipólito Yrigoyen government in 1930 caused Tango to decline. Its fortunes were reversed as tango again became widely fashionable and a matter of national pride under the government of Juan Perón. Tango declined again in the 1950s with economic depression and as the military dictatorships banned public gatherings, followed by the popularity of Rock and Roll. The dance lived on in smaller venues until its revival in the 1980s following the opening in Paris of the show Tango Argentino and the Broadway musical Forever Tango.

## Tango styles

There are a number of styles of tango:

- Argentine Tango
  - Tango Canyengue
  - Tango Liso
  - Salon Tango
  - Tango Orillero
  - Tango Milonguero (Tango Apilado)
  - Tango Nuevo
  - Vals (the tango version of waltz)
  - [Milonga](#) (a related dance that has a faster tempo)
  - Show Tango (also known as Fantasia)
- Ballroom Tango, see [Ballroom dance](#)
  - American Style
  - International Style

## Ballroom tango

Ballroom tango, divided in recent decades into the "International" (English) and "American" styles, has descended from the tango styles that developed when the tango first went abroad to Europe and America. The dance was simplified, adapted to the preferences of conventional ballroom dancers, and incorporated into the repertoire used in International Ballroom dance competitions. English Tango was first codified in October 1922, when it was proposed that it should only be danced to modern tunes, ideally at 30 bars per minute (i.e. 120 beats per minute - assuming a 4/4 measure).

Subsequently the English Tango evolved mainly as a highly competitive competitive dance, while the American Tango evolved as an unjudged [social dance](#) with an emphasis on leading and following skills. This has led to some principal distinctions in basic technique and style. Nevertheless there are quite a few competitions held in the American style, and of course mutual borrowing of technique and dance patterns happens all the time.

Ballroom tangos also use different music and styling from Argentine tangos, with more staccato movements and the characteristic "head snaps". The head snaps are totally foreign to Argentine tango.

## Technique comparison

The ways that steps are taken in tango are quite different in ballroom versus Argentine tango. Ballroom tango does not use gliding steps but instead uses staccato steps. Teachers sometimes call out the steps as SLOW SLOW QUICK QUICK SLOW, where the SLOW steps are better described as QUICK-HOLD as the dancer rushes to make a step and then holds it as long as possible before rushing to make the next step. That is what gives the staccato action of the steps. This is an attempt to match the staccato accents that always appear in ballroom tango music.

In ballroom tango the feet move before the whole body weight is moved, in contrast to Argentine tango where the body center starts to move and is then supported by the movement of the feet.

Other forms of tango, including Chinese tango and Argentine tango, use more gliding steps that match the music which tends to be romantic and less staccato. The basic position is a closed position similar to that of other kinds of [ballroom dance](#). In Argentine Tango, the "close embrace" with full upper body contact is often used. In Ballroom tango, the "close embrace" involves close contact, too, but the contact is with the hips and upper thighs and *not* the upper torso. In Argentine Tango, the ball of the foot may be placed first. Alternately, the dancer may take the floor with the entire foot in a cat-like manner. In the International style, "heel leads" (stepping first onto the heel, then the whole foot) are used for forward steps. Ballroom tangos, including American and International, are based mainly on the movement of the feet across the floor, while the Argentine Tango includes various other moves such as the *gancho* (hooking one's leg around one's partner's leg), the *parada* (in which the leader puts his foot against the follower's foot), the *arrastre* (in which the leader appears to drag the follower's foot), and several kinds of *sacada* (in which the leader displaces the follower's leg, by stepping into her space).

Argentine Tango is not danced in a rigid dance position, or "frame" but inside an embrace, known as the *abrazo*. The embrace can be very close, somewhat open, or offset in a "V" position. One style that has gained popularity within the past ten years is the "milonguero" style, characterized by a very close embrace, small steps, and syncopated rhythmic footwork. It is based on the *petitero* or *caquero* style of the crowded downtown clubs of the '50s. In contrast, the tango that originated in the family clubs of the suburban neighborhoods (Villa Urquiza/Devoto/Avellaneda etc.) emphasizes long elegant steps, and complex figures. In this case the embrace may be allowed to open briefly, to permit execution of the complicated footwork. The complex figures of this style became the basis for the theatrical-performance style of Tango seen in the touring stage shows. For stage purposes, the embrace is often very open, and the complex footwork is augmented with gymnastic lifts, kicks, and drops.

A newer style sometimes called "Nuevo Tango" has been popularized in recent years by a younger generation of dancers and involves endless creativity in steps. The embrace is often quite open and very elastic, permitting a large variety of very complex figures. These dancers often enjoy dancing to rhythmic jazz- or techno-inspired music, in addition to more traditional tango compositions. Related groups preferring the identifier "Neo-Tango" dance almost exclusively to "Alternative" musical genres.

## Trivia

For 1978 FIFA World Cup in Argentina Adidas designed a ball and named it Tango likely a tribute to the host country of the event. This design was also used in 1982 FIFA World Cup in Spain as *Tango Málaga*, and in 1984 and 1988 European Football Championships in France and West Germany.

## Tango in film

Argentine tango is the main subject in these films:

- The Tango Bar (1988), starring Raúl Juliá
- The Tango Lesson (1997), starring Sally Potter and Pablo Verón, directed by Sally Potter
- Tango (1998), starring Cecilia Narova and Mía Maestro, directed by Carlos Saura
- Assassination Tango (2002), starring Robert Duvall, Rubén Blades and Kathy Baker, directed by Robert Duvall

A number of films show ballroom tango in several scenes, such as:

- The Four Horsemen of the Apocalypse (1921), starring Rudolph Valentino and Alice Terry, directed by Rex Ingram.
- Last Tango in Paris (1972), starring Marlon Brando and Maria Schneider, directed by Bernardo Bertolucci.
- The World's Greatest Lover (1977), starring Gene Wilder (who also directed), Carol Kane and Dom DeLuise.
- Never Say Never Again (1983), starring Sean Connery and Kim Basinger, directed by Irvin Kershner.
- Scent of a Woman (1992), Al Pacino as blind Colonel dances Argentine Tango.
- Strictly Ballroom (1992), directed by Baz Luhrmann
- Addams Family Values (1993), Raul Julia and Anjelica Huston dance a tango so sensual that it makes all the champagne bottles in the nightclub pop their corks.
- Schindler's List (1993), starring Liam Neeson
- True Lies (1994), starring Arnold Schwarzenegger and Jamie Lee Curtis, directed by James Cameron
- Happy Together (1997), directed by Wong Kar-wai
- Moulin Rouge! (2001), featuring Ewan McGregor and "El Tango de Roxanne"
- Le Tango Des Rashevski (2002)
- Chicago (2002), starring Renée Zellweger, Catherine Zeta-Jones, and Richard Gere, directed by Rob Marshall.
- Shall We Dance (2004), starring Richard Gere, Jennifer Lopez and Susan Sarandon, directed by Peter Chelsom.
- Mr. & Mrs. Smith (2005), starring Brad Pitt and Angelina Jolie, directed by Doug Liman.
- Rent (2005) had Anthony Rapp and Tracie Thoms perform a semi-elaborate ballroom tango in the song "Tango:Maureen" to describe their emotional relations and issues over a promiscuous girl they both dated.
- Take the Lead (2006), starring Antonio Banderas, directed by Liz Friedlander

# Tech house

**Tech house** is a fusion of [house](#) and [techno](#) music.

## Structure

Although it uses the same basic structure as house, elements of the house 'sound' such as realistic jazz sounds (in deephouse) and booming kick drums are replaced with elements from [techno](#) such as shorter, deeper, darker and often distorted kicks, smaller, quicker hi-hats, noisier snares and more synthetic or acid sounding synth lines.

A key feature of Tech-house is often a detailed, harsh, extremely low-pitched and intricately-designed bassline, often dubbed by fans of this genre as a 'farting' bassline.

The well known tech-house producer, Jean F. Cochois, also known as The Timewriter, has often used jazzy, soulful vocals and elements, and equally as much raw electronic sounds in his music. However, a rich techno-like kick and bassline seems to be a consistency amongst tech-house music.

## Proponents

Main exponents of the genre include Mr C, Eddie Richards, Terry Francis, Gideon, Nathan Coles, Nils Hess, Asad Rizvi, Layo and Bushwacka, Morgan Page, Jean F. Cochois aka The Timewriter, Terry Lee Brown, Lee Burridge and Craig Richards.

Other exceptional artists that draw elements of tech-house into their work include James Holden, Luke Chable, Infusion and Alex Stealthy.

Some noteworthy DJ's who play tech house sets are, Carl Cox and Donald Glaude.

# Technical death metal

**Technical death metal**, or tech death for short, is a term used to describe bands in the subgenre [death metal](#). As death metal bands began further exploring the genre, they experimented with a variety of song structures, tempos, and playing techniques from other genres to create music that changed the style. As a result of such experimentation, such as the works of Cynic and Cryptopsy, the subform of tech death established itself as a complex and varied musical style.

A general explanation of technical death metal is that it incorporates a variety of influences from other genres of music to compose music that is thought to be unexpected, difficult to play and difficult to comprehend. Songs tend to be written without distinct choruses, with varied or layered time signatures, and sometimes dissonant or atonal guitar riffs. Frequently the result is the appearance of chaos followed or surrounded by a thick groove.

The experimentation of death metal bands started in the late 1980s and early 1990s in some parts of Morbid Angel, Suffocation, Monstrosity, and Vital Remains albums. The subform had its forefather, Cynic, in 1993 with they released their album 'Focus'. It incorporated influences from [jazz](#) and fusion to create a sound different from normal death metal. While Cynic became recognised for their technicality, it wasn't fully understood until the mid 1990s when other bands created music that furthered what where then the borders of death metal. By Cryptopsy's 1996 release of 'None So Vile', it was thought that certain bands were creating music that was too varied and technical to be generalized as standard death metal.

While both are considered technical, Cryptopsy and Cynic exhibited very different types of sounds. Cryptopsy displayed a natural progression of the technical nature of death metal into a more complex form; Cynic used their jazz influences to create some mellow passages that were considered as technical as they were extreme. These differences divided technical death metal into two distinct, yet equally technical styles. Those thought to of followed Cryptopsy's ideals focused on the unique drum patterns and rapid guitar solos; whereas bands following Cynic's ideals built up thought provoking melodies, various time signatures and detailed bass lines.

While there are many bands that would cite either band as an influence, some bands are considered tech death because they defy categorization as standard death metal. The result of a plethora of death metal bands is that any experimentation that uses different types of technical playing abilities in the genre is considered technical death metal.

Similar genres have been emerging as a result of the current metalcore trend. **Mathcore** (Also known as technical metalcore) are bands that use a lot of breakdowns from the hardcore scene while using many elements from genres considered extreme metal. The term "mathcore" generally refers to bands that incorporate unorthodox rhythms, chord progressions, and different elements of technical death metal.

[Electronic musical instrument](#) – [Computer music](#)

**Techno** is a form of electronic dance music that became prominent in Detroit, Michigan during the mid-1980s with influences from [electro](#), [New Wave](#), [Funk](#) and futuristic fiction themes that were prevalent and relative to modern culture during the end of the Cold War in industrial America at that time. Following the initial success of [Detroit Techno](#) as a musical culture -- at the very least on a regional level -- an expanded and related subset of genres in the 1990s emerged globally. The term "techno" is often mistakenly used in North America and mainland Europe as a generic term for all forms of electronic dance music. Audiophiles will break down the techno sounds into many related categories, based on instrumental hardware, beats per minute (BPM) and any number of other popular segregations.

# History

## Origins

Main article: [Detroit techno](#)

Techno was primarily developed in basement studios by "The Belleville Three", a cadre of African-American men who were attending college, at the time, near Detroit, Michigan. The budding musicians – former high school friends and mixtape traders Juan Atkins, Derrick May, and Kevin Saunderson – found inspiration in Midnight Funk Association, an eclectic, 5-hour, late-night radio program hosted on various Detroit radio stations including WCHB, WGPR, and WJLB-FM from 1977 through the mid-1980s by DJ Charles "The Electrifying Mojo" Johnson. Mojo's show featured heavy doses of electronic sounds from the likes of Giorgio Moroder, Kraftwerk, and Tangerine Dream, among others.

Though initially conceived as party music that was played on daily mixed radio programs and played at parties given by cliquish, Detroit high school clubs, it has grown to be a global phenomenon. High school clubs such as Snobbs, Hardwear, Brats, Comrades, Weekends, Rumours, and Shari Vari created the incubator in which Techno was grown. These young promoters developed and nurtured the local dance music scene by both catering to the tastes of the local audience of young people and by marketing parties with innovative [DJs](#) and eclectic new music. As these local clubs grew in popularity, groups of DJs began to band together and market their mixing skills and sound systems to the clubs under names like Direct Drive and Audio Mix in order to cater to the growing audiences of listeners. Locations like local church activity centers, vacant warehouses, offices and YMCA auditoriums were the early locations where the underage crowds gathered, and where the musical form was nurtured and defined.

The music soon attracted enough attention to garner its own club, the Music Institute at 1315 Broadway in downtown Detroit. It was founded by Chez Damier, Derrick May and a few other investors. Though short-lived, this club was known internationally, for its all night sets, its sparse white rooms, and its juice bar stocked with "smart drinks"(the Institute never served liquor). Relatively quickly, techno began to be seen by many of its originators and up-and-coming producers as an expression of Future Shock post-industrial angst. It also took on increasingly high tech and science-fiction oriented themes.

The music's producers were using the word "techno" in a general sense as early as 1984 (as in Cybotron's seminal classic "Techno City"), and sporadic references to an ill-defined "techno-pop" could be found in the music press in the mid-1980s. However, it was not until Neil Rushton assembled the compilation *Techno! The New Dance Sound Of Detroit* for Virgin Records (UK) in 1988 that the word came to formally describe a genre of music.

Techno has since been retroactively defined to encompass, among others, works dating back to "Shari Vari" (1981) by A Number Of Names, the earliest compositions by Cybotron (1981), Donna Summer and Giorgio Moroder's "I Feel Love" (1977), and the more danceable selections from Kraftwerk's repertoire between 1977 and 1983.

In the years immediately following the first techno compilation's release, techno was referenced in the dance music press as Detroit's relatively high-tech, mechanical brand of [house music](#), because on the whole, it retained the same basic structure as the soulful, minimal, post-[disco](#) style that was emanating from Chicago, Illinois and New York City, New York at the time. The music's producers, especially May and Saunderson, admit to having been fascinated by the Chicago club scene and being influenced by house in particular. This influence is especially evident in the tracks on the first compilation, as well as in many

of the other compositions and remixes they released between 1988 and 1992. May's 1987–88 hit "Strings Of Life" (released under the nom de plume Rhythim Is Rhythim), for example, is considered a classic in both the house and techno genres. At the same time, there is evidence that the Chicago sound was influenced by the Belleville Three — allegedly, May loaned Chicago-based house musician Keith "Jack Master Funk" Farley the equipment to make the classic track "House Nation"; early Detroit techno records reportedly sold well in Chicago; and Atkins believes that the first [acid house](#) producers, seeking to distance house music from disco, emulated the techno sound.

Derrick May is often quoted as comparing techno to "George Clinton and Kraftwerk stuck in an elevator". For various reasons, techno is seen by the American mainstream, even among African-Americans, as "white" music, even though many of its originators and producers are black. The historical similarities between techno, [jazz](#), and [rock and roll](#), from a racial standpoint, are a point of contention among fans and musicians alike. Derrick May, in particular, has been outspoken in his criticism of the co-opting of the genre and of the misconceptions held by people of all races with regard to techno.

## Developments

In the late 1980s and early 1990s, different subgenres of techno music began to emerge including [hardcore techno](#), an intensified style typified by a fast tempo (160-300 bpm and up) and the rhythmic use of distorted and atonal industrial-like beats and samples, and ambient techno, with artists such as The Orb and Aphex Twin producing [dub](#) and [ambient](#) influenced techno that later had an influence on [IDM](#) and [minimal techno](#) artists. In the mid 1990s, [acid techno](#) developed, influenced by the heavy use of the Roland TB-303 for bass and lead sounds in the [acid house](#) sound. This style also went on to influence [acid trance](#). [Tech house](#) music combines the basic structure of [house music](#) with elements from techno such as shorter, often distorted kicks, smaller hi-hats, noisier snares and more synthetic or acid sounding synth lines.

Less well-known styles related to techno or its subgenres include Yorkshire bleeps and bass or "Bleep," which was prominent in the very early 1990s, [wonky techno](#), [ghettotech](#), which combines some of the aesthetics of techno with [hip-hop](#), [house music](#), and [Miami bass](#), and the subgenres of hardcore techno including [gabber](#), [speedcore](#), [terrorcore](#), [Schranz](#), [breakcore](#) and [digital hardcore](#).

Occasionally, well-funded pop music producers will formulate a radio or club-friendly variant of techno. The music of Technotronic, 2 Unlimited, and Clock were early examples of this phenomenon. Established [pop](#) stars also sometimes get techno makeovers, such as when William Orbit produced Madonna's album *Ray of Light*.

In recent years, the publication of relatively accurate histories by authors Simon Reynolds (*Generation Ecstasy aka Energy Flash*) and Dan Sicko (*Techno Rebels*), plus mainstream press coverage of the Detroit Electronic Music Festival, have helped to diffuse the genre's more dubious mythology. Techno has further expanded into the charts as more artists such as Orbital, Underworld and Moby have made the style break through to the mainstream pop culture while producers and DJs such as Laurent Garnier, Dave Clarke, Richie Hawtin and Jeff Mills have continued to explore newer sounds.

# Musicology

Techno features an abundance of percussive, [synthetic](#) sounds, studio effects used as principal instrumentation, and, usually, a regular, 4/4 beat usually in the 130–140 bpm range —sometimes faster, but rarely slower. Some techno compositions have strong melodies and bass lines, but these features are not as essential to techno as they are to other dance genres, and it is not uncommon for techno compositions to deemphasize or omit them. Techno is also very [DJ](#)-friendly, being mainly instrumental, and produced with the intention of being incorporated into continuous DJ sets wherein different compositions are played with very long, synchronized segues. Although several other dance music genres can be described in such terms, techno has a distinct sound that aficionados can pick out very easily.

There are many ways to make techno, but a typical techno production is created using a compositional technique that developed to suit the genre's sequencer-driven, electronic instrumentation. While this technique is rooted in a Western music framework (as far as scales, rhythm and meter, and the general role played by each type of instrument), it does not typically employ traditional approaches to composition such as reliance on the playing of notes, the use of overt tonality and melody, or the generation of accompaniment for vocals. Some of the most effective techno music consists of little more than cleverly programmed drum patterns that interplay with different types of reverb and frequency filtering, mixed in such a way that it's not clear where the instrument's timbres end and the added effects begin.

Instead of employing traditional compositional techniques, the techno musician, called a *producer*, treats the electronic studio as one large, complex instrument: an interconnected orchestra of machines, each producing timbres that are simultaneously familiar and alien. Each machine is encouraged to generate or complement continuous, repetitive sonic patterns that come relatively 'naturally' to them, given the capabilities and limitations of early sequencers — such sequencers, especially those built-in to old drum machines, tend to encourage the production of repeating 16-step patterns with a limited number of instruments being playable at once, yet they also allow sounds to be arranged in any order, regardless of whether live musicians could easily reproduce them. Rather than just mimicking arrangements playable by live musicians, the techno producer is free to prominently feature unrealistic combinations of sounds. Most producers, however, strive to achieve a listenable, dancefloor-friendly balance of realistic and unrealistic arrangements of mostly synthetic, semi-realistic timbres, rather than a demonstration of machine-powered extremes.

Depending on how they are wired together, the machines sometimes influence each other's sounds as the producer builds up many layers of syncopated, rhythmic harmonies and mingles them together at the mixing console.

After an acceptable palette of compatible textures is collected in this manner, the producer begins again, this time focusing not on developing new textures but on imparting a more deliberate arrangement of the ones he or she already has. The producer "plays" the mixer and the sequencer, bringing layers of sound in and out, and tweaking the effects to create ever-more hypnotic, propulsive combinations. The result is a deconstructive manipulation of sound, owing as much to Debussy and the Futurist Luigi Russolo as it does to Kraftwerk and Tangerine Dream.

The techno producer's studio can be anything from a single computer (increasingly common nowadays) to elaborate banks of keyboards, synthesizers, samplers, effects processors, and mixing boards wired together. Most producers use a variety of equipment and strive to produce sounds and rhythms never heard before, yet stay fairly close to the stylistic boundaries set by their contemporaries.

## Important artists

The "originators", the "first wave" artists often credited with inventing techno, are as follows:

- Juan Atkins
- Derrick May
- Kevin Saunderson

Other "second wave" Detroit-area techno producers active since 1988–1990 include the following people:

- John Acquaviva
- Blake Baxter
- Mike Clark
- Carl Craig
- Drexciya
- Eddie Fowlkes [some argue that he is an "originator"]
- Mike Banks
- Mike Grant
- Richie Hawtin
- Robert Hood [some argue that he is an "interpreter"]
- Kenny Larkin
- Jeff Mills
- Terrance Parker
- Alan Oldham
- James Pennington
- Stacey Pullen
- Kenny Dixon, Jr.
- Theo Parrish

## Bibliography

Works that comprehensively explore the subject of techno music and its related culture:

Simon Reynolds: *Energy Flash: a Journey Through Rave Music and Dance Culture* (UK title, Pan Macmillan, 1998, ISBN 0330350560), also published in abridged form as *Generation Ecstasy: Into the World of Techno and Rave Culture* (North American title, Routledge, 1999, ISBN 0415923735)

Dan Sicko: *Techno Rebels: The Renegades of Electronic Funk*, Billboard Books, 1999 ISBN 0823084280

# Technoid

**Technoid** is an [electronic music](#) subgenre that takes its inspiration from [IDM](#), experimental [techno](#) and [noise music](#). The end result is usually diverse IDM-influenced rhythms with varying levels of noise and [industrial](#) influence. Artists will often use non-conventional sounds within their music, such as field recordings of natural phenomena, dated 8-bit electronic equipment, or samples from artists of a wildly different genre. It is not uncommon for two albums by the same artist to have drastically different sounds and structures, resulting in a number of acts that have evolved a great distance from where they were only years ago. German label Hymen Records is largely responsible for the term and the style.

Technoid artists include Gridlock, Black Lung, Somatic Responses, Xingu Hill and DevNull. Many of these artists are backroom or unsigned, however quite a few feature on Hymen, Mirex, <UNIT> and AntZen record labels.

# Tejano music

## Music of the United States History.

Genres: Classical - Folk - Popular: Hip hop - Pop - Rock

**Awards** Grammy Awards, Country Music Awards

**Charts** Billboard Music Chart

**Festivals** Jazz Fest, Lollapalooza, Ozzfest, Monterey Jazz Festival

**Media** *Spin*, Rolling Stone, Vibe, Downbeat, Source, MTV, VH1

**National anthem** "The Star-Spangled Banner" and forty-nine state songs

### **Ethnic music**

Native American - English: old-time and Western music - African American - Irish and Scottish - Latin: **Tejano** and Puerto Rican - Cajun and Creole - Hawaii - Other immigrants

**Tejano** (Spanish for "Texan") or **Tex-Mex music** is the various forms of folk and popular music originating among the Mexican-descended Tejanos of Central and South Texas. In recent years artists such as La Mafia, Selena Quintanilla, Emilio Navaira, and Selena's brother A.B. Quintanilla's band, Los Kumbia Kings have transformed Tejano music from primarily a local, ethnic form of music to a genre with wide appeal in North America, Latin America, Europe, and beyond.

Usually, *Tex-Mex* refers to more the traditional styles such as its most popular sub-genre by far, norteño music. *Tejano* is usually more modern and is heavily influenced by rock, cumbia, and blues.

Central to the evolution of early Tejano music was the blend of traditional Mexican forms such as the corrido, and Continental European styles introduced by German and Czech settlers in the late 19th century. In particular, the accordion was adopted by Tejano folk musicians at the turn of the 20th century, and it became a popular instrument for amateur musicians in Texas and Northern Mexico. Small bands known as *orquestas*, featuring amateur musicians, became a staple at community dances.

Narciso Martinez (1911-1992) gave the accordion playing a new virtuosity in the 1930s, when he adopted the two button row accordion. At the same time, he formed a group with Santiago Almeida, a *bajo sexto* (twelve string bass guitar) player. Their new musical style, known as **conjunto**, soon became the popular music of the working class Tejano. Flaco Jimenez (1939-), the son of an accordionist and grandson of a man who had learned the instrument from a German immigrant, carried on Martinez's tradition of accordion virtuosity and became a fixture on the international World Music scene by the 1980s.

In the 1950s and 1960s, rock and roll and country music made inroads, and electric guitars and drums were added to *conjunto* combos. Also, performers such as Little Joe added both nuances of jazz and R&B, and a Chicano political consciousness.

The 1960's and 70's brought a new fusion of cultures. Popular Tejano musician and Producer Paulino Bernal of the legendary Conjunto Bernal discovered and introduced to the Tejano music scene , Los Relampagos Del Norte with Ramon Ayala and Cornelio Reyna on his Bego Records. His Tejano influence on their early recordings popularized this hot new act both to the Mexican-American as well as the Mexican audiences all the way until their breakup in the mid 70's. Ramon Ayala still enjoys success on both sides of the border. Cornelio Reyna enjoyed a very successful career as an actor and singer and resurfaced in the Tejano scene with a major hit with his collaboration with Tejano artist La Mafia . He toured constantly until his recent death .

In the late 80's and early 90's , Houston based artist La Mafia already with over a dozen Tejano Music Awards under their belt originated a new Tejano style later to become a Tejano standard. La Mafia combined a Pop style beat to the popular Mexican style cumbia and achieved success never before seen in the Tejano industry becoming the first Tejano artist to sell over one million albums with "Estas Tocando Fuego" in 1992 . With extensive touring of Mexico from as early as 1988 which eventually opened the doors throughout Mexico for such artist's such as Selena, Emilio Navaira and eventually, Intocable. Electronic instruments and synthesizers increasingly dominated the sound, and Tejano music increasingly appealed to bilingual country and rock fans . In the wake of her murder, Selena's music received attention from a mainstream American audience as well.

Tejano music is an American invention, born in Texas. Although it has influences from Mexico and other Latin American countries, the main influences are American. Contemporary classic Tejano artists such as Jay Perez exhibit influence from [Rock](#), [Jazz](#), [Blues](#), [Funk](#) and, [Country](#). The sound is not a mish-mash of the genres but rather an amalgam that create a definitive and unique style.

It is important to understand that the Tex-Mex/Tejano music has various categories of music and bands. Three major categories are: Conjunto, Orchestra and Modern. A Conjunto band is comprised of an accordion, a bajo sexto, a bass, and a drum. An Orchestra consists of a bass, drum, electric guitar, synthesizer and, a brass section which it relies heavily on for its sound. It can also have an accordion in the band at times. A Modern Tejano band consists of synthesizers, drums, electric guitar, bass and at times an accordion. It relies heavily on the synthesizer for its sound. Examples of Conjunto Bands are The Hometown Boys and Jaime de Anda y Los Chamacos. An example of an Orchestra is Ruben Ramos and the Texas Revolution. Modern Bands are Jay Perez and Jimmy Gonzalez and his group Mazz. Other categories consist of Progressive, Pop and Urban Tejano music. All of these categories are classified as Tejano, and one category is never seen as superior to the other.

At the turn of the 21st century, today's Tejano music, while far more pop-oriented than in its Depression era roots, is one of the most vital regional musical styles in the United States.

The term *Tex-Mex* is also used in American rock and roll for Tejano-influenced performers such as the Sir Douglas Quintet; Sam the Sham and the Pharaohs; The Mars Volta; Louie and the Lovers; The Champs with "Tequila"; the Texas Tornados, featuring Flaco Jimenez, Freddy Fender, Augie Meyers, and Doug Sahm; and Los Lonely Boys.

Texan accordion music has also influenced Basque trikitixa players.

Tex-Mex is also a type of Mexican food which originated in Texas. See Tex-Mex cuisine.

*Tejanos* means also blue jeans in the Spanish language of some parts of Spain, particularly Catalonia.

## **Television news music**

**Television news music** are used by television stations to brand their news operations. Each television station uses an identifiable news theme; some themes are used by multiple stations while others are composed specifically for a certain station.

## News music in the United States

In the United States, news themes used on local television stations are typically organized into news music packages, with each theme within a package sharing a similar musical signature. A typical television news music package consists of anywhere from 50 to as much as 500 cuts of music. One of the largest news music packages is Shelly Palmer's Millennium 3 combined with its two other versions, Millennium 3 with PNP Signature and Millennium 3.2, with a total over 450 cuts.

News music packages consist of the following: opens, promo beds and bumpers, IDs, stingers, utility tracks and billboards.

- **Opens:** These are the cuts used to begin a newscast or a specific segment, such as weather, sports, etc. In many cases, news opens can double as promo beds. In a news package, opens come in long credit and short credit forms.
- **Closes:** Closes also come in different formats, many of which are similar in sound to that package's open.
- **Promo beds:** These are the cuts of music used only in promos for a specific upcoming newscast. Promo beds come in four types: theme donut/theme donut open beds, ID/promo beds, end theme news open/promo beds, and ID/stingers.
- **Promo bumpers:** These are used primarily before a commercial break during a newscast. When the bumper is played, a summary of what will air later in that newscast or in an upcoming newscast will be shown.
- **In-show stingers:** Stingers are used to open various segments (bulletins, special reports, sports, weather, etc.).

Other compositions in a news package include tickers and vamps.

Stations within the same market area will typically use different music packages, unless they are related to each other in some manner. For example, the two stations may be owned by the same company (or operated by the same company under a local marketing agreement), or one station may contract out its news production to the other.

## Custom made news music packages

Some news music packages are custom made for one station only, as opposed to syndicated packages which are used by multiple stations. While syndicated packages are the norm in the industry, there are some stations that still use custom made packages. Such examples include:

- KFOR-TV Oklahoma City
  - Newsmusic Central's KFOR Custom News Package (1994-1997)
  - Wow and Flutter Music's KFOR-TV News Package (1997-present)
- KTHV 11, Little Rock
  - KTHV 1995 News Package (1995-2004)
  - KTHV 2004 News Package (2004-present)
- WGN-TV 9, Chicago
  - Chicago's Very Own by John Hegner (1994-1997)
  - WGN News Theme (1997-present, a modified version is currently used)

Some packages are custom made for a specific broadcast group, or owned and operated stations and affiliates of a specific broadcast network:

- Sinclair News Music Package by Stephen Arnold (2004-present, for Sinclair Broadcast Group stations)
- Hearst-Argyle News Package by NewsMusic Central (2003/2004-present)
- The Rock by Stephen Arnold (2005-present), The Tower by 615 Music (1999-present) and The NBC Collection by Frank Gari ((1998-present) for NBC O&Os and affiliates)

## Station image packages

Some news music packages are accompanied by a station image package, featuring promotional jingles which often share the same musical signature as the parent news music package. Such promotional packages first came to prominence in the United States in the 1970s, and had become widespread by the 1980s, used by many (though not all) television stations. Many memorable packages, such as Frank Gari's "Hello" and "*Stand Up and Tell 'em You're From Detroit*", were composed during this era, and some were even used on stations in Canada and Australia.

Station image packages are designed to give a positive branding method for broadcast television stations. Many such packages from the 1970s and 1980s often portrayed stations in a community-oriented light, accompanied by footages of the stations' personalities participating in recreational activities and charity events with regular everyday people. By the 1990s, many stations had adopted a more hard-hitting approach to branding, resulting in a reduced demand for traditional promotion campaigns. However, a few stations which used Gari's *Hello* campaign briefly re-introduced it in the 2000s as part of their 50th anniversary celebrations.

# Tenor

## Vocal ranges

### Female ranges

[Soprano](#)

[Mezzo-soprano](#)

[Contralto](#)

### Male ranges

[Sopranist](#)

[Alto](#)

**Tenor**

[Baritenor](#)

[Baritone](#)

[Bass-baritone](#)

[Bass](#)

In music, a **tenor** is a male [singer](#) with a high voice (although not as high as the modern countertenor). In four part chorale-style harmony, it is the second lowest voice, above the [bass](#) and below the [soprano](#) and [alto](#). A typical [operatic](#) tenor will have a range extending from the C below middle C to the C above middle C (C3-C5), though in choral music tenors are rarely asked to sing above Bb4 except in solos. In a mixed-gender choir, females may also sing as tenors. Generally the tenor roles are parallel to the soprano roles, in that they are usually the most sympathetic male roles; they play the hero, the lover... but there are the occasional villains (the Duke of Mantua in Rigoletto; Lt. Pinkerton and Goro in Madame Butterfly). A tenor is classified by several vocal traits, including range, tone quality, vocal lift points, and transition points within the singer's range.

## Origin of the term

The name "tenor" comes from the Latin word *tenere*, which means "to hold". In [medieval](#) and [Renaissance](#) polyphony between about 1250 and 1500, the tenor was the structurally fundamental (or 'holding') voice, vocal or instrumental. All other voices were normally calculated in relation to the tenor, which often proceeded in longer note values and carried a borrowed Cantus firmus melody. Until the late 15th-century introduction of the contratenor bassus, the tenor was usually the lowest voice, assuming the role of providing a harmonic foundation. It was also in the 15th century that "tenor" came to signify the male voice that sang such parts; later it was applied not only to singers, but also instrumental parts occupying approximately the same register, such as the Tenor violin.

## Other uses

In the Barbershop harmony musical style, the name "tenor" is used for the *highest* part. The four parts are known (lowest to highest) as *bass*, *baritone*, *lead*, and *tenor*. The tenor generally sings in falsetto voice (thus the term *tenor* used in barbershop terminology most closely corresponds to the term *countertenor* as used in classical music), and harmonizes above the lead, who sings the melody. The barbershop tenor range is, as notated, Bb-below-middle C to D-above-high-C (and sung an octave lower).

It is often applied to instruments to indicate their range in relation to other instruments of the same group. For instance the tenor [saxophone](#).

Also a literary term referring to part of a sentence.

# Types of tenor and tenor roles in operas

In [opera](#), distinctions are made between different types of tenor:

- **Tenore drammatico, di forza or robusto**: a powerful, rich, heroic tenor
  - Calaf (Turandot)
  - Otello (Otello)
  - Radamés (Aida)
  - Rodolfo (Luisa Miller)
  - Samson (Samson et Dalila)
- **Heldentenor**: the German equivalent of the tenore drammatico, however with a more [baritonal](#) quality; the typical Wagnerian protagonist
  - Apollo (Daphne)
  - Claudio (Das Liebesverbot)
  - Cola Rienzi (Rienzi)
  - Erik (Der fliegende Holländer)
  - Florestan (Fidelio)
  - Heinrich Tannhäuser (Tannhäuser)
  - Loge (Das Rheingold)
  - Lohengrin (Lohengrin)
  - Parsifal (Parsifal)
  - Paul (Die Tote Stadt)
  - Siegfried (Götterdämmerung, Siegfried)
  - Siegmund (Die Walküre)
  - Walter von Stolzing (Die Meistersinger von Nürnberg)
  - Tristan (Tristan und Isolde)
- **Tenore leggero**: a light, flexible tenor, specializing in the Mozartean repertoire, but also in the operas of Rossini, Donizetti and Bellini, and sometimes specializing in Baroque repertoire or in comical roles
  - Belmonte (Die Entführung aus dem Serail)
  - Count Almaviva (Il barbiere di Siviglia)
  - Don Ottavio (Don Giovanni)
  - Don Ramiro (La Cenerentola)
  - Ernesto (Don Pasquale)
  - Ferrando (Cosi fan tutte)
  - Gérald (Lakmé)
  - Lindoro (L'Italiana in Algeri)
  - Nemorino (L'Elisir d'Amore)
- **Tenore Buffo**: a relatively weak voice with certain limitations, with a timbre that is not entirely appealing. Specializes in comic roles such as
  - Don Basilio (Le nozze di Figaro)
  - Don Curzio (Le nozze di Figaro)
  - Gabriel von Eisenstein (Die Fledermaus)
  - Mime (Das Rheingold)
  - Monostatos (Die Zauberflöte)
  - Pedrillo (Die Entführung aus dem Serail)
- **Tenore lirico or di grazia**: a lightweight, graceful, lyric tenor
  - David (Die Meistersinger von Nürnberg)
  - Duke of Mantua (Rigoletto)
  - Edgar (Edgar)

Edgardo (Lucia di Lammermoor)  
Faust (Faust)  
Hoffmann (Les contes d'Hoffmann)  
Idomeneo (Idomeneo)  
Lensky (Eugene Onegin)  
Lionel (Martha)  
Macduff (Macbeth)  
Nadir (Les Pêcheurs de Perles)  
Rodolfo (La Bohème)  
Roméo (Roméo et Juliette)  
Ruggero (La Rondine)  
Tamino (Die Zauberflöte)  
Tito (La clemenza di Tito)  
Werther (Werther)  
Wilhelm Meister (Mignon)

- **Tenore (lirico) spinto**: a lyric tenor with more "punch", therefore able to play more heroic roles
  - An Italian Tenor (Der Rosenkavalier)  
Benjamin Pinkerton (Madame Butterfly)  
Benvenuto Cellini (Benvenuto Cellini)  
Canio (I Pagliacci)  
Don Carlos (Don Carlos)  
Don José (Carmen)  
Ernani (Ernani)  
Foresto (Attila)  
Manrico (Il trovatore)  
Mario Cavaradossi (Tosca)  
Maurizio (Adriana Lecouvreur)  
Max (Der Freischütz)  
Riccardo (Un Ballo di Maschera)  
Turiddu (Cavalleria Rusticana)
- **Trial**: a high, thin, nasal tenor, used for character roles. Named after Antoine Trial (1736-1792), a singer at the Opéra Comique. Benoit (La Bohème)
- **Baritenor**, a lyric dark tenor, or one with a strong baritonic lower register, but tops out only a A or B below middle C.

## Tenor roles in operettas and musicals

Alfred (Tanz der Vampire)  
Anthony Hope (Sweeney Todd)  
Adolfo Pirelli (Sweeney Todd)  
Tobias Ragg (Sweeney Todd)  
The Beadle (Sweeney Todd)  
Barinkay (Der Zigeunerbaron)  
Bat Boy (Edgar) (Bat Boy: The Musical)  
Caliph (Kismet)  
Candide (Candide)  
Charlie (Brigadoon)  
Che (Evita) (Must also have a strong lower and middle register.)  
The Emcee (Cabaret)  
Enjolras (Les Miserables) (Can also be played effectively by a baritone.)  
Freddy Eynsford-Hill (My Fair Lady)  
Frederic (The Pirates of Penzance)  
Henry Jekyll / Edward Hyde (Jekyll & Hyde)  
Herr Schultz (Cabaret)  
Imam (Kismet)  
Jean Valjean (Les Miserables)  
Jesus (Jesus Christ Superstar)  
Joseph (Joseph and the Amazing Technicolor Dreamcoat) (However, some baritones have played the role.)  
Judas Iscariot (Jesus Christ Superstar)  
Leader (Lost in the Stars)  
Lt. Cable (South Pacific)  
Marcellus Washburn (The Music Man)  
Marius (Les Miserables) (Can also be played just as effectively by a baritone.)  
Mark Cohen (Rent (musical))  
Marryin' Sam (Li'l Abner)  
Mr. Snow (Carousel)  
Nanki-Poo (The Mikado)  
Nicely-Nicely Johnson (Guys and Dolls)  
Dr. Thomas Parker (Bat Boy: The Musical)  
The Phantom (Erik) (The Phantom of the Opera), although baritones have also sung the part.  
Pompineau (The Cat and the Fiddle)  
Professor Abronsius (Tanz der Vampire)  
Ralph Rackstraw (H.M.S. Pinafore)  
Raoul de Chagny (The Phantom of the Opera) Can also be performed effectively by baritones  
Roger Davis (Rent)  
Sam Kaplan (Street Scene)  
Simba (The Lion King)  
Tony (West Side Story)  
Tateh (Ragtime)  
Mother's Younger Brother (Ragtime)  
The Leading Player (Pippin)  
Pippin (Pippin)

Riff Raff (The Rocky Horror Show)  
Angel Dumott-Schunard (Rent)  
Nicky/Trekkie Monster/Bad Idea Bear (Avenue Q)  
Fiyero (Wicked)  
Alex Dillingham (Aspects of Love) (Has been played successfully by baritones)  
Seymour Krelbhorn (Little Shop of Horrors)  
Radames (Aida (musical))  
Tony (West Side Story)

# Famous tenors

## Classical music

[Soprano.](#)

[Alto.](#)

Tenor.

[Basso.](#)

Many of the most famous [opera](#) singers have been tenors.

There have also been some tenors who have been well known for other types of music, who have concentrated on concert performances either with orchestras, or in chamber music, such as lieder or song recitals. These performers may be better known for this kind of work than for opera.

# Terrorcore

**Terrorcore** is a term used to describe a subgenre of [hardcore techno](#). Compared to other hardcore styles like [breakcore](#), which uses the influence of [breakbeat](#), and [speedcore](#), which concentrates on exceedingly high beats per minute, terrorcore is a difficult term to define as each listener has a different definition of what terror is. Terrorcore employs the use of "scary" samples, synthesised sounds to give the tunes their "terror" edge, hip-hop/punk vocal samples, heavily distorted guitar samples, very high pitched high hats/toms and very distorted bass drums set to their maximum on the bass channels. Also terrorcore can utilize both sped-up [drum and bass](#) samples and four-to-the-floor drum patterns similar to [speedcore](#), frequently with tunes switching between both styles and then dropping with both simultaneously. The "beat" being dropped is common in this style and when a beat is dropped a vocal sample or melody is usually inserted.

Terrorcore has been used to describe:

- Tracks between 120 to 500 beats per minute.
- Tracks with varying numbers of layers to their sound. ie, a simple construction of bassline and ambient sounds versus tracks that use many sound sources, all often played at the same time (a "busy" track).
- Tracks will often contain heavy guitar samples from metal bands or from films, mainly horror or death, and other such "dark" media sources.

# Texas blues

**Texas blues** is a subgenre of the [blues](#). It has had various style variations but typically has been played with more [swing](#) than other blues styles.

Texas blues began to appear in the early 1900s among African Americans who worked in oilfields, ranches and lumber camps. In the 1920s, Blind Lemon Jefferson innovated the style by using jazz-like improvisation and single string accompaniment on a guitar; Jefferson's influence defined the field and inspired later performers, like Lightnin' Hopkins and T-Bone Walker. During the Great Depression in the 1930s, many bluesmen moved to cities like Galveston, Houston and Dallas. It was from these cities that a new wave of popular performers appeared, including slide guitarist and gospel singer Blind Willie Johnson and legendary vocalist Big Mama Thornton. Duke Records and Peacock Records were the most important [labels](#) of the scene.

In the 1960s, however, the record industry moved north, reducing Texas' importance in the blues scene. The area's importance returned in the 1970s when a Texas [blues rock](#) sound developed, led by ZZ Top and the Fabulous Thunderbirds. This set the stage for the revival of the 1980s, which produced Stevie Ray Vaughan and moved Austin to being the blues capital of the state.

## Performers

Albert Collins  
The Fabulous Thunderbirds  
Lightnin' Hopkins  
Blind Lemon Jefferson  
Freddie King  
Jimmie Vaughan  
Stevie Ray Vaughan  
T-Bone Walker  
Tony Vega Band  
Wes Jeans  
Johnny Winter  
Tracy Conover  
ZZ Top

# Texture

In [music](#), the word **texture** is often used in a rather vague way in reference to the overall sound of a piece of music. A piece may be described as having a "thick" texture, or a "light" texture, or other terms taken from outside of music (Aaron Copland's more popular pieces are described as having an "open" texture). The perceived texture of a piece can be affected by the number of parts playing at once, the [timbre](#) of the instruments playing these parts and the [harmony](#) and [rhythms](#) used, among other things.

There are more precise terms which describe the number and relationships between voices:

- *Monophony* (base musical texture) is music with just one part (such as [Gregorian chant](#)).
- *Heterophony* is a kind of complex monophony - there is only one melody, but multiple voices each of which play the melody differently.
- *Polyphony* is music with several parts, each independent but related and each as important as the others - none of them is merely [accompaniment](#).
- *Homophony* is music in which the top part has a dominant melody and other parts are subservient to it, moving in the same, or nearly the same, rhythm.
- *Monody* is 17th century Italian song with a dominant melody and a separate accompaniment.

Note that none of these terms accurately describes the majority of western music made today, featuring a melody and rhythmically free accompaniment; in homophony the accompaniment is not rhythmically free, and monody is typically used in a historically specific way.

A [simultaneity](#) is more than one complete musical texture occurring at the same time, rather than in succession.

A more recent type of texture first used by György Ligeti is micropolyphony. Other textures include homorhythmic, polythematic, polyrhythmic, onomatopoeic, compound, and mixed or composite textures (Corozine 2002, p.34).

## The golden age of hip hop

**The golden age of hip hop**, derivative of [old school hip hop](#), began with the popularity of Run-DMC's album *Raising Hell* in 1986 and ended with the popularity of [G-Funk](#) around 1993. It was characterized by ubiquitous soul and funk samples (ala James Brown and Curtis Mayfield) and Afrocentric lyrics. The golden age was overwhelmingly based in New York City.

During the golden age of hip hop, rappers like Rakim, KRS-ONE, and Chuck D advanced the wordplay, delivery, and possible subject matter of rapping. Groups such as De La Soul, A Tribe Called Quest, and Leaders of the New School combined soul-laden production with positive messages as a reaction against the predominant gangster posturing of numerous 1980s rappers. During this period, Def Jam (founded by Run of Run DMC's brother, Russell Simmons) became the first independent hip-hop [record label](#).

## **Socially conscious rap**

Social consciousness was key to golden age hip-hop. While KRS-ONE discussed the rectification of violence and moral and ethical issues in the ghetto, De La Soul refrained from heavy-handed politics and remained in the realm of calm and secure lyrics. Groups such as A Tribe Called Quest took the two opposites and combined them into intelligent and relaxed output. For many fans of hip-hop ATCQ's *The Low End Theory* and *Midnight Marauders*, both rather sophisticated albums, are considered to be the standard of golden-age hip-hop.

Many duos in the golden age of hip-hop also fit the conscious mold. Eric B. & Rakim's Rakim furthered both technique and subject matter for generations of rappers to come, while Eric Barrier's sparse and soulful beats ingrained the stereotype of early 1990s hip-hop. Gang Starr, a consistently evolving group, started with stereotypical golden age beats courtesy of DJ Premier and tough, assertive rhymes, eventually evolving into a solo project for Guru (see *Jazzmatazz*), and reuniting again to reminisce about prior lifestyles and to criticize the current condition of hip-hop. De La Soul took a similar turn, first as a carefree group, then evolving into a street-smart, thuggish and conscious machine, and then back again as a collective critic of modern hip-hop.

## **Post-golden age**

A few contemporary artists remain true to the golden age hip-hop standard, such as People Under The Stairs, Jurassic Five, and Little Brother. These groups are commonly referred to as "retro-rap" rather than "golden-age," perhaps due to the realization that golden-age hip-hop is no longer en vogue or relevant to current sociopolitical conditions

# Theme music

The **theme music** of a radio or television program is a [piece](#) that is written specifically for that show and usually played during the title sequence and/or end credits. If it is accompanied by lyrics, most often associated with the show, it is a **theme song**.

The purpose of the music is to establish a mood for the show and to provide an audible cue that a particular show is beginning, which was especially useful in the early days of radio (See also interval signal). In some cases, including *The Brady Bunch*, *Gilligan's Island*, and *The Beverly Hillbillies* the lyrics of the theme song provide some necessary exposition for people unfamiliar with the show.

In addition, some theme music uses orchestra scores or original music set mood for the show. One of the most notable of these is the *Batman: The Animated Series* theme song, which was drawn from the theme for the 1989 *Batman* film created by Danny Elfman. Others uses remixes or covers of older songs, such as the theme song of *Spider-Man: The Animated Series* (1994-1998), which featured a reworked cover of the theme song from the classic *Spider-Man* cartoon from the 1960s. The song was created and performed by Aerosmith lead guitarist Joe Perry.

Theme music has been a feature of the majority of television programs since the medium's inception, as it was for the ancestral radio shows that provided their inspiration. Programs have used theme music in a huge variety of styles, sometimes adapted from existing tunes, some composed specifically for the purpose. A few have been released commercially and become popular hits; examples would include the theme tune to *Friends*, "I'll Be There For You", was a hit for The Rembrandts and the theme from *S.W.A.T.* was a hit for Rhythm Heritage.

Other themes, like the music for *The Young and the Restless*, *Days of Our Lives*, and *Coronation Street* have become iconic mostly due to the shows' respective longevities. Unlike others, these serials have not strayed from the original theme mix much, if at all, allowing them to be known by multiple generations of television viewers.

Virtually every TV show has specific, melodic theme music, even if it's just a few notes (such as the snatch of eerie music that fades in and out in the title sequence for *Lost*). One famous exception is *60 Minutes*, which features only the ticking hand of a Heuer stopwatch.

Some series use major hit songs that were popular before the shows' creation. A well known example is the *CSI* franchise, with each series having a well known song by The Who for their theme song. Another series, *Murphy Brown*, used a different classic Motown song each week as the show's opening theme.

Also notable is the *Law & Order* series, which started out with one theme song for *Law and Order*, and remixed it for its three spinoffs (*Law & Order: Special Victims Unit*, *Law & Order: Criminal Intent*, and *Law & Order: Trial by Jury*). The related reality show *Crime and Punishment* also aired with a remix of the theme.

Radio programs with notable theme music include *Just a Minute*, which uses a high-speed rendition of the "Minute Waltz" by Frédéric Chopin.

# Third Stream

**Third Stream** music is a term coined in 1957 by Gunther Schuller referring to the synthesis of [classical music](#) and [jazz](#). The style is notably separate from the symphonic jazz movement of the 1920s in that it involves improvisation. In 1961, Schuller defined Third Stream as "a new genre of music located about halfway between jazz and classical music." (Schuller, 114) Schuller insisted that "by definition there is no such thing as 'Third Stream Jazz.'" (Schuller, 120)

Schuller noted that while purists on both sides of Third Stream objected to tainting their favorite music with the other; more strenuous objections were typically made by jazz musicians who felt such efforts were "an assault on their traditions." Schuller writes that "by designating the music as a 'separate, third stream', the other two mainstreams could go about their way unaffected by the attempts at fusion." (Schuller, 115) Because Third Stream is involved in classical as much as jazz it is generally required that composers and performers be proficient in both genres.

Some critics have argued that Third Stream—by drawing on two very different styles—dilutes the power of each in combining them. Others reject such notions, and consider Third Stream an interesting musical development.

Schuller suggested that a similar fusion was made by Béla Bartók, who earned great acclaim after incorporating elements of Hungarian folk music into his music, which had earlier been heavily influenced by Claude Debussy and Richard Strauss.

In 1981, Schuller offered a list of "What Third Stream is not:

1. It is not jazz with [strings](#).
2. It is not jazz played on 'classical' instruments.
3. It is not classical music played by jazz players.
4. It is not inserting a bit of Ravel or Schoenberg between [be-bop](#) changes--nor the reverse.
5. It is not jazz in fugal form.
6. It is not a fugue played by jazz players.
7. It is not designed to do away with jazz or classical music; it is just another option amongst many for today's creative musicians." (Schuller, 120)

There were very early attempts to integrate jazz and classical music such as some [Ragtime](#), and symphonic pieces such as George Gershwin's 1924 Rhapsody In Blue. Some works by French composer Darius Milhaud have been classified as Third Stream, but some object to this classification, because Milhaud's pieces arguably represent jazz material in the context of Western European art music (classical music), and do not involve improvisation. Igor Stravinsky contributed to this genre many compositions, including "Ragtime", "Piano-rag Rag Music" and "The Ebony Concerto" (the latter composed for jazz clarinetist Woody Herman and his orchestra in 1945;). Another important jazz-classical fusion was Shaw's "Interlude in B-flat," recorded in 1935 with the most unusual ensemble of a string quartet, a jazz rhythm section, and Shaw on clarinet. Other notable composers in the style are John Lewis and his Modern Jazz Quartet, Gunther Schuller, J. J. Johnson, Gil Evans, and Bill Russo, George Russell, Dave Brubeck and members of his Octet and Quartets (and his brother, Howard Brubeck), Toshiko Akiyoshi, David Amram, Ran Blake, Gunther Schuller, Gil Evans, and David Baker. Many free jazz composer/performers, such as Cecil Taylor, Anthony Braxton, the band Oregon (free jazz band), and Sun Ra, were also influenced by the Third Stream school.

Third Stream proper was most popular in the late 1950s and early 1960s, though it has exerted an influence to the present. While the elements of jazz are incorporated into the

music of contemporary composers and jazz musicians likewise continue to draw on their musical context, a true Third Stream Music is extremely rare as most efforts seem to favor one stream or shift between the two throughout the composition. Examples of recordings that synthesize composed and improvised music are the albums *Miles Ahead*, Miles Davis, Gil Evans; *Focus* Stan Getz, Eddie Sauter; *Perceptions* Dizzy Gillespie, J. J. Johnson; *Alegria* Wayne Shorter; *Wide Angles* Michael Brecker. These albums feature a soloist improvising in a jazz style over a complex composed background. Third Stream Music will be realized in its truest sense when more musicians learn at least basic jazz improvisation and style (especially players of traditionally "non-jazz" instruments such as strings, horn, double reed, etc.), thus opening up the possibilities of improvisation throughout the ensemble.

## Third-wave of ska

The **third-wave of ska** is a [musical genre](#) derived from the fusion of Jamaican [ska](#) and various American styles of music, such as: [rock](#), [punk rock](#), [hardcore](#), and [jazz](#). [Ska punk](#) and skacore are major sub-genres, which together comprise a majority of third-wave ska music.

## History

Originating in America during the late 1980s, and gaining popularity throughout the early 1990s, the third-wave of [ska](#) is the latest incarnation of [ska](#) music to date. During the height of its popularity, some third-wave bands enjoyed major commercial success, including regular radio play and outstanding album sales. However, this success proved short-lived as [metalcore](#) and third wave [emo](#) scenes gained popularity and superseded the upbeat spirit of [ska music](#).

Third-wave [ska](#) lost much of its popularity at the turn of the millennium. Currently, it stands as a faded genre, holding the interest of a relatively small, though loyal, fanbase.

## Influences

Third-wave ska artists such as Sublime , Jesse James and The Mighty Mighty Bosstones were influenced by two-tone ska revivalists from the early 1980s such as The Specials, Fishbone, and The Toasters. Third-wave music features the use of horns and a heavily accented offbeat, a common characteristic of the second wave of ska. The Third-wave lead to bands such as Five Iron Frenzy and The O.C. Supertones

# Thrash metal

**Stylistic origins:** [Hardcore Punk](#) - [Speed metal](#) - NWOBHM

**Cultural origins:** Early-Mid 1980s United States, Germany and Brazil

**Typical instruments:** [Guitar](#) – [Bass guitar](#) – [Drums](#)

**Mainstream popularity:** Underground in early 1980's, moderate in late 1980's and early 1990's, underground ever since

[Black metal](#) – [Death metal](#) – [Groove metal](#)

[Crossover Thrash](#) – [Grindcore](#)

**Thrash metal** is a subgenre of [heavy metal music](#), characterized by a [punk rock](#) beat. The origins of thrash metal are generally traced to the late 1970s and early 1980s, when a number of bands began incorporating the sound of the New Wave of British Heavy Metal with elements of [hardcore punk](#), creating a new genre. This genre is much more aggressive compared to its relative, [speed metal](#).

Beyond this, thrash metal has proven somewhat difficult to categorise. Some fans and musicians have a firm concept of genre and subgenre, but others reject such categorisation as limiting or useless. There is often significant crossover from one metal category to another, and the influence of non-metal genres, including [classical music](#) and [jazz](#), is not uncommon.

Generally, the musical base of thrash metal is composed of fast paced time signatures, and low-register, fast or complex guitar riffs, sometimes layered with high-register guitar solos, often in combination with palm muting to create a "chugging" sound. The speed and pacing of the songs is usually what defines basic thrash metal. The music tends to have a visceral, propellant feel to it due to the often intense drumming, most commonly utilizing the snare drum on the 1/2 beat, or the 2nd and 4th beats of the measure. Frantic bass drum use is also common. (Thrash drummers often use two foot-pedaled bass drums, known as "double bass").

## Beginnings

1981 is seen by some fans as a critical year, though others cite earlier influences on the genre: The first riff of Black Sabbath's "Symptom of the Universe" (1975) is possibly one of the first thrash riffs, though their "Into the Void" and "Children of the Grave" (both 1971) were influential as well. Some point to another early example, Queen's Stone Cold Crazy (1974) (from their Sheer Heart Attack album), which was unusually heavy and fast for its time (and indeed for Queen as well), and ultimately covered many years later by thrash metal's most famous and successful band, Metallica.

Some suggest that Motörhead's Overkill LP (1979) would give the name to a New York band that would write what is often considered the first thrash metal song in 1981: "Unleash the Beast Within". Soon thereafter, the short-lived Southern California band Leather Charm would write "Hit the Lights". This band would break up, but the primary songwriter James Hetfield's next band, Metallica, would feature this song. The band Metal Church recorded a few rehearsals in 1980-81, which were similar to the early Metallica and Overkill efforts, though not quite as thrashy.

The first thrash metal demo may very well be Metal Church's *Red Skies* from late 1981. An instrumental demo that combined thrash, speed, and power metal, it did not receive much circulation, and was overshadowed by their October 1982 *Four Hymns* demo.

Metallica were second on the scene (the Power Metal demo, April 1982, and then No Life 'til Leather in July) and the first with a studio LP (Kill 'Em All, July 1983). Meanwhile, in Europe, Artillery recorded a demo in November, 1983. Their *We Are the Dead* took a more Black Sabbath oriented direction, resulting in a thrash metal form that was not quite as fast as that of Metallica but had similar riff ideas.

## Take off

Thrash metal took off in 1984 or so, with Overkill releasing their second demo (Feel the Fire), and Slayer's seminal Haunting the Chapel EP, which featured the song "Chemical Warfare". This led to a darker and heavier sounding thrash, which was then reflected in Exodus's Bonded by Blood and Slayer's Hell Awaits in 1985. Outside of the U.S. in 1985, the German band Kreator released their debut album Endless Pain and the Brazilian band Sepultura released their EP Bestial Devastation. In Canada, Eudoxis, who performed live in full body armor, metal spikes, and the legendary six-foot long stainless steel bass drums, released the Metal Fix demo in 1985. Also, Megadeth, formed by former Metallica axeman Dave Mustaine, debuted with the release of Killing Is My Business... And Business Is Good! in 1985. Megadeth combined the riffs of thrash metal with the more fancy soloing of speed metal à la Judas Priest, and their sound would become best realised on 1990's Rust in Peace.

1986 was a landmark year for thrash metal, with some of the greatest thrash albums of all time being released in this year. Dark Angel put out the generally underrated Darkness Descends, which is one of the heaviest and fastest thrash albums ever. Slayer's Reign in Blood is universally acclaimed as a classic, and also the German band Kreator had Pleasure to Kill, which set new standards for brutality and would be a heavy influence on the death metal genre. Megadeth put out Peace Sells... But Who's Buying?, Metallica had Master of Puppets, and Nuclear Assault debuted with the punkish Game Over — an album stripped to its bare riff essentials. Hobbs' Angel Of Death emerged from Australia, playing a brand of thrash metal drawing heavily on early Slayer, yet geared towards the European market.

In 1987 Anthrax released the renowned Among the Living album. This release saw the band once again thrash metal territory (similarly to their two previous releases: Fistfull of Metal and Spreading the Disease) with fast and heavy guitars and pounding drums. Anthrax's songs can be considered slightly more "melodic" than other thrash bands of the time, due to their upbeat and catchy riffs.

Anthrax's lyrical direction was also quite different than other thrash bands of the period. Other bands took a more serious direction lyrically, while Anthrax's lyrics can be considered border-line "silly" (Notably: N.F.L. (Among the Living), I Am The Law (Among the Living), A Skeleton In The Closet (Among the Living), and Lone Justice (Spreading the Disease)). Their lyrics complemented their humorous stage appearance. (Singer Joey Belladonna wore a headress while performing the song Indians live from their Among the Living album.

On the other end of this, Testament would release their debut, The Legacy that same year. Musically, Testament generally emphasized on the more progressive elements of thrash metal, but their songs were still melodic. The lyrics on this album especially were about the occult and other Satanic topics that would no doubt influence the lyrics of [death metal](#).

Thrash metal developed in the mid 1980s to split into many sub-genres and influence a lot of bands like Death and Possessed (who are best known for guitarist Larry LaLonde, who would later join popular alternative rock group Primus). Possessed were among the first death metal bands, making a demo in mid-1984 of a more dark-sounding thrash metal. This sound would be called death metal by the band and fans, and perhaps the first example of it would be the death metal classic Seven Churches, from 1985. Some bands combined speed metal and thrash metal, like the aforementioned Megadeth, and also Helstar, Testament, and Heathen were known for their flashy lead guitar work. Watchtower's Energetic Disassembly (1985) set new standards in technical, jazzy songwriting, which

would later be further developed by the thrash metal band Coroner and also the technical death metal bands Atheist and Cynic, as well as later efforts by Death.

In 1988 Suicidal Tendencies, who had previously been a straightforward hardcore punk band, released their major label debut *How Will I Laugh Tomorrow If I Can't Even Smile Today?*. This album had very thrashy guitar riffs and an overall very metal oriented sound, with much more complicated song structure than on their previous albums, but the band still stayed true to their roots as a hardcore band in that the songs were very melodic and had catchy choruses.

By 1988 or so the genre was quite saturated with new bands, but classic albums would still be recorded and released. Sepultura's third album, *Beneath the Remains* (1989) earned them some mainstream appeal as it appeared on Roadrunner records. Vio-lence, a relative latecomer to the Bay Area thrash metal scene put out an acclaimed debut in *Eternal Nightmare* (1988), combining relentless riffage with a [hardcore punk](#) vocal delivery.

However, the genre was also filled with many bands that were not attempting to expand on the style. The progressive leaning *Rust in Peace* (1990) by Megadeth is still thought to this day to be Megadeth's finest work. ...And Justice for All (1988) by Metallica, spawned the band's first video, the WWI themed song, "One," and with it's extremely complex song structures, is considered to have pioneered progressive metal (many bands in this genre, including Dream Theater, cite Metallica as a major influence) Testament's *Practice What You Preach* album in 1989 nearly broke them into the mainstream with it's title track. Suicidal Tendencies released the highly successful *Lights...Camera...Revolution!* in 1990, which furthered the bands thrash experimentation as well as adding in funk influences (provided by future Metallica bassist Robert Trujillo), creating a then-commercially accessible sound in that it boarded the then emerging [funk metal](#) genre.

## Evolution in the 1990s

Soon, post-thrash metal bands with a newer sound would continue the more innovative direction, whilst those that played *classic* thrash metal were seen as throw-backs, though the 1990s had some excellent thrash metal, for example Iced Earth's *Night of the Stormrider* (1992), which combined power-metal and thrash metal. Many bands, however, opted for a slower, more groove-oriented sound, including Machine Head and Pantera who were strongly influenced by Exhorder. This would give rise to many 1990s-metal bands.

While [alternative rock](#) was the predominant genre of the 90's, thrash managed to gain influence. Popular 90's [funk metal](#) group Primus (who featured ex-Possessed guitarist Ler LaLonde), particularly in their earlier years, blended Les Claypool's funky bass lines with considerably thrash influenced guitar riffs and songs played at an overall high speed.

In a notable change which irked many fans (but which saw their records sell more than ever), Metallica famously cut their long hair and released two albums, *Load* (1996), and *Re-Load* (1997), which had more [bluesy](#), and [Southern rock](#) influenced songs.

Thrash metal has seen something of a comeback in the late 1990s with European bands like Hypnosia (sounding much like *Pleasure to Kill*) or Carnal Forge, a fast death-thrash hybrid. Some bands also combine Swedish death metal riffs and punk influence, but these stray too far from the original ideals to be really called thrash metal bands. Meanwhile, other bands soldier on — including Overkill, who have recently put out a fourteenth studio album, *Relixiv*, and Destruction, whose *The Antichrist* (2001) is a staple of modern thrash metal — updated production values, and a classic riff sound. The recently released *Exodus* album, entitled *Tempo Of The Damned*, is another recent highlight of the genre, as is Megadeth's 'comeback' album, *The System Has Failed*. The latter, while not 'true' thrash, is a complex hybrid of thrash and power metal, reminiscent of *Rust In Peace*. Indeed, the opening track, "Blackmail the Universe", shares much in common with *Rust In Peace*'s opening track, the seminal "Holy Wars". The album's cover art also seems like a cross between 1986's *Peace Sells... But Who's Buying?* and *Rust In Peace*. The album met with commercial success, reaching #17 in the United States. *Exodus* opened for Megadeth on their 2004 *Blackmail The Universe* tour.

Members of Sepultura, Annihilator, and many others have recently performed on RoadRunner's *United* album in 2005-06. The first release of its kind combined vintage thrash talents with newer metal musicians who incorporate thrash textures into their music. There has recently been older Thrash Metal bands that have reunited and put out new albums including Nuclear Assault who has just recently released their new album *Third World Genocide*. Bay Area Thrashers Dark Angel have been attempting to reunite the band and put out a new album called "darkness returns". Recently the original line-up of the band Testament reunited and toured, there was also a live album and video released with the classic line-up playing called *Live In London*.

Often considered the four most Popular bands in this genre (especially in the US, and generally called the "Big Four of Thrash") are:

- Anthrax
- Megadeth
- Metallica
- Slayer

The three most important bands in Teutonic thrash (a metal scene in germany) are:

- Destruction
- Kreator
- Sodom

Other crucial thrash metal bands include:

Annihilator  
Artillery  
Coroner  
Cyclone  
Cyclone Temple  
Dark Angel  
Death Angel  
Demolition Hammer  
Destruction  
Doomsday  
Epidemic

# Thrashcore

**Thrashcore** (or **thrash**) is a fast and raw brand of [hardcore punk](#) music. Thrashcore saw its beginnings after the decline of [punk rock](#) in the early 1980s. Hardcore punk began to take off in places like Washington, D.C. and California. Early bands categorized as thrash, such as Minor Threat,edit( minor threat was never catogarized as thrash but many of the new york bands at the time were) played faster hardcore punk and they distinguished themselves from other hardcore punk bands such as Black Flag. Some bands incorporated elements of [thrash metal](#). These bands are often categorized as [crossover thrash](#). Many of the most influential crossover thrash bands started out as influential thrashcore bands. Thrashcore as a genre ties in heavily to [hardcore](#), [grindcore](#), [power violence](#), [crust](#), and other subgenres of punk rock. Today thrashcore is mostly a definition for ultra-fast hardcore punk.

625 Thrashcore, Havoc, Hardcore Holocaust, Ebullition, Crimes Against Humanity, Slap-a-Ham, Unfun Records and other labels have been known to put out thrashcore records.

The speed and intensity classification of Hardcore Punk goes like this:

Hardcore Punk (fast)--> Thrashcore (faster)--> Grindcore (fastest)

## Thrashcore bands

## Three-chord song

A **three-chord song** is a [song](#) whose [music](#) is built around three [chords](#) that are played in a certain [sequence](#). Perhaps the most prevalent type of three-chord song is the simple twelve bar blues used in [blues](#) and [rock and roll](#).

Typically, the three chords used are the chords on the tonic, subdominant, and dominant (scale degrees I, IV and V): in the key of C, these would be the C, F and G chords. Sometimes the V7 chord is used instead of V, for greater tension.

Three-chord songs are easy for the listener to remember, which can make them effective in [pop music](#). Some of the most famous songs to use three-chord patterns are "Louie Louie" by The Kingsmen, "Wild Thing" by The Troggs and "Blitzkrieg Bop" by The Ramones. Three-chord songs like these are also easier to learn than other, more complicated songs. Among others, country singer Hank Williams and folk singer Bob Dylan have written large numbers of such songs. Punk music very often features three-chord songs - sometimes called a 'three chord trash' (cf. The Ramones).

# Timbre

In [music](#), **timbre**, also **timber** (French, IPA /'tæmbYr/ as in the first two syllables of [tambourine](#)), is the quality of a [musical note](#) or sound which distinguishes different types of sound production or [musical instruments](#). The physical characteristics of sound which are used in the determination of timbre are spectrum and envelope; psychoacoustics or human perception describe the perceived quality of a sound as the "sound color".

For example, timbre is what, with a little practice, people use to recognise the [saxophone](#) from the [trumpet](#) in a [jazz](#) group, even if they are playing notes at the same [pitch](#) and amplitude. Timbre has been called *the psychoacoustician's waste-basket* as it can denote many apparently unrelated aspects of a sound.

## Synonyms

**Tone quality** is used as a synonym for *timbre*.

*Tone color* is also often used as a synonym. People who experience synaesthesia may see certain colors when they hear particular instruments. Helmholtz used the German Klangfarbe (tone color), and Tyndall proposed its English translation, clangtint. But both terms were disapproved of by Alexander Ellis who also discredits *register* and *color* for their pre-existing English meanings (Erickson 1975, p.7).

Colors of the optical spectrum are not generally explicitly associated with particular sounds. Rather, the sound of an instrument may be described with words like "warm" or "harsh" or other terms, perhaps suggesting that tone color has more in common with the sense of touch than of sight.

## American Standards Association definition

The American Standards Association defines timbre as "[...] that attribute of sensation in terms of which a listener can judge that two sounds having the same [loudness](#) and [pitch](#) are dissimilar". A note to the 1960 definition (p.45) adds that "timbre depends primarily upon the spectrum of the stimulus, but it also depends upon the waveform, the sound pressure, the frequency location of the spectrum, and the temporal characteristics of the stimulus."

## Attributes

J.F. Schouten (1968, p.42) describes the "elusive attributes of timbre" as "determined by at least five major acoustic parameters" which Robert Erickson (1975) finds "scaled to the concerns of much contemporary music":

1. The range between tonal and noiselike character.
2. The spectral envelope.
3. The time envelope in terms of rise, duration, and decay.
4. The changes both of spectral envelope (formant-glide) and fundamental frequency (micro-intonation).
5. The prefix, an onset of a sound quite dissimilar to the ensuing lasting vibration.

## Spectra

The richness of a sound or note produced by a musical instrument is due to the combination of a number of distinct frequencies. The lowest frequency is called the fundamental frequency and the [pitch](#) it produces is used to name the note. For example, in western music, instruments are normally tuned to A = 440 Hz. The other frequencies are called overtones of the fundamental frequency, which may include harmonics and partials. Harmonics are whole number multiples of the fundamental frequency -- x2, x3, x4, etc. Partials are other overtones. Most western instruments produce harmonic sounds, but many instruments produce partials and inharmonic tones.

When the orchestral tuning note is played, the sound is a combination of 440 Hz, 880 Hz, 1320 Hz, 1760 Hz and so on. The balance of the amplitudes of the different frequencies is responsible for the characteristic sound of each instrument. This is used in FM synthesis.

The fundamental is not necessarily the strongest component of the overall sound. But it is implied by the existence of the harmonic series -- the A above would be distinguishable from the one an octave below (220 Hz, 440 Hz, 660 Hz, 880 Hz) by the presence of the third harmonic, even if the fundamental were indistinct. Similarly, a pitch is often inferred from non-harmonic spectra, supposedly through a mapping process, an attempt to find the closest harmonic fit.

It is possible to add artificial 'subharmonics' to the sound using electronic effects but, again, this does not affect the naming of the note.

William Sethares (2004) wrote that just intonation and the western equal tempered scale derive from the harmonic spectra/timbre of most western instruments. Similarly the specific inharmonic timbre of Thai metallophones would produce the seven-tone near-equal temperament they do indeed employ. The five-note sometimes near-equal tempered slendro scale provides the most consonance in the combination of the inharmonic spectra of Balinese metallophones with harmonic instruments such as the stringed rebab.

## Envelope

The timbre of a sound is also greatly effected by the following factors: attack or interonset interval, decay, sustain, release and transients. Thus these are all common controls on [samplers](#). For instance, if one takes away the attack from the sound of a piano or trumpet, it becomes more difficult to identify the sound correctly, since the sound of the hammer hitting the strings or the first blat of the player's lips are highly characteristic of those instruments.

## In music

Timbre is often cited as one of the fundamental aspects of [music](#). Formally, timbre and other factors are usually secondary to pitch. "To a marked degree the music of Debussy elevates timbre to an unprecedented structural status; already in *L'Après-midi d'un Faune* the *color* of flute and harp functions referentially," according to Jim Samson (1977). Surpassing Debussy is Klangfarbenmelodie and surpassing that the use of sound masses.

Erickson (ibid, p.6) gives a table of subjective experiences and related physical phenomena based on Schouten's five attributes:

| <b>Subjective</b>   | <b>Objective</b>   |
|---|--|
| Tonal character, usually pitched                                    | Periodic sound   |
| Noisy, with or without some tonal character, including rustle noise | Noise, including random pulses characterized by the rustle time (the mean interval between pulses) |
| Coloration  | Spectral envelope  |
| Beginning/ending  | Physical rise and decay time   |
| Coloration glide or formant glide                                   | Change of spectral envelope  |
| Microintonation   | Small change (one up and down) in frequency  |
| Vibrato   | Frequency modulation   |
| Tremolo   | Amplitude modulation   |
| Attack  | Prefix   |
| Final sound   | Suffix   |

Often listeners are able to identify the kind of instrument even across "conditions of changing pitch and loudness, in different environments and with different players." In the case of the clarinet, an acoustic analysis of the waveforms shows they are irregular enough to suggest three instruments rather than one. David Luce (1963, p.17) suggests that this implies "certain strong regularities in the acoustic waveform of the above instruments must exist which are invariant with respect to the above variables." However, Robert Erickson argues that there are few regularities and they do not explain our "powers of recognition and identification." He suggests the borrowing from studies of vision and visual perception the concept of subjective constancy. (Erickson 1975, p.11)

# Timeline of alternative rock

This is a **timeline of [alternative rock](#)**, from its beginnings in the 1970s to the present.

## 1976

- Newly formed bands
  - The Cure
  - Siouxsie & the Banshees
  - U2
  - XTC
- Events
  - Rodney Bingenheimer, the DJ for the popular Los Angeles modern rock station KROQ begins hosting his midnight show *Rodney on the ROQ*.

## 1977

- Newly formed bands
  - The Feelies
  - X

# 1978

- Newly formed bands
  - Bauhaus
  - Echo and the Bunnymen
  - Public Image Ltd.
  - Pulp
- Events
  - Manchester journalist and nightclub manager Tony Wilson founds Factory Records
  - Rough Trade Records is founded.

## 1979

- Newly formed bands
  - Cocteau Twins
  - Hüsker Dü
  - The Replacements
  - Social Distortion
- Events
  - Bauhaus release their single for "Bela Lugosi's Dead", which is generally viewed as the first ever gothic rock song
  - Touch and Go is founded

# 1980

- Newly formed bands
  - Depeche Mode
  - Minutemen
  - Mission of Burma
  - Meat Puppets
  - New Order
  - R.E.M.
  - The Sisters of Mercy
- Albums
  - Bauhaus - In the Flat Field
  - Echo and the Bunnymen - Crocodiles
  - The Feelies - Crazy Rhythms
- Events
  - The first ever countdown by KROQ takes place.
  - Sub Pop is founded as the fanzine Subterranean Pop.
  - Joy Division frontman Ian Curtis hangs himself, the rest of the band continue as New Order.

# 1981

## Newly formed bands

- Judas Priest

## Albums

- Led Zeppelin - Led Zeppelin  
Led Zeppelin - Led Zeppelin II  
The Who - Tommy

## Disbandments

## Events

- The hard rock group The Who releases the concept album Tommy, about a deaf, dumb and blind boy who wins a mass following after becoming a pinball guru. The album's consistent themes, plot, story and interlinking songs set the template for many other hard-rock artists to attempt such concept albums.

## Disbandments

## Events

- Dream Theater releases *Live Scenes From New York* which made headlines as the album's artwork (which was released before September 11, 2001) had an image of the New York City skyline "in flames", including a depiction of the World Trade Center. After the terrorist attack, the artwork was recalled and a new version was released. The original artwork is now a rare collectible.

- Transatlantic, a progressive rock "supergroup" that consisted of members from four of progressive rock's most popular modern bands, released their follow-up studio album titled *Bridge Across Forever*. Members included Neal Morse (Spock's Beard), Roine Stolt (The Flower Kings), Pete Trewavas (Marillion), and Mike Portnoy (Dream Theater).
- Tool releases *Lateralus* and later tours with King Crimson.
- 70s progressive rock icons Yes release the album *Magnification*. The album contains no keyboardist, but includes the backing of a symphony orchestra.

- Pain of Salvation - Remedy Lane (Sweden)

## Disbandments

## Events

- Growing in popularity since its inception in 1999, NEARfest relocates to Trenton, NJ for the next two years to an venue that seats 1,850.
- Neal Morse, the frontman and primary contributor for Spock's Beard, leaves the band and eventually pursues a solo career producing albums (progressive rock and otherwise) with strong Christian content. The band continues on without him.
- Progressive Ears, an online discussion board, grows to 1,000 members and beyond.

- Rush released their first studio album since *Test For Echo* in 1996. *Vapor Trails* will likely be better known for its controversial recording quality (critics panned it for being too loud and compressed).

## 2003

- The Tangent - *The Music That Died Alone* (Various)
- The Mars Volta - *De-Loused In The Comatorium* (USA)

### Disbandments

### Events

- The Mars Volta forms out of the punk group At The Drive-In and releases their first full studio album *De-Loused in the Comatorium*. The album mixes elements of prog, post-rock, and punk. The release is very successful and becomes an example of progressive rock success in the mainstream.
- Robert Fripp and King Crimson release *The Power to Believe*, their first studio album since 2000.
- The Tangent is formed and releases their first album *The Music That Died Alone*. The initial lineup of this "supergroup" consisted of Andy Tillison & Sam Baine (Parallel Or 90 Degrees), Roine Stolt, Jonas Reingold, & Zoltan Czorsz (The Flower Kings), David Jackson (Van der Graaf Generator), and Guy Manning (Manning). It featured the epic

track The Canterbury Sequence, which was an homage to the Canterbury scene of the 1970s.

### Events

- 1970s progressive rock legends Van der Graaf Generator reunite and release a double CD titled *Present* which contained strong lyrical content and an entire disc of improvisations.
- Kino, a new progressive rock supergroup consisting of members from Porcupine Tree, Arena, Marillion, and It Bites is formed. They release their first album, *Picture* in 2005.
- Pink Floyd members David Gilmour, Nick Mason, and Rick Wright reunite with Roger Waters, the leading creative force of the band during its 1970s heyday, at Live 8 on July 2nd in Hyde Park, England. Waters had acrimoniously left the band in 1985, and the quartet had last played together during a performance of *The Wall* in 1981.

# 2006

## Newly formed bands

- One
- Mother Military

## Albums

- Tool- 10,000 Days (USA)
- Queensryche- Operation: Mindcrime II (USA)
- Univers Zero - Live (Belgium)
- Zaar - Zaar (France)
- Sympozion - Kundabuffer (Israel)
- The Flower Kings - Paradox Hotel (Sweden)

## Disbandments

## Events

- A combination of high-speed internet connections, MP3 compression, inexpensive streaming web servers, and the iPod/iTunes phenomenon has resulted in an explosion of internet radio stations devoted to playing progressive rock and other similar music. Some of these stations and radio programs have begun podcasting their programming, making it even more convenient to access music online.
- Former Soft Machine member Elton Dean died.

  - Patti Smith Group - Radio Ethiopia
  - The Saints - (I'm) Stranded
- Events
  - The Ramones make their first non-US appearance at the Roundhouse, London, July 4, often pointed to as a galvanizing event for the UK punk scene.
  - Malcolm McLaren organizes a two day punk festival on Sunday, September 20th and Monday, September 21st at the 100 Club on Oxford Street in London. The Sunday performers were: Subway Sect, Siouxsie and the Banshees, The Clash, and the Sex Pistols. The Monday line-up consisted of the Stinky Toys, Chris Spedding and the Vibrators, The Damned, and the Buzzcocks.
  - Sniffin' Glue, Mark Perry's punk fanzine is first published, shortly after The Ramones' Roundhouse appearance. Perry would soon form the band Alternative TV.
  - The Damned, The Saints and the Sex Pistols release their first singles: "New Rose", "(I'm) Stranded" and "Anarchy in the U.K." respectively.
  - The Sex Pistols, The Damned, and The Clash begin the Anarchy Tour in November. Most of the previously booked gigs refuse to let the bands play

however.

On December 1st, the Sex Pistols and several members of the Bromley Contingent (including Siouxsie and the Banshees singer Siouxsie Sioux and bassist Steve Severin) appear live on ITV to be interviewed by television host William Grundy. The band unleashes a torrent of curse words. The following day the Daily Mirror runs the now infamous headline - "THE FILTH AND THE FURY!".

  - The Heartbreakers  
London
  
- Events
  - The Roxy club opens on January 1st, 1977 in London by club owner Andrew Czeowski. The opening night the Clash play. The club is solely a venue for punk acts. The club closes in April.  
Sex Pistols bassist is Glen Matlock is fired from the Sex Pistols and is replaced with Sid Vicious. Matlock forms The Rich Kids.  
The Stranglers embark on a three month nationwide tour in May. They are supported by the four piece band London.  
The Sex Pistols' single God Save the Queen is released on May 27, 1977 and reaches number #2 on the British charts. It is banned by the BBC's Radio 1 and the title is left blank in the chart listings.  
In June, the Sex Pistols rent a boat to take them down the Thames during Queen Elizabeth II's Silver Jubilee anniversary celebration. The police force the boat to dock and several Pistols fans are arrested and injured in the meleé. Among those arrested are Pistols manager Malcolm McLaren, Vivienne Westwood, and Bromley Contingent members Tracie O'Keefe and Debbie Juvenile.  
The Roxy club deejay Don Letts begins filming The Punk Rock Movie, taking video footage of the London punk scene and editing it into a documentary.  
On October 28th the Sex Pistols' album Never Mind the Bollocks, Here's the Sex Pistols is released by Virgin Records and despite being banned by most of Britain's record shops, reaches #1 on the British charts.

## **Timelines of music**

# Timpani

**Timpani** are [musical instruments](#) in the [percussion](#) family. A type of [drum](#), they consist of a skin called a head stretched over a large bowl commonly made of copper. They are played by striking the head with a special drum stick called a timpani stick or timpani mallet. Unlike most drums, they produce a definite pitch when struck. Timpani evolved from military drums to become a staple of the classical orchestra in the 17th century. Today, they are used in many types of [musical ensembles](#) including [concert](#), [marching](#), and even [rock bands](#).

*Timpani* is an Italian plural, the singular of which is ***timpano***. This is rarely used in informal English speech, however, as a timpano is typically referred to as simply a *drum* or a *timpani*. An alternative spelling, ***tympani***, is occasionally encountered in older English texts. It is derived from the Latin word *tympanum*, from which the Italian word descends. A [musician](#) who plays the timpani is known as a ***timpanist***. While the word *timpani* has been widely adopted in the English language, some English-speaking composers choose to use the word ***kettledrums***. The native German word for timpani is ***Pauken***, and the native French word is ***timbales***.

# The instrument

## The basic timpano

The basic timpano consists of a drumhead stretched across the opening of a bowl typically made of copper or, in less expensive models, fiberglass. The drumhead is connected to a hoop, which is then attached to the bowl via a number of tuning screws called *tension rods* placed regularly along the circumference. The head's tension can be adjusted by loosening or tightening the rods. Most timpani have six to eight tension rods.

The shape of the bowl contributes to the tone quality of the drum. For example, hemispheric bowls produce brighter tones while parabolic bowls produce darker tones. Another factor that affects the timbre of the drum is the quality of the bowl's surface. Copper bowls may have a smooth, machined surface or a rough surface with many small dents hammered into it.

Timpani come in a variety of sizes from about 84 centimeters (33 inches) in diameter down to piccolo timpani of 30 centimeters (12 inches) or less. A 33-inch drum can produce the C below the bass clef, and speciality piccolo timpani can play up into the treble clef. In Darius Milhaud's [ballet](#) *La création du monde*, the timpanist must play the F sharp at the bottom of the treble clef!

Each individual drum typically has a range of a perfect fifth to an octave.

## Machine timpani

Changing the pitch of a timpano by turning each tension rod individually is a laborious process. In the late 19th century, mechanical systems to change the tension of the entire head at once were developed. Any timpani equipped with such a system may be called *machine timpani*, although this term commonly refers to drums that use a single handle connected to a spider-type tuning mechanism.

## Pedal timpani

By far the most common type of timpani used today are *pedal timpani*, which allow the tension of the head to be adjusted using a pedal mechanism. Typically, the pedal is connected to the tension screws via a spider-like system of metal rods.

There are three types of pedal mechanisms in common use today:

- The *ratchet-clutch* system uses a ratchet and clutch to hold the pedal in place. The timpanist must first disengage the clutch before using the pedal to tune the drum. When the desired pitch is achieved, he must reengage the clutch.
- In the *balanced action* system, a spring is used to balance the tension on the timpani head so that the pedal will stay in position and the head will stay at pitch. The pedal on a balanced action drum is sometimes called a *floating pedal* since there is no clutch holding it in place.
- The *friction clutch, post and clutch*, or *Berlin* system uses a clutch that moves along a post. When the player disengages the clutch, he frees it from the post allowing the pedal to move without restraint.

Any pedal drums that are tuned using the spider system can be called *Dresden* timpani, though the term is most often used for drums whose design is similar to the original pedal timpani built in Dresden (see *below*). These drums may also be called *Ringer*-style timpani after Günther Ringer, who revived the original Dresden design. Dresden timpani typically have a fine-tuning handle using to make small adjustments to the head's tension.

The drums most professional timpanists use are Dresden timpani, commonly with a ratchet-clutch or friction clutch pedal. Most school bands and orchestras below the university level use cheaper, more durable timpani. The mechanical parts of these timpani are almost completely contained within the frame and bowl of the drum. They may use any of the pedal mechanisms, though the balanced action system is by far the most common, followed by the friction clutch system. Many professionals also use these drums for gigs and outdoor performances because of their durability.

### **Chain timpani**

On *chain timpani*, the tension rods are connected by a roller chain much like the one found on a bicycle, though some manufacturers have used other materials, including steel cable. In these systems, all the tension screws can then be tightened or loosened by one handle. Though far less common than pedal timpani, chain and cable drums still have practical uses. Occasionally, a player is forced to place a drum behind other items so that he cannot reach it with his foot. Professional players may also use exceptionally large or small chain and cable drums for special low or high notes.

### **Other tuning mechanisms**

A rare tuning mechanism allows the pitch of the head to be changed by rotating the drum itself. A similar system is used on rototoms. Jenco, a company better known for mallet instruments such as vibraphones and orchestra bells, made timpani tuned in this fashion.

Early 20th century German *travel timpani* are tuned with a handle, or less commonly a pedal, that connects to the base, which raises and lowers the bowl, adjusting the tension against the stationary head.

### **Timpani heads**

Like most drumheads, timpani heads can be found made from two materials: animal skin (typically calfskin) and plastic (typically PET film). Plastic heads are durable, weather resistant, and relatively inexpensive. Thus, they are more commonly used than calfskin heads. However, many professional players prefer natural skin heads because they feel that skin heads produce a warmer, better quality [timbre](#).

## Timpani sticks

Timpani are typically struck with a special type of drumstick fittingly called a timpani stick or timpani mallet. Timpani sticks are used in pairs. They have two components: a shaft and a head. The shaft is typically made from wood – usually hickory, cherry, birch, or maple – or bamboo, but may also be made from aluminum or graphite. The head of the stick can be constructed from a number of different materials, though felt wrapped around a wood core is the most common. Other core materials include felt and cork, and other wrap materials include leather. Sticks can also have exposed wood heads. These are used as a special effect and in authentic performances of [Baroque music](#).

Although it is not commonly written in the music, timpanists will change sticks – often many times within the same piece – to suit the nature of the music. However, choice of stick during performance is entirely subjective and depends on the timpanist's own preference, and occasionally, the wishes of the conductor. Thus, most timpanists own a great number of timpani sticks. The weight of the stick, the size of the head, the materials used for the shaft, core, and wrap, and the method used to wrap the head all contribute to the timbre the stick produces.

# Timpani in the modern ensemble

## A set of timpani

A standard set of timpani consists of four drums: roughly 80 cm (32 in), 75 cm (29 in), 66 cm (26 in), and 61 cm (23 in) in diameter. The range of this set is roughly the D below the bass clef to the top-line bass clef A. A great majority of the orchestral repertoire can be played using these four drums. However, Igor Stravinsky writes for the B below middle C in *The Rite of Spring*, and Leonard Bernstein requires the timpanist to execute both a top-line bass clef A flat and the B flat above it on the same drum in the *Overture to Candide*. Adding a 51 cm (20 in) piccolo timpano to the standard set of four extends the range to middle C. Beyond this extended set of five, any added drums are nonstandard. Many professional orchestras and timpanists own multiple sets of timpani consisting of both pedal and chain drums allowing them to execute music that cannot be performed correctly using a standard set of four or five drums.

Many schools and ensembles that cannot afford to purchase equipment regularly only have a set of three timpani. This was the standard set until the second half of the 20th century. It consists of 75 cm (29 in), 66 cm (26 in), and 61 cm (23 in) drums. Its range extends down only to the F below bass clef.

The drums are set up in an arc or horseshoe around the performer. Traditionally, North American timpanists set their drums up with the lowest drum on the left and the highest on the right, and German and Austrian players set them up the opposite way. Over time, that distinction has blurred: German and European players have adopted the North American layout and vice versa.

## Timpanists

Throughout their education, timpanists are trained as percussionists, and they learn to play all instruments of the percussion family along with timpani. However, when a timpanist is appointed to a position in a professional orchestra or concert band, he is not required to play any other percussion instruments. In his book *Anatomy of the Orchestra*, Norman Del Mar writes that the timpanist is "king of his own province", and that "a good timpanist really does set the standard of the whole orchestra."

Most pieces of music call for one timpanist playing one set of timpani. However, occasionally composers seeking a thicker texture or a greater palette of pitches ask for multiple players to perform on one or many sets of timpani. Gustav Mahler writes for two timpanists in six of his symphonies. Gustav Holst uses two timpanists to achieve the range of notes needed to echo the main theme in "Jupiter" from *The Planets* suite. Two timpanists is relatively common in late Romantic and 20th century works for large orchestras, although the early Romantic composer Hector Berlioz took multiple timpanists to the extreme in his *Requiem*, which calls for eight pair of timpani played by ten timpanists.

## Timpani concerti

Although it is not common, there have been concerti written for timpani. The 18th century composer Johann Fischer wrote a symphony for eight timpani and orchestra, which requires

the solo timpanist to play eight drums simultaneously. In the year 2000, American composer Philip Glass wrote his Concerto Fantasy for two timpanists and orchestra, which has its two soloists each playing seven timpani.

# Performance techniques

## Striking the drum

For general playing, a timpanist will beat the head approximately 4 inches in from the edge. Beating at this spot produces the round, resonant sound commonly associated with timpani.

A timpani roll is executed simply by rapidly striking the drum, alternating between left and right sticks. In general, timpanists do not use multiple stroke rolls like those played on the snare drum.

The tone quality of the drum can be altered without switching sticks or fiddling with the tuning of the drum. For example, by playing closer to the edge of the head, the sound becomes thinner. A more staccato sound can be produced by beating the drum with the heads of the sticks as close together as possible. When playing rolls, the sticks may be placed farther apart to cause as much of the head as possible to vibrate. There are many more variations in technique a timpanist uses during the course of playing to produce subtle timbral differences.

Occasionally, composers will ask the timpanist to strike the drum at specific spots. Béla Bartók writes a passage "to be played at the edge of the head" in his Violin Concerto.

## Tuning

Prior to playing the instruments, the timpanist must *clear* the heads by equalizing the tension at each tuning screw. This is done so every spot on the head is tuned to exactly the same pitch. When the head is clear, the timpano will produce a beautiful, in-tune sound. If the head is not clear, the pitch of the drum will rise or fall after the initial impact, and the drum will produce different pitches at different dynamic levels.

In performance, tuning is typically accomplished with a method called *interval tuning*. Timpanists who are not blessed with absolute pitch obtain a reference pitch from a tuning fork, pitch pipe, or even a note played by another instrument in the course of the performance, then use musical intervals to arrive at the desired note. For example, to tune the timpani to G and C, a timpanist may sound an A with a tuning fork, then sing (or think) a minor third above that A to tune the C, and then sing a perfect fourth below the C to tune the G. Timpanists are required to have a very well developed sense of relative pitch.

Some timpani are equipped with tuning gauges, which provide a visual indication of the drum's pitch. They are physically connected either to the counterhoop, in which case the gauge indicates how far the counterhoop is pushed down, or the pedal, in which case the gauge indicates the position of the pedal. These gauges can be useful. However, every time the drum is moved, the overall pitch of the head changes, thus the pitches must be re-marked on the gauges before every performance. Gauges are especially useful when performing music that involves fast tuning changes that do not allow the player to listen to the new pitch before playing it. Many good timpanists prefer to tune by ear and will rely on gauges only if absolutely necessary.

Timpanists are commonly required to tune in the middle of a piece of music, thus all timpanists must develop techniques to tune undetectably and accurately in the midst of other music.

Occasionally, players use the pedals to retune a drum while playing it. Portamento effects can be achieved by changing the pitch of the drum while it can still be heard. This is

commonly called a glissando, though this use of the term is not strictly correct. The most effective glissandos are those from low notes to high notes and those performed during rolls. One of the first composers to call for a timpani glissando was Carl Nielsen, who used two sets of timpani, both playing glissandos at the same time, in his Symphony No. 4 ("The Inextinguishable").

*Pedaling* refers to changing the pitch of the drum with the pedal; it is an alternate term for *tuning*. In general, timpanists reserve this term for passages where the performer must change the pitch of a drum in the midst of playing – for example, playing two consecutive notes of different pitches on the same drum. In Samuel Barber's *Medea's Meditation and Dance of Vengeance*, the timpanist must play A–B–C–D in consecutive sixteenth notes. There is no way to place this passage across a common set of four drums, thus the timpanist must use the pedal to change the notes while playing. *Nocturne*, by Benjamin Britten, contains a longer chromatic passage using the same technique.

## Muffling

*Muffling* or *damping* is an implicit part of playing timpani. Often, timpanists will muffle notes so they only sound for the length indicated by the composer. However, early drums did not resonate nearly as long as modern timpani, so composers often just wrote a note when the timpanist was to hit the drum without worrying about the sustain. Today, timpanists must use their ear and the [score](#) of the piece to determine the actual length the note should sound.

The typical method of muffling is to place the pads of the fingers against the head while holding onto the timpani stick with the thumb and index finger. Timpanists are required to develop techniques to stop all vibration of the drumhead without making any sound from the contact of their fingers.

Muffling is often referred to as *muting*, which can also refer to playing the drums with mutes on them.

## Extended techniques

- It is typical for only one timpano to be struck at a time. Occasionally, composers will ask for two notes to be struck at once. This is called a *double stop*. Ludwig van Beethoven uses this effect in the slow movement of his Ninth Symphony.
- Although timpanists only have two hands, it is possible to play more than two timpani at once. One way to do this is by holding two sticks in one hand much like a marimbist. Another is by adding the hands of more timpanists. Hector Berlioz achieves fully voiced chords on timpani in his Requiem ("Grande messe des morts") by employing eight timpanists, each playing a pair of timpani.
- When the timpani are struck directly in the center of the head, the drums have a sound that is almost completely devoid of tone. George Gershwin uses this effect in *An American in Paris*.
- Often, when one drum is struck, another will vibrate quietly. In orchestral playing, timpanists must actively avoid this effect, but composers have exploited this effect in solo pieces, such as Elliot Carter's *Eight Pieces* for four timpani.
- Sometimes composers will specify that timpani be played *con sordino* (*with mute*) or *coperti* (*covered*), both of which indicate that mutes should be placed on the head. Timpani mutes are typically small, rectangular pieces of felt or leather. The degree the head is dampened can be altered by placing the mute at different spots on the head. Barber specifies that the timpani be played *con sordino* in a section of *Medea's Meditation and Dance of Vengeance*. Mutes are also often used to dampen the

sympathetic vibrations generated by external factors such as the sound produced by other instruments.

- Composers will sometimes specify that the timpani should be struck with implements other than timpani sticks. It is common in timpani etudes and solos for performers to play with their hands or fingers. Leonard Bernstein calls for maracas on timpani in both the "Jeremiah" Symphony and Symphonic Dances from West Side Story. Edward Elgar attempts to use the timpani to imitate the engine of an ocean liner in his "Enigma" Variations by requesting the timpanist play with snare drum sticks. However, snare drum sticks tend to produce too loud a sound, and since this work's premiere, the passage in question has been performed by striking the timpani with the edges of coins.
- Robert W. Smith's *Songs of Sailor and Sea* calls for a "whale sound" on the largest timpano. This is achieved by moistening the thumb and rubbing it from the edge to the center of the drumhead.
- Another technique used primarily in solo work is striking the copper bowls of the timpani. This technique is used in the first movement of John Beck's *Sonata for Timpani*. Timpanists tend to be reluctant to use this effect at loud dynamic levels or with hard sticks, since copper can be dented easily.
- Occasionally a composer will ask for an upside-down [cymbal](#) to be placed upon the drumhead and then struck, usually rolled while executing a glissando on the drum.

# History

## Pre-orchestral history

Arabic nakers, the direct ancestors of timpani, were brought to 13th century Europe by Crusaders and Saracens. These drums, which were small (around 20–22 cm or 8–8½ in in diameter) and mounted to the player's belt, were used primarily for military ceremonies. This form of timpani remained in use until the 16th century.

In 1457, a Hungarian legation sent by King Ladislaus V carried larger timpani mounted on horseback to the court of King Charles VII in France. This variety of timpani had been used in the Middle East since the 12th century. These drums evolved together with trumpets to be the primary instruments of the cavalry. This practice continues to this day in sections of the British Army, and timpani continued to be paired with trumpets when they entered the [classical orchestra](#).

Over the next two centuries, a number of technical improvements were made to timpani. Originally, the head was nailed directly to the shell of the drum. In the 15th century, heads began to be attached and tensioned by a counterhoop that was tied directly to the shell. In the early 16th century, the bindings were replaced by screws. This allowed timpani to become tunable instruments of definite pitch.

## Timpani in the orchestra

Jean-Baptiste Lully is the first known composer to score for timpani, which he included in the orchestra for his 1675 opera *Thésée*. Other 17th century composers soon followed suit. In music of this time, timpani are almost always tuned to the tonic and dominant notes of the piece – a perfect fourth apart. Interestingly, timpani are often treated as [transposing instruments](#) in the music of this period: the notes were written as C and G with the actual pitches indicated at the top of the score.

Ludwig van Beethoven revolutionized timpani music in the early 19th century. He not only wrote for drums tuned to intervals other than a fourth or fifth, but he gave a prominence to the instrument as an independent voice. For example, his *Violin Concerto* opens with five timpani strokes, and the scherzo of his *Ninth Symphony* pitches the timpani against the orchestra in a sort of call and response.

The next major innovator was Hector Berlioz. He was the first composer to indicate the exact sticks that should be used – felt-covered, wooden, etc. In several of his works, including *Symphonie fantastique*, he demanded the use of several timpanists at once.

Until the late 19th century, timpani were hand-tuned; that is, there was a sequence of screws with T-shaped handles, called taps, which altered the tension in the head when turned by players. Thus, tuning was a relatively slow operation, and composers had to allow a reasonable amount of time for players to change notes if they wanted to be sure of a true note. The first pedal timpani originated in Dresden in the 1870s and are called Dresden timpani for this reason. However, since vellum was used for the heads of the drums, automated solutions were difficult to implement since the tension would vary unpredictably across the drum. This could be compensated for by hand-tuning, but not easily by a pedal drum. Mechanisms continued to improve in the early 20th century.

Despite these problems, composers eagerly exploited the opportunities the new mechanism had to offer. By 1915, Carl Nielsen was demanding glissandos on timpani in his *Fourth Symphony* – impossible on the old hand-tuned drums. However, it took Béla Bartók

to more fully realize the flexibility the new mechanism had to offer. Many of his timpani parts require such a range of notes that it would be unthinkable to attempt them without pedal drums.

## Timpani outside the orchestra

Later, timpani were adopted into other classical music ensembles such as [concert bands](#). In the 1970s, [marching bands](#) and [drum and bugle corps](#), which evolved both from traditional marching bands and concert bands, began to include marching timpani. Each player carried a single drum, which was tuned by a hand crank. Marching timpani were heavy and awkward to play, as the drumhead was almost at the player's chest. Often, during intricate passages, all the timpani players would put their drums on the ground, and they would be played more like conventional timpani. In the early 1980s, Drum Corps International, a drum corps governing body, allowed timpani and other percussion instruments to be grounded. This was the beginning of the end for marching timpani: Eventually, standard concert timpani found their way onto the football field as part of the marching band's [front ensemble](#), and marching timpani fell out of common usage.

As [rock and roll](#) bands started seeking to diversify their sound, timpani found their way into the studio. In 1964, Ringo Starr played timpani on the song "Every Little Thing" from The Beatles album Beatles for Sale. Beginning in 1969, John Bonham employed timpani both in the studio and onstage with the release of the debut Led Zeppelin album Led Zeppelin 1, as well as the intro of "In The Evening" off their 1979 album In Through The Out Door and his solo percussion masterpiece single "Bonzo's Montreux", later re-released on Coda. Early in the next decade, progressive rock bands began utilizing all sorts of percussion instruments, including timpani. Mike Oldfield's 1973 album Tubular Bells featured timpani along with other percussion instruments that were traditionally part of the orchestra. Green Day also used timpani in their song "Homecoming" for the album American Idiot. Also, Queen drummer Roger Taylor would perform a tympani solo during Queen concerts from October of 1978 to November of 1981.

[Jazz](#) musicians also experimented with timpani. In 1964, Elvin Jones incorporated timpani into his drum kit on John Coltrane's four-part composition A Love Supreme.

Jonathan Haas is one of the few timpanists who markets himself as a soloist. Haas, who began his career as a solo timpanist in 1980, is notable for performing music from many genres including jazz, rock, and classical. In fact, he released an album with a rather unconventional jazz band called *Johnny H. and the Prisoners of Swing*.

## Tonal memory

In [music](#), **tonal memory** is the recollection of a previously sounded tone (Gorow 2002, p.35). It is an important skill that assists with staying in tune and is developed through [ear training](#). Extensive tonal memory is often used as an indication of potential [compositional](#) ability (Haroutounian 2002, p.74).

## Topical song

A **topical song** is a song that comments on current political and social events. Typically, these songs offer a mix of narrative and commentary, although some (such as Neil Young's song "Ohio", reacting to the Kent State shootings) assume that the events are so well known that only commentary is called for.

Topical songs are often (but needn't be) [protest songs](#). Two examples whose titles should be self-explanatory in this respect are "Talkin' John Birch Paranoid Blues" by Bob Dylan (c. 1963) and "The Marines Have Landed on the Shores of Santo Domingo" by Phil Ochs (1965). However, they may also celebrate the events described, such as the 1936 calypso "FDR in Trinidad" (a.k.a. "Roosevelt in Trinidad") recorded by several artists in Trinidad at the time (probably most famously by a singer who went by the name Atilla) and covered decades later by Ry Cooder, or Joni Mitchell's "Woodstock", about the Woodstock Festival.

Generally speaking, one would call a song "topical" only if the events referred to were at least reasonably recent at the time the song was written. Thus, Al Stewart's songs about historical events are generally not considered topical. However, "Biko" by Peter Gabriel, written in 1980, three years after Steve Biko's death in a South African prison, would generally be considered topical because the anti-apartheid struggle of which Biko was part was still in full flower when the song was written.

Tom Lehrer's 1965 album *That Was the Year That Was* consisted entirely of satirical topical songs on topics ranging from Nuclear proliferation ("MLF Lullaby") to the Second Vatican Council ("The Vatican Rag"). He originally wrote these songs for the television show *That Was the Week That Was*; most of them were written and first performed in the very week of the events referred to. The album also contains a song — "Folk Song Army" — which takes a satirical look at protest songs.

Although English-language topical songs are more associated with the political left than the right, this is by no means a given. Two examples of right-wing topical songwriters are Staff Sergeant Barry Sadler who had a hit in 1966 with "Ballad of the Green Beret" or Toby Keith, who has written numerous songs in favor of aggressive U.S. military policies in reaction to the September 11, 2001 attacks. Although Merle Haggard is not particularly on the right politically, his 1969 song "Okie from Muskogee" was seized upon by the cultural right for its putdown of hippies.

The tradition of topical songs extends to many parts of the world. Some examples from non-English-speaking countries include "Rock 'n' Roll-Arena in Jena" by the Udo Lindenberg of Germany, "Criogenia salveaz România" ("Cryogenia saves Romania") by the Romanian band Taxi and "Fora da ordem" ("Out of order") by the Brazilian musician Caetano Veloso.

## Tortured artist

The **Tortured artist** is a stock character and stereotype, who is in constant ferment due to frustrations with art and other people. The tortured artist feels alienated and misunderstood due to what he/she perceives as the ignorance or neglect of others who do not understand them, and the things they feel are important. They sometimes smoke, are sexually frustrated, and appear overwhelmed by their own emotions and inner conflicts. The tortured artist is often mocked in popular culture for being attention seeking, narcissistic, or just adverse to happiness.

## Examples in culture

Todd Cleary in 2005 movie Wedding Crashers  
Russell Corwin on tv show Six feet under  
Charlie Kaufman in 2002 movie Adaptation

# Totalism

In music, **totalism** is some people's term for a style of music that arose in the 1980s and '90s as a developing response to [minimalism](#) - parallel to post-minimalism, but generally among a slightly younger generation, born in the 1950s. In the early 1980s, many young composers began writing music within the static confines of [minimalism](#), but using greater rhythmic complexity, often with two or more tempos (or implied tempos) audible at once. The style acquired a name circa 1990, when it became evident to composers working in New York City that a number of them - John Luther Adams, Glenn Branca, Rhys Chatham, Kyle Gann, Michael Gordon, Arthur Jarvinen, Diana Meckley, Ben Neill, Larry Polansky, Mikel Rouse, Evan Ziporyn, among others - were employing similar types of global tempo structures in their music. The term *totalist* refers to the aims of the music, in trying to have enough surface rhythmic energy (often emulating pop) to attract unsophisticated listeners, but also to contain enough background complexity to satisfy connoisseurs. There is also an echo in the term of [serialism](#)'s "total organization," here drawn not from the 12-tone row, but from Henry Cowell's theories about using the same structuring devices for rhythm that have been traditionally used for pitch. For instance, the traditional ratio between frequencies of a major second interval is 9:8, and 9-against-8 is an important tempo contrast in many totalist pieces, achieved by having some instruments play dotted eighth-notes while others play triplet quarter-notes. In practice, totalist music can either be consonant, dissonant, or both, but generally restricts itself to a small number of sonorities within a given piece.

Some major works in the totalist idiom include:

- Mikel Rouse: *Quick Thrust*, *Failing Kansas*, *Dennis Cleveland* (a talk-show opera)
- Michael Gordon: *Thou Shalt!/Thou Shalt Not!*, *Van Gogh Video Opera*, *Trance*
- Rhys Chatham: *An Angel Moves Too Fast to See*
- John Luther Adams: *Dream in White on White*, *Clouds of Forgetting*, *Clouds of Unknowing*, *The White Silence*
- Kyle Gann: *Long Night*, *Custer and Sitting Bull*
- Ben Neill: *678 Streams*, *ITSOFOMO*
- Arthur Jarvinen: *Murhpy-Nights*, *The Paces of Yu*

# Trad jazz

**Trad jazz**, short for "traditional" jazz is a [music genre](#) popular in Britain and Australia from the 1940s onward through the 1950s and which still has enthusiasts today. It represented a recreation of the sounds and playing styles of New Orleans [dixieland](#) jazz. British and Australian bands of this genre copied the playing style of such artists as Sidney Bechet or King Oliver.

Opinions are divided about whether "trad jazz" is a valid name because one point of view would have it that jazz is a folk music tradition like any other, while the opposite point of view holds that jazz playing breaks loose from traditions and conventions so that, therefore, "traditional jazz" is a contradiction in terms.

In Britain during the 60's trad jazz was used to dance skip jive, a descendent of jive and [swing dance](#).

## Other topics

[Jazz standard](#) - [Jazz royalty](#)

For definition, many aficionados today consider trad to be the traditional playing of a piece with solo after solo leading up to a finish. Some feel that "hot jazz" though similar to trad, and indeed containing many of the same tunes, was more ensemble playing with less individual virtuosity brought to the forefront. Early King Oliver pieces define hot jazz to many. As individual performers began stepping to the front as soloists, the music changed. Ironically, one of ensemble players in King Oliver's Original Creole Band, Louis Armstrong, was by far, the most influential of the soloists, creating a big demand for the new style of jazz in the late 1920's and early 1930's. Other influential stylists who are still revered in trad jazz circles today include Sidney Bechet, Bix Beiderbecke and Muggsy Spanier.

## Traditional bluegrass

**Traditional bluegrass**, as the name implies, emphasizes the traditional elements of [bluegrass music](#), and stands in opposition to [progressive bluegrass](#). Traditional bluegrass musicians are likely to play [folk songs](#), songs with simple traditional [chord progressions](#), and use only acoustic instruments. In the early years, traditional bluegrass sometimes included instruments no longer accepted in mainstream bluegrass, such as washboards and mouth harps. Traditional bands may use bluegrass instruments in slightly different ways (clawhammer style of [banjo](#) playing, or multiple [guitars](#) or [fiddles](#) within a band). In this sub-genre, the guitar rarely takes the lead (the notable exception being gospel songs), remaining a rhythm instrument. Melodies and lyrics tend to be simple, and a I-iv-V chord pattern is very common.

# Traditional pop music

**Traditional pop music** is a neologism for Western [popular music](#) which encompasses music that succeeded [big band music](#) and preceded [rock and roll](#) as the most popular kind of music in the United States, most of Europe, and some other parts of the world. Its heyday is considered to be from the late 1940s to early 1960s. It evolved from big band music as a result of the emphasis shifting from the band to the singer.

Singers and groups who typified this genre include:

| <b>Male singers</b> | <b>Female singers</b> | <b>Male groups</b> | <b>Female groups</b> |
|---------------------|-----------------------|--------------------|----------------------|
| Tony Bennett        | Teresa Brewer         | The Ames Brothers  | The Andrews Sisters  |
| Don Cherry          | Alma Cogan            | The Crew-Cuts      | The Chordettes       |
| Nat "King" Cole     | Rosemary Clooney      | The Four Aces      | The Fontane Sisters  |
| Perry Como          | Doris Day             | The Four Lads      | The McGuire Sisters  |
| Bing Crosby         | Connie Francis        | The Hilltoppers    |                      |
| Don Cornell         | Georgia Gibbs         | The Lettermen      |                      |
| Eddie Fisher        | Connie Haines         | The Mills Brothers |                      |
| Jack Jones          | Joni James            | The Vogues         |                      |
| Frankie Laine       | Kitty Kallen          |                    |                      |
| Julius LaRosa       | Vera Lynn             |                    |                      |
| Dean Martin         | Jane Morgan           |                    |                      |
| Tony Martin         | Patti Page            |                    |                      |
| Guy Mitchell        | Dinah Shore           |                    |                      |
| Johnnie Ray         | Jo Stafford           |                    |                      |
| Jimmie Rodgers      | Kay Starr             |                    |                      |
| Frank Sinatra       | Gale Storm            |                    |                      |
| Frankie Vaughan     | Margaret Whiting      |                    |                      |

The Jimmie Rodgers mentioned above is not to be confused with an earlier [country music](#) singer of the same name. He, Connie Francis, The Lettermen, and The Vogues were from a somewhat later era than most of the singers listed above; however, their style is closer to traditional pop than to the rock and roll typical of their era. However, it should be noted that the Vogues began as a pop/rock group with hits like "You're The One" and "Five O'Clock World" before embracing a softer sound in the late 1960s, and Connie Francis' early catalog of hits includes some rock and roll tunes, including "Stupid Cupid" and "Lipstick On Your Collar."

The **tramen** is a drum loop which is very popular in [drum and bass](#), made by combining several other classic [breakbeats](#).

## History

Although also known by various other names (including the firefight, dramen and domen), tramen is easily the most widespread name. The name came by combining "Trace" (the artist who first popularised the break) and "[amen](#)" (the component break which is most distinctive and recognisable).

However, whilst the break is frequently credited to Trace, this is in fact an oft-repeated fallacy. The original creator was Dom and Roland, as Trace explained himself:

*It is a beat Dom made, that he hadn't used yet. When I heard it I was like, "That's the beat we need to use for Mutant Jazz Revisited. I then used it on Sonar and on Sniper where it was left it clean for 16 bars on the intro - this is where everyone ripped it from. As long as people know that it's a Dom beat. Because I used it on 3 tracks I got associated with it... The Tramen tag is something that Fresh started when he started rinsing it after we made Nitrous."*

The tramen is generally known as a combination of the [Amen break](#) (from "Amen Brother", by The Winstons) with the break from "Tighten Up" (James Brown). However in an interview with Knowledge Magazine, Dom confirmed it also used a third, harder to hear, element: the "Pulp Fiction" break, which was itself a second-generation breakbeat, made by Alex Reece for a remix of Model 500's "The Flow".

Artists who are particularly notable for their use of the tramen include Trace, Dom and Roland, Bad Company and Technical Itch.

# Trance fusion

**Trance Fusion** A style of music that incorporates the structure and sound of electronica/trance, but is played with traditional rock/jazz instruments allowing for more versatility in a live setting.

One of the most popular and possibly the first trance fusion band is the The Disco Biscuits. There is now a fairly good number of trance fusion groups, or groups with strong trance fusion influences. Such groups include Sound Tribe Sector 9 and The New Deal (band).

Some say Marc Brownstein came up with the name for this genre; others say Frank Zappa did in the late '80s.

## Trance

**Stylistic origins:** [Techno](#), [House](#), [Electronic art music](#), [Industrial](#)  
**Cultural origins:** Early 1990s, Europe, particularly Germany, The Netherlands, Belgium and UK  
**Typical instruments:** [Synthesizer](#), [Keyboard](#), [Drum machine](#), [Sequencer](#), [Sampler](#)  
**Mainstream popularity:** High

## Subgenres

[Acid](#), [Euro](#), [Goa](#), [Hard](#), [Hardcore](#), Progressive, [Psychedelic](#), [Uplifting](#), [Vocal](#)

## Fusion genres

Deep, [Futurepop](#), [Hardstyle](#), [Trancestep](#), Tech

## Other topics

## [Raves](#)

**Trance** is a style of [electronic dance music](#) that developed in the 1990s. Trance music is generally characterized by a tempo of between 130 and 160 bpm, featuring repeating melodic [synthesizer](#) phrases, and a [musical form](#) that builds up and down throughout a track, often crescendoing or featuring a breakdown. Sometimes vocals are also utilised. The style is arguably derived from a combination of largely [techno](#) and [house](#) as well as being heavily influenced by [Goa trance](#). 'Trance' received its name from the repetitious morphing beats, and the throbbing melodies which would presumably put the listener into a trance-like state. As this music is almost always played in nightclubs at popular vacation spots and in inner cities, trance can be understood as a form of club or house music.

# History

## Origins

Early [electronic art music](#) artists such as Klaus Schulze have proven to be a significant influence on trance music. Throughout the 1970s Schulze recorded numerous albums of atmospheric, sequencer-driven electronic music. Also, several of his albums from the 1980s include the word "trance" in their titles, such as the 1981 *Trancefer* and 1987 *En=Trance*.

Elements of what became modern club music also known as trance music were also explored by [industrial](#) artists in the late 1980s. Most notable was Psychic TV's 1989 album *Towards Thee Infinite Beat*, which featuring drawn out and monotonous patterns with short looping voice samples and is considered by some to be the first trance record. The intent was to make sound that was hypnotic to its listeners, this would also lead to a strain of trance known as Euphoria being developed which caused an uplifting sensation among its listeners who became somewhat euphoric during listening.

These industrial artists were largely dissociated from rave culture, although many were interested in the developments happening in [Goa trance](#) which is a much 'heavier' sound than what is now known as trance. Many of the trance albums produced by industrial artists were generally experiments, not an attempt to start a new genre with an associated culture - they remained firmly rooted culturally in industrial and avant-garde music. As trance began to take off in [rave](#) culture, most of these artists abandoned the club style.

## Trance begins as a genre

*Main articles: [acid trance](#), [Goa trance](#)*

The earliest identifiable trance recordings came not from within the trance scene itself, but from the UK acid house movement, and were made by The KLF. The most notable of these were the original 1988 / 1989 versions of 'What Time Is Love' and '3AM Eternal' (the former indeed laying out the entire blueprint for the trance sound - as well as helping to inspire the sounds of hardcore and rave) and the 1988 track 'Kylie Said Trance'. Their use of the term 'pure trance' to describe these recordings reinforces this case strongly. These early recordings were markedly different from the releases and re-releases to huge commercial success around the period of the 'White Room' album (1991) and are significantly more minimalist, nightclub-oriented and 'underground' in sound.

The trance sound beyond this acid-era genesis is said to have begun as an off-shoot of [techno](#) in German clubs during the very early 1990s. Frankfurt is often cited as a birthplace of Trance. Some of the earliest pioneers of the genre included DJ Dag (Dag Lerner), Oliver Lieb, Sven Väth and Torsten Stenzel, who all produced numerous tracks under multiple aliases. Trance labels like Eye Q, Harthouse, Superstition, Rising High, FAX +49-69/450464 and MFS Records were Frankfurt based. Arguably a fusion of techno and house, early trance shared much with techno in terms of the tempo and rhythmic structures but also added more melodic overtones which were appropriated from the style of house popular in Europe's club scene at that time. This early music tended to be characterized by hypnotic and melodic qualities and typically involved repeating rhythmic patterns added over an appropriate length of time as a track progressed.

At about the same period of time in the late 1980's and early 1990s, a musical revolution was happening in [Goa](#), India. [Electronic body music](#) (EBM) bands like Cabaret Voltaire and

Front 242 came to Goa and began influencing artists like Goa Gil, Eat Static, Doof, and Man With No Name who heard the psychedelic elements of EBM, expanded on them minus the vocals and guitars to create [Goa trance](#). Goa music is heavily influenced by Indian culture and psychedelic drugs, as seen in numerous references to both in track and album titles.

## The sound of modern trance

By the mid-1990s, trance, specifically progressive trance, which emerged from acid trance much as progressive house had emerged from [acid house](#), had emerged commercially as one of the dominant genres of dance music. Progressive trance set in stone the basic formula of modern trance by becoming even more focused on the anthemic basslines and lead melodies, moving away from hypnotic, repetitive, arpeggiated analog synth patterns and spacey pads. Popular elements and anthemic pads became more widespread. Compositions leaned towards incremental changes (aka progressive structures), sometimes composed in thirds (as BT frequently does). Buildups and breakdowns became longer and more exaggerated. The sound became more and more excessive and overblown. This sound came to be known as anthem trance.

Immensely popular, trance found itself filling a niche as 'edgier' than house, more soothing than [drum and bass](#), and more melodic than techno, something that makes it accessible to many people. Artists like Paul van Dyk, Ferry Corsten, and Armin van Buuren came to the forefront as premier producers and remixers, bringing with them the emotional, "epic" feel of the style. Meanwhile, DJs like Paul Oakenfold, DJ Tiësto, and DJ Jean were championing the sound in the clubs and through the sale of pre-recorded mixes. By the end of the 1990s, trance remained commercially huge, but had fractured into an extremely diverse genre. Some of the artists that had helped create the trance sound in the early and mid-1990s had, by the end of the decade, abandoned trance completely (artists of particular note here are Pascal F.E.O.S. and Oliver Lieb).

Perhaps as a consequence, similar things were happening with the DJs as well. For example, Sasha and Digweed, who together had helped bring the progressive sound to the forefront, all but abandoned it by 2000, instead spinning a darker mix of the rising "deep trance" and "tech-trance" style they pioneered along with producers and DJ's like Slacker and Breeder. Sasha and John Digweed might argue that their 2000 release "Communicate" not be called trance at all.

## **Trance in the mainstream**

As trance has entered the mainstream it has alienated many of its original fans. As the industry became bigger, companies (especially Ministry of Sound) and DJs began to alter their sound to that of a more pop based one, so as to make the sound more accessible to an even wider, and younger, audience. Vocals in particular are now extremely common in mainstream trance, adding to their poppy sound.

## Musicology and styles

Trance is a form of music best characterized by quarter note drum patterns, and 16th/32nd note rhythm synthesizer patterns. It has a meter of 4/4, with a quarter note bass drum acting as metronome, and quarter note high-hat hits on upbeats. This unwavering drum mechanism may be constantly tweaked with for effect, with the Attack, Decay, Sustain, Release (ADSR) all given liberal treatment. The tempo is generally around 130-160 beats per minute (bpm).

The arrangement consists mostly of a repeating 16th note sequencing arpeggio, and a bass section of whole notes usually drifting through the aeolian or natural minor scale. Harmonic structure is typically minimalist, with often no more than 2-4 chords. Iterations of the i-iv-v progression (A minor, D minor, and E minor, for example) lend a dark feel by eschewing major chords entirely. Additional rhythm sections are added and subtracted every 16 measures (sometimes 8, and sometimes 32) to add weight and anticipation to the composition. The bass chord will usually change every 4 measures.

There is a lead synth, and it will be a simple minor scale melody of 8th notes, looping every 4 measures (some have 2, some have 8. Some even have 16). Trance is produced with [keyboards](#), computerized [synthesizers](#), [drum machines](#), and [music sequencer](#) software connected via MIDI. The average trance song has a polyphony of 8. The most busy will have 16.

Some sub-genre classifications of trance include:

- [Acid trance](#): An early '90's style. Characterized by the use of a Roland TB-303 bass machine as the lead synth.
  - Artists: Hardfloor, Art of Trance, Eternal Basement, Solar Quest
- Anthem trance (also known as uplifting trance): Style of trance that emerged in the wake of progressive trance in the late 90's. Characterized by extended chord progression in all elements (lead synth, bass chords, treble chords), extended breakdowns, and relegation of arpeggiation to the background while bringing wash effects to the fore.
  - Artists: Vincent de Moor, Ronski Speed, Tiësto, System F, Super8, Ayla, Paul van Dyk, Armin van Buuren, ATB, Blank & Jones, Airbase, M.I.K.E, Nu NRG, Tony Burt vs. Mat Silver, Matt Darey.
- Classic trance: Original form of trance music, said to have originated in the very early 90's. Characterized by less percussion than techno, more melody, arpeggiated melody, and repetitive melodic chords/arpeggios.
  - Artists: Resistance D, Progressive Attack, Arpeggiators, LSG (Oliver Lieb), Union Jack, Dance 2 Trance, Jam and Spoon, Terra Ferma, Moogwai, Nostrum.
- [Euro-Trance](#): Euro-Trance is a hybrid of hard trance and [Eurodance](#) music incorporating hardstyle bass drums and trance elements. The trance synths at times sound like techno hoovers with trancey effects and strings backing it up. The vocals are often pitched up for the most part, but sometimes they can be heard as in normal pitch range. This is often confused as vocal trance because of its use of vocals. The lyrical content is usually pretty simple, containing an introduction to the song with usually no or little drums, and often includes renderings of classic [happy hardcore](#) anthems or melodies.
  - Artists: DJ Trancemaster, Groove Coverage, Jan Wayne, Starsplash, Rob Mayth, Special D, DJ Volume, Rocco, Sven-R-G vs. Bass-T.
- [Goa trance](#): A complexly melodic form of trance named for Goa, India, and originating in the early 90's. Often uses the [Raga](#).

- Artists: Psygone, mfg, S.U.N. Project, Man With No Name, Astral Projection, Juno Reactor
- [Hard Trance](#): Aggressive sounding, Originating in Frankfurt, includes influences from hardcore and hard house.
  - Artists: DJ Scot Project, Darude, JS16, Dallas Superstars, Bostik, Mighty 44, DJ Wag, Yoji Biomehanika, Cosmic Gate, Hennes & Cold, DuMonde, Uberdruck, Alphazone, Dave 202 vs. Phil Green, Marcos, JK Walker.
- [Hardstyle](#): Closely related to nu style [gabber](#) and hard trance. Its sound is usually characterized by a mix of gabber and hardcore like kick/bass sounds, trance like synth stabs and sweeps and miscellaneous samples. However, Hardstyle usually has a lot slower BPM (between 140 and 150).
  - Artists: Blutonium Boy, Lady Dana, DJ Pavo, DJ Neo, DJ Virus.
- Progressive trance (aka Progressive House): Style of trance that originated in the early-mid 90's. Differentiated from the then "regular" trance by bass chord changes that gave the repeating lead synth a feeling of "progression".
  - Artists: BT, Cosmic Baby, Art of Trance, Sasha, John Digweed, ATB, Marc O'Tool, Lemon8.
- [Psychedelic trance](#): Better known as [psytrance](#); ambiguously synonymous with Goa trance, less melodic and more abstract and futuristic.
  - Artists: Shiva Chandra, Etnica, Infected Mushroom, Astrix, Phacelift, Total Eclipse
- Progressive psytrance: Emerged from both progressive house and psytrance. Identified by slower BPM range (roughly between 125 and 138), deep, low bass line, similarities to house in percussion, track structure and other things as well as psychedelic trance depth and relative musical unpredictiveness.
  - Artists: Buzzmonx, Magnetrixx, Ticon, Beat Bizarre, Phony Orphants, Antix, Freq, Lish
- Tribal: A trance derivative that took classic trance and overlaid it with polyrhythmic percussive beats, ethnic samples, bongo sounds. It emphasizes the rhythmic core of trance. It shares many things with early Goa trance and Balearic House. Tribal can also be understood not so much as a style in itself, but as a component of any other trance style that has a bongo polyrhythm to it.
  - Artists: Parks and Wilson, Etnoscope, Tarentella
- [Vocal trance](#): Broad term referring to trance with a full set of lyrics, which may or may not be any of the above genres. Oftentimes an artist will borrow a singer's talents as opposed to the singer herself (vocalists are typically female), or sample from/remix more traditional pop music. Note that there is some debate as to where the divide lies between vocal trance and pop or Eurodance.
  - Artists: 4 Strings, Lange, Ian Van Dahl, Above & Beyond, Fragma, Paradise, Lost Witness, Armin Van Buuren, Chicane, Milk, Inc., Lasgo.
- Euphoric trance:
- Deep trance:

## Notable trance records

1988

- ***What Time Is Love (Original Version)*** by The KLF

One of the KLF's groundbreaking proto-trance recordings from the acid house era.

1989

- ***System*** by Force Legato

An early production of Oliver Lieb and one of the first trance tracks

1990

- ***Q*** by Mental Cube

Huge, early FSOL production, which helped secure the UK's dance music production credentials.

- ***Techno Trance*** by D-Shake

A driving piece of early tech-trance.

- ***Pacific*** by 808 State

A classic anthem from the Madchester scene.

- ***Age Of Love*** by Age Of Love

Many DJs and fans of the time as well as trance historians consider this record a trance classic, even before trance became a genre of its own. The ethereal sound of this record is the foundation of the trance sound.

1991

- ***Lock Up*** by Zero B: This UK hardcore techno / rave piece spelled out exactly how the big, uplifting trance / dance breakdown should (and would) go for years to come. They didn't get bigger than this, and still struggle to do the same. The central riff is a trance classic, the rest of the track pure rave - all ahead of its time by years whichever angle you observe it from...
- ***Papua New Guinea*** by Future Sound Of London

A classic rave-era, UK progressive breaks track that also defined a huge part of trances later sound, direction and high production values. FSOL were established at last.

- **Go** by Moby

Moby's most famous track before he found fame from his album *Play*.

- **No Fate** by Zyon

The first successful trance release on Eye Q. One of the most renowned tracks of the label.

- **We Came In Peace** by Dance 2 Trance

The classic trance record which very probably officially gave a name to the genre in Germany, where the sound was first emulated and produced by subsequent German artists, and played in underground clubs and raves; never alone, but always with another genre of electronic music, as the DJ's back then never played only one style of music.

## 1992

- **Perfect Day** by Visions of Shiva

Cosmic Baby and Van Dyk sure started on a high with this piano-fuelled-delicacy-turns-monster...

- **Liquid Is Liquid** by Liquid

This is a prime example of atmospheric "old skool" trance, with its continuous arpeggios and haunting sound. One of the first tracks to enjoy anthem status. 11 years later it was revamped by Scooter in their album *The Stadium Techno Experience*.

- **Rave Generator** by Toxic Two

The title says it all really, as to which direction this first true commercial trance track took... 'generates the ecstasy in you', anyone!?!?

- **Stella** by Jam and Spoon

A classic Balearic trance track.

- **Pacific Symphony** by Transformer 2

Big rave / trance hybrid piece from 1992, epic strings with cheesy vocals.

- **Camargue** by CJ Bolland

Strings, chords and elegant techno-trance from the ex-hardcore man who would bring the darkside in 1992's 'Mantra' and the seminal, groundbreaking 'The Fourth Sign' LP (1992)

## 1993

- ***How much Can You Take?*** by Visions Of Shiva

Cosmic Baby and Van Dyk get deeper, darker and more driving with this highly musical track.

- ***Love Stimulation*** by Humate

The Paul van Dyk Lovemix is easily considered a defining moment in art of remixing, giving an otherwise plain tune "classic" status.

- ***Outface*** by Komakino

Outface is in the middle of the road between techno and trance and serves as a perfect guide in order to understand the evolution from one genre to the other.

- ***Abduction*** by Eat Static

One of the very first Goa trance artist albums. This album set a standard for future releases in this genre.

- ***Café Del Mar*** by Energy 52

Has become one of the most well known trance tunes of all time. Remains one of the most popular and energetic trance records to this day sprouting off numerous remixes.

- ***The First Rebirth*** by Jones & Stephenson

Perhaps the first [hard trance](#) track, at least the first well known one, with a very deep bassdrum and possibly one of the most recognisable melody lines in trance music.

- ***Vernon's Wonderland*** by Vernon

A huge hit back in the day, this track has become a cornerstone of trance music.

## 1994

- ***The Milky Way*** by Aurora Borealis

A fast and hard trance track, originated in France

- ***For an Angel*** by Paul van Dyk

An early trance classic it defined a style and a sound that continued for a decade. Paul van Dyk continues to play it.

- ***The Orange Theme*** by Cygnus X

This Cygnus X (aka A.C.Boutsen) classic continues to be played even today and has been remixed countless times. It is notable for the number of [scales](#) the main theme is

played.

## 1995

- **Oasis** by Paragliders

One of the last major classic-style trance tracks before the progressive sound emerged.

- **Twisted** by Hallucinogen

Considered to be one of the most original and innovative psychedelic goa trance albums. Completely representative of psychedelic goa trance at that time (others such as Astral Projection and X-Dream are typical of a slightly later sound (1996 onwards)), and some claim that it defines the sound of psychedelic trance music, it has been highly influential. This was one of the first Goa Trance albums to sell over 50,000 copies.

- **Mahadeva** by Astral Projection

This is considered by many the greatest ever goa trance track. Mahadeva catapulted Astral Projection to the top of the genre and brought to prominence the Israeli psy-trance scene.

- **Children** by Robert Miles

A powerful dream trance/house hit that has received acclaim from critics both inside and outside trance. This is a song which has introduced many music lovers into the world of dream trance and is widely considered one of the greatest trance songs of all time.

## 1996

- **Flaming June** by BT

A widely-accepted classic. Example of progressive trance. Composed in thirds, the structure of this tune represents the evolving, progressive structure of mid-1990s progressive trance.

## 1997

- **Open your eyes** by At the villa People

a venerable club classic, At the Villa people came from the rather underground club "At the Villa, which at this time was located in a church in Belgium, the original location, which was a true villa, had burned down.

- **Desert Storm** by Desert Storm

originated from Germany, a slow paced, heavy bass tune, very long, and very deep. Originally released in 1994, but re-released in 1997 on the At the Villa compilation maxi bundle called "At the Villa Laurence, Music from the Club".

- **No Access** by Hondy

The Salone Margherita mix, at this time played often by Pete Tong on BBC Radio 1 is a key example of trance at its peak demonstrating its amazing symphonic and anthemic qualities.

## 1998

- **1998** by Binary Finary

An epic trance monster that took Binary Finary (producers Matt Laws and Stuart Matheson) worldwide within a year and became an all time classic overnight. Famously influenced by goa and psytrance.

- **El Niño** by Agnelli & Nelson

The famous trance track popularized by Oakenfold's album "Tranceport". A genre-defining tune of epic trance.

- **Someone (Slacker's Rolling mix)** by Ascension

Massive epic trance club hit, which heralded in the use of female vocals and vocal trance which would soon come to dominate the mainstream aspect of the genre. Initially popularized on Paul Oakenfold's seminal Tranceport mix CD, which featured the superior "Slacker's Rolling mix" of the track.

- **Words** by Paul Van Dyk

Another widely accepted classic of Paul Van Dyk's. Considered by many to be a stronger track than even his ultimate classic "For an Angel."

- **Madagascar** by Art of Trance

This track from the Platipus label was composed by Simon Berry and has been remixed several times since its first release.

- **Purple (Sasha vs. The Light mix)** by Gus Gus

One of the first breaktrance tracks ever released, and still a highlight of the genre for its distinctive layered melodies. Also famous as the track to popularize "cut-up" vocals in the genre.

- **Greece 2000** by Three Drives

Widely considered to be one of the greatest anthems of progressive trance, as well as a perennial favorite in Ibiza. Still played by many DJs to this day.

## 1999

- **Sandstorm/Feel The Beat/Out Of Control** by Darude

This track blew up on the Finnish, UK and US club scene and helped bring recognition to Hard Trance. Darude originally found fame as an online unsigned band on the now demised mp3.com site. As well, relatively unknown musically, Finland also became prominent on the Dance music scene with JS16 producing this track and the subsequent album in 2000, *Before The Storm*.

- ***Better Off Alone*** by Alice DeeJay

A UK #2 and a debut hit by Dutch Trance act Alice DeeJay in July 1999. The track and the band are similar to Finnish act Darude. It was a big headline hit for Dance festivals that summer.

- ***Another Way*** by Paul van Dyk

An amazing and awe-inspiring journey through the mind and beats by one of the true pioneers of the genre.

- ***Universal Nation*** by Push

Belgian immortal trance and club classic by Push aka M.I.K.E.

- ***Carte Blanche*** by Veracocha

This driving epic trance track was produced by Vincent de Moor & Ferry Corsten and is regarded as one of the tracks that defines epic trance.

- ***Out of the Blue*** by System F

This track has become a huge success, giving trance a big popularity boost.

- ***Saltwater*** by Chicane

This uplifting, epic track was produced by the British DJ Nick Bracegirdle and is widely regarded as one of the greatest trance singles ever.

- ***Ayla (Veracocha mix)*** by Ayla

A high energy trance classic remixed by Veracocha.

- ***Barber's Adagio for Strings (Ferry Corsten Remix)*** by William Orbit

This Ferry Corsten treatment of William Orbit's rendition of the Adagio For Strings by Samuel Barber, has been one of the most successful marriages to date of classical music and trance.

- ***Xpander*** by Sasha

This track is probably the highlight of Global Underground 13: Ibiza, arguably the best GU album that was released at the height of popularity of progressive trance.

**2001**

- ***Urban/Suburban Train*** by DJ Tiesto

This is a widely regarded classic released by Dutch DJ Tiesto at the height of his career.

## 2002

- ***Ligaya*** by Gouryella

A relatively recent track that has been an important addition with its euphoric and emotional melody to any dj's sonic arsenal.

## 2003

- ***Music/Next To You*** by Darude

Finnish trance artist Darude does it again with his new album *Rush* in which his two most popular singles, *Music* and *Next To You* brought about the same popularity of his 1999/2000 offerings *Sandstorm*, *Feel The Beat* and *Out Of Control*. It is widely stated that the Bostik Radio Edit version of *Music* from the *Rush* album is considered to be the best version, even over the original album version.

# Trancestep

A sub-genre of [Drum and Bass](#) Music, "trancestep" is the combination of riveting drums, deep, rolling basslines, and melodic synth sequences. Sometimes accompanied by vocals, tracks are generally upbeat, around 140 - 160 BPM.

# Transposing instrument

A **transposing instrument** is a musical instrument whose music is written at a [pitch](#) different from the actual "concert pitch". Concert pitch is the pitch as notated for piano (or any other non-transposing instrument) - e.g., the note "C" on piano is a concert C. On a transposing instrument, a concert C is written as another note. On the surface, this may be confusing, but there are several reasons for the existence of transposing instruments. The difference between a transposing instrument and a non-transposing instrument is only in whether or not the music is written at its sounding (concert) pitch.

Transposing keyboards such as transposing [harmoniums](#) or electronic keyboards with a transpose function can have a similar effect, but are not usually called transposing instruments. These instruments allow the player to change the instrument's transposition electronically or mechanically. This is different from the instruments discussed in this article, which have set pitches but merely do not read their music at concert pitch.

## Reasons for transposing

At first sight it might seem awkward to use transposing instruments. The B $\flat$  clarinet and the C clarinet, for example, are identical except for being a few centimetres different in length. The use of the transposing instrument entails more work for the composer or arranger. There are, however, some clear reasons for preferring a transposing instrument:

### Families of instruments

Some instruments belong to a family of instruments of different sizes (and, therefore, sounding at different pitches), such as the [clarinet](#) or the [saxophone](#) family. Musicians can read the same notes on the page for each instrument in the family without having to learn new fingerings. For example, the note that is written as middle C for the alto saxophone and the tenor saxophone is fingered the same on each instrument, but the alto's sounding pitch will be higher than the tenor's.

### Transposing at the octave

If an instrument has a range that is too high or too low for their music to be easily written on the staff, the music may be written either an octave higher or lower than it sounds, in order to reduce the use of ledger lines. Instruments that “transpose at the octave” are not playing in a different [key](#) from concert pitch instruments, but sound an octave higher or lower than written.

### Historical reasons

Historically, some instruments have come to be accepted (and widely manufactured) with a certain transposition as a standard.

### Tone and sound quality

Because of tone quality issues, some C (concert pitch) instruments — saxophones in C (the C melody and C soprano) and the C soprano clarinet, for example — have declined in popularity in favor of the currently more standard versions (B $\flat$  soprano and tenor sax, E $\flat$  alto and baritone; B $\flat$  and A clarinets).

## Families of instruments

Transposing instruments are often members of a family of instruments that are identical in every way but for their size. As a result they have differing ranges, with the larger instruments sounding lower than the smaller ones. It is desirable for these instruments all to have the same fingering for each written pitch, so that a player who wishes to switch between different instruments in a family does not have to learn new fingerings for each one.

Instruments that transpose this way are often referred to as being in a certain key, such as the A clarinet (clarinet in A), or the [F horn](#) (horn in F). The "key" an instrument is said to be in tells how far from concert pitch an instrument's music is written. Specifically, the given key tells which note is the sounding pitch when the player reads a note written as C. A player of a B $\flat$  clarinet who reads a C on the music will sound a B $\flat$ , while an F horn player will read the same note and sound an F.

One example of an instrument family with different transpositions is the flutes. The standard concert [flute](#) has a range from middle C up about 3 octaves. The alto flute is a very similar instrument, but longer, and hence pitched lower, with a range starting from the G below middle C. The fingering that would on a normal flute sound a C produces a G a [fourth](#) lower on the alto flute. If alto flute music were written at sounding pitch, flute players wishing to learn to play alto flute would have to re-learn fingerings for each written pitch.

Instead, the music for the alto flute is transposed up a fourth so that the player may play the alto flute using the same fingering for the written notes, but the resulting pitches are a fourth lower. The result of this is that the flute player can easily learn the new instrument, and can easily switch back and forth between the two (a common requirement in orchestra music) without risking confusion between two different fingering systems. The alto flute is then a 'transposing instrument in G', sounding a fourth lower than written.

A similar thing happens in other instrument families. For example, [clarinets](#) come in various sizes and hence pitches (A, B $\flat$ , C, E $\flat$ ), but the music is transposed appropriately for each size of instrument so that the player can easily move from one to the other. Expert clarinet players often use a different instrument than the transposition of their parts calls for, transposing the parts at sight instead; expert [trumpet](#) players may do this also.

In some families of instruments, the non-transposing C version had fallen into disuse; the [clarinet](#) family is one example, where only the B $\flat$  and A members are common but, in recent years, there is a tendency to utilize the C clarinet when called for. Horns are another example.

Some families containing transposing instruments:

- the [clarinet](#) family (piccolo clarinet in A $\flat$ ; soprano clarinet in E $\flat$ , D, B $\flat$  and A; basset horn in F; alto clarinet in E $\flat$ ; bass clarinet in B $\flat$ ; and A; contra-alto clarinet in E $\flat$ ; contrabass clarinet in B $\flat$ )
- some members of the [oboe](#) family (oboe d'amore, cor anglais)
- the [saxophone](#) family (either B $\flat$  or E $\flat$ )
- most [brass instruments](#), notably the [trumpet](#) and [horn](#).

The [horn](#) is a particularly interesting case. Before valves became common about 1800, horns could only play the notes of the overtone series from a single fundamental pitch. However, this fundamental could be changed by inserting one of a set of crooks into the instrument, shortening or lengthening the total length of its sounding tube. As a result, all horn music was written as if for a fundamental pitch of C, but the crooks could make a single instrument a transposing instrument into almost any key. Changing the crooks was a

time-consuming process, so it only took place between pieces or movements. The introduction of valves made this process unnecessary, but Richard Wagner (1813-1883) wrote horn parts as if crooks were still in use. Furthermore, even though an F transposition became standardized in the early 19th century, composers were inconsistent in whether they expected the instruments to transpose down a fifth or up a fourth, especially when written in treble clef.

There are a few families of instruments which have instruments of various sizes and ranges, but whose music is rarely or never transposed. The recorder family is one of these. The higher members of the family (alto and above) transpose at the octave, as do the bass instruments (bass and great bass). However, they are referred to as "C-fingered" or "F-fingered" depending on the lowest note, which is fingered the same on all sizes. A player may go from one C-fingered instrument to another easily, and from one F-fingered instrument to another easily, but switching between the two requires learning a new set of fingerings.

## Transposition at the octave

Many instruments whose ranges are extremely high or low transpose at the octave in order to make their written music easier to read. While these are technically transposing instruments, they are a special case, since their written C, for example, still sounds as a concert C, just an octave away from the written pitch. They are therefore in the same [key](#) as concert pitch instruments, but their music is notated an octave higher or lower than actual pitch.

For example, the contrabassoon and the double bass both play in the extreme low ranges. Their music is written one octave higher than it sounds on the bass staff. The [piccolo](#) and the soprano recorder, which are extremely high-pitched, are written an octave lower than they sound so that their music can be written easily on the treble staff. If these instruments did not transpose at the octave, most of their notes would have to be written with many ledger lines above or below the staff, making reading extremely cumbersome by comparison.

## Historical reasons

Prior to the adoption of the equal-tempered scale (around the time of J.S. Bach), all instruments had to be specifically built or tuned to the key in which they were to be playing. For instance, if a trumpet was to play a work in D major, the trumpet had to be built so that its fundamental frequency sounded the note D. Since brass instruments of that time had no valves, they could only play notes in the overtone series. This set a precedent for the idea of using transposing instruments.

## **Tone and sound quality**

Once the equal-tempered scale was generally adopted, this was no longer necessary. However, it was found that sometimes instruments sounded better when built in certain keys. For instance, the C clarinet was not a very pleasant sounding instrument, nor was the D or the Eb clarinet; it was generally agreed that the Bb clarinet was the most pleasant sounding, and for this reason was the one which remained in dominant use in the present day. This is also true of the Bb trumpet, as well as several other instruments, such as the French horn and the trombone.

## Mechanical and physical considerations

On [woodwind instruments](#) there is one major scale whose execution involves (more or less) simply picking up each finger sequentially from the bottom to top. This is usually the scale which reads as a C scale (the major scale with no sharps or flats) on that instrument. If it is a transposing instrument, the note written as C sounds as the note of the instrument's transposition - on an E $\flat$  alto saxophone, that note sounds as a concert E $\flat$ , on an A clarinet, that note sounds as a concert A. The [bassoon](#) is an exception; it is not a transposing instrument, yet its "home" scale is F.

[Brass instruments](#), when played with no valves engaged (or, for [trombones](#), with the slide all the way in) play a series of notes which form the overtone series based on some fundamental pitch. e.g., the B $\flat$  [trumpet](#), when played with no valves being pressed, can play the overtones based on B $\flat$ . Usually, that pitch is the note which indicates the transposition of that brass instrument. [Trombones](#) are an exception - they do not transpose, instead reading at concert pitch, although tenor and bass trombones are pitched in B $\flat$ , alto trombone in E $\flat$ .

In both cases above, there is some reason to consider a certain pitch the "home" note of an instrument, and that pitch is usually written as C for that instrument. The concert pitch of that note is what determines the how we refer to the transposition of that instrument.

## **On the conductor's score**

In conductors' scores, most often the music for transposing instruments is written in transposed form, just as in the players' parts; but a few publishers, especially of contemporary music, provide conductors with music which is all at concert pitch. The argument for the latter practice is that it makes the pitch relationships of the entire sound easier for the conductor to read. The advantage of traditional practice is that it facilitates spoken communication in rehearsal since conductor and player are looking at the same notation.

## List of instruments by transposition

- Instruments in C - 15ma (sounds two octaves above what is written)
  - Glockenspiel
- Instruments in high Dm - high (sounds a minor ninth above what is written)
  - [Piccolo](#) in Dm
- Instruments in C - 8va (sounds an octave above what is written)
  - [Piccolo](#)
  - Celeste
  - Soprano (descant), sopranino, bass, great bass recorder
  - Tin whistle
  - [Xylophone](#)
- Instruments in Bm - high (sounds a minor seventh above what is written)
  - Piccolo trumpet (may also be tuned to A)
- Instruments in Am - high (sounds a minor sixth above what is written)
  - Am piccolo clarinet
- Instruments in Em - high (sounds a minor third above what is written)
  - Em soprano clarinet
  - Sopranino saxophone
- Instruments in D - high (sounds a major second above what is written)
  - D soprano clarinet
  - [D trumpet](#) (may also be tuned to Em)
- A selection of Instruments in C - unison (sounds as written; these are *nontransposing instruments*)
  - [Piano](#)
  - [Vibraphone](#)
  - [Flute](#)
  - [Oboe](#)
  - [Bassoon](#)
  - Alto trombone
  - Tenor trombone

- Bass trombone
  - Euphonium or Baritone horn when written in bass clef
  - [Tuba](#)
  - [Violin](#)
  - [Viola](#)
  - [Cello](#)
- Instruments in B<sub>m</sub> (sounds a major second below what is written)
    - B<sub>m</sub> soprano clarinet
    - Soprano saxophone
    - [Trumpet](#)
    - [Cornet](#)
    - Flugelhorn
- Instruments in A (sounds a minor third below what is written)
    - Oboe d'amore
    - A soprano clarinet
    - A [Trumpet](#)
- Instruments in G (sounds a perfect fourth below what is written)
    - Alto flute
    - so-called Turkish clarinet
- Instruments in F (sounds a perfect fifth below what is written)
    - English horn
    - [Horn](#)
    - Basset horn
- Instruments in E<sub>m</sub> (sounds a major sixth below what is written)
    - Alto clarinet
    - Alto saxophone
- Instruments in C - 8vb (sounds an octave below what is written)
    - [Guitar](#)
    - Bass flute
    - Double bass
    - [Bass guitar](#)
    - Contrabassoon
- Instruments in B<sub>m</sub> - low (sounds an octave and a major second below what is written)
    - B<sub>m</sub> Bass clarinet
    - Tenor saxophone
    - Euphonium or Baritone horn when written in treble clef

- Instruments in A - low (sounds an octave and a minor third below what is written)
  - A Bass clarinet (obsolete)
  
- Instruments in Em - low (sounds an octave and a major sixth below what is written)
  - Em Contra-alto clarinet
  - Baritone saxophone
  
- Instruments in Bm - super low (sounds two octaves and a major second below what is written)
  - Bm contrabass clarinet
  - Bass saxophone

Note: Many instruments read different clefs upon different occasions, also brass instruments can often be written as transposing instruments in various times depending on the ensemble (usually in Bm or Em plus adjusting for the octave of the instrument).

# Triangle

The **triangle** (also known as the "180-degree tri-pointed noisemaker," or "1/5 sides of a pyramid with a hollowed out centre") is an [idiophonic musical instrument](#) of the [percussion](#) family. It is a bar of metal, usually steel in modern instruments, bent into a [triangle](#) shape. One of the angles is left open, with the ends of the bar not quite touching - this causes the instrument to be of indeterminate [pitch](#). It is usually suspended from one of the other corners by a piece of thin wire or gut, leaving it free to vibrate. It is usually struck with a metal beater, giving a high-pitched, ringing tone. In [folk music](#) it is more often hooked over the hand so that one side can be damped by the fingers to vary the tone. The pitch can also be modulated slightly by varying the area struck and more subtle damping.

The exact origins of the instrument are unknown, but a number of paintings from the Middle Ages depict the instrument being played by angels, which has led to the belief that it played some part in church services at that time. Other paintings show it being used in [folk bands](#). Some triangles have jingling rings along the lower side.

Although the instrument is nowadays generally in the form of an equilateral triangle, these early instruments were often isosceles triangles.

The triangle has been used in the western [classical](#) orchestra since around the middle of the 18th century. Wolfgang Amadeus Mozart, Joseph Haydn and Ludwig van Beethoven all used it, though sparingly, usually in imitation of Janissary bands. The first piece to make the triangle really prominent was Franz Liszt's Piano Concerto No. 1, where it is used as a solo instrument in the second movement.

The triangle appears to require no specialist ability to play and is often used in jokes and one liners as an archetypal instrument that even an idiot can play (see also Drummer jokes). The Martin Short sketch comedy character Ed Grimley is the best known example. However, triangle parts in classical music can be very demanding, and James Blades in the Grove Dictionary of Music and Musicians writes that "the triangle is by no means a simple instrument to play". In the hands of an expert it can be a surprisingly subtle and expressive instrument.

Most difficulties in playing the triangle come from the complex rhythms which are sometimes written for it, although it can also be quite difficult to control the level of volume. Very quiet notes can be obtained by using a much lighter beater — knitting needles are sometimes used for the quietest notes. Composers sometimes call for a wooden beater to be used instead of a metal one, which gives a rather "duller" and quieter tone.

# Tribal house

## Tribal House

**Stylistic origins:** [House music](#), Funky house

**Cultural origins:** 1990s, South America, Africa, Spain

**Typical instruments:** [Synthesizer](#) - [Drum machine](#) - [Sequencer](#) - [Keyboard](#) - [Sampler](#)

**Mainstream popularity:** Medium

## Subgenres

[Acid](#) - [Chicago](#) - [Deep](#) - [Garage](#) - [Microhouse](#) - Progressive - Dream - Amsterdam - Amyl - Gabber - [French](#) - Happy - Hard - Italo - Latin - [Minimal](#) - NY - Oriental - [Pumpin'](#) - UK Hard - US Hard - [Vocal](#)

**Tribal house** is a form of electronic dance music derived from [house music](#) but being highly drum-centric and often without a core melody.

In many tribal house tracks, it is rare to find a core melody or prolonged [synth](#) sound, such as those found in [techno music](#) and similar electronic music styles. Instead, tribal house tracks rely on sophisticated drum patterns for their rhythm. A track can consist of several different drum sounds.

There is no clear-cut definition of tribal house music, instead tracks are usually classified or perceived as tribal because of their 'live' sound. Tribal house is reminiscent of the ethnic music of various tribes of Africa and South America, and it is not unusual for this music to feature chanting and ululation as acappellas. Tribal music can be produced with either live (ie. with real drums and instruments) or digital instrumentation: however, live-produced music of this sort in the purest sense is seen as 'ethnic', while digital tribal music is called 'tribal house'.

Tribal house is a fusion of various styles of EDM. It is an extension of the 'funky house' genre, and is usually uplifting and cheerful (see Latin House and African House). It can sometimes distort the boundaries between 'dark house', which is an offshoot of 'progressive house', and '[tech-house](#)', a more techno-like, yet jazzy kind of house, as if mixing [IDM](#) and minimal techno. Tribal music can be produced in such a way that it absorbs the characteristics of all styles of house music.

## Proponents of this genre

Some artists and disc jockeys that support this type of music include: Sander Kleinenberg, Del Horno, Superchumbo, DJ Tarkan, Rick Pier 'O Neil, Eric Entrena, DJ Kramer, D-Formation, Marcelo Castelli, Dave Seaman, Alex Santer, Ralphi Rosario, Saeed Younan, Palash, Victor Calderone, Junior Vasquez, DJ Vibe, Antoine Clamaran, Frank Bailey, Robbie Rivera, Simon & Shaker, Peace Division.

# Tribute album

A **tribute album** is a recorded collection of [cover versions](#) of a specific artist's songs. An example is *Sharin' in the Groove*, which consists entirely of Phish covers by various artists. *Sharin' in the Groove*, like many tribute albums, is a charity fundraising project.

The birth of the 'modern' tribute album is often credited to record producer Hal Willner with the *Amarcord Nino Rota* LP in 1981. He followed up with tributes to Thelonious Monk, Disney cartoons, Kurt Weill, Charles Mingus and Harold Arlen.

Some tribute albums are created with a further conceptual twist than a simple collection of covers. These include:

Albums which aid the artist whose work is being covered. These include *Where the Pyramid Meets the Eye*, a tribute Roky Erickson, whose cult fame has not led to financial success, as well as the 2CD *Orphans of God*, a tribute to the late Mark Heard, a singer/songwriter who's work has been praised by fellow artists such as Bruce Cockburn, Victoria Williams, Sam Phillips and T-Bone Burnett.

Albums consisting of one artist performing only songs by another artist, such as *Great Zeppelin*, a tribute album for Led Zeppelin, performed solely by Great White or *Wicked Grin*, a collection of Tom Waits songs performed by John Hammond Jr..

Albums consisting cover songs done in one style of music, often another style than that of the person being tributed. These include *Is It Rolling Bob?: A Reggae Tribute to Bob Dylan* and *Goth Oddity 2000: A Tribute to David Bowie*.

Albums which recreate a specific album with cover versions of songs from that album. These include *Legacy: A Tribute to Fleetwood Mac's Rumours*. and *More Oar: A Tribute to Alexander "Skip" Spence*, which recreates Spence's only album *Oar*.

Albums consisting of cover songs sung in another language. These include *Tributo a the Cure - Porque No Puedo Ser Tu* (1999) and *Tributo a Queen: Los Grandes del Rock en Espanol* (1997).

Albums consisting of cover songs performed by artists who influenced the band being covered, rather than those influenced by that band. These include *Sharin' in the Groove: Celebrating the Music of Phish*.

# Tribute band

A **tribute band** (sometimes **tribute group**) is a musical group created in order to specifically play the music of a well-known band, often one which has disbanded or ceased touring. A tribute band rarely includes any members of the original band whose music is being honoured.

The typical tribute band differs from a cover band that simply plays songs by other artists by striving to capture every nuance of the imitated artist's actions and appearance for a perfect imitation. Some tribute bands imitate the appearance but re-interpret the original works in a particular genre or for comic effect. For example Dread Zeppelin plays Led Zeppelin songs in a reggae style with a lead singer who looks like Elvis Presley, while Gabba perform the songs of ABBA in the style of The Ramones.

## History

The first tribute bands to emerge may have been Beatles tribute bands, who attempt to look and sound like The Beatles while playing their songs. However, one might argue that Elvis impersonators qualify as well.

Although initially created to honour the original bands, many tribute bands have grown to have their own fan base. Tribute band names are often a pun on the original name or the names of band members, or are derived from a famous track or record album released by the original band.

Those bands and artists that have inspired a cult following in their fans tend to have a significant tribute band presence as well, such as Led Zeppelin, Pink Floyd, Kiss, Madonna, The Grateful Dead, Van Halen, ABBA, The Rolling Stones, and Neil Diamond. At the 2003 Edinburgh Fringe Festival the Japanese Beatles appeared, accompanied on a few songs by someone billed as the Japanese Eric Clapton. It made for an incongruous sight, since the former wore the familiar Beatle suits while their guest dressed in contemporary clothes.

One of the most well-known members of a tribute band is Tim "Ripper" Owens, who went from singing in a Judas Priest tribute band to becoming the group's actual lead singer in 1996. This story was used as the basis for the 2001 movie *Rock Star* starring Mark Wahlberg, although neither Owens nor Judas Priest assisted in the film's production. Owens recorded two studio albums and a live album with Judas Priest before leaving in 2003 to make way for the band's reunion with former frontman Rob Halford. Owens would later become the singer for the band Iced Earth.

In 2000, filmmakers Jeff Economy and Darren Hacker produced a documentary film *...An Incredible Simulation* that examined the tribute band phenomenon. Produced separately and independently in 2001 was the documentary *Tribute* by directors Kris Curry and Rich Fox which also covered the movement.

An exception to the impersonation style are The Muffin Men, who play the music of Frank Zappa in their own style, do not look like, or attempt to look like original members, and often tour with former band members. Jimmy Carl Black is a regular in the band, and they have in the past played, recorded and toured with Ike Willis, Bunk Gardner, and Don Preston.

In 2004, tribute band Beatallica received attention when they were sued over their unique interpretation of Beatles songs done in a Metallica style. They won their legal battle, and still record and tour today

# Trip hop

**Stylistic origins:** [Hip hop](#), [Downtempo](#), [House](#), [Breakbeat](#), [Acid jazz](#), [Reggae](#)

**Cultural origins:** 1990s Bristol

**Typical [instruments](#):** Keyboards (especially Rhodes), turntables, samplers, brass, flutes, strings

**Mainstream popularity:**

**Derivative forms:** Dream pop

N/A

N/A

Bristol

**Trip hop** (also known as the **Bristol sound**) is a term coined by British dance magazine Mixmag, to describe a musical trend in the mid-1990s; trip hop is downtempo electronic music that grew out of England's hip hop and house scenes. Sometimes characterized by a reliance on breakbeats and a sample-heavy sound pioneered by Coldcut's remix of Eric B. & Rakim's "Paid in Full", trip hop gained notice via popular artists such as Portishead, Massive Attack, Thievery Corporation, Tricky, and rock-influenced sound groups such as Ruby, California's DJ Shadow, and the UK's Howie B.

Londoners Morcheeba and Glideascope are also often associated with this sound. The latest additions to this line of performers are Jem and Australia's Spook. The Bristol Sound came out of the wider Bristol Urban Culture scene.

The "trip" in "trip hop" refers to the "out-of-this-world" state following the use of a drug. This provides insight into trip hop's strong connection with the senses. Furthermore, the "hop" in "trip hop" indicates its roots in [hip hop](#).

The style is perhaps typified by Massive Attack's piece "Unfinished Sympathy" which has frequently been described as one of the best songs of all time, according to polls produced by MTV2, NME, and various other magazines and reviewers. A reviewer for the BBC has said that: "More than a decade after its release it remains one of the most moving pieces of dance music ever, able to soften hearts and excite minds just as keenly as a ballad by Bacharach or a melody by McCartney."

Trip hop originated in the 90's in Bristol, England, during a time when American hip hop was taking over Europe's music industry. British DJs decided to put a local spin on the international phenomenon and developed hip hop into a different style, marking the birth of trip hop. The originators in Bristol developed hip hop with a laid-back beat (down tempo). Bristol hip hop (trip hop's predecessor) is characterized by the emphasis on slow and heavy drum beats and a wide open sound that draws heavily on [acid jazz](#), Jamaican [dub music](#) and [electronica](#). Massive Attack's first album "Blue Lines" in 1991, is often seen as the first manifestation of the "Bristol hip hop movement" (known as the "First Coming of Bristol Sound"), but in fact Massive Attack drew heavily on the pre-existing British hip hop scene, and their sound is remarkably similar to that pioneered earlier by Marxman, an Irish-Jamaican hip hop crew that was popular in the UK in the 1980's.

1994 and '95 saw trip hop near the peak of its popularity. Massive Attack released their second album entitled "Protection." Those years also marked the rise of Portishead and Tricky. Portishead's female lead singer Beth Gibbons' sullen voice was mixed with samples of music from the '60s and '70s, as well as sound effects from LPs, giving the group a

distinctive style. Tricky's style was characterized by murmuring and low-pitched singing. Artists and groups like Portishead and Tricky led the second wave of the Bristol Movement (a.k.a. "Second Coming of Bristol Sound"). This second wave produced music that was dreamy and atmospheric, and sometimes deep and gloomy. The British press termed this style of music "trip hop," referring to this evolved style of hip hop.

Incidentally Massive Attack, Portishead and Tricky actually had a common history. Massive Attack's three members used to work with Tricky, under the group "The Wild Bunch" (headed by Nellee Hooper in 1982), explaining why many Massive Attack songs feature Tricky. Portishead member Geoff Barrow also previously helped produce Massive Attack's "Blue Lines."

## The Bristol sound

**The Bristol sound** was the name given to a number of [bands](#) from Bristol, England, in the 1990s. These bands spawned the musical genre trip-hop, though many of the bands shunned this name when other British and international bands imitated the style and preferred not to distinguish it from [hip-hop](#).

It is characterised by a slow, spaced-out sound that a number of artists in the early and mid 1990s made synonymous with the city. These artists can include the aforementioned original Bristolians Massive Attack, Portishead and Tricky and others such as Way Out West, Smith and Mighty, Up, Bustle & Out, and The Wild Bunch.

The Bristol Sound was part of the wider Bristol Urban Culture scene.

## Post trip hop

Early Trip-Hop lacked diversity and variety, as the genre was in its early stages of development. As electronic music became developed and pioneers like Massive Attack, Portishead and Tricky released new albums in '94 and '95, a new generation of trip hop artists emerged. "Post trip hop" artists included Morcheeba, Alpha, Mono, The Aloof, Glideascope, Cibo Matto, etc. These artists integrated trip hop with [Ambience](#), [R&B](#), Brit-Hop, [Breakbeat](#), [Drum 'n' Bass](#), [Acid Jazz](#), [New Age](#), etc. Furthermore, vocals expanded beyond melancholy female voices. Eventually trip hop developed into a diversified genre that was no longer limited to the "deep, dark style" of the early years, eliminating the original impression of trip hop as "dark and gloomy."

## **Abstract hip hop**

James Lavelle, founding member of UNKLE and owner of the famous trip hop label Mo'Wax used to say, "British hip hop lacks the lyrical skills of U.S. counterparts, but British kids have got the musical side." This offers insight as to why trip hop artists like DJ Shadow, DJ Krush, and DJ Cam often choose to strip out vocals in their works. The absence of vocals produces an effect that emphasizes the intrinsic nature of the music, allowing the listener to step into unknown territory (just like viewing an abstract painting). Though this style of music is coined "trip hop," many artists (including DJ Shadow) frown upon this term, disagreeing with the interpretation. DJ Cam calls this style of music "abstract hip hop."

# Musicology

Trip hop is known for its moody, dark, yet lyrical sound.

The trip hop sound relies on jazz samples, usually taken from old vinyl jazz records. This reliance on sampling has changed the way record labels deal with clearing samples for use in other people's tracks. Trip hop tracks often sample Rhodes pianos, [saxophones](#), [trumpets](#), and [flutes](#), and develops in parallel to hip hop, each inspiring the other.

Trip hop production is historically [lo-fi](#), relying on analog recording equipment and instrumentation for an ambiance. Portishead, for example, record their material to old tape from real instruments, and then sample their recordings rather than recording their instruments directly to a track. They also tend to put their drums through considerable compression.

Later artists have taken inspiration from many other sources including world and orchestral influences

# Trombone

## Trombone

en:, fr:, it:, nl:, no: *trombone*, de: *Posaune*, es: *trombón*, sv: *Basun*

### Classification

- [Wind](#)
- [Brass](#)
- [Aerophone](#)

### Playing range

### Related instruments

- [Trumpet](#)
- Bass Trumpet
- Baritone horn
- Euphonium
- [Tuba](#)

A lip-reed [aerophone](#) with a predominantly cylindrical bore, the **trombone** is a [musical instrument](#) in the [brass](#) family. The trombone is usually characterised by a telescopic slide with which the player varies the length of the tube. A person who plays the trombone is referred to as a trombonist.

The word *trombone* derives from Italian *tromba* (trumpet) - and -one (a suffix meaning large). Thus, quite literally, a trombone is a "large trumpet". The trombone is often referred to by its name in other languages, e.g. *Posaune*, *trombón*, *Pasuuna*, *Puzon*, *Basun*. The most frequently encountered trombones are the tenor and bass counterparts of the trumpet.

## Construction

The trombone consists of a cylindrical tube bent into an elongated "S" shape in a complex series of tapers, the smallest being at the mouthpiece receiver, and the largest being at the throat of the bell, before the flare for the bell begins. (Careful design of these tapers is crucial to the intonation of the instrument.) As with other [brass instruments](#), sound is produced by blowing air through closed lips producing a vibration that creates a standing wave in the instrument.

The detachable cup-shaped mouthpiece, closely related to that of the [trumpet](#), is inserted into the mouthpiece receiver in the slide section, which consists of a leadpipe, inner and outer slide tubes, and bracing, known as inner and outer slide *stays*. While the stays are soldered nowadays, sackbuts were made with loose, unsoldered stays, which remained the pattern for German trombones until the mid-20th century. The leadpipe contains the *venturi*, which are a small constriction of the air column, adding a certain amount of resistance and to a great extent dictating the tone of the instrument; leadpipes may be soldered in permanently or interchangeable, depending on the maker.

The telescopic 'slide', the defining feature of the trombone (c.f. valve trombone below) allows the player to extend the length of the air column, lowering the pitch. In order to prevent friction from slowing the action of the slide, additional sleeves were developed during the [Renaissance](#) and these *stockings* were soldered onto the ends of the inner slide tubes. Nowadays, the stockings are incorporated into the manufacturing process of the inner slide tubes and represent a fractional widening of the tube to accommodate the necessary method of alleviating friction. This part of the slide is of necessity lubricated on a frequent basis. Additional tubing connects the slide to the bell of the instrument through a neckpipe, and bell or back bow (U-bend). The joint connecting the slide and bell sections is furnished with a ferrule to secure the connection of the two parts of the instrument, though older models from the early 20th century and before were usually equipped with friction joints and no ancillary mechanism to tighten the joint.

The adjustment of intonation is most often accomplished with a tuning slide that is a short slide between the neckpipe and the bell incorporating the bell bow (U-bend); this device was designed by the French maker François Riedlocker during the early nineteenth century and applied to French and British designs and later in the century to German and American models, though German trombones were built without tuning slides well into the 20th century.

As with the [trumpet](#), the trombone is considered a cylindrical bore instrument since it has sections of tubing, principally in the slide section, that are of continuous diameter. This is in contrast to conical bore instruments like the [cornet](#), euphonium, and [tuba](#), whose only cylindrical tubing is in the valve section. Tenor trombones typically have a bore of 0.450" (small bore) to 0.547" (large or *orchestral* bore) after the leadpipe and through the slide. The bore expands through the neck pipe and backbore to the bell which is typically between 7" and 8½". A number of common variations on trombone construction are noted below.

# History

Until the early 18th century, the trombone was called the sackbut in English, a word with various different spellings ranging from sackbut to shagbolt and derived from the Spanish *sacabuche* or French *sacqueboute*. This was not a distinct instrument from the trombone, but rather a different name used for an earlier form. Other countries used the same name throughout the instrument's history, viz. Italian trombone and German Posaune. The sackbut was built in slightly smaller dimensions than modern trombones, and had a bell that was more conical and less flared. Today, *sackbut* is generally used to refer to the earlier form of the instrument, commonly used in early music ensembles. Sackbuts were (and still are) made in every size from alto to contrabass, though then as now the contrabass is very rare.

## Renaissance & Baroque periods

The trombone was used frequently in 16th century Venice in canzonas, sonatas, and ecclesiastical works by Andrea Gabrieli and his nephew Giovanni Gabrieli, and also later by Heinrich Schütz in Germany. While the trombone was used continuously in Church music and in some other settings (i.e., as an addition to the opera house orchestra or to represent the supernatural or the funerary) from the time of Claudio Monteverdi onwards, it remained rather rare in the concert hall until the 19th century. During the Baroque period, Johann Sebastian Bach and George Frideric Handel used the trombone on few occasions; Bach used it in combination with the cornett to evoke the *stile antica* in some of his many cantatas and Handel used it in the Dead March from *Saul, Samson, and Israel in Egypt*, all of which were examples of a new oratorio style popular during the early 18th century.

## Classical period

The repertoire of trombone solo and chamber literature has its beginnings in Austria in the Classical Era where composers such as Leopold Mozart, Georg Christoph Wagenseil, Johann Albrechtsberger, Johann Ernst Eberlin and Sodio Mandersio (in late 18th century Spain) were featuring the instrument, often in partnership with a voice. Joseph Haydn and Wolfgang Amadeus Mozart used the trombones in a number of their sacred works, including two extended duets with voice from Mozart, the best known being in the *Tuba Mirum* of his *Requiem*. The inspiration for many of these works was no doubt the virtuosic playing of Thomas Gschladt who worked in the court orchestra at Salzburg, although when his playing faded, so did the general composing output for the instrument. The trombone retained its traditional associations with the opera house and the Church during the 18th century and was usually employed in the usual alto/tenor/bass trio to support the lower voices of the chorus, though Viennese court orchestra Kapellmeister Johann Joseph Fux rejected an application from a bass trombonist in 1726 and restricted the use of trombones to alto and tenor only, which remained the case almost until the turn of the 19th century in Vienna, after which time a second tenor trombone was added when necessary. The construction of the trombone changed relatively little between the [Baroque period](#) and [Classical period](#) with the most obvious feature being the slightly more flared bell than was previously the custom.

## Romantic Period

During the late [Classical](#) and Romantic eras, composers from across Europe and beyond wrote for the instrument. The first example of its use in a symphony was in 1807 in a Symphony in E flat by the Swedish composer Joachim Nikolas Eggert, though the composer usually credited with its introduction into the symphony orchestra was Ludwig van Beethoven in the last movement of his Symphony No. 5 in C minor (1808); he also used the trombones in Symphony No. 6 in F major ("Pastoral") and Symphony No. 9 ("Choral").

Leipzig, in particular, became a centre of trombone pedagogy as for the first time in centuries the trombone began to be taught at the new Musikhochschule founded by Felix Mendelssohn Bartholdy. Mendelssohn's bass trombonist, Karl Traugott Queisser, was the first in a long line of distinguished professors of trombone at the academy in Leipzig and several composers penned works for him, including Ferdinand David (Mendelssohn's concertmaster), Ernst Sachse and Friedrich August Belcke, whose solo works all remain popular today in Germany. Queisser almost single-handedly helped to re-establish the reputation of the trombone in Germany and began a tradition in trombone-playing that is still practised there today. He championed and popularised Christian Friedrich Sattler's new tenorbass trombone during the 1840s, leading to its widespread use in orchestras throughout Germany and Austria. Sattler's influence on trombone design is not to be underestimated; he introduced a significant widening of the bore (the most important since the Renaissance), the innovations of Schlangenverzierungen (snake decorations), the bell garland and the wide bell flare, all of which are features that are still to be found on German-made trombones today and were widely copied during the 19th century.

Many composers were directly influenced by Beethoven's use of trombones and the 19th century saw the trombones become fully integrated in the orchestra, particularly by the 1840s, as composers such as Franz Schubert, Franz Berwald, Johannes Brahms, Robert Schumann, Felix Mendelssohn Bartholdy, Richard Wagner, Hector Berlioz, Gioacchino Rossini, Giuseppe Verdi, Giacomo Puccini, Franz Liszt, Richard Strauss, Anton Bruckner, Gustav Mahler, Piotr Ilyich Tchaikovsky, Nikolai Rimsky-Korsakov, Alexander Borodin, Bedřich Smetana, Antonín Dvořák, Charles Gounod, César Franck, Claude Debussy, Camille Saint-Saëns and many others included trombones in their operas, symphonies and other orchestral compositions.

The 19th century also saw the erosion of the traditional alto/tenor/bass trombone trio in the orchestra. While the alto/tenor/bass trombone trio had been paired with one or two cornetts during the Renaissance and early Baroque periods, the disappearance of the cornett as a partner and eventual replacement by oboe and clarinet did not fundamentally alter the *raison d'être* for the trombones, which was to support the alto, tenor and bass voices of the chorus (typically in an ecclesiastical setting), whose harmonic moving lines were more difficult to pick out than the melodic soprano line. The introduction of the trombones into the orchestra, however, allied them more closely with the trumpet and it did not take long for the alto and bass trombones to be replaced by tenor trombones, though the Germans and Austrians held on to the alto trombone and long F or E flat bass trombone somewhat longer than the French, who came to prefer a section of three tenor trombones until after the Second World War.

By the time the trombone gained a regular footing in the orchestra, players of the instrument were no longer usually employed by a cathedral or court orchestra and were therefore expected to provide their own instrument, though while military musicians were provided with instruments by the army and instruments like the long F or E flat bass trombone remained in use there until approximately the time of the First World War, the orchestral musician understandably took to the instrument with the widest range which could be most easily applied to play any of the three trombone parts usually scored in any given work - the tenor trombone. The appearance of the valve trombone during the mid-19th century did little to alter the make-up of the trombone section in the orchestra and though it remained popular almost entirely to the exclusion of the slide instrument in countries such as Italy and Bohemia, the valve trombone was ousted from orchestras in

Germany and France. The valve trombone continued to enjoy an extended period of popularity in Italy and Bohemia and composers such as Giuseppe Verdi, Giacomo Puccini, Bedřich Smetana and Antonín Dvořák scored for a section of valve trombones.

Especially with the ophicleide or later the tuba subjoined to the trombone trio during the 19th century, parts scored for the bass trombone rarely descended as low as the parts scored before the addition of either of these new low brass instruments and only later in the early 20th century did it regain a degree of independence. Experiments with different constitutions of the trombone section during the 19th and early 20th centuries, including Richard Wagner's addition of a contrabass trombone in *Der Ring des Nibelungen* and Gustav Mahler's and Richard Strauss' occasional augmentation by adding a second bass trombone to the usual trio of two tenor trombones and one bass trombone, have not had any lasting effect as the vast majority of orchestral works are still scored for the usual mid to late 19th century low brass section of two tenor trombones, one bass trombone and one [tuba](#).

## Twentieth century

In the [20th Century](#), the trombone maintained its important position in the orchestra with prominent parts in works by Richard Strauss, Gustav Mahler, Arnold Schoenberg, Alban Berg, Maurice Ravel, Darius Milhaud, Olivier Messiaen, Igor Stravinsky, Dmitri Shostakovich, Sergei Rachmaninov, Sergei Prokofiev, Ottorino Respighi, Edward Elgar, Gustav Holst, Ralph Vaughan Williams, Benjamin Britten, William Walton, Jean Sibelius, Carl Nielsen, Leoš Janáček, George Gershwin, Aaron Copland, Leonard Bernstein and Béla Bartók.

In the second half of the century, new composers began giving back to the trombone a level of importance in solo and chamber music. Pieces such as Edgar Varèse's *Octandre*, Paul Hindemith's *Sonata* and Luciano Berio's *Sequenza V* led the way for lesser-known composers to build a wider repertoire. Popular choices for recital music today include Stjepan Sulek's *Vox Gabrieli*, Jacques Casterède's *Sonatine* and Jean Michel Defaye's *Deux Danses*. The best known trombone concertos from this period include works by Derek Bourgeois, Lars-Erik Larsson, Launy Grøndahl, Jan Sandström and Gordon Jacob.

Numerous changes in construction have occurred during the 20th century, including the use of different materials, increases in mouthpiece, bore and bell dimensions, new valve types and the innovation of different mute types.

Today, the trombone can usually be found in [wind ensembles/concert bands](#), [symphony orchestras](#), [marching bands](#), [military bands](#), [brass bands](#), brass choirs, etc. It can be part of smaller groups as well, such as [brass quintets](#), quartets, or trios, or trombone trios, quartets, or choirs (though the size of a trombone choir can vary greatly from five or six to twenty or more members). Trombones are also common in [swing](#), [jazz](#), salsa, and [ska](#) music, though it is in jazz and swing music that it has arguably made the greatest advances since the turn of the 20th century with famous artists such as Kid Ory, Jack Teagarden, Trummy Young, Tommy Dorsey, Glenn Miller, Ted Heath, Kai Winding, J. J. Johnson, Bill Watrous, Urbie Green, Frank Rosolino, Carl Fontana, Stan Kenton and Don Lusher.

## Types of trombones

The most frequently encountered trombones today are the tenor and bass, though as with other Renaissance instruments such as the recorder, the trombone has been built in every size from piccolo to contrabass. These several instruments are described below.

### Tenor trombone

The tenor trombone has a fundamental note of B flat (though tenor trombones with C as their fundamental note were almost equally popular during the mid-19th century in Britain and France) and is usually treated as a non-transposing instrument (see below). As the trombone in its simplest form has neither crooks, valves nor keys to lower the pitch by a specific interval, trombonists use seven chromatic *slide positions*, each of which progressively increases the length of the air column, thus lowering the pitch.

The slide is in "first position" when it is retracted all the way and in "seventh position" when it is fully extended. Note that in practice first position is played with the slide extended a slight amount to prevent injury to the musician through repeatedly impacting the lips with a hard metal object and to allow vibrato. Extending the slide from one position to the next lowers the pitch by one semitone. Thus, for each note in the harmonic series a downwards interval of up to a tritone may be added to the first position note, making the lowest note of the standard instrument an E natural. However, most professional trombonists can play lower "falset" notes and much lower pedal notes (first partials or fundamentals, which have a peculiar metallic rumbling sound) on the instrument. Table 1 below illustrates the seven positions of the trombone slide and the harmonic series associated with each. It may be noted that these positions are subject to adjustment, compensating for imperfections in the tuning of different harmonics. The fifth partial is rather flat on most trombones and usually requires a minute shortening of the slide position to compensate; other small adjustments are also normally required throughout the range. Note that trombonists also make frequent use of alternative positions (shown to the right of the dividing line in the diagram below); for instance, Bb4 may be played in first or fifth positions. This allows a skilled player opportunity to produce a perfect legato - the basic positions often putting him in danger of unwanted glissandi (portamento between adjacent notes).

The range of the B flat tenor trombone (excluding fundamentals or pedal notes) is therefore E2 to F5, though is typically not written higher than D5, though jazz players are often able to produce notes as high as B flat6.

### Tenorbass trombone

Modern tenor trombones often include an extra attachment of tubing which can be activated by a trigger or valve. This device was invented by German instrument maker Christian Friedrich Sattler during the late 1830s and patented in 1839. It took its rise at a time when the old German E flat and F bass trombones had fallen out of favour with orchestral players and were replaced by a B flat tenor trombone with a larger bore and bell. This instrument, known as the *tenorbass* trombone (German *Tenorbaßposaune*) by virtue of the fact that it was a tenor trombone in B flat built with the bore and bell dimensions of the bass trombone and used to play either tenor or bass trombone parts, was adapted by Sattler to include the rotary valve attachment in order to provide a method of bridging the gap between the first partial (fundamental) B flat in closed position and second partial E with the slide fully extended in seventh position. The valve attachment allowed players access to

low E flat, D, D flat, C and B, thus making the full range of the old bass trombone in 12' F available once more and extending the chromatic range of the tenor trombone through the fundamentals to E1. Sattler's intention was not to create a trombone that would replace the older F and E flat bass trombones, but rather to provide an instrument with the ability to cover the range of the bass and tenor trombones seamlessly. In the event, however, his invention did come to be used as a replacement for the older bass trombones and modern bass trombones are B flat/F trombones that are now used universally to play parts originally conceived for the bass trombone in G, F or E flat.

Although the tenorbass or B flat/F trombone is equipped with a valve, it is not called a *valve trombone*. Engaging the valve attachment tubing by depressing a metal lever or trigger (known colloquially in Britain and the Commonwealth as *the plug*) adds approximately 3'/1m of tubing to the total length of the instrument and lowers the pitch from 9' B flat to 12' F. This facilitates, among many things, the playing of fast passages and legato sections, as well as extending the low range of the tenor trombone into that of the bass trombone. The distance between each position is longer with the valve attachment engaged; there are only six positions available to the player instead of the standard seven as the slide is too short for what is effectively now an instrument equivalent to a bass trombone in 12' F; the distance between positions is 4/3 as long as for a B flat instrument. It should be noted that on this variation of the instrument, the low B (two leger lines below the bass staff) is impossible to play, unless the F attachment is tuned to E by extending the tuning slide in the attachment tubing.

The range of the *tenorbass* trombone is therefore E1 to B flat<sup>2</sup>, then C<sup>2</sup> to D5.

## Bass trombone

The modern bass trombone is pitched in B flat. It is identical in length to the 9' B flat tenor trombone and was developed from the 19th century *tenorbass* trombone, but has a wider bore to aid in the production of a fuller, weightier tone in the low register and one or two valves which, when engaged, lower the key of the instrument to 12' F (and if a second valve is fitted, to G, G flat, E, E flat or D, depending on the design), allowing the player to bridge the gap between the first partial (fundamental) with the slide in first or closed position and the second partial with the slide fully extended in seventh position. 19th and early 20th century examples of the modern bass trombone were sometimes made with a valve attachment in E rather than F, or with an alternative tuning slide for the attachment tubing enabling the pitch to be lowered to E flat. Bore sizes of the bass trombone are generally slightly larger than those of the largest tenor trombones. Typical specifications include a bore size of 0.562" in the slide and 0.580" through the valve attachment tubing, with a bell from 9" to 10.5" in diameter.

The configuration of the valves falls into one of three categories on the modern bass trombone: a simple B flat/F instrument (of larger dimensions than the B flat/F tenor trombone) equipped with one valve; a B flat/F instrument equipped with a second *dependent* valve, which relies on the first to be engaged before the ancillary tubing is deployed; a B flat/F instrument equipped with a second *independent* or *in-line* valve, which acts independently from the first and may be used to lower the pitch to G or G flat individually, or to E flat or D when used in combination with the first valve.

The range of the modern bass trombone is fully chromatic from the lowest fundamental with the valve attachment tubing deployed, potentially as low as C<sup>1</sup> or B flat<sup>1</sup>, up to C<sup>5</sup> or higher, depending on the player. It is usually scored in the range B flat<sup>2</sup> to B flat<sup>5</sup>.

There is usually one bass trombone in a standard symphony [orchestra](#) (some works call for two) and it is also seen in brass bands, swing bands, wind ensembles, and a variety of brass groups; the bass trombone is usually played by the third or fourth trombonist in a trombone section, the first two or three parts usually being for tenor (and possibly alto) trombones.

## **Bass trombones in G, F, E flat, etc.**

Older, obsolete versions of the bass trombone were of smaller bore than the modern bass trombones described above. They were pitched in G, F, E, E flat, D or C and had a longer slide and a handle attached to the outer slide stay to allow for full extension of the slide. These older types of bass trombone were used in Europe and the British Empire.

The oldest of these instruments were the E, D and C bass trombones, which were used in Europe during the Renaissance and early Baroque periods; by the 18th century the F and E flat bass trombones were used in Germany, Austria and Sweden and the E flat bass trombone in France, though these fell out of favour in the early nineteenth century and began to be replaced by the tenor trombone, later (after 1840) the *tenorbass* trombone with F rotary valve attachment.

The bass trombone in G (the orchestral version was in G equipped with a rotary valve attachment actuating D or C, extending the range to A<sub>2</sub> or A flat<sub>1</sub>) enjoyed a period of extended popularity in France during the second half of the nineteenth century, and in Great Britain and the British Empire from approximately 1850 to the 1950s, though it lingered on in some parts of Britain until the 1970s and 1980s and is still occasionally to be seen there in brass bands and period instrument orchestras.

The range of the E flat bass trombone is A<sub>2</sub> to B flat<sub>5</sub>, that of the F bass trombone is B<sub>2</sub> to C<sub>5</sub> and that of the G bass trombone is D flat<sub>2</sub>, or A<sub>2</sub> or A flat<sub>1</sub> with a D or C valve attachment (the C attachment being used expressly for playing parts written for the contrabass trombone), to D<sub>5</sub>.

## **Contrabass trombone**

The contrabass trombone is usually pitched in 12' F a perfect fourth lower than the modern tenor or bass trombone and has been through a number of changes in its history. Its first incarnation during the Renaissance was in 24' F, one octave below the modern pitch of 12' F, or 18' B flat. During this period it was built as an oversized bass trombone with a long slide and extension handle to reach the lower positions. The innovation of the double slide, in which the slide is wound back on itself to produce four tubes, each of which moves in tandem with its partner and halves the usual length of the slide shifts, took place towards the end of this period and was applied to the bass and contrabass trombones. During the nineteenth century, the contrabass trombone enjoyed a revival and it was constructed according to the double slide principle.

Wagner's *Der Ring des Nibelungen* (1876, though the individual operas were performed separately before the entire cycle saw its première in 1876) employed the contrabass trombone for the first time in the opera house and was followed by Strauss' *Elektra* in 1908 and Schoenberg's mammoth cantata *Gurrelieder* (scored for a section of seven trombones including alto and contrabass) in 1913, although generally the contrabass trombone has not proven to be a permanent addition to the opera or concert orchestra and is only required in a small number of mainly 20th century works.

In 1921 Ernst Dehmé, a German inspector of orchestras and bass trombonist from Berlin, patented a new design of contrabass trombone utilising the old German military band bass trombone in F equipped with two independent rotary valves to replace the handle required on the long slide and to fill in the missing notes between the first partial (fundamental) in closed position and the second partial with the slide fully extended. This bass-contrabass instrument is the precursor of the modern contrabass trombone, which is still largely constructed according to the same principles and to all intents and purposes completely replaced the older double slide variety, which is very rarely seen today. Bore sizes for the slide of the contrabass trombone are typically in the 0.567" to 0.635" range; the most common sizes on contrabass trombones in F are between 0.567" and 0.580" as the larger sizes are usually reserved for the contrabass trombone in low B flat. The bell diameter is typically 10"-11".

The range of the contrabass trombone (excluding fundamentals or pedal notes) demanded by Wagner is from E1 to E4, though composers since then have required even lower notes - even as low as B flat. Given that the older B flat contrabass is less common nowadays in professional ensembles, the F contrabass trombonist produces notes below G flat1 as fundamentals, allowing full access to the range of the older B flat contrabass trombone and extending the range even lower.

The use of a contrabass trombone almost always requires the addition of a fourth player to the trombone section and while in the past parts for the instrument were sometimes played on a tuba or, more recently, a bass trombone, it is nowadays considered unacceptable to use anything but a contrabass trombone to play these parts, at least in professional settings. Most opera house orchestras and some symphony orchestras require the bass trombonist to double on the contrabass trombone.

## **Alto trombone**

The alto trombone is pitched in E flat (occasionally with a D or B flat rotary valve attachment) or F, a perfect fourth or fifth higher than the tenor trombone and was commonly used from the 16th to the 18th centuries as the highest voice in the brass choir, though it declined in popularity from the early 19th century, when the trumpet acquired valves and trombones became an established section in the symphony orchestra, and it was replaced by a tenor trombone as the range of the parts can usually be covered by the tenor instrument. While some first trombonists have used the alto trombone as indicated, it was unfashionable from the mid-19th century to the late 20th and has only recently enjoyed something of a revival.

As the slide is shorter, the positions are different from the tenor and bass trombones and as most players are familiar with the slide positions of the B flat trombone, it is easy to appreciate why the instrument fell out of favour, especially with the increase in upper range and flexibility cultivated by and demanded of first trombonists in the 19th and 20th centuries. The tone of the alto is more brilliant than that of the tenor or bass trombone. The bore of an alto trombone is similar to that of a small tenor trombone - usually around 0.450"-0.500", with a 6.5" or 7" bell.

The range of the E flat alto trombone (excluding fundamentals or valve attachments) is A3 to B flat6, though it is typically not scored any higher than F5, this being already quite an exalted region for this instrument.

The alto trombone is primarily used in choral, orchestral and operatic settings, although it has enjoyed a history as a solo instrument, primarily in 18th century Vienna. Modern composers have rediscovered the instrument and the alto trombone has begun making more appearances in modern compositions. Nowadays professional orchestral tenor trombonists are expected to play the alto trombone and famous works scored for this instrument include several Mozart masses including the Great Mass in C minor, Requiem, Don Giovanni and Die Zauberflöte, Haydn's Die Schöpfung and Die Jahreszeiten, Beethoven's Symphonies Nos. 5, 6 & 9 and Missa Solemnis, Schubert's Symphonies Nos. 7, 8 & 9, Mass No. 5 in A flat and Mass No. 6 in E flat, Berlioz' Symphonie Fantastique, Mendelssohn's Symphony No. 2 "Lobgesang", Symphony No. 5 "Die Reformation", Elijah, incidental music to A Midsummer Night's Dream and Ruy Blas, Schumann's Symphonies 1, 2, 3 & 4, Brahms' Symphonies 1, 2, 3 & 4, Akademische Festouvertüre, Tragische Ouvertüre, and Ein deutsches Requiem, as well as a handful of 20th century works including Schoenberg's mammoth cantata Gurrelieder (scored for a section of seven trombones including alto and contrabass) and Britten's The Burning Fiery Furnace.

## **Soprano trombone**

The soprano trombone is usually pitched in B flat an octave above the tenor and built with a bore size of between 0.450" and 0.470" and a [trumpet](#)-sized bell. It appears to have been created in the late 17th century, from which the earliest surviving examples date. It was used in German-speaking lands to play the treble part in chorales, and this tradition survives in the Moravian trombone choir at Bethlehem, Pennsylvania. During the 20th century some manufacturers made soprano trombones as doubling instruments for jazz cornet players, dubbing them *slide cornets*, or as a novelty, but the instrument has never been widely used or enjoyed much popularity. It rather lacks its own character and historically had little validity as it was easily replaced by the cornett or woodwind instruments and the short shifts make it difficult to play in tune. Soprano trombone slides being so short, there are often only six positions on the slide rather than seven. The soprano trombone is usually played by a trumpeter owing to the high pitch of the instrument.

The range of the B flat soprano trombone is E3 to C6, though is not usually written higher than B flat6.

## Sopranino and piccolo trombones

The sopranino and piccolo trombones are even smaller and higher instruments than the soprano; they are also extremely rare. Sopranino and piccolo are pitched in high E flat and B flat respectively, one octave above the alto and soprano trombones. They are called for in some trombone choir literature, the sopranino, for example, being used in the Moravian trombone choirs in the USA. Bore sizes vary between 0.430" and 0.400" respectively, with bells approximately 4" in diameter. Owing to the very high pitch of these instruments, they are played exclusively by trumpeters.

The range of the E flat sopranino trombone is A4 to E flat6; that of the B flat piccolo trombone is E4 to F7.

## Valve trombone

Valve trombones always have the same tonal range as their slide trombone equivalents, though a somewhat different attack, as they are shaped more like very large trumpets. They are built in either short or long form. Some musicians consider them difficult to play in tune, although a small minority prefer them to the more common slide trombone. The valve trombone has been built in every size from alto to contrabass, though it is principally the tenor valve trombone which has seen the most widespread use.

The valve trombone enjoyed its greatest popularity in the 19th century when the technology of rotary valve and piston valve instruments was developing rapidly. With the mass production of better quality, reliable, slide trombones starting at the end of the 19th century, the slide trombone regained its popularity during the late 19th century. Despite the increase in popularity of the slide trombone, these instruments have remained popular, for example, in Austria, Italy, Bohemia, Moravia, Slovakia, Spain, Portugal, South America and India, almost to the exclusion of the slide trombone. Sharp-eyed fans of Western films may spot one in *The Good, the Bad and the Ugly*.

Certain passages of music are significantly easier to play on a valve trombone, while others are easier on a slide trombone. A bass or contrabass version of the valve trombone is the cimbasso and is used mainly in operatic works by Giuseppe Verdi and Giacomo Puccini.

It is much easier to play fast musical figures on a valve trombone than on a slide trombone, although many players consider the tone of a valve trombone more stuffy and less open and it is not used in orchestral settings, though Giuseppe Verdi in particular made extensive use of the ability of the valve trombone to negotiate its way through fast passages in his works. As the B flat tenor valve trombone uses the same fingering as the B flat

trumpet, it is also a natural doubling instrument for some jazz trumpeters. Notable jazz musicians who play the B flat tenor valve trombone include Bob Brookmeyer, Juan Tizol of the Duke Ellington Orchestra, and Bob Enevoldsen.

An unusual variation has both a slide and valves. This was first manufactured in the early 20th century, has sometimes been known as a *valide trombone*, but is now best known as a superbone, thanks to the influence of jazz musician Maynard Ferguson, who used it in his band.

## Technique

As with all brass instruments, progressive tightening of the lips and increased air pressure allow the player to move to a different partial in the harmonic series. In the first or closed position on a B flat trombone, the notes in the harmonic series begin with the pedal or fundamental B flat<sup>1</sup>, followed by B flat<sup>2</sup> (one octave higher), F<sup>3</sup> (a perfect fifth higher), B flat<sup>3</sup> (a perfect fourth higher), D<sup>4</sup> (a major third higher), F<sup>4</sup> (a minor third higher), A flat<sup>4</sup> (a minor third higher - this note is always flat and is not usually played in this position, though it has been the practice in Germany and Austria to do so), B flat<sup>4</sup> (a major second higher), C<sup>5</sup> (a major second higher), D<sup>5</sup> (a major second higher), E flat (a minor second higher, but very sharp), F<sup>5</sup> (a major second higher). Theoretically a very skilled player could go higher than this, to G<sup>5</sup>, A flat<sup>5</sup>, A<sup>5</sup> and B flat<sup>5</sup>, but this is by no means easy and only a few trombonists have been heard to venture as high as this.

In the lower range, significant movement of the slide is required between positions, which becomes more exaggerated on lower pitched trombones, but for higher notes the player need only use the first four positions of the slide since the partials are closer together, allowing higher notes to be played in alternate positions. As an example, F<sup>4</sup> (at the bottom of the treble clef) may be played in both first, fourth and sixth positions on a B flat trombone. The note E<sup>1</sup> (or the lowest E on a standard 88-key piano keyboard) is the lowest attainable note on a 9' B flat tenor trombone, requiring a full 2.24 metres of tubing, but the repertoire seldom demands anything below G<sup>1</sup>. On trombones without an F attachment, there is a gap between B flat<sup>1</sup> (the fundamental in first position) and E<sup>2</sup> (the first harmonic in seventh position). Skilled players can produce so-called "falset" notes between these, but the sound is relatively weak and not usually used in performance.

## Notation

Unlike most other brasses, the trombone is not usually a [transposing instrument](#). Prior to the invention of valve systems, most brasses were limited to playing one overtone series at a time; altering the pitch of the instrument required manually replacing a section of tubing (called a "crook") or picking up an instrument of different length. Their parts were transposed according to which crook or length-of-instrument they used at any given time, so that a particular note on the staff always corresponded to the a particular partial on the instrument. Trombones, on the other hand, have used slides since their inception. As such, they have always been fully chromatic, so no such tradition took hold, and trombone parts have always been notated at concert pitch (with one exception, discussed below).

Trombone parts are typically notated in bass clef; it is also common for trombone music to be written in tenor clef or alto clef. The use of alto clef is usually confined to orchestral first trombone parts intended for the alto trombone, with the second (tenor) trombone part written in tenor clef and the third (bass) part in bass clef. As the alto trombone declined in popularity during the 19th century, this practice was gradually abandoned and first trombone parts came to be annotated in the tenor or bass clefs. Taking their cue from Robert Schumann, the first composer to practise writing for the alto and tenor trombones on one staff annotated in the alto clef, some composers of Russian and Eastern European orchestral music have both first and second trombones annotated in the alto clef, which is all the more confusing given that the instruments scored for are two tenor trombones. Examples of this practice are evident in scores by Igor Stravinsky, Sergei Prokofiev, Dmitri Shostakovich. Trombone parts can often contain both bass and tenor clef or bass and alto clef sections, sometimes changing clef for the sake of a single note and then back again.

Some music publishers (especially Dutch) often include trombone parts in transposing bass clef in B flat, perhaps for the only reason that the trombone section in a band will refer to transposed note names and key signatures along with the rest of the brass section.

### **Brass bands**

In brass band music, however, the trombone is treated like all the other members (except the bass trombone) as a transposing instrument in B flat and reads the treble clef. This puts the notes in exactly the same stave position as they would be if the music were written in a (non-transposing) tenor clef, though the key signature must be adjusted. This is no mere coincidence, for brass bands used to employ a section of alto, tenor and bass trombones in the early to mid-19th century, later replacing the alto with a tenor trombone, all the while annotated in the corresponding clefs. Eventually a decision was taken in the early 20th century to replace the tenor clef with the transposing B flat treble clef in order to aid new starters to integrate more quickly and effectively into the brass band, though the bass trombone, then in G, remained (and is still) annotated in concert pitch bass clef. An accomplished performer today is expected to be proficient in reading parts annotated in bass clef, tenor clef, alto clef, and (more rarely) treble clef in C, with the British brass band performer expected to handle treble clef in B flat as well.

### **Mutes**

A variety of mutes can be used with the trombone to alter its timbre. Many are held in place with the use of cork grips, including the straight, cup, harmon and pixie mutes. Some fit over the bell, like the bucket mute. In addition to this, mutes can be held in front of the bell and moved to cover more or less area for a wah-wah effect - such as the "hat" (a metal mute shaped like a bowler), and plunger, which looks like (and often is) the rubber suction cup from a sink or toilet plunger. On occasion real hats have been used, as have soap dishes, saucepans, water glasses and even stranger objects, though the most commonly used are straight and cup.

## Variations in construction

### Bells

Trombone bells (and sometimes slides) may be constructed of different brass mixtures to achieve slightly different [timbres](#). The most common material is yellow brass, comprising 70% copper and 30% zinc, though other materials used include gold brass (85% copper, 15% zinc) and red brass (90% copper, 10% zinc). These different materials affect the tone quality of the instrument and change the timbre quite considerably. Some manufacturers now offer interchangeable bells so that the player can select which bell he prefers according to the artistic requirements. Tenor trombone bells are usually between 7" and 9" in diameter, the most common being sizes from 7½" to 8½". The smallest sizes are found in small jazz trombones and older narrow bore instruments, while the larger sizes are common in orchestral models. Bass trombone bells can be as large as 10" or more. The bell may be constructed out of two separate brass sheets or out of one single piece of metal and hammered on a mandrel until the part is shaped correctly. The edge of the bell may be finished with or without a piece of bell wire to secure it, which also affects the tone quality; most bells are built with bell wire.

### Valve attachments

#### Valves

Some trombones have valves instead of a slide: see *valve trombone* above. Slide trombone valve attachments may be fitted with rotary valves or sometimes with piston or disc valves, which are modern variations on types of valve invented during the 1820s, but discarded at the time in favour of the rotary valve and the Périnet or piston valve.

#### Tubing

More often than not, tenor trombones with an F attachment have a larger bore through the attachment than through the *straight* section (the portion of the trombone through which the air flows when the attachment's trigger is not depressed). Typically, for orchestral instruments, the slide bore is 0.547" and the attachment tubing bore is 0.562". A wide variety of valve attachments and combinations are available. Valve attachment tubing usually incorporates a small tuning slide so that the attachment tubing is able to be tuned separately from the rest of the instrument. Most B flat/F tenor and bass trombones include a tuning slide, which is long enough to lower the pitch to E with the valve tubing engaged, enabling the production of low B.

### Tuning

Some trombones (principally bass trombones) are tuned through a mechanism in the slide section (Tuning-in-the-Slide or "TIS") rather than via a separate tuning slide in the bell section. This method preserves as long and smooth as possible an expansion from the start of the bell section to the bell flare. The tuning slide in the bell section requires two portions

of cylindrical tubing in an otherwise conical part of the instrument, which of necessity affects the tone quality. For the sake of convenience and ease of production, most trombones feature this device, which in instruments with no valve attachment is often completed by the addition of a counterbalance weight to offset the weight of the slide.

## Slides

Common and popular bore sizes for trombone slides are 0.500", 0.508", 0.525" and 0.547" for tenor trombones, and 0.562" for bass trombones. The slide may also be built with a *dual bore* configuration, in which the bore of the second leg of the slide is slightly larger than the bore of the first leg, producing a step-wise conical effect. The most common *dual bore* combinations are 0.500"-0.508", 0.508"-0.525", and 0.525"-0.547", 0.547"-0.562" for tenor trombones, and 0.562"-0.578" for bass trombones.

## Regional variations

### Germany & Austria

German trombones have been built in a wide variety of bore and bell sizes and differ substantially from American designs in many aspects. From the mouthpiece to the bell, there is a great deal of difference in how the traditional German *Konzertposaune* is constructed. The mouthpiece is typically rather small and is placed into a slide section that uses very long leadpipes of at least 12"-24". The whole instrument is often constructed of gold brass and this naturally characterises the sound, which is usually rather dull compared with British, French or American designs. While bore sizes were considered large in the 19th century, German trombones have altered very little over the last 150 years and are now typically somewhat smaller than their American counterparts. Bell sizes remain very large in all sizes of German trombone and in bass trombones may exceed 10" in diameter. Valve attachments in tenor and bass trombones were traditionally constructed to be engaged via a thumb-operated rotary valve equipped with a leather thong rather than a metal lever. Older models are still to be found with this feature, though modern variants use the metal lever. As with other German and Austrian brass instruments, rotary valves are used to the exclusion of almost all other types of valve, even in valve trombones. Other features often found on German trombones include long waterkeys and snake decorations on the slide and bell U-bows.

### France

French trombones were built in the very smallest bore sizes up to the end of the Second World War and whilst other sizes were made there, the French usually preferred the tenor trombone to any other size. French music, therefore, usually employed a section of three tenor trombones up to the mid-20th century. Tenor trombones produced in France during the 19th and early 20th centuries featured bore sizes of around 0.450", small bells of not more than 6" in diameter, as well as a funnel-shaped mouthpiece slightly larger than that of the [cornet](#) or [horn](#). French tenor trombones were built in both C and B flat, altos in D flat, sopranos in F, piccolos in high B flat, basses in G and E flat, contrabasses in B flat.

## Didactics

In recent years, several makers have begun to market compact B flat/C trombones that are especially well suited for young children learning to play the trombone who cannot reach the outer slide positions. Their fundamental note is C, but they have a short valve attachment that puts them in B flat and is *open* when the trigger is *not* depressed. While they have no seventh slide position, C and B natural may be comfortably accessed on the first and second positions by using the trigger. A similar design ("*Preacher model*") was marketed by C.G. Conn in the 1920s, also under the Wurlitzer label. Currently, B flat/C trombones are available from German makers Günter Frost, Thein and Helmut Voigt as well as the Japanese Yamaha Corporation.

# Troubadour

A **troubadour** was a composer and performer of songs during the Middle Ages in Europe.

The etymology of the word troubadour is controversial. In general, the argument breaks into two camps. Romanists argue that the root of the word can be found either in the Occitan verb trobar, 'to compose, invent, or devise', or in the Vulgar Latin tropare, 'to say with tropes'. By contrast, Arabists posit an Arabic origin in the word *taraba*, 'to sing'.

The word is used to designate poet-musicians who spoke Occitan (or langue d'oc); their style spread to the trouvères in the north of France, who spoke langues d'oïl. The tradition began to flourish during the 11th century. The earliest troubadour whose work survives is Guilhem de Peitieu (Guillaume d'Aquitaine or William IX, Duke of Aquitaine, 1071-1127). However, Peter Dronke, author of *The Medieval Lyric*, notes that "[his] songs represent not the beginnings of a tradition but summits of achievement in that tradition." [1] His name has been preserved because he was a Duke, but his work plays with already established structures; Eble le chanteur is often credited as a predecessor, though none of his work survives. The style flourished in the eleventh century and was often imitated in the thirteenth. Many troubadours traveled for great distances, aiding in the transmission of trade and news.

The texts of troubadour songs deal mainly with themes of chivalry and courtly love. Many songs addressed a married lover, perhaps due to the prevalence of arranged marriages at the time. The [aubade](#) formed a popular genre.

A complementary role was filled at the same period by performers known as *joglares* in Occitan, *jongleurs* in French (minstrels in English). Jongleurs are often addressed in troubadour lyrics. Their profession was that of popular entertainer; as such jongleurs sometimes performed troubadour compositions but more often other genres, notably *chansons de geste* (epic narratives).

The German Minnesingers are closely related to - and inspired by - troubadours, but have distinctive features of their own.

Troubadours whose works have survived to the present day include Bernart de Ventadorn, Arnaut Daniel and Jaufré Rudel.

## Playing range

in Bb: sounds a whole tone lower

## Related instruments

Flugelhorn, [Cornet](#), Bugle,

Natural trumpet, Bass trumpet, Post horn, Roman tuba, Bucina, Shofar, Conch, Lur

The **trumpet** is the highest [brass instrument](#) in register, above the [horn](#), [trombone](#), euphonium, and [tuba](#). A musician who plays the trumpet is called a *trumpet player* or *trumpeter*.

The most common trumpet by far is a [transposing instrument](#) pitched in B $\flat$  – the note read as middle C sounds as the B $\flat$  a whole step below – but there are several other trumpets in this family of instruments (see Types of trumpets below)

## Construction

The trumpet is made of brass tubing bent into a rough spiral. The bore is, roughly speaking, cylindrical, but more precisely a complex series of tapers, smaller at the mouthpiece receiver and larger just before the flare of the bell begins. Careful design of these tapers is critical to the intonation of the instrument. Sound is produced by blowing air through closed lips, producing a "buzzing" sound into the mouthpiece and starting a standing wave vibration in the air column inside the trumpet. The trumpet player can select the pitch from a range of overtones or harmonics by changing the lip aperture. There are three piston valves, each of which increases the length of tubing when engaged, thereby lowering the pitch. The first valve lowers the instrument by a whole step, second valve by a half step, and third valve by one-and-a-half steps. This makes the instrument fully chromatic, i.e., able to play all twelve pitches of Western music. The sound is projected outward by the bell.

The mouthpiece has a circular rim which provides a comfortable environment for the lips' vibration. Directly behind the rim is the cup, which channels the air into a much smaller opening (the backbore or shank) which tapers out slightly to match the diameter of the trumpet's lead pipe. The dimensions of these parts of the mouthpiece affect the [timbre](#) or quality of sound, the ease of playability, and player comfort. A wider and deeper cup are often best suited for a fuller, more expansive sound, while shallow-cupped "pea-shooter" mouthpieces can facilitate execution in the extreme high register (e.g. double high c). A larger rim allows for more assured striking of the notes, making it less likely for the player to split the note. A smaller rim improves endurance but decreases flexibility.

## Types of trumpets

Trumpets are pitched in several keys relative to concert pitch, which makes them (except for the trumpet in C) [transposing instruments](#). The most common is the B♭ trumpet, but C, D, E♭, E, F, G and A trumpets are also available. The C trumpet is most commonly used in orchestral playing, where its slightly smaller size gives it a brighter, more lively sound than the B♭ trumpet. Because music written for early trumpets required the use of a different trumpet for every key (they did not have valves and were therefore not chromatic), and also because a player may choose to play a particular passage on a different trumpet from the one indicated on the written music, orchestra trumpet players are generally adept at transposing music at sight. Being able to play music written for the B♭ trumpet on the C trumpet, and vice-versa, is fairly common. Each trumpet's range extends from the written F♯ immediately below middle C, up to about three octaves higher. Standard repertoire rarely calls for notes beyond this range, and the fingering tables of most method books peak at the C (high C) two octaves above middle C. Fingerings above this are generally the same as those for the notes an octave lower. Several trumpeters have achieved fame for their proficiency in the extreme high register, among them Arturo Sandoval, Dizzy Gillespie, Bill Chase and Maynard Ferguson, who helped make well-known the term double high C to describe the next octave above high C. It is also possible to produce pedal tones below the low F♯, although this technique is more often encountered as a sound-production exercise rather than as a written trumpet part. It is possible to play up to 3 octaves below middle C. Trumpets equipped with a fourth valve (which lowers the pitch by a perfect fourth) can produce these notes 'normally', i.e. not as pedal tones.

The smallest trumpets are referred to as *piccolo* trumpets. The most common of these are built to play in both B♭ and A, with separate leadpipes for each key. The tubing in the B♭ piccolo trumpet is exactly one-half the length of that in a standard B♭ trumpet. Piccolo trumpets in G, F and even high C are also manufactured, but are more rare. Many players use a smaller mouthpiece on the piccolo trumpet. The tone is metallic and clean. Because of the smaller mouthpiece size, the player's embouchure is affected much more severely than when playing a regular trumpet; endurance is often limited to very short periods of playing per day. Many piccolo trumpets have four valves instead of the usual three: the fourth valve takes the instrument down in pitch, usually but not always by a fourth, to allow the playing of lower notes which are otherwise hard to obtain on a three-valve instrument. Among its best-known proponents are Maurice Andre, Wynton Marsalis and Hakan Hardenberger.

The bass trumpet is usually played by a [trombone](#) player, being at the same pitch and using a similar mouthpiece.

The slide trumpet is a B♭ trumpet that has a slide instead of valves. It is very similar to a soprano trombone.

The pocket trumpet is a compact B♭ trumpet. The bell is usually smaller than a standard trumpet, and the tubing is more tightly wound, to reduce the instrument size without reducing the total tube length. Because of their contorted shape, the intonation is severely hindered.

There are also rotary-valve, or German, trumpets, as well as alto and Baroque trumpets.

The trumpet is often confused with its close relative, the [cornet](#), which has a more conical tubing shape compared to the trumpet's more cylindrical tube. This, along with additional bends in the cornet's tubing, gives the cornet a slightly mellower tone, but the instruments are otherwise nearly identical. They have the same length of tubing and, therefore, the same pitch, so music written for cornet and trumpet is interchangeable. Another relative, the flugelhorn, has tubing that is even more conical than that of the cornet, and an even richer

tone. It is sometimes augmented with a fourth valve to extend the lower range of the instrument.

## History

The first trumpets reputedly came from Egypt, and were primarily used for military purposes (Joshua's shofar, blown at the battle of Jericho, came from this tradition) like the bugle as we still know it, with different tunes corresponding to different instructions. In medieval times, trumpet playing was a guarded craft, its instruction occurring only within highly selective guilds. The trumpet players were often among the most heavily guarded members of a troop, as they were relied upon to relay instructions to other sections of the army. Eventually the trumpet's value for musical production was seen, particularly after the addition of valves around the mid 1830s, and its use and instruction became much more widespread. The Arabic word for trumpet was naffir. The Spanish used the Arabic name al naffir and changed it into anafil, while the French gave the trumpet its own name, buisine, derived from the Latin word buccina. (Trompet.nl, 2005)

Today, the trumpet is used in nearly all forms of music, including [classical](#), [jazz](#), [rock](#), [blues](#), [pop](#), [ska](#), [polka](#) and [funk](#). Among the great modern trumpet players are Maurice André, Louis Armstrong, Miles Davis, Jon Faddis, Maynard Ferguson, Adolph "Bud" Herseth, Wynton Marsalis, Philip Smith, Doc Severinsen and James Morrison. See 20th century brass instrumentalists for a more comprehensive list.

## Instruction and method books

Perhaps the most well-known trumpet method is Jean-Baptiste Arban's Complete Conservatory Method for Trumpet (Cornet Or E-flat Alto, B-flat Tenor, Baritone, Euphonium and B-flat Bass in Treble Clef). Copies of the text can be purchased new (copyright 1982 by Carl Fisher, Inc.) but include much of the unmodified original text from the 1894 edition.

Other well-known method books include those written by Herbert L. Clarke, Saint-Jacome, Claude Gordon, and Colin. A common method book for beginners is the "Walter Beeler Method", and there have been several fine instruction books written by virtuoso Allen Vizzutti. In many schools, the Breeze Eazy method is used to teach younger students, as it includes lots of musical background information as well as trumpet related info.

# Technique

As with all musical instruments, there are physical challenges to playing the trumpet. The knowledge of operating the instrument is called *technique*. Almost all aspects of technique are controversial, since different people have different problems to overcome, and different successes to celebrate.

Several important aspects of technique:

1. Breathing properly (abdominal support of air). "This is one of the areas of brass playing that causes a great deal of confusion. Much discussion about the importance of the diaphragm has sent many a player down the road to confusion, inability, and bleeding lips. The upper part of the torso contains a large family of muscles that all have been designed to function in a teamwork fashion specially when we do something requiring forced exhalation, eg. blowing out candles, spitting something out of our mouth, or **blowing into a wind instrument**.

"There are 3 layers of abdominal muscles from the groin to the sternum (breastplate); there are 2 layers of muscles (inner and outer) in between the ribs; there are back muscles from the lumbar region upward to the shoulders; there is the diaphragm just below the lung sacs; and there are muscles coming-down diagonally from behind the ear which connect to the top of the rib cage . When a person does a "forced exhalation", the entire family is activated as a "one- family" movement. They ALL simultaneously increase their tension levels in order to raise the internal compression level (PSI) in the lung chambers. This moves the air FASTER which is one of the first necessary things that must occur when a player moves "upward" in the register.

The area that the player needs to become aware of is NOT in the diaphragm but in the center of the abdominal muscles, approximately near the navel. The body has a natural way of centering itself if you only just try to blow suddenly as if spitting a piece of rice or blowing out a candle. By learning to control the variance of tension, either isometric for holding a compression level or by tightening and relaxing the degrees of tension based upon what you are playing, one discovers that it is really the abdominal support that controls the air. This ab support certainly influences the diaphragm but it is NOT the diaphragm alone that moves the air. It is the FAMILY of muscles, all guided by the abdominal centering." (Bobby Shew)

As the lower abdominal muscles pull up and in; the internal organs are all slightly moved the same direction. These push against the diaphragm and pressurize the air by making the chest cavity smaller. The farther you move the abdominal muscles and the faster that you do it; then the stronger the air support is.

1. Strengthening the embouchure (muscles of the face, sometimes "chops" in common slang). Some commonly accepted ways to do this are:
  1. **Lip slurs**: playing exercises that change notes without changing the fingering. This forces all of the work to come from the facial and tongue muscles as well as changes in breathing.
  2. **Tonguing exercises**: playing exercises that have many notes started with a sharp definition produced by the tongue.
  3. **Practicing on the mouthpiece**: playing exercises on the mouthpiece only, without the trumpet. Without the resonating chamber of the rest of the instrument, the pitch

may vary much more freely. To be able to play something requires development of control. Also, this may reduce the amount of pressure one can apply. This was a favorite exercise of the famous Rafael Mendez.

4. **Playing high:** playing in the upper register, at the top of the player's comfortable range. This is an excellent way to increase one's range, as eventually the higher notes will become easier and the player can move on to progressively higher top notes.
5. **Reducing pressure.** To play higher notes on the trumpet requires compression of the embouchure (the muscles of the face and lips), as well as air pressure to provide the energy for the vibration of the lips. One way to compress the lips is to press the mouthpiece firmly onto them, however this is counterproductive in the long run and is not an effective way of playing in the upper register. Blood cannot flow into the lips, so they become stiff and swollen, unable to vibrate. Also, the other muscles necessary to play without pressure are not sufficiently developed.
6. **Soft Playing.** Another aspect is playing really, really softly. Herbert L. Clarke was the first person to really teach soft playing. In his first exercise in the Clarke Technical Studies, he recommends starting pianissimo and decrescendoing until you can barely hear it. When you play it really softly, it teaches you how to focus your lip aperture to a fine point so there's just a thread of air coming through.

1. Avoiding bad habits. There are many bad habits that can develop while learning trumpet that can ultimately lead to slower improvement, a poorly developed sound, lessened endurance, or even pain. Common bad habits include pressing the mouthpiece to the lips (as explained above), uneven pressure, inflating cheeks when blowing (although this is debated - some of the greatest jazz trumpeters such as Dizzy Gillespie, Harry James, and Charlie Shavers were known for it and it is essential to circular breathing, a technique necessary to play continuously for any significant period of time), playing with poor posture, and closing the throat (tensing of the throat muscles, resulting in partially choking the air flow.).
2. Having too tense a posture is another bad habit . Producing notes becomes easier when the body, especially the embouchure and shoulders, are relaxed. Try not to extend the arms more than 90 degrees from the elbows.
3. Keeping neutral corners. Keep the corners of the mouth in a neutral position to avoid stretching or compressing the aperture too much. Pulling the corners back too much (into a smile) pushes the lips together thereby restricting vibration. Pushing them front too much pulls the lips apart too much, also restricting vibration.
4. Not resting the pressure of the mouthpiece evenly on both lips. One wants to find the ideal mouthpiece placement that allows maximum vibration. Experiment with different angles and positions until the best possible one for vibration is found. This position may vary in extreme registers.

## Fingering

On any trumpet, cornet, or flugelhorn, pressing the valves indicated by the numbers below will produce the written notes shown - "OPEN" means all valves up, "1" means first valve, "1-2" means first and second valve simultaneously and so on. The concert pitch which sounds depends on the transposition of the instrument. Engaging the fourth valve, if present, drops any of these pitches by a perfect fourth as well. Within each overtone series, the different pitches are attained by changing the embouchure, or *lip position* and *tightness*, along with increasing air velocity. Standard fingerings above high C are the same as for the notes an octave below (C# is 1-2, D is 1, etc.).

Note that the fundamental of each overtone series does not exist - the series begins with the first overtone. Notes in parentheses are the sixth overtone, representing a pitch with a frequency of seven times that of the fundamental; while this pitch is close to the note shown, it is slightly flat and use of those fingerings is therefore discouraged.

The fingering schema arises from the length of each valve's tubing (air passing through longer lengths of tubing produces a lower pitch). Valve "1" increases the tubing length enough to lower the pitch by one whole step, valve "2" by one half step, and valve "3" by one and a half steps. This schema and the nature of the overtone series create the possibility of alternate fingerings for certain notes. For example, third-space "C" can be produced with no valves engaged (standard fingering) or with valves 2-3. Also, any note produced with 1-2 as its standard fingering can also be produced with valve 3 - each drops the pitch by 1-1/2 steps. Alternate fingerings may be used to improve facility in certain passages. Extending the third valve slide when using the fingerings 1-3 or 1-2-3 further lowers the pitch slightly to improve intonation.

## Orchestral Excerpts

If you wish to apply for a job in an orchestra playing trumpet, there are certain excerpts of orchestral works that you must know.

Petrushka -- Ballerina's Dance and Waltz; occasionally "Petrushka's Ghost" from the end.

Pines of Rome -- Movement II, offstage solo

Mahler's 5th Symphony -- First movement

Pictures at an Exhibition -- Opening Promenade, Samuel Goldenberg & Schmyule

Beethoven's Leonore Overtures -- No. 2 & 3

Mahler's 3rd Symphony-Posthorn Solo

Bizet-Carmen

Ravel-Piano Concerto in G, rehearsal No. 2 - 3 and 36 to the end.

# Tuba

## Tuba

en: *Tuba*, it: *Tuba*, fr: *Tuba*, de: *Tuba*, sp: *Tuba*

## Classification

- [Wind](#)
- [Brass](#)
- [Aerophone](#)

## Playing range

## Related instruments

Euphonium, Sousaphone, Contra bass bugle

The **tuba** is the largest of the low-[brass instruments](#) and is one of the most recent additions to the modern symphony orchestra, first appearing in the mid-19th century, when it largely replaced the ophicleide.

## Role of tuba

There is usually only one tuba in an orchestra, and it is used as the bass of the brass section, though its versatility means that it can be used to reinforce the strings and woodwind, or increasingly as a solo instrument. *Symphonie Fantastique* by Hector Berlioz was the first major work orchestrated for tuba. It was originally scored for two ophicleides, but Berlioz changed it after hearing the newly invented tuba. Other composers such as Richard Strauss [*Also Sprach Zarathustra*, *Eine Alpensinfonie*], Shostakovich [4th Symphony] and Stravinsky [*The Rite of Spring*] have also used two tubas.

Concertos for Tuba have been written by Ralph Vaughan Williams, Edward Gregson, John Williams, Robert Fleming, Gary Kulesha, Josef Horovitz, and Samuel Jones.

Tubas are also used in wind and concert bands and in British style brass bands, although in the latter instance both Eb and BBb tubas are used, usually two of each.

## Types and construction

Tubas are found in various pitches, most commonly in F, Eb, C, or Bb in "brass band" pitching. The main bugle of Bb tubas is approximately 18 feet long, while C tubas are 16 feet, Eb tubas 13 feet, and F tubas 12 feet in tubing length without adding any valve branches. Tubas are considered to be conical in shape as from their tapered bores, they steadily increase in diameter along their lengths. If the tubing is wrapped for placing the instrument on the player's lap, the instrument is usually called a tuba or concert tuba. It may have a bell pointing forward instead of upward, in which case it is often called a *recording tuba* because of its popularity in the early days of recorded music. When wrapped to surround the body for marching, it is traditionally known as a *helicon*. A *sousaphone* is a helicon with a bell pointed up, or then curved to point forward (really, a recording sousaphone).

When reading bass clef music, all of which is usually in concert pitch, all tubas play the notes as they sound and must know the correct fingerings for their instrument, because the fingerings are different for instruments in each of the four tuba pitches. Music for brass band is written on the treble clef, usually a ninth above the sounded note, to facilitate music interchangeability with other brass band instruments. The CC tuba is the common professional instrument in the United States and is used as the default instrument in American orchestras. In the United Kingdom, the Eb tuba is the default professional instrument, though many will supplement it with the C tuba in orchestral applications for big works. In Europe, the F tuba is the common default instrument in orchestras, though American practice is taking hold in some European orchestras. In Germany, Austria and Russia in particular, orchestral tuba players will use an Bb tuba when extra weight is desired. In military or concert bands and brass bands, the BBb tuba is preferred because its intonation better matches that of other wind instruments in Bb or Eb. Players of the Eb tuba often find themselves in demand from brass bands, where they read music in treble clef pitched in Eb, as well as orchestras where they read music in bass clef at concert pitch (C).

The lowest pitched tubas are the contrabass tubas, pitched in C or Bb; (referred to as CC and BBb tubas respectively, based on a traditional distortion of a now-obsolete octave naming convention). The BBb is almost exclusively used in brass bands because the other instruments are usually based on Bb. The CC tuba is used as an orchestral instrument in the U.S. because they are perceived to tune more easily with other orchestral instruments, but BBb tubas are the contrabass tuba of choice in German, Austrian, and Russian orchestras. Most beginners play BBb tubas to start with, and the Bb tuba is still the standard adult amateur instrument in the United States. Most professionals (and those trained or training to be professionals) in the U.S. play C tubas, but most also are trained in proficiency of all four pitches of tubas.

The next smaller tubas are the bass tubas, pitched in F or Eb (a fourth above the contrabass tubas). The Eb Tuba often plays an octave above the contrabass tubas in brass bands, and the F tuba is commonly used by professional players as a solo instrument and, in America, to play higher parts in the classical repertoire. In most of Europe, the F tuba is the standard orchestral instrument, supplemented by the C or Bb only when the extra weight is desired. In the United Kingdom, the Eb is the standard orchestral tuba. The euphonium is sometimes referred to as a tenor tuba, and is pitched one octave higher than (in Bb) than the BBb contrabass tuba. The "French tuba" corresponds to the tenor tuba, but is pitched in C and has 6 valves.

Though extremely rare, there have been larger BBBb subcontrabass tubas created. There were at least four known examples created. The first two were built by the Gustav Besson on the suggestion of American Bandmaster John Philip Sousa. The monster

instruments were not completed until just after Sousa's death. Later, in the 1950's British musician Gerald Hoffnung commissioned the London firm of Paxman to create a subcontrabass tuba for use in his comedic music festivals. These three instruments were all pitched in BBBb, one octave below the standard Bb tuba. Also, a tuba pitched in FFF was made in Kraslice by the manufacturer Bohlad & Fuchs probably already in the years 1910/1911 and was destined for the World Exhibition in New York in 1913. This tuba is "playable", but two persons are needed; one presses the valves and one blows.

Tubas come in both piston and rotary valve models. Rotary valves are based on a design that derived from the Berlinerpumpen used on the very first bass tuba patented by Wilhelm Wieprecht in 1835. Cerveny of Graslitz was the first to use true rotary valves, starting in the 1840's or 1850's. Piston valves are based on valves developed by Perinet for the Saxhorn family of instruments promoted by Adolphe Sax around the same time. Pistons may either be oriented to point to the top of the instrument (top-action, as pictured at left) or out the front of the instrument (front-action or side-action). Debate abounds as to the advantages and disadvantages of each piston style, with assertions concerning sound, speed, and clarity commonly proclaimed but with little or no scientific measurement. The German tradition prefers rotary valves; the British and American traditions favor piston valves (top-action in the case of British; front-action in the case of American), but this is not absolute and choice of valve types remains up to the performer.

Tubas generally have from three to six valves, though some rare exceptions exist. Three-valve tubas are generally the least expensive and are almost exclusively used by beginners and amateurs, and the sousaphone (a marching instrument which is just a different way to wrap the tubing of a Bb tuba) almost always has three valves. Among more advanced players, four and five valve tubas are by far the most common choices, with six valve tubas being relatively rare except for F tubas intended to be used by European orchestral performers.

The valves add tubing to the bugle of the instrument, thus lower its fundamental pitch. The first valve lowers the bugle by a whole step (two semitones), the second valve by a semitone, and the third valve by three semitones. Used in the combination, the valves are too short and the resulting pitch tends to be sharp. For example, a Bb bugle becomes an Ab bugle when the first valve is depressed. The third valve is long enough to lower a Bb bugle by three semitones, but it is not long enough to lower an Ab bugle by three semitones. Thus, the first and third valves used in combination lower the bugle by something *just short* of five semitones, and the first three valves used in combination are nearly a quarter tone sharp.

The fourth valve is used in place of combinations of the first and third valves, and the second and fourth used in combination are used in place of the first three valves in combination. The fourth valve can be tuned to accurately lower the pitch of the main bugle five semitones, and thus its use corrects the main problem of combinations being too sharp. By using the fourth valve by itself to replace the first and third combination, or the fourth and second valves in place of the first, second and third valve combinations, the notes requiring these fingerings are more in tune.

The fifth and sixth valves are used to provide alternative fingering possibilities in the low register of the instrument where all the valves will be used in combination to fill the first octave between the fundamental pitch and the next available note on the open bugle.

Since the bass tuba in F is pitched a fifth above the BBB tuba and a fourth above the CC tuba, it needs additional tubing length beyond that provided by four valves to play securely down to a low F as required in much tuba music. The fifth valve is commonly tuned to a flat whole step, so that when used with the fourth valve, it gives an in-tune low Bb. The 6th valve is commonly tuned as a flat half step, allowing the F tuba to play low G as 1-4-5-6 and low Gb as 1-2-4-5-6. In CC tubas with five valves, the fifth valve may be tuned as above or tuned to replace the 2-3 combination depending on the instrument selected.

Some believe that the external finish of the tuba can play an important role in the tone production, though this has never been objectively measured. Performers have individual preferences on the finish that they select, and will sometimes have horns in more than one finish for different musical settings. However, tone quality is subjective and there is no

scientific basis for these claims. Tubas are generally finished in raw brass, lacquered brass, or silver-plated brass.

Some piston-valved tubas have a compensating system to allow accurate tuning when using several valves in combination to play low notes, simplifying fingering and removing the need to constantly adjust slide positions. The most common approach is to plumb the valves so that if the fourth valve is used, the bugle is sent back through a second set of branches in the first three valves to compensate for the combination of valves. This does have the disadvantage of making the instrument significantly more 'stuffy' or resistant to air flow when compared to a non-compensating tuba. This is due to the need for the air to flow through the valve block twice. It also makes the instrument heavier. But many prefer this approach to additional valves or to manipulation of tuning slides while playing to achieve perfect intonation within an ensemble.

# Jazz

Tubas have been used in [jazz](#) from the music's beginning. In the earliest years, bands often used a tuba for outdoor playing and a double bass for indoor jobs. In this context, the tuba was sometimes called "brass bass," as opposed to the double bass, which was called "string bass"; it was not uncommon for players to double on both instruments.

In modern jazz, the role of the two bass instruments remains similar. Tubas are usually featured in a supporting role, although it is not uncommon for them to take solos. Many jazz bands actually use a sousaphone, commonly if technically incorrectly called a "tuba" in this context. One of the most prominent tubists specializing in jazz is the New York City-based Marcus Rojas, who has performed frequently with bandleader Henry Threadgill. Another notable group is the Modern Jazz Tuba Project, which consists of tubas and euphoniums.

The tuba has also played a large role in [ragtime](#) music, and in [big band](#) music, the tuba (usually bass tuba pitched in Eb) would provide a walking bass similar to that of a double bass, but with a larger range.

## Miscellaneous

Former Chicago Symphony Orchestra tuba player Arnold Jacobs was well-known for his breathing techniques and teachings.

Some tubas are capable of being converted into a marching style. A leadpipe can be manually screwed on next to the valves. The tuba is then usually rested on the left shoulder (although some tubas allow use of the right shoulder), with the bell facing directly in front of the player. However, many players usually opt for the much easier alternative, the sousaphone.

Category: [Brass instruments](#)

# Tubular bell

**Tubular bells** (also known as **chimes**) are [musical instruments](#) in the [percussion](#) family. Each [bell](#) is a metal, typically brass, tube, 30–38 mm (1¼–1½ inches) in diameter, tuned by altering its length. Tubular bells are typically hung vertically in chromatic sets of 1½ octaves with a range from C5 to F6. Two-octave sets that extend to F4 do exist, but they are extremely heavy and not commonly used.

Tubular bells are typically struck on the top edge of the tube with a rawhide- or plastic-headed hammer. They are commonly used to mimic the sound of heavy and impractical church bells in programmatic classical music pieces such as Berlioz's *Symphonie Fantastique*, Sousa's "Liberty Bell" March and Tchaikovsky's 1812 Overture. The bands of the Indian Army uses these bells when playing the beautiful Hymn Abide With Me. Tubular bells are used in popular music, as well. Mike Oldfield used tubular bells in his 1973 debut album, *Tubular Bells*, the title song of which was used as part of the score for *The Exorcist*.

The tubes used provide a purer tone than solid cylindrical chimes, such as those on a mark tree.

# Tumbi

The **tumbi** is a traditional South-Asian instrument from the Punjab region. The high pitched, single [string](#) plucking instrument is associated with folk music of Punjab and presently very popular in Western [Bhangra](#) Music.

The tumbi was popularized by the Punjabi folk-singer Yamla Jatt (also spelled 'Jamla Jatt'). The instrument is made of a wooden stick mounted with a Toomba or wooden resonator covered with skin. A metallic string is passed on a resonator over a bridge and tied to the key at the end of the stick. The string is struck with the continuous flick and retraction of the forefinger.

"Get your freak on" by Timbaland and Missy Elliot saw the introduction of the distinct tumbi sound into the popular mainstream music scene.

"Mundeya tou bach ke rahi" (Beware of Boys) from Panjabi MC, a huge hit in the UK charts, is perhaps the most widely-known example of the use of tumbi in popular music.

# Turntablism

**Turntablism** is the art of manipulating sound and creating music using **phonograph turntables** and an audio mixer. Beat mixing, scratching, and beat juggling are some of the elements in a *Tablist's* arsenal.

Turntablism is a subgenre of [hip hop](#), emphasising manipulation of a vinyl record. One who engages in turntablism is a *turntablist*: A term created in 1994 by DJ Supreme, to describe the difference between a [DJ](#) who just lets records play, and one who actually manipulates the sounds of a record. This term was later popularized by DJ Babu (of the Beat Junkies and Dilated Peoples) who inscribed his mixtapes as "mixed by Babu the Turntablist."

Turntablists [DJ's](#) use turntable techniques like scratching or beat juggling in the composition of original [musical](#) works. Turntablism is generally focused more on turntable technique and less on mixing. Some turntablists seek to have themselves recognized as a legitimate musician capable of interacting and [improvising](#) with other performers.

## History

Turntables were first used as musical instruments in the 1940's and 1950's by musique concrète and other experimental composers, such as John Cage and Pierre Schaeffer, who used them in a manner similar to digital sampling. (Even earlier, Edgard Varese experimented with turntables in 1930, though he never produced any works using them.) Modern experimental turntablists include Christian Marclay, Otomo Yoshihide, Phillip Jeck and Janek Schaefer.

Hip hop DJ's developed independently of the earlier techniques, and the sounds produced by these experimental composers are quite different from later hip hop turntablism.

## Old school

Hip hop turntablism can be traced to the 1970s. DJ Kool Herc and Grandmaster Flash laid some of the groundwork, but it was DJ Grand Wizard Theodore who accidentally isolated the single most important technique in turntablism: he put his hand on a record one day, to silence the music while his mother was calling out to him. He thus accidentally discovered the sound of scratching-moving the record back and forth under the stylus.

DJ Grand Mixer DXT is credited with inventing turntablism, the rhythmic scratching of a record on one or more (usually two) turntables, then using different velocities to alter the pitch of the note or sound on the recording, making the turntable a fully performable and improvisational instrument (Alberts 2002). DXT appeared ( as DST ) on Herbie Hancock's hit song "Rockit", perhaps the first non-rap use of scratching.

More sophisticated methods of scratching were developed later, which involve moving the fader on the mixer in a rhythmic manner while scratching, giving a wide variety of different sounding scratch effects. Others still have used effect pedals to alter or manipulate the sound.

One of the earliest academic studies of the turntable (White 1996) argued for its designation as a legitimate electronic musical instrument -- a manual analog sampler -- and described turntable techniques such as backspinning, cutting, scratching and blending as basic to the repertoire of the virtuoso hip hop DJ. White demonstrated that the proficient hip hop DJ must possess many of the same skills required by trained musicians, including a keen sense of timing, sharply-developed hand-eye coordination, technical competence and creativity with his material.

New DJs/turntablists/crews like DJ Craze, Roc Raida, Dj Focus, DJ Q-bert, Gunkhole, A-Trak, Noisy Stylus, D-Styles, Birdy Nam Nam and Kid Koala owe a distinct debt to Old School DJs like DJ Kool Herc, Grand Wizard Theodore, Grandmaster Flash, Afrika Bambaataa and DJs of [the golden age of hip hop](#), who originally developed many of the concepts and techniques that evolved into modern turntablism.

## New school

Within the realm of hip hop, notable modern turntablists are the cinematic DJ Shadow, who influenced Diplo and RJD2, among others, and the experimental DJ Spooky, whose *Optometry* albums showed that the turntablist can perfectly fit within the classic jazz setting.

Cut Chemist and DJ Nu-Mark, members of old school hip hop collective Jurassic 5, and Mix Master Mike, who collaborated with the Beastie Boys on 1998's *Hello Nasty*, are also known as virtuosi of the turntables.

## **Turntable contests**

Like many other musical instrumentalists, turntablists compete to see who can develop the fastest, most innovative and most creative approaches to their instrument. The selection of a champion comes from the culmination of battles between turntablists.

Battling involves each turntablist performing a routine (A combination of various technical scratches, beat juggles, and other elements, including body tricks) within a limited time period, after which the routine is judged by a panel of experts. The winner is selected based upon score. These organized competitions evolved from actual old school "battles" where DJs challenged each other at parties, and the "judge" was usually the audience, who would indicate their collective will by cheering louder for the DJ they thought performed better. Often, the winner kept the loser's equipment and/or records.

# Twee pop

**Stylistic origins:** [Bubblegum pop](#), [Punk rock](#), [New wave](#), [Indie rock](#), 1960's [Girl groups](#)  
**Cultural origins:** mid 1980s, United Kingdom  
**Typical instruments:** [Guitar](#) - [Bass](#) - [Drums](#)  
**Mainstream popularity:** Largely underground, with some acts gaining a cult following.

England - Scotland - Wales - Ireland

## [Timeline of alternative rock](#)

**Twee pop** is a type of [indie pop](#) that is known for simple, sweet melodies and lyrics, often with jangling guitars and a noted emphasis on childlike naivete. The genre began in 1986, when New Musical Express released C86, a compilation of bands including the Pastels and Primal Scream.

The 1970s-1980s [Post-Punk](#) Band The Television Personalities are often cited as a major influence on the genre, along with Buzzcocks and The Ramones. This was more evident in the more punk influenced bands, like Shonen Knife.

In the United Kingdom, where twee pop was most popular, Sarah Records was home to most of the bands in the field, including Heavenly and the Orchids. In the United States, the movement was championed by K Records out of Olympia, Washington and was headed by the band Beat Happening.

Although 'twee pop' is a widely accepted term for this style of music it did not come into use until the 1990s. In the 1980s 'twee' bands were simply described to as 'indie' or 'shambling'.

Although Belle & Sebastian have been described as a twee pop band, this is a description the band have rejected.

"Twee", a baby-talk alteration of "sweet", is an English term for something that is overly sweet or knowingly cute.

A more punk-influenced, North American variant of twee pop is also sometimes referred to as **cuddlecore** and is exemplified by bands such as Cub and Go Sailor.

## Twelve tone technique

**Twelve-tone technique** (also **dodecaphony**) is a method of musical [composition](#) devised by Arnold Schoenberg. Music using the technique is called **twelve-tone music**. Josef Matthias Hauer also developed a similar system using unordered hexachords, or tropes, at the exact same time and country but with no connection to Schoenberg. Other composers have created systematic use of the chromatic scale, but Schoenberg's method is historically most significant.

Schoenberg himself described the system as a "method of composing with 12 notes which are related only to one another".

## The technique

The basis of twelve-tone technique is the tone row, an ordered arrangement of the twelve notes of the [chromatic scale](#) (the twelve equal tempered pitch classes). The tone row chosen as the basis of the piece is called the prime series (P). Untransposed, it is notated as P<sub>0</sub>. Given the twelve pitch classes of the chromatic scale, there are 12! (12 factorial, i.e. 479,001,600) unique tone rows.

When twelve-tone technique is strictly applied, a piece consists of statements of certain permitted transformations of the prime series. These statements may appear serially, or may overlap, giving rise to [harmony](#).

Appearances of P can be transformed from the original in three basic ways:

- transposition up or down, giving P<sub>Ç</sub>.
- reversal in time, giving the *retrograde* (R)
- reversal in pitch, giving the *inversion* (I): I(Ç) = 12 - P<sub>Ç</sub>.

The various transformations can be combined. The combination of the retrograde and inversion transformations is known as the [retrograde inversion](#) (RI).

|        |          |          |               |
|--------|----------|----------|---------------|
| RI is: | RI of P, | R of I,  | and I of R.   |
| R is:  | R of P,  | RI of I, | and I of RI.  |
| I is:  | I of P,  | RI of R, | and R of RI.  |
| P is:  | R of R,  | I of I,  | and RI of RI. |

thus, each cell in the following table lists the result of the transformations in its row and column headers:

|     |     |    |    |
|-----|-----|----|----|
|     | RI: | R: | I: |
| RI: | P   | I  | R  |
| R:  | I   | P  | RI |
| I:  | R   | RI | P  |

More recently, composers such as Charles Wuorinen have also used multiplication of the row. However, there are only a few numbers which one may multiply a row by and still end up with twelve tones. Multiplication is indicated by MX, X being the multiplier. As with the other compound operations multiplication is carried out and then transposition. P<sub>0</sub> = M1<sub>0</sub>, I<sub>0</sub> = M11<sub>0</sub>, M7<sub>0</sub>=I(M5<sub>0</sub>). Thus, for the untransposed form of all:

|      |     |     |      |
|------|-----|-----|------|
| M1:  | M5: | M7: | M11: |
| M5:  | M1  | M11 | M7   |
| M7:  | M11 | M1  | M5   |
| M11: | M7  | M5  | M1   |

Even numbers remain unchanged under M7 and all odd numbers become transposed by a tritone. The chromatic scale may be mapped onto the circle of fourths with M5, and the circle of fifths with M7.

Suppose the prime series is as follows:

Then the retrograde is the prime series in reverse order:

The inversion is the prime series with the [intervals](#) inverted (so that a rising minor third becomes a falling minor third):

And the retrograde inversion is the inverted series in retrograde:

P, R, I and RI can each be started on any of the twelve notes of the chromatic scale, meaning that 47 permutations of the initial tone row can be used, giving a maximum of 48 possible tone rows. However, not all prime series will yield so many variations because transposed transformations may be identical to each other. This is known as invariance. A simple case is the ascending chromatic scale, the retrograde inversion of which is identical to the prime form, and the retrograde of which is identical to the inversion (thus, only 24 forms of this tone row are available).

When rigorously applied, the technique demands that one statement of the tone row must be heard in full (otherwise known as aggregate completion) before another can begin. Adjacent notes in the row can be sounded at the same time, and the notes can appear in any octave, but the order of the notes in the tone row must be maintained. Durations, dynamics and other aspects of music other than the pitch can be freely chosen by the composer, and there are also no rules about which tone rows should be used at which time (beyond them all being derived from the prime series, as already explained).

Schoenberg's idea in developing the technique was for it to act as a replacement for tonal harmony as a basic grounding force for music. As such, twelve-tone music is usually atonal, and treats each of the 12 semitones of the chromatic scale with equal importance, as opposed to earlier classical music which had treated some notes as more important than others (particularly the tonic and the dominant note).

## History of the technique's use

Founded by Austrian composer Arnold Schoenberg around the late 1910s, the method was used during the next 20 years almost exclusively by the Second Viennese School (Alban Berg, Anton Webern, Hanns Eisler and Arnold Schoenberg himself). Rudolph Reti, an early proponent says: "To replace one structural force (tonality) by another (increased thematic oneness) is indeed the fundamental idea behind the twelve-tone technique," arguing it arose out of Schoenberg's frustrations with free atonality (Reti, 1958). The technique became widely used by the fifties, taken up by composers such as Luciano Berio, Pierre Boulez, Luigi Dallapiccola and, after Schoenberg's death, Igor Stravinsky. Some of these composers extended the technique to control aspects other than the pitches of notes (such as duration, method of attack and so on), thus producing [serial music](#). Some even subjected all elements of music to the serial process.

In practice, the "rules" of twelve-tone technique have been bent and broken many times, not least by Schoenberg himself. For instance, in some pieces two or more tone rows may be heard progressing at once, or there may be parts of a composition which are written freely, without recourse to the twelve-tone technique at all. Offshoots or variations may produce music in which:

- the full chromatic is used and constantly circulates, but permutational devices are ignored
- permutational devices are used but not on the full chromatic

Charles Wuorinen claimed in a 1962 interview that while, "most of the Europeans say that they have 'gone beyond' and 'exhausted' the twelve-tone system," in America, "the twelve-tone system has been carefully studied and generalized into an edifice more impressive than any hitherto known." (Chase 1992, p.587)

## Derivation

Derivation is transforming segments of the full chromatic, less than 12 pitch classes, to yield a complete set, most commonly using trichords, tetrachords, and hexachords. A derived set can be generated by choosing appropriate transformations of any trichord except 0,3,6, the diminished triad. A derived set can also be generated from any tetrachord that excludes the interval class 4, a major third, between any two elements. The opposite is partitioning, the use of methods to create segments from sets, most often through registral difference.

## Combinatoriality

Combinatoriality is a side-effect of derived rows where combining different segments or sets such that the pitch class content of the result fulfills certain criteria, usually the combination of hexachords which complete the full chromatic.

## Invariance

Invariant formations are also the side effect of derived rows where a segment of a set remains similar or the same under transformation. These may be used as "pivots" between

set forms, sometimes used by Anton Webern, see George Perle.

## **Other**

Also, some composers have used cyclic permutation, or rotation, where the row is taken in order but using a different starting note.

Although usually atonal, twelve tone music need not be - several pieces by Berg, for instance, have tonal elements.

One of the best known twelve-note compositions is *Variations for Orchestra* by Arnold Schoenberg. "Quiet", in Leonard Bernstein's *Candide*, satirizes the method by using it for a song about boredom.

# Two Tone

**2 Tone** (or **Two Tone**) is a style of music created by fusing elements of [punk rock](#) and [ska](#). The sound was pioneered in the late 1970s by English bands such as The Specials, The Selecter, The Beat and Madness. Many of these bands were signed to 2 Tone Records, Stiff Records and Go Feet Records and were based around the West Midlands area in the UK.

The term 2 Tone was coined by Jerry Dammers of the Specials from Coventry and summed up the West Midlands scene at that time.

The name that Dammers chose for his label had two meanings: It referred both to the black-and-white suits favored by ska-loving "rude boys", and it symbolized solidarity between blacks and whites at a time when racial tensions among the British working class were at an all-time high.

Dammers had long had a dream of starting his own label, similar to Motown, that The Specials could release their own records on. With the assistance of The Specials' bassist, Horace Panter, he composed some artwork that was soon to become central to the 2 Tone world, and in fact feature as the label on all their releases. The logo was based on an early album cover picture of Peter Tosh (which itself was inspired by a photograph of The Impressions), and with the signature black and white checks dropped in for good measure, *Walt Jabsco* was born.

The label also released two albums by legendary Jamaican trombonist Rico Rodriguez (who had appeared on first two albums by The Specials).

## **Types of bagpipes**

# Europe

## British Isles

Great Highland Bagpipe : perhaps the most well-known bagpipe.  
Uilleann pipes : bellows-blown bagpipe with keyed chanter, from Ireland.  
Northumbrian smallpipe : a smallpipe with a closed end chanter played in a staccatto style.  
Border pipe : Also called the "Lowland Bagpipe," commonly confused with Smallpipes, but much older. Played in the Lowlands of Scotland.  
Scottish smallpipe : a modern reinterpretation of an extinct instrument  
Cornish pipes: formerly extinct double chanter bagpipe from Cornwall (southwest England), currently undergoing a revival.  
Welsh pipes (pibe cyrn, pibgod): Of two types, one a descendant of the pibgorn, the other loosely based on the Breton Veuze. Both mouthblown with one bass drone.  
Lancashire Great-pipe: another formerly extinct English bagpipe currently undergoing a revival  
Pastoral bagpipe : ancestor of the Irish bagpipe, also played by the Scots and northeast English.

## Eastern Europe

Gaida (also the large kaba gaida from the Rhodope Mountains in Bulgaria): Southern Balkan (i.e. Bulgarian and Macedonian) and Greek bagpipe with one drone and one chanter  
Gajdy or gajde: the name for various bagpipes of Eastern Europe, found in Poland, Serbia, Slovakia, Croatia.  
Dudy (also known by the German name "Bock") : Czech bellows-blown bagpipe with a long, crooked drone and chanter that curves up at the end. There are at least three Polish traditions, generically known as "dudy," and the region of Zakopanie on the border with Slovakia is the home of the best known tradition.  
Magyar Duda or Hungarian duda (also known as tömlösíp, börduda and Croatian duda) has a double chanter (two parallel bores in a single stick of wood) with single reeds and a bass drone. It is typical of a large group of pipes played in the Carpathian Basin.  
Istarski mih (Piva d'Istria), a double chantered, single drone bagpipe whose side by side chanters are cut from a single rectangular piece of wood. They are typically single reed instruments, using the istrian scale.  
Torupill, of Estonia, with a single chanter and drone.

## France

Musette de cour : French ancestor of the Northumbrian pipes, used in folk music as well as classical compositions in the 18th century French court. The shuttle design for the drones was recently revived and added to a mouth blown Scottish

smallpipe.

Biniou (or Biniou Koz (old style bagpipe): a mouth blown bagpipe from Brittany, a Celtic region of France. It is the most famous bagpipe of France. The great Highland bagpipe is also used in marching bands called "bagadoù" and known as "Biniou Braz" (great bagpipe).

Veuze, found in Vendee, close to Galician gaitas.

Cabrette, played in Auvergne.

Chabrette or chabretta, found in Limousin.

Bodega, found in Languedoc, made of an entire goat skin.

Boha, found in Gascogne.

Musette bressane, found in Bresse.

Bagpipes of central France: called in French cornemuse du centre or musette du centre) are of many different types, some mouth blown. It can be found in the Bourbonnais, Nivernais, and Morvan regions of France and in different tonalities. "Chabrette poitevine", found in Poitou but extremely rare nowadays.

## The Low Countries

### Flanders and the Netherlands

- Doedelzak: the type of bagpipe made famous in the paintings of Pieter Brueghel the Elder

### Wallonia

- Muchosa or muchosac, found in Hainaut.

## Germany

- Dudelsack : German bagpipe with two drones and one chanter

## Greece

- Tsampouna (also tsambouna, tsabouna, etc.) : Greek island bagpipe with a double chanter, no drone and a bag made from an entire goatskin.

## Iberia (Spain and Portugal)

Iberic gaitas: Gaita, gaita-de-fole or gaita de fol is a generic term for "bagpipe" in Spanish, Portuguese, Galego, and Asturian, for distinct bagpipes used in Galicia (Spain), Asturias (Spain), Cantabria (Spain), Catalonia (Spain) and Trás-os-Montes (Portugal). Just like "Northumbrian smallpipes" or "Great Highland bagpipes," each country and region attributes its toponym to the respective gaita name: gaita galega (Galicia, Spain), gaita transmontana (Trás-os-Montes, Portugal), gaita asturiana (Asturias, Spain), gaita sanabresa (Sanabria, Spain), sac de gemecs (Catalunya) etc. Most of them have a conical chanter with a partial

second octave, obtained by overblowing. Folk groups playing these instruments have become popular in recent years, and pipe bands for some models.  
Sac de gemecs : used in Catalonia. In the Balearic Islands, Mallorca, Minorca, (but not Ibiza), this same bagpipe is called a "Xeremie" and is played in a duet with a Flabiol (one handed) whistle and drum.  
Galician gaita is a traditional bagpipe used in Galicia and Minho.

## Italy

Zampogna : A generic name for an Italian bagpipe, with different scale arrangements for two chanters (for different regions of Italy), and from one to three drones (single drone versions can sound a fifth, in relation to the chanter keynote). Other drones are tuned higher or lower than the chanters, and the drones, like the chanters, can be single or double reeded. The double reeded version of the Zampogna is generally played with the Piffero [called "biffera" in the Ciociaria] (a shawm, or folk oboe), which plays the melody and the Zampogna provides chord changes, "vamping" or rhythmic harmony figures or a bass line and a soprano harmony as an accompaniment. This double reed tradition would include the Ciociaria (Latium, southern Abruzzo and Molise), that of southern Basilicata (Pollino) and nearby areas of Calabria, and some areas of Sicily (Siracusa, Palermo). Single reed versions are played solo in the Calabrian tradition of the "surdullina"(Cosenza), and a version with a plugged chanter called the "surdullina Albanese," and the Sicilian "chiamedda" or "chiamella" (Messina). The chanters and drones vary, according to the tradition, from a few inches long (surdullina) to two meters in length, such as used in the cathedral of Monreale (Palermo) and nearly every size in between. The word "tzipounas/tsimponas" still used for bagpipe in Pontic Greek and Turkish (Trebizond region of northeast Anatolia; its Romanian counterpart is "cimpoi", which also means symphony or "many sounds played together").  
Piva, used in northern Italy (Bergamo, Emilia). A single chantered, single drone instrument, with double reeds, often played in accompaniment to a shawm, or piffero.  
Launeddas of Sardinia. While not strictly a bagpipe in that it is played in the mouth by circular breathing, it is nonetheless a cousin and likely ancestor of the Italian zampogna, in that it has two chanters and a drone, all single reed. They vary, according to the tradition, from about a foot long to almost a meter in length.

## Sweden

- Säckpipa : Also the Swedish word for 'bagpipe' in general, this instrument was on the brink of extinction in the first half of the 20th century. It has a cylindrical bore and a single reed, as well as a single drone at the same pitch as the bottom note of the chanter.

## Switzerland

- Schweizer Sackpfeife (Swiss bagpipe): In Switzerland, the "Sackpfeife" was a common instrument in the folk music from the middle-ages to the early 18th century –

documented by iconography and in written sources (one or two drones and one chanter with double reeds).

## Southwest Asia and North Africa

### Anatolia

Dankiyo: An ancient word for bagpipe in Trebizond area in the text of Evliya Çelebi (17. century, Ottoman Era)"The Laz's of Trebizond invent bagpipe called dankiyo..." Etymology: < Ancient Greek *To ankiyo*, *angion* (ἀγκύιον) "skin, bagpipe" Source: Öztürk, Özhan (2005). *Karadeniz: Ansiklopedik Sözlük*. 2 Cilt. Heyamola Yayınları. İstanbul. p. 300 ISBN 975-6121-00-9.  
Tülüm : skin bag; Turkish bagpipe featuring two parallel chanters, (and no drone) usually played by the Laz and Hamsheni people.

### North Africa

- Mizwad (Arabic مِزْوَاد / plural مِزْوَادَات / *mizwad*): Tunisian bagpipes; often referred to as *mezoued*, a French form of the Arabic word. *Mizwad* literally means "sack". The *mizwad* is also known as the *zukah* (زُكْرَاه / pl. زُكْرَاهَات / *zukah*), a word literally meaning "(wine)skin".

# Ukulele

The **ukulele** (pronounced /ˈukulele/, or the Anglicised /ɪjʊkʏˈleɪli/), or **uke**, is a fretted [string instrument](#) which is, in its construction, essentially a smaller, four-stringed version of the [guitar](#). In the early 20th century, the instrument's name was often rendered as "ukelele", a spelling still used in Great Britain. The Hawai'ian spelling **‘ukulele** is also sometimes seen.

## History

It is commonly associated with [music](#) from Hawaii where the name roughly translates as "jumping flea" and was developed there in the 1880s as a combination of the Madeiran Portuguese braguinha and rajão. A braguinha is a cavaquinho-like instrument built in the city of Braga and named after it; the Brazilian cavaquinho is usually tuned in D-G-B-D, a G-major chord. The Madeiran rajão is tuned D-G-C-E-A, in other words, the D and G strings are both re-entrant, i.e., tuned an octave higher than expected in the normal low-to high course of strings. The GCEA strings of the rajão are the source of the re-entrant tuning of the modern ukulele.

In 1879 the three men generally credited as the first ukulele makers arrived from Portugal in Hawai'i, sailing into Honolulu on the ship Ravenscrag. These were Manuel Nunes, José do Espírito Santo, and Augusto Dias. One of these, Manuel Nunes, was the neighbor of famous ukulele player Bill Tapia. He sold Bill his first instrument for 75¢ many years later in 1915.

The ukulele comes in four sizes, (from smallest to largest): soprano (the original size), concert, tenor (created in the 1920s), and baritone (created in the late 1940s). On a tenor instrument, the strings may be doubled : six strings (where first and third strings are doubled) or eight strings (where all fourth strings are doubled with second and fourth course). In traditional Hawaiian tuning, first and third courses are tuned in an octave.

In the United States, soprano and concert ukes are usually tuned in the [chord](#) of C6: G-C-E-A from low to high, with the G-string traditionally tuned an octave up (re-entrant), so it is [pitched](#) between the E- and A-strings. In the past, it was not uncommon for the soprano to be tuned a whole step higher in the [chord](#) of D6: A-D-F#-B, with the lowest [note](#) being D (the A is a whole step below the B). This tuning was very popular in vaudeville in the days before amplification. The tension and tone are a little brighter and louder. This tuning is still used today by some known personalities in ukulele circles.

The baritone ukulele, which was not invented (or developed) until the 1940s at the request of Arthur Godfrey, is usually tuned in G (like the top four strings of a guitar, D-G-B-E) which makes it as much a tenor guitar as a ukulele.

The tenor ukulele can be tuned either way, and in C tuning is sometimes tuned with the G-string an octave lower, so it's pitched below the C-string, where you might expect it. Some historians say such a tuning makes it a small guitar, since the re-entrant tuning is the characteristic that most identified the original ukulele.

An alternative tuning is Bm-Em-G-C (raised a semitone to the key of E flat). Either of these tunings, and the C tuning above, may be referred to jocularly as "My dog has fleas", because the strings sounded in order are the same as the phrase in the song My Dog Has Fleas.

Other tunings are in use today. Some more creative-minded ukulele players tune their ukuleles to the key of Bm, F, or any tuning they see the need to utilize. Some even tune their ukuleles to E-A-D-G—the bottom four strings of a guitar. These never became popular, but because the ukulele is a stringed instrument, it can be tuned to the player's specifications.

## Tuning a Ukulele

Since the ukulele is a stringed instrument, it can be tuned with a guitar tuner or a pitch pipe. Like all stringed instruments, the ukulele becomes detuned if not frequently tuned. When the strings are new, the ukulele cannot hold a tune for more than a few seconds. It can take up to two weeks for new strings to stretch out and hold a tune. If old strings are put on a ukulele, it will still take some time before the strings can hold a tune, but it usually only takes two days or less, depending on how much the string has been stretched in the past.

## Ukulele musicians

Musicians and entertainers, both past and present, particularly known for playing the ukulele include:

Former Beatle George Harrison became very excited about the ukulele in the last few years of his life in particular. He was reported to have always travelled with two ukuleles so that he could play with someone, including producer and musician Jeff Lynne and fellow former Beatle Paul McCartney. Other famous people known to have dabbled with the ukulele are Joni Mitchell, Jimi Hendrix, David Byrne, Chrissie Hynde, Neil Armstrong, Warren Buffet, Loudon Wainwright, Tony Blair and Elvis Presley.

## Tahitian ukulele

The Tahitian ukulele is significantly different from other ukuleles because it does not have a sound box. The body—including the head and neck—is carved from a single piece of wood, with a wide conical hole bored through the middle. At the back, the bore is about 4 cm in diameter; at the front it is about 10 cm in diameter. The hole at the front is covered with a thin piece of wood, on which the bridge sits, so the instrument works rather like a wooden-skinned banjo. Indeed some of these instruments are referred to as Tahitian banjos. The strings are usually made from light-gauge fishing line—usually green in colour (usually around 40-50 lb test).

The instrument seems to be a relatively recent invention, popular in eastern Polynesia, particularly French Polynesia. It is reported to have been introduced to the Cook Islands in 1990 by the band Te Ava Piti as a newly invented instrument.

### Tuning a Tahitian ukulele

These instruments may have just four strings—or some strings may be paired, so that the instrument has six or eight strings.

The strings or pairs ("courses") are tuned to  $A_6 D_6 F\#_6 B_5$  or  $G_6 C_6 E_6 A_5$

After the Hawaiian ukulele was invented, the Hawaiians referred to a similar, eight-string instrument tuned GCEA as a taro-patch fiddle. Before the invention of the ukulele, taro-patch fiddle referred to the rajão.

Those who are familiar with ukulele chords will find that the same chord shapes will fit these tunings, but that the chords will be transposed and inverted.

# Underground gabber

**Underground gabber** or **real gabber** refers to non-commercial [gabber](#) music created mostly for artistic expression and not for monetary purposes. Some underground [DJs](#), after some years off of the non-commercial stage, did find a way to make money through their music and even began to change the music style to [rave](#), [trance music](#), [hip hop music](#) or [happy hardcore](#). This was partly the product of discovering new musical skills and also because of different music influences. This situation caused some underground gabber fans to name their music **real gabber** instead of [gabber](#).

Categories: [Techno music genres](#)

## Uplifting trance

**Uplifting trance**, also known as **anthem trance**, is a subgenre of [trance music](#) that emerged in the wake of progressive trance in the late 1990s. Characterized by extended [chord progression](#) in all elements (lead synth, bass chords, treble chords), extended breakdowns, and relegation of arpeggiation to the background while bringing wash effects to the fore.

## Genre

**Uplifting trance**, while commonly referred to as "anthem trance" or "epic trance", is a subgenre of trance electronica forming in the mid-to-late 90's. Uplifting trance is derived partially from progressive trance, but is characterized by its own unique chord progressions. Uplifting trance songs usually have longer breakdowns than progressive trance, and contain melodies that are similar to that of [happy hardcore](#), giving it the nickname "happy trance". They tend to keep a steady beat around 140 BPM throughout the song (excluding occasional breakdown breakbeats) Many uplifting trance [DJs](#) seek to be independent of epic and anthem trance, relying solely on the more joyous progressions of underground trance songs. Since the uplifting trance scene was only popular in the late 1990s, today's uplifting DJs have little club exposure especially in the western hemisphere, and thus uplifting trance has become more and more underground in the 2000's. This has led to a strong decrease in the number of famous uplifting DJs, though some still exist.

# Uptempo

**Uptempo** (sometimes **UpTempo** or **up tempo**) is an umbrella term for a quick-paced [electronic music](#) style. Other than for example [Downtempo](#), Uptempo is usually intended more for dancing than relaxing and socializing, as most releases are produced for the dance floor.

Examples are Holly Valance's "Downboy" and Sarah Connor's "One Nite Stand (Of Wolves And Sheep)" featured Wyclef Jean.

# Urban Folk

**Urban Folk** is a form of [folk music](#) which combines elements of traditional folk and [post-punk/new wave](#) influences. It got its name from the fact that the songs often reflect urban life. The style borrows more from the "Feeling" of punk (i.e. the directness and, often, the political subject matter) than the actual sound. It is closely related to [anti-folk](#).

## [Folk music](#)

[American folk music](#) - [Anti-folk](#) - [Celtic music](#) - Counterfolk - Filk music - [Folk metal](#) - [Folk punk](#)  
[Folk-rock](#) - [Folktronica](#) - [Neofolk](#) - Pop-folk - [Psych folk](#) - [Roots revival](#) - **Urban Folk**  
[Folk dance](#) - [Instrumentation](#) - [Protest song](#) - [Singer-songwriter](#) - [Traditions](#) - [World music](#)

# Urban jazz

**Urban jazz** is the fusion of [smooth jazz](#) and [R&B/hip-hop](#) music. Urban jazz usually contains strong R&B percussion and bass lines. The better known urban jazz artists are Boney James, Urban Jazz Coalition , Wayman Tisdale, and Paul Jackson, Jr.

Due to the natural progression from jazz to hip hop and hip hop's sampling of jazz, it only made sense to cover [hip hop](#) and [R&B](#) with jazz musicians.

Some of the more successful releases in this genre have been more creative while other more laidback releases have struggled. One great release Hidden Beach Unwrapped featured Paul Jackson Jr, Mike Phillips, and vocalists covering Notorious BIG and other hip hop acts. This led to a series of imitation releases including the lackluster Streetwize.

A genre that is definitely growing, urban jazz has an increasing audience on non conventional radio, TV and especially the internet.

Categories: [Jazz](#) | [Jazz genres](#)

# Urban Pasifika

**Urban Pasifika** is a sub-genre of [hip hop](#) which combines American style hip hop or [R&B](#) rhyming and beats with Pacific Island or Maori instrumentation (such as [ukulele](#) samples) and Pacific Island or Maori language [singing/rapping](#).

It originated in Auckland, New Zealand in around 1993 with the release of the album **Urban Pasifika - Pioneers of a Pasifikan Frontier** on an Auckland based [record label](#) started by Phillip Fuemana called Urban Pasifika Records. This [record label](#) is widely credited with creating the genre.

**Urban Pasifika** can also be called *Pasifikan Hiphop* and has close links with New Zealand hip hop.

Main artists active in this sub-genre include:

Che Fu  
King Kapisi  
Dei Hamo  
Adeaze  
Savage (rapper)  
Deceptikonz

# Varnam

**Varnam** is one of the most important parts of [Carnatic music](#).

It has two types:

- Tana varnam
- Pada varnam

On the concert stage, the varnam occurs quite often. At the opening of any concert, one varnam will be performed.

Varnams are considered vocal exercises in a particular [raga](#). The patterns in a varnam are considered to be characteristic patterns of a particular raga or scale. Varnams are considered the most complex of the vocal exercises in Carnatic Music. They are designed to help develop voice culture and proper control of rhythm. Indeed, varnams are often practiced in double and triple speeds and proper rhythmic control (tala) must be kept.

Tana varnams are considered pure vocal exercises, and pada varnams are generally sung to accompany South Indian classical dance (bharatanatyam). Pada varnams generally contain much more text and lyric content than the tana varnam. The tana varnam is composed of just a few lines, and words may be extended through many notes. For example, many varnams contain the lyric "*Smi*", meaning God, may be extended to "*sa a a a a m i i i i i i*"... and so on.

The varnam is subdivided into several sections:

- Pallavi: the first line, sung with lyric
- Anupallavi: a sort of recapitulation, sung with lyric
- Muktyi Swaram: sung completely with syllables -- or swaras -- (like *sa ri ga ma pa da ni sa*)
- Charanam: sung with lyric
- Charanam Swaras: sung completely with syllables. In a Pada varnam, there are lyrics which correspond to the Charanam swaras. The swaras occur in several groups or stanzas.

Generally, a varnam is sung as follows:

- Pallavi
- Anupallavi
- Muktyai Swaram
- Pallavi (in double speed)

Repeat, then Pallavi sung in triple speed, or in original speed.

- Charanam
- Charanam Swara Group 1
- Charanam
- Charanam Swara Group 2
- Charanam
- Charanam Swara Group 3
- Charanam
- Charanam Swara Group 4

- Charanam

There are generally 3-5 swara groups in every varnam. In a concert, the entire charanam section is sung at approximately 1.5 speed.

Varnams are generally sung in 2 varieties of talas, or metric systems, *Adi Tala* (8 beat cycle) and *Ata Tala* (14 beat cycle), where *Ata Tala* varnams are generally more complicated and advanced.

Famous *adi tala tana* varnams include "Smi Ninne" in *raga Sree* and "Valachi Vacchi" in a *navargamlika*, or 9 ragas. Famous *ata tala* varnams are "Viriboni" in *raga Bhairavi*, and "Nera Nammi" in *raga Knada*. A famous *adi tala pada* varnam is "Chalamela" in *raga Nttakurinji*.

## Venetian polychoral style

The **Venetian polychoral style** was a type of music of the late [Renaissance](#) and early [Baroque](#) eras which involved spatially separate [choirs](#) singing in alternation. It represented a major stylistic shift from the prevailing polyphonic writing of the middle Renaissance, and was one of the major stylistic developments which led directly to the formation of what we now know as the Baroque style. A commonly encountered term for the separated choirs is *cori spezzati*—literally, separated choirs.

## History of the style

The style arose from the architectural peculiarities of the imposing Basilica San Marco di Venezia, also known as St. Mark's, in Venice. Aware of the sound delay caused by the distance between opposing choir lofts, composers began to take advantage of that as a useful special effect. Since it was difficult to get widely separated choirs to sing the same music simultaneously (especially before modern techniques of conducting were developed), composers such as Adrian Willaert, the *maestro di cappella* of St. Mark's in the 1540s, solved the problem by writing antiphonal music where opposing choirs would sing successive, often contrasting phrases of the music; the stereo effect proved to be popular, and soon other composers were imitating the idea, and not only in St. Mark's but in other large cathedrals in Italy. This was a rare but interesting case of the architectural peculiarities of a single building influencing the development of a style which not only became popular all over Europe, but defined, in part, the shift from the Renaissance to the Baroque era. The idea of different groups singing in alternation gradually evolved into the [concertato](#) style, which in its different instrumental and vocal manifestations eventually led to such diverse musical ideas as the [chorale cantata](#), the [concerto grosso](#), and the [sonata](#).

The peak of development of the style was in the late 1580s and 1590s, while Giovanni Gabrieli was organist at San Marco and principal composer, and while Gioseffo Zarlino was still *maestro di cappella*. Gabrieli was the first to specify instruments specifically, including large choirs of brass; he also began to specify dynamics, and to develop the "echo" effects for which he became famous. The fame of the spectacular, sonorous music of San Marco at this time spread across Europe, and numerous musicians came to Venice to hear, to study, to absorb and bring back what they learned to their countries of origin. Germany, in particular, was a region where composers began to work in a locally-modified form of the Venetian style, though polychoral works were also composed elsewhere, such as the many masses written in Spain by Tomás Luis de Victoria.

After 1603, a basso continuo was added to the already considerable forces at San Marco—orchestra, soloists, choir—a further step towards the Baroque cantata. Music at San Marco went through a period of decline, but the fame of the music had spread far, and transformed into the concertato style. In 1612 Claudio Monteverdi was appointed *maestro di cappella*, and though he brought the musical standards back to a high level, the vogue of the polychoral style had passed; concertato music, much with solo voice, was now the norm; the productions of this late period are identifiably Baroque.

## **Representative composers**

Adrian Willaert  
Cipriano de Rore  
Giuseppe Zarlino  
Claudio Merulo  
Giovanni Gabrieli  
Andrea Gabrieli  
Claudio Monteverdi  
Hans Leo Hassler

## Examples of the style

- Adrian Willaert, *salmi spezzati*
- Andrea Gabrieli, *Psalmi Davidici*
- Giovanni Gabrieli, *sacrae symphoniae*
  - *in ecclesiis*
  - *Sonata pian' e forte*

# Venetian School

In music history, the **Venetian School** is a term used to describe the [composers](#) working in Venice from about 1550 to around 1610; it also describes the music they produced. The Venetian polychoral compositions of the late 16th century were among the most famous musical events in Europe, and their influence on musical practice in other countries was enormous. The innovations introduced by the Venetian school, along with the contemporary development of monody and [opera](#) in Florence, together define the end of the musical [Renaissance](#) and the beginning of the musical [Baroque](#).

Two major factors came together to create the Venetian School. The first, and most important, was the existence of the splendid Basilica San Marco di Venezia (commonly known as St. Mark's), with its unique interior with opposing choir lofts. Because of the spacious architecture of this basilica, it was necessary to develop a musical style which exploited the sound-delay to advantage, rather than fought against it: thus the [Venetian polychoral style](#) was developed, the grand antiphonal style in which groups of singers and instruments played sometimes in opposition, and sometimes together, united by the sound of the organ. The first composer to make this effect famous was Adrian Willaert, who became maestro di cappella of St. Mark's in 1527, and remained in the position until his death in 1562. Gioseffo Zarlino, one of the most influential writers on music of the age, called Willaert "the new Pythagoras," and Willaert's influence was profound, not only as a composer but as a teacher, since most of the Venetians who followed studied with him.

The other factor which promoted the rich period of musical creativity was printing. In the early 16th century Venice, prosperous and stable, had become an important center of music publishing; composers came from all parts of Europe to benefit from the new technology, which then was only a few decades old. Composers from northern Europe—especially Flanders and France—were already renowned as the most skilled composers in Europe, and many of them came to Venice. The international flavor of musical society in the city was to linger into the 17th century.

In the 1560s, two distinct groups developed within the Venetian school: a progressive group, lead by Baldassare Donato, and a conservative group, led by Zarlino who was then maestro di cappella. Friction between the two groups came to a head in 1569 with a dramatic, public fight between Donato and Zarlino during the Feast of St. Mark. Members of the conservative branch tended to follow the style of Franco-Flemish polyphony, and included Cipriano de Rore, Zarlino, and Claudio Merulo; members of the progressive group included Donato, Giovanni Croce, and later Andrea and Giovanni Gabrieli. An additional point of contention between the two groups was whether or not Venetians — or at least Italians — should be given the top job of maestro di cappella at St. Mark's. Eventually the group favoring local talent prevailed, ending the dominance of foreign musicians in Venice; in 1603, Giovanni Croce was appointed to the job, followed by Giulio Cesare Martinengo in 1609 and Claudio Monteverdi in 1613.

The peak of development of the Venetian School was in the 1580s, when Andrea and Giovanni Gabrieli composed enormous works for multiple choirs, groups of brass and string instruments, and organ. These works are the first to include dynamics, and are among the first to include specific instructions for ensemble [instrumentation](#). Organists working at the same time included Claudio Merulo and Girolamo Diruta; they began to define an instrumental style and technique which moved to northern Europe in the succeeding generations, culminating in the works of Sweelinck, Buxtehude, and eventually J.S. Bach.

The term **Venetian School** is sometimes used to distinguish it from the contemporary, and very different, [Roman School](#). Other important centers of musical activity in Italy at the same time included Florence (the birthplace of opera), Ferrara, Naples, Padua, Mantua and Milan.

# Composers

Major members of the Venetian school include:

Adrian Willaert (c.1490-1562)  
Jacques Buus (c.1500-1565)  
Andrea Gabrieli (c.1510-1586)  
Nicola Vicentino (1511-c.1576)  
Cipriano de Rore (c.1515-1565)  
Gioseffo Zarlino (1517-1590)  
Baldassare Donato (1525-1603)  
Annibale Padovano (1527-1575)  
Costanzo Porta (c.1529-1601)  
Claudio Merulo (1533-1604)  
Gioseffo Guami (c.1540-1611)  
Vincenzo Bellavere (d.1587)  
Girolamo Diruta (c.1554-after 1610)  
Girolamo Dalla Casa (d.1601)  
Giovanni Gabrieli (c.1555-1612)  
Giovanni Croce (c.1557-1609)  
Giovanni Bassano (c.1558-1617)  
Giulio Cesare Martinengo (c.1561-1613)

# Verdiales

**Verdiales** are a [Flamenco](#) music style, and song form belonging to Canté Chico.

Originating near the Spanish port of Málaga in Andalusia, it is based upon the [fandango](#). For this reason, the Verdiales are sometimes known as *Fandangos de Málaga*.

Normally played in the key of E major (rarely, A minor), the Verdiales have a 12-count rhythm similar to the Soleares, and [Bulerias](#).

Categories: [Flamenco styles](#)

# Verse

**Verse** is writing which uses meter as its primary organizational mode, as opposed to prose, which uses grammatical and discursal units like sentences and paragraphs. Verse may also use rhyme and other technical devices that are often associated with poetry.

Not all verse is poetry. Generally speaking, what separates the two is that in poetry language achieves the highest possible level of condensation.

Holy books such as the Bible or Qur'an are divided into small verses.

## Popular music

In [popular music](#) a **verse** roughly corresponds with a poetic stanza. It is often sharply contrasted with the chorus or [refrain melodically](#), [rhythmically](#), and [harmonically](#), and assumes a higher level of dynamics and activity, often with added instrumentation.

# VGM

**VGM** (**V**ideo **G**ame **M**usic) is a [audio format](#) for multiple video game platforms, such as Sega's Master System, Game Gear, Mega Drive/Genesis, SG-1000 Mark III, and possibly many others in the future.

The normal filename extension is .vgm, but files can also be Gzip compressed into .vgz files. Technically, .vgz files should be named .vgm.gz, but because some popular operating systems' file managers cannot handle file name suffixes that themselves contain a dot, .vgz is used in order to launch a VGM player (eg. Winamp with the proper plugin) and not a data compression program such as WinZip or WinRAR.

On November 20, 2005, VGM 1.50 was officially announced, and a new version of the input plugin released. The new version of the format now supports PCM optimization for the Yamaha YM2612 sound chip, what makes sound files using the chip a lot smaller - sometimes with over 75% of size reduction. The first YM2612 VGM archive, Project 2612, optimized all of its packages soon after.

# Vibraphone

The **vibraphone**, sometimes called the **vibraharp** or simply the **vibes**, is a [musical instrument](#) in the [percussion](#) family.

It is similar in appearance to the [xylophone](#), although the vibraphone uses metal bars instead of the wooden bars on the xylophone. The standard modern instrument has a range of three octaves, from the F below middle C. Larger four octave models from the C below middle C are also becoming more common. The vibraphone is commonly played with cord or yarn mallets.

Below each bar is a resonator, a resonant metal tube, with a metal disc of a slightly smaller diameter located at the top. The discs in each tube are connected via a rod which can be made to rotate with an electric motor. When the motor is on and a note is struck, the notes acquire a tremolo sound as the resonators are covered and uncovered by the rotating discs. The player can vary the speed of the tremolo. At slower speeds, the effect sounds more like a "wah-wah-wah." At faster speeds the tremolo is more pronounced. With the motor off, the vibraphone has a mellow, bell-like sound. The "vibrato" sound effect is what the vibraphone was named after. Because the amplitude is what varies, not the pitch, the name of the instrument is somewhat of a misnomer. The sound is dated and many modern vibists eschew the effect altogether.

The vibraphone also has a sustain pedal similar to that used on a piano. When the pedal is up, the bars are all damped and the sound of each bar is quite short; with the pedal down, they will sound for several seconds, so frequent rapid pedalling is common when playing a vibraphone.

The vibraphone was invented in the United States in 1921. It has a long history as a [jazz](#) instrument. However, the vibraphone has since been used in many other musical idioms, including [popular music](#).

For a list of famous players, see vibraphonist.

## Technique

As with the [xylophone](#), early vibraphonists such as Lionel Hampton and Milt Jackson used two mallets to play the instrument. The instrument was primarily featured as solo instrument and contributed little to harmonic accompaniment. Modern vibraphonists such as Gary Burton, Mike Mainieri, Victor Feldman, Jerry Tachoir, Joe Locke and Dave Samuels, among others, use four mallets and the instrument has joined the modern jazz [rhythm section](#) as an accompaniment instrument. Often the vibes can substitute for a guitarist or pianist in this respect. The most common four-mallet grip used on the vibraphone is the Burton Grip named after Gary Burton. Five and six mallet grips are possible, but not as common, because using more mallets tends to adversely impact the player's ability to easily play melodic lines.

Phrasing is a constant consideration for the player due to the mechanics of the instrument. Vibraphone bars have an extremely long sustain time, often rivaling that of the electric guitar or piano. Unlike the piano, the vibraphone only allows for one sustain and dampening system: the sustain pedal and single dampening bar. With the pedal up, the notes played have an extremely staccato sound. Legato playing requires that the pedal be depressed, however this can lead to the notes bleeding together. To promote clarity in legato phrasing and prevent the notes of a melody from bleeding together, modern vibists employ the technique of mallet dampening. To do this, the vibist holds the pedal down and dampens the previous note in a melody with the head of the mallet when playing the subsequent note. This also allows the player to let a chord ring out while playing a melody line above it. This is another technical innovation introduced by Gary Burton.

One experimental technique is a note bend effect by sliding a mallet from the node (the portion of the bar through which the string passes) to the middle of the bar. While it does not actually bend the pitch, it does have the effect of filtering out the overtones. Another is using the bows of stringed instruments (such as a double bass bow) as an alternative way to cause the bars to vibrate.

Mike Mainieri, in 1964 invented the first pickup system for amplifying the vibes by glueing hot dot pickups on each nodal point of the bar. In the 70's Mainieri introduced the first monaural midi vibraphone and then in the 80's developed a polyphonic system that could trigger any synthesizer with a midi input. Since then other vibists have also experimented with incorporating electronics to the instrument. Some third-party companies market kits to add pickups to the bars, allowing electronic amplification and midi control.

# Computer and video game music

**Video game music** is any of the musical pieces or [soundtracks](#) from computer and video games.

# History

## 8-bit machines and chip music

Arcade games in the 1970s often contained [music](#) of some sort, but it was typically monotonous and so indistinct that it was easily dismissed and parodied. Often this music was simply folk songs which were transcribed by the programmers, who might have known little about music. This trend continued in arcade games well into the 1980s, and in early home consoles and computers until the release of the Commodore 64 and the Nintendo Entertainment System (NES). Previous game systems and home computers had for the most part continued the beeps and boops of early arcade games (except for the Magnavox Odyssey, which was silent). There were some exceptions however, and arcades often generally led the industry in technological innovation. For example some early games played fully sampled soundtracks from tapes, and many games by Exidy featured fully sampled digitized soundtracks.

The capabilities of the Commodore 64 and NES (not to mention numerous other 8-bit gaming computers and consoles of 1980s) were not up to what most people today would ever consider listening to, but the ability to play multiple tones simultaneously (effectively multiple instruments) at higher quality than had usually been possible before allowed composers to be much more creative with their music.

On the Commodore 64 it was composers such as Rob Hubbard and Martin Galway who started to compose video game music with catchy and profound melodies. Some people consider Hubbard's wildly spirited music for *Monty on the Run* (1985) as the beginning of profound computer game music. Martin Galway's music for *Rambo II* (1986) is another early milestone that relies on a strong melody. The C64's SID chip was highly advanced when the computer was released in 1982 and it took years before programmers (such as Hubbard and Galway) learned to fully utilize its capabilities.

Many melodies originally composed for the NES have become classics, notably music from the *Super Mario Bros.* (1985), *Legend of Zelda* (1986), *Dragon Quest* (1986), *Castlevania* (1986), *Mega Man* (1987), *DuckTales* (1989), *Fire Emblem* (1990) and *Final Fantasy* (1987). One of the most important NES-composers was Koji Kondo, who wrote themes for *Mario* and *Zelda*.

In the field of arcade games that were often played in noisy atmosphere, the quality of music got less attention with some notable exceptions like music by composer Hiroshi Miyauchi who wrote soundtracks for *Out Run* and *Afterburner*.

One notable case during this period was Atari's POKEY sound chip, which was used in 8-bit Atari computers such as the Atari 800 since 1979. The chip was highly advanced - excelling in the playback of digital samples in comparison to the SID, but no game composers tried to utilize its potential and the music of 8-bit Atari computers remained of low quality while able composers concentrated on the Commodore 64. The chip remained unused until the 1990s, when amateur composers started to explore the possibilities of the Pokey chip and compose music for it.

## 16-bit machines and digitized sound

The first computer to feature a digital sound processor was the Commodore Amiga released in 1985. Until the appearance of the Amiga, video game music often sounded characteristically "bleepy", (although some home computer sound chips, like the

Commodore 64's SID, partly ameliorated this). This was due to the use of basic sine wave synthesis instead of FM Synthesis or digitized sound.

The Amiga's 8364 "Paula" chip featured four independent 8-bit D/A converters. This gave the Paula four mono audio channels, or two stereo channels when two channels are combined. This meant for the first time a computer could play digital samples from memory without heavy CPU usage by using clever software tricks.

This was another evolutionary step in the progress of video game music technology, but a critical one that made it much easier for developers to put music that sounds like "real music" into their games. However, it took some years before Amiga game designers learned to wholly utilize digitized sound effects in music. In the early years of Amiga there was just few games (a notable case being the title music of text adventure game *The Pawn*, 1986), that used well made digitized instrument samples in their music. Also, by this time computer music had already begun to form its own identity, and thus many music makers intentionally tried to produce music that sounded like what was heard on the Commodore 64, which resulted in the [chiptune](#) genre.

The release of a freely distributed program named *Sound Tracker* by Karsten Obarski in 1987 started the era of MOD-format which made it easy for anyone to produce music based on digitized samples. MOD-files were made with programs called "trackers" after Obarski's *Sound Tracker*. This MOD/tracker -tradition continued with PC computers in 1990s. Good examples of Amiga games using digitized instrument samples include David Whittaker's soundtrack for *Shadow of the Beast*, Chris Hülsbeck's soundtrack for *Turrican 2* and Matt Furniss's tunes for *Laser Squad*. Richard Joseph also composed some theme songs featuring vocals and lyrics for games by Sensible Software most famous being *Cannon Fodder* (1992) with a song "War has never been so much fun" and *Sensible World of Soccer* (1994) with a song "Goal Scoring Superstar Hero." These songs used long vocal samples.

The Amiga's arch rival, Atari's own 16-bit computer the Atari ST, utilized the Yamaha YM2149 sound chip. Though many professional musicians used Atari ST as a MIDI device (ST was notable for having built-in midi ports), the computer's own YM2149 chip was not revolutionary. In some respects it was actually less advanced than the C64's SID. Of course, this did not mean that Atari ST music was bad - as many good tunes were composed for the ST. Although the ST's hardware was not designed for digital audio playback, programmers later learned to get digitized sound out of ST, but at the expense of processor time. Digitized sound was seldom heard on ST games. Towards the end of the ST's production, programmers were able to emulate the unique sound of the SID, again by using CPU intervention.

In the field of game consoles, the Sega Mega Drive/Sega Genesis was a huge step forward in sound quality from previous game console systems, but still had a limited variety of sounds due to its use of FM-synthesis. The SNK Neo Geo was also a big step forward, but its capabilities were less noticeable because it was primarily an arcade system, the home version of the Neo Geo failing to sell well due to its price. Nintendo's 16-bit console SNES finally brought music used in game consoles to a level of audio fidelity that most people would accept. With its Sony SPC700 chip, the SNES brought digitized sound effects to game consoles, spawning the modern age of this field of applied acoustics as exemplified by games such as the later *Final Fantasy* titles, *Chrono Trigger*, *Castlevania IV*, and *ActRaiser*. Since the Amiga's popularity was mostly limited to Europe, it was the SNES that brought digitized music for gamers in Japan and the USA. It was the first game console capable of producing sequenced audio which could fool an untrained ear into believing it had been recorded live. As in the case of Amiga, many SNES games did not utilize the potential of machine's sound capabilities very well, and thus many SNES games actually did not have essentially better sounding music than games for competing platforms. The quality of sequenced music on game consoles has also continued to improve on later systems as sound chips and increased storage space allow; the advent of CD-based consoles allowed some titles to include particularly impressive music, such as that found in *Final Fantasy VII* on the Sony PlayStation, or *Panzer Dragoon II* on the Sega Saturn.

## The arrival of CD-quality sound

From the point of view of game music listeners, digitized music was not entirely worthless. The old machines in 1980s had sound chips that produced personal sounds (see: [chiptune](#)) that are not heard anywhere else (the Atari XL is famous for its "metallic" bass-sounds). Despite sounding "bleepy" to gamers' parents, many gamers themselves liked these kinds of sounds. Amiga and SNES, though supporting digitized sound, still did not have CD-quality audio and lacked the large amounts of disk/ROM-space needed to store long pieces of digitized sound. Thus the music of Amiga and SNES still sounded very different compared to "ordinary" commercial music most of the time. But when the CD-ROM era and sound cards supporting 16-bit/44 kHz samples arrived, computer and video game music started to sound more and more like ordinary commercial music. It is a matter of opinion whether this is a good or bad thing, but the nature of video game music changed completely.

Video game music can be stored in several ways. The two most common are for it to be sequenced together from stored samples, or from computer-generated tones; or for the music to be prerecorded in either a standard CD format, or some streaming audio format. Sequenced music has been around from the start. Prerecorded music had previously been prohibitively expensive to use in video games, even in arcade games. When Teenage Mutant Ninja Turtles first appeared in the arcades, its recorded title screen song seemed amazing. Before that, some Amiga games had already included commercial music converted for Amiga (most notably in Xenon 2 by Bomb the Bass and in Gods by Nation 12) but that music, though sounded almost "real", was made by using long and numerous 8-bit samples in MOD-files.

The first widespread use of genuinely prerecorded music came with the release of the Turbograft 16/PC Engine CD system. This console never really caught on in the US, but was very long-lived in Japan. Other companies also released CD-based systems, which often had music saved in a standard CD format which one could listen to by putting the discs into any CD player. This Red Book audio format had a disadvantage in that it didn't allow the consoles of the time to access other data while playing music, and it took up a lot of space. Eventually, with the release of the Sega Saturn and Sony PlayStation, streaming audio formats were introduced (look for the .XA files on a Saturn or PlayStation disc). They use much less disc space and can be accessed much more quickly and randomly, and can contain loops. From early times, and continuing today, much video game music comes in the form of loops, music which repeats continually without interruption. This isn't always the case, and loops saw a particular decline with the popularity of CD-based game systems. Looped music is deemed necessary by many game designers, due to the uncertain time constraints in which a game will be played.

IBM PC compatible computers became a major format for gamers during the first half of 1990s when Commodore's and Atari's empires started to decline. It took quite a while for average PC computers to have a good support for digitized sound. Originally IBM PC was not made for gaming and it did not have any sound support except an ill-fated beeper gadget called PC speaker. Roland released a very good synthesizer module MT-32 used in PCs already in late 1980s but it was too expensive for the home user. The only affordable alternative available was the AdLib card which produced very acceptable FM synthesis but did not support digital sound. Soon afterwards, Creative's Sound Blaster cards came out, becoming the most popular sound cards during the first half of 1990s. The Sound Blaster had support for Adlib's FM synthesis and support for 8-bit digital audio. Eventually the Sound Blaster 16 came out (1992) which supported 44 kHz/16-bit sound, giving full CD quality. This happened about same time as CD-ROM drives arrived to homes. The gap between video game music and "real music" started to decline quickly - though CD-ROM drives and 16-bit sound cards did not put an immediate stop for using low-quality FM-synthesis of PC's sound cards on PC games (for example, the famous Doom game still used FM-music in 1993). Even though the hardware existed for MOD type songs in games and CD music, many games, especially action games, preferred to use FM synthesis

because it did not waste CPU cycles, which at the time were very limited. With an increase in CPU power every year, the eventual change for using CD music on games happened during the second half of 1990s (on Amiga this problem did not appear. Due to different kind of technology, MOD playing did not waste Amiga's CPU time and thus MOD format was widely used in Amiga games despite of computer's 7.14 MHz Motorola processor). The same kind of easy replay was also possible on PC's equipped with the Gravis Ultrasound, which provided hardware sample mixing - despite this, however, very few games supported the GUS, most remarkably those made by Apogee and Epic. Epic later put the module music into good use again with the release of Unreal and Unreal Tournament, thus allowing to have significantly better audio quality than its contemporaries.

## Recent years' developments

The storage media and file formats which have allowed the use of pre-recorded music have contributed to a trend towards using the music of well-known artists in video games. An early example would be *Way of the Warrior* on the 3DO, with music by White Zombie. A more well known example would be Trent Reznor's score for Quake. More recent games, especially sports and racing games produced in the US even more commonly use not only music composed by popular artists, but previously-released popular songs of theirs.

There have been games developed in recent years which actually use the music as a necessary component of the game. The most notable of these is the popular Dance Dance Revolution series, where players step on arrow buttons on a dance pad in time to the music. This genre is known as rhythm games.

Also in recent years, a trend towards combining the two approaches has begun. Games for the PC such as Republic: The Revolution (music composed by James Hannigan) and Command & Conquer: Generals (music composed by William Brown) have utilised sophisticated systems governing the flow of incidental music by stringing together short phrases based on the action on screen and the player's most recent choices. An earlier, more primitive use of this sort of technique (called iMuse) was created at LucasArts and utilised in such games as Monkey Island 2: LeChuck's Revenge on PC, Amiga & Macintosh, and X-Wing and TIE Fighter on PC. LucasArts also pioneered a technique in their Dark Forces series which allowed the game to dynamically mix the audio from "dramatic" and "standby" loops, attempting to mimic the musical cues found in movies.

Microsoft's Xbox console provided gamers with the ability to copy music from their own CDs onto the system's hard drive. This feature, called "Custom Soundtrack," allows users to play their stored music on any Xbox videogame which supports it, such as Major League Baseball 2k5 or Tony Hawk's Underground 2. The new Xbox 360 platform also has the Custom Soundtrack feature. Some games on the Xbox 360 and possibly other future consoles will have the ability to stream live internet radio during the game if the console is connected to the internet. This feature will most likely be taken advantage of during racing/driving games under the guise of a car radio.

## Game music as a genre

Many of the games made for the Nintendo Entertainment System and other early game systems featured a similar style of music which may come closest to being described as the "video game genre" in terms of musical composition, as opposed to simply "video game music" for being in a video game or being played on a video game console. Some compositional features of this genre continue to influence certain music today, though, game soundtracks currently tend to emulate movie soundtracks more-so than this classic genre. This genre's compositional elements may have developed due to technological restraints. Features of this genre include:

- Songs almost always have main sections or "verse sections" consisting of [chord progressions](#) of four or more chords (similar to much of J-Pop and 1980's Western Pop), as opposed to the two chord progressions found in most Western Pop verses. The "chorus" of the songs also often contain four or more different chords in their chord progressions. Often many songs feature a chord progression which is extremely popular in J-Pop, which (in the key of c) could be given as: F minor, C minor, G major, C minor, with C major quickly inserted before the series repeats again. Overall, there would be generally a higher number of sections of a song than a comparable pop song, as this helps to reduce the repetitive aspect of the music, which was generally played as a continuous loop. This also sets it apart from even J-Pop music or most other forms of popular music.
- Songs feature a heavy amount of synchronization between instruments, in a way that would be difficult for a human to play. For example, although the tones featured in NES music can be thought of emulating a traditional four piece rock band (triangle wave used as a bass, two pulse waves analogous to two guitars, and an affected white noise channel used for drums), and although video game music was influenced by rock or pop music at the time, composers would often go out of their way to compose complex and rapid sequences of notes. That has been compared to music composition during the [baroque](#) period, where it is believed that composers compensated for instruments such as the harpsichord (which do not allow for musical expression based on the volume of the sound) by focusing more on musical embellishments. Composers were also limited in terms of polyphony, or the amount of notes that can be played at once. Only three notes can be played at once on the Nintendo Entertainment System. A great deal of effort was put into creating the illusion that more notes are playing. As of the late 1990s, musical groups covering these melodies have sprung up. One such group is The Minibosses, who attempt to emulate these melodies as closely as possible using real instruments. Another such group is The NESkimos, who opt to explore these songs artistically, and create entirely new songs out of them.
- The bassline of a large percentage of tunes during the 8-bit period consisted of notes played in the rhythm of a quarter note followed immediately by two eighth notes on most beats. The particular note played would often be the root of the chord.

## Fan culture

The Final Fantasy series, including the Kingdom Hearts series, has some of the most popular music of any modern video game series, especially the pieces that are part of the work of Nobuo Uematsu, and it has been widely recognized for its soundtracks. Japanese game companies routinely make CD soundtracks, called OSTs (Original Soundtrack), for their games as they do with anime, and also make sheet music books for their games. Like animé soundtracks, these soundtracks and sheet music books are usually marketed exclusively in Japan. Therefore, interested non-Japanese gamers have to import the soundtracks and/or sheet music books through on or offline firms specifically dedicated to video game soundtrack imports. There are plenty of such firms, mostly online.

The Dragon Quest series music has one of the largest following in Japan. Every year there is at least one Dragon Quest Concert, conducted by Koichi Sugiyama. The Dragon Quest music has been performed by various orchestras, including the Tokyo Philharmonic Orchestra, NHK Symphony, and London Philharmonic Orchestra. There are more albums of Dragon Quest music released in Japan than those of any other video game series worldwide.

Some of those firms also offer animé soundtrack imports. Listening to video game music outside gaming, especially *Final Fantasy* music, along with animé music, is getting more and more popular among non-Japanese gamers. *Final Fantasy* has, in May 2005, become the first Japanese series to mass market music to the US (some soundtracks have had limited runs in specialty stores), offering its soundtracks on iTunes, and performing a series of live concerts. Video game music is performed by orchestras around the world, such as the London Symphony Orchestra or the FILMharmonic Orchestra in Prague. Final Fantasy music is enjoyed not only by gamers, but also by music lovers. The video game soundtrack market is growing and may extend to overseas markets. Many games, such as Fire Emblem, have a special feature, the Sound Room, where players can listen to unlocked game music.

Video game soundtracks are frequently "ripped" electronically through emulation in formats such as NSF, GBS, SID, HES, VGM, SPC, PSF, and PSF2, and can be played through modern media players like Winamp. Modern video game music is traditionally done in classical orchestra or techno music genres. A number of video game critics are known to prefer digitized recordings of orchestrated music in games as opposed to [synthesized](#) music. An example of orchestrated classical music in video games can be heard in *Super Smash Bros. Melee*, with its score performed by the aptly named Orchestra Melee.

On November 17, 2003, Square Enix launched the Final Fantasy Radio on America Online. The radio station has initially featured complete tracks from Final Fantasy XI and Final Fantasy XI: Rise of Zilart and samplings from Final Fantasy VII through Final Fantasy X. Inclusion of video game music on America Online Radio network, iTunes or on other online radio stations may contribute to the increase of realization of video games as a form of media or artwork.

Several video game music concerts have taken place. Five Orchestral Game Concerts were performed in Tokyo, Japan, from 1991 to 1996. In August 20, 2003 the first event of the European Symphonic Game Music Concert series took place at the Gewandhaus zu Leipzig in Germany, performed by the Czech National Symphony Orchestra. This sold-out concert appeared to be the first of its kind ever to occur outside of Japan. The concert was repeated in 2004 and 2005 as part of the Leipzig Games Conference.

A Final Fantasy concert was scheduled for the first time in the United States, and it was performed by the Los Angeles Philharmonic Orchestra at Walt Disney Concert Hall in Los Angeles, California, on May 10, 2004. The concert was a one-day sell-out: all seats were

sold out on a single day. That popularity led the concert, "Dear Friends: Music from Final Fantasy", to be performed at various cities across the United States. On July 6, 2005, the Los Angeles Philharmonic Orchestra also held a "Video Games Live" concert at the Hollywood Bowl. This concert featured a variety of video game music, ranging from Pong to Halo 2. It also incorporated real-time video feeds that were in sync with the music, as well as laser and light special effects.

Also notable is an a capella music group from the University of Wisconsin known as Redefined, who performed (and acted) an a capella medley of songs from popular Nintendo games including Super Mario Bros., Tetris, Mortal Kombat, and The Legend of Zelda. A video clip of the entire performance was widely circulated on the Internet in 2005.

Video game music is so popular that online cultures have been created, dedicated to bring new life to both old and new songs. These scenes vary from people who transcribe video game music to midi along with other scenes who remix video game music and release MP3 files. There are several websites (listed below) which serve this community.

## Video game music timeline

- 1980: Sega releases *Carnival*, the first game to have continuous background music. Previously, some games used prerecorded cassettes for music.
- 1983: Exidy releases *Crossbow*, the first game to feature fully digitized sounds (no music).
- 1984: The recording company known as "Yen" releases the first album with game music ever. *Video Game Music* contained music from various Namco games, including *Pole Position*, *Xevious*, *Pac-Man*, *New Rally X*, amongst others. This compilation of original Namco arcade music was released on LP (YLR-20003) and CT (YLC-20003).
- 1985: Yen, the world's first company to release a game music album, was discontinued after only two releases. The sequel to *Video Game Music* was released by Alfa.
- 1986: Game Music Organization was formed as Yen's successor. Abbreviated to G.M.O., it was the first major label recording company to release only game music. They released many albums for many Japanese developers, almost all with titles along the lines of: *[company] Game Music (vol. #)*. Example: *Sega Game Music Vol. 1*.
- 1987: The first video game orchestral concert is taken place at Suntory Hall, Tokyo, Japan. Named *Dragon Quest in Concert*, it is conducted by composer Koichi Sugiyama and features music from *Dragon Quest I* and *Dragon Quest II*.
- 1989: Game Music Organization is put to an end and Scitron becomes its successor. Scitron was put under Pony Canyon, instead of Alfa, as Game Music Organization was. Scitron didn't keep all the companies Game Music Organization had control over; Falcom and Konami went to King Records, Namco used Victor more and more, and many smaller development houses used King Records instead. Before, the game music industry was centered around Game Music Organization only, but now started to spread out. DATAM, Polystar's label for game music was also established now. KOEI creates the world's first in-house game music recording company.
- 1991: The first Orchestral Game Concert takes place in Tokyo, Japan, with music performed by the Tokyo Philharmonic Orchestra. The concert is repeated in 1992, 1993, 1994 and 1996. The series of concerts features music from games such as *Dragon Quest*, *Final Fantasy*, *Mario*, *The Legend of Zelda*, *Chrono Trigger* and many more.
- 1993: *Mortal Kombat II* is released with the DCS soundsystem, featuring the highest-quality music and sound effects in the arcade environment at the time.
- 1997: *The Lost World: Jurassic Park* is released on PlayStation with the first ever fully orchestral soundtrack in a video game. The first *Sakura Taisen* game featured some orchestra earlier, and *Heart of Darkness* was developed earlier, but not released until later.
- 2001: Accomplished Hollywood film composer Harry Gregson-Williams is hired to score *Metal Gear Solid 2: Sons of Liberty*.
- 2003: The first Symphonic Game Music Concert outside of Japan takes place in Leipzig, Germany, with music performed by the Czech National Symphony Orchestra and conducted by video game composer Andy Brick. The concert is repeated in 2004 and 2005. The series of concerts features music from games such as *Final Fantasy*, *Dragon Quest*, *Mario*, *Silent Hill*, *The Legend of Zelda*, *Metal Gear Solid*, *ActRaiser*, *The Elder Scrolls III: Morrowind*, *Turrican*, *Shenmue*, *Hitman* and many more. The concerts feature special performances by Shakespearan actor James Walker, piano virtuoso Seiji Honda, the rock band -123min. and percussionist Rony Barrak.

Composers such as Nobuo Uematsu, Yuzo Koshiro, Akira Yamaoka, Jason Hayes, Chris Huelsbeck, Rob Hubbard and many others attend the concerts.

- 2004: The first major U.S. concert featuring video game music takes place. A Final Fantasy Concert gets presented in Los Angeles, with music performed by the Los Angeles Philharmonic and the Los Angeles Master Chorale.
- 2004: During the 2004 Summer Olympics, the United States synchronized swimming duet of Alison Bartosik and Anna Kozlova wins the bronze medal whilst using two songs from Final Fantasy VIII in the second half of their routine.
- 2005: Composers Tommy Tallarico and Jack Wall introduce Video Games Live, the first U.S. Video Game Concert with playing from various games such as Mario, The Legend of Zelda, Halo, Metal Gear Solid, Warcraft, Myst, Final Fantasy, Castlevania, Medal of Honor, Sonic, Donkey Kong and many more. The L.A. Philharmonic Chorus and the L.A. Symphony Orchestra play at the concert, and features such guests as Martin Leung (AKA Video Game Pianist), and many more. Most of the announced 24 concerts get cancelled.
- 2005: The first worldwide videogame concert tour gets announced by the production team behind the Dear Friends - Music from Final Fantasy concerts. The name of the tour is PLAY! A Video Game Symphony (Video Game Symphony).

## Video single

A **video single** is a [music single](#) in the form of a videotape. Although the format has existed in form since the early 1980s in the form of Video 45s, the format gained higher levels of mainstream popularity when Madonna released "Justify My Love" as a video single in 1990 following the blacklisting of the video by MTV. U2 also released "Numb", the lead single from their 1993 album Zooropa as a video single.

Despite the success of these releases, the video single struggled as its releases were relatively periodical, and it was replaced by the DVD Single by the early 2000s.

# Viking metal

**Viking metal** is a cross-genre reference usually used to describe the lyrical and thematic elements of bands rather than the music itself. The bands that are associated with viking metal cover a broad range of musical genres and influences, such as [folk metal](#), [death metal](#), [black metal](#), and in some cases [power metal](#).

The origin of Viking Metal can be traced to the Swedish metal band Bathory, with the release of their fourth album in 1988, entitled Blood Fire Death. The album blended the aesthetics of [black metal](#), with an atmosphere rich in imagery of war and Norse mythology. Quorthon (The mastermind of Bathory) explains some of the philosophy behind the musical and lyrical changes from [black metal](#) to viking metal in Bathory for the official website .

Bathory would continue on to innovate the genre further with their next release in 1990, titled Hammerheart. The album further explored the romantic elements of the previous album, and experimented with Scandinavian folk instruments and musical form. Along with Skyclad's The Wayward Sons of Mother Earth, Hammerheart helped form the metal subgenre [folk metal](#). The album is regarded by many as an important and influential release in viking metal's history.

While viking metal cannot technically be categorised as a specific sub-genre with unique musical aspects, it does share similar themes and values. Common among all viking metal is a reverence for pagan Germanic, or Viking culture, as well as a rejection of contemporary Christianity, and disdain of the Christianisation of Northern Europe in favour of a pre-Christian, Pagan world. Thus, most viking metal bands are native Scandinavians and Germans, and often associate themselves with pagan and Ásatrú belief. The music is often highly romanticised and epic in composition similar to Norse folklore itself, and creates an atmosphere rich both in Germanic heroic and metal music tradition.

Some prominent viking metal bands include: Enslaved, midperiod Bathory, Moonsorrow, Ensiferum, Einherjer, Amon Amarth, Falkenbach, early Borknagar, early Vintersorg, Thyrfing, Týr, and Windir.

# Villancico

**Villancico** (or **Vilancete**, in Portuguese) was a common lyric form of the Iberian Peninsula, in the [Renaissance](#) epoch. The villancicos could also be adapted to music: many Iberian composers of the 15th and 16th century, like Juan del Encina or Pedro de Escobar composed musical villancicos.

This type of poem has a *mote* - the beginning of the poem, which functions, when in music, as a refrain - followed by one or more intervening stanzas - the *volta*, *copla* or *glosa* - each one with 7 verses. The difference between the villancico and the *canción* (*cantiga*) depends on the number of verses in the *mote*: if there are 2 or 3 it is a *villancico*, if there are 4 or more it is a *canción*.

Each verse of a villancico is usually divided in five or seven metric syllables ("old measure").

When the last verse of the *mote* is repeated at the end of each stanza, the villancico is "perfect".

Here is an example of a Portuguese villancico, written by Luís de Camões:

(Mote:)

Enforquei minha Esperança;  
Mas Amor foi tão madraço,  
Que lhe cortou o baraço.

(Volta:)

Foi a Esperança julgada  
Por setença da Ventura  
Que, pois me teve à pendura,  
Que fosse dependurada:  
Vem Cupido com a espada,  
Corta-lhe cerce o baraço.  
Cupido, foste madraço.

As you can see, the rhyme scheme is: abb cddc cbb, which is the most common one.

The theme of a Villancico was usually about the *saudade*, about the countryside and the shepherds, about 'the perfect woman' and about non-returned love and consequent suffering. Iberian poets were strongly influenced by Francesco Petrarca, an Italian poet.

# Villanella

In music, a **villanella** (pl. **villanelle** — not to be confused with the French poetic form villanelle) is a form of light Italian secular vocal music which originated in Italy just before the middle of the 16th century. It first appeared in Naples, and influenced the later [canzonetta](#), and from there also influenced the [madrigal](#).

The subject matter is generally rustic, comic, and often satirical; frequently the mannerisms of art music, such as the madrigal, are a subject of parody. The rhyme scheme of the verse in the earlier Neapolitan forms of the villanelle is usually abR abR abR ccR. The villanelle became one of the most popular forms of song in Italy around mid-century.

The music of the early villanella is invariably for three unaccompanied voices. The first composers of villanellas were the Neapolitans Giovanni Domenico da Nola and Giovan Tomaso di Maio; later composers of villanellas, no longer from Naples, included Adrian Willaert, Luca Marenzio, Adriano Banchieri, Orlande de Lassus and others.

# Viola

The **viola** (in French, *alto*; in German *bratsche*) is a stringed [musical instrument](#) played with a bow which serves as the middle voice of the [violin family](#), between the upper lines played by the higher violin (soprano register) and the lower lines played by the deeper [cello](#) (bass) and double bass.

The viola has an extremely rich sonority, much more full-bodied than the violin, dark-toned and earthy. Being frequently used for playing inner harmonies, the viola does not enjoy the wide solo repertoire of the violin, and though its deep mellow voice has its own beauty, the viola is sometimes underrated. In the right hands, it is both capable of expressing a mournful, penetrating melancholia and a dignified, joyous voice, unique and delightful in its restrained clarity. There are very powerful soloists who play the viola with tremendous volume and energy as well as very challenging pieces of music for viola which demand flair and the entire range of emotions one might expect to be drawn from any instrument.

## The form of the viola

The viola is similar in material and construction to the [violin](#) but is larger in size and more variable in its proportions. Unlike the violin, there is no standard "full size" viola. The reason for this is that the ideal viola size for the "best" tone quality (disregarding the craftsmanship of the instrument) would not fit on the player's shoulder. Therefore, violists compensate by playing the largest instrument practicable for the musician, and viola makers often compensate by tweaking the proportions or shape of the instrument in order to make a viola with a shorter string length and lighter weight which still has a large enough sounding box. It is increasingly common to see professional violists playing on instruments which, at first glance, bear little resemblance to the traditional shape of violins (see External Links). On average, the "full size" viola's body length is between one and four inches greater than the full size violin's.

The viola's four strings are tuned in fifths: the C an octave below middle C is the lowest, with G, D and A above it. This tuning is exactly one fifth below the violin, so that they have three strings in common — G, D, and A — and is one octave above the [cello](#).

## Playing the viola

While it may appear to be similar to the violin's, the technique required for playing viola has subtle but important differences. The most notable of these spring from the size of the viola.

- When a player switches from violin to viola (or vice versa), the viola will generally have a larger body as well as a longer string length. The most immediately noticeable accommodations a player must make are to use wider-spaced fingerings, a wider and more "extreme" vibrato in the left hand, and to place the bow farther away from the player's body (right arm). The player must also bring the left elbow farther forward or around, so as to reach the lowest string. This allows the fingers to be firm and create a clearer tone.
- The viola bow is slightly shorter (74.0 rather than 74.5 cm) than that of the violin, with a wider band of horse-hair, particularly noticeable near the frog (or 'heel' in the UK). Viola bows (70 to 74 g) are heavier than violin bows (58 to 61 g). Bowing technique differs from violin bowing in that more weight must be applied to pull sound from the strings. One reason for the extra weight requirement is that the viola's heavier strings and larger construction necessitate more energy to initiate vibration, thus the sound. (In the picture at right, the viola bow has a "Parisian" eye on the frog, with a metal ring around the shell eye.)
- The viola is usually strung with thicker strings than the violin. This, combined with its larger size and lower pitch range, results in a tone much more mellow and deep. However, a thicker string gauge also means that the viola "speaks" more slowly than its soprano cousin. Practically speaking, if a violist and violinist are playing together, the violist has to begin moving their bow a fraction of a second sooner than the violinist does to produce a sound that starts at the same moment as the violinist's sound.

## Tuning

Violas are tuned by turning the pegs near the scroll, around which the strings are wrapped. Tightening the string will raise the note (make it sharper) while loosening the string will lower the note (making it flatter). The A string is tuned first, typically to 440 Hz (see [Pitch \(music\)](#)). The other strings (D,G,C) are then tuned to it in intervals of perfect fifths, bowing two strings simultaneously. Some violas also have *adjusters* (also called *fine tuners*) that are used to make finer changes. These permit the tension of the string to be adjusted by rotating a small knob at the opposite end of the string, at the tailpiece. Such tuning is generally easier to learn than using the pegs, and adjusters are usually recommended for younger players. Adjusters work best, and are most useful, with higher tension metal strings. It is common to use one on the A-string even if the others are not equipped with them. The picture above shows normal stringing of the pegs. Some violists reverse the stringing of the C and G pegs, so the thicker C string does not turn so severe an angle over the nut.

Small, temporary tuning adjustments can also be made by stretching a string with the hand. A string may be flattened by pulling it above the fingerboard, or sharpened by pressing the part of the string in the pegbox. These techniques may be useful in performance, reducing the ill effects of an out-of-tune string until the arrival of a rest or other opportunity to tune properly.

The tuning C-G-D-A is used for the great majority of all viola music. However, other tunings are occasionally employed (for example, tuning the C string up to D), both in [classical music](#) (where the technique is known as *scordatura*) and in some [folk](#) styles.

## Viola music

Historically, the viola was used less often for solo concerti and [sonatas](#) than the violin and the cello. This was often attributed to its sound, which, being mellower and less brilliant than that of the violin, is less suited to virtuoso display. As the violist was usually also a violinist, the brighter instrument was usually picked as the solo instrument.

[Music](#) written for the viola differs from that of other instruments in that it primarily uses alto clef, which is otherwise rarely seen. Viola sheet music also frequently employs the treble clef for higher registers.

In [orchestral](#) music prior to the middle of the 19th century, the viola part is frequently limited to the filling in of [harmonies](#) with little [melodic](#) material assigned to it. When the viola gets melodic parts in music of that era, it might be duplication in unison or octaves of whatever other strings are playing.

A rare example of a piece written before the 20th century which features a solo viola part is Hector Berlioz's *Harold in Italy*, though there are also a few [Baroque](#) and [Classical](#) concerti, for example those by Telemann (one of the earliest viola concertos known) and Carl Stamitz.

The viola plays an important role in [chamber music](#). In the [string quartet](#), the function of the viola can be comparable to its function in the orchestra; filling in the inner harmonies. Mozart succeeded in liberating the viola somewhat when he wrote his six [string quintets](#), which are widely considered to include some of his greatest works. The quintets use two violas, which frees the instrument (especially the first viola) for solo passages and increases the variety and richness of the ensemble. Johannes Brahms wrote two greatly admired sonatas for viola and [piano](#), his Opus 120 (1894); these Brahms transcribed from the originals for the [clarinet](#). Brahms also wrote Two Songs for [Alto](#) with Viola and Piano (Zwei Gesänge für eine Altstimme mit Bratsche und Pianoforte), Op. 91, "Gestillte Sehnsucht" or "Satisfied Longing" and "Geistliches Wiegenlied" or "Spiritual Lullaby," which was a present for the famous violinist Joseph Joachim and his wife, Amalie. Antonín Dvořák played the viola, and was alleged to have said it was his favorite instrument; his chamber music is rich with important parts for the viola. Another Czech composer, Bedřich Smetana, included a significant viola part in his quartet "From My Life"; indeed the quartet begins with an impassioned statement by the viola.

The viola has also occasionally had a major role in orchestral music. An example of this is in the sixth variation of the *Enigma Variations* by Edward Elgar, called "Ysobel".

While the viola repertoire is quite large, the amount written by well-known pre-twentieth century composers is relatively small. Violists therefore choose to play arrangements of works originally written for the violin, cello or other instruments. Many solo viola pieces are transcribed from violin or cello.

In the earlier part of the 20th century, more composers began to write for the viola, encouraged by the emergence of specialised soloists such as Lionel Tertis. William Walton and Béla Bartók both wrote well-known viola concertos. One of the few composers to write a substantial amount of music for the viola was Paul Hindemith, who was a violist himself, often playing the premiere. Debussy's Sonata for Flute, Viola and Harp has inspired a significant number of composers to also write for this combination. Elliot Carter writes well for the viola. His *Elegy* is one of many fine compositions employing the viola, subsequently transcribed for clarinet. Ernst Toch wrote an Impromptu (opus 90b) for solo viola. Rebecca Clarke was a 20th century composer who also wrote extensively for the viola. In the latter part of the 20th century a substantial repertoire has been produced for the viola with many composers writing a [Viola Concerto](#), however most of these works struggle to establish themselves in the repertoire receiving only a limited number of performances.

Although rare, the viola is sometimes used in contemporary popular music, mostly in the avante-garde. The influential group Velvet Underground famously used a viola, as do some modern groups such as Defiance, Ohio and others. [Jazz](#) music has also seen its share of violists, from those used in string sections in the early 1900's to a handful of quartets and soloists emerging in from the 1960s onward.

The viola is also an important accompaniment instrument in Hungarian and Romanian folk string band music, especially in Transylvania. Here the instrument usually has four strings tuned g - d' - a - c (note that the a is an octave lower than found on the classical instrument), and the bridge is flattened with the instrument usually playing triads in a strongly rhythmic manner.

## Violists

There are only a few really well known viola virtuosos, likely owing to the bulk of the music featuring the instrument having been written in the twentieth century. Among the better known violists from the twentieth century are Lionel Tertis, Paul Hindemith, William Primrose, Joseph de Pasquale, Lillian Fuchs and Walter Trampler. More recent well-known violists include Yuri Bashmet, Kim Kashkashian, Garth Knox, Roberto Diaz, Wolfram Christ, Tabea Zimmermann, Nobuko Imai, Rivka Golani, Paul Neubauer, Karen Dreyfus, Patricia McCarty and, from the younger generation, Roland Glassl, Viacheslav Dinerchtein, Cathy Basrak, Paul Coletti and Antoine Tamestit.

Among the great composers, several preferred the viola to the violin when playing in ensembles, notably J. S. Bach and Wolfgang Amadeus Mozart. Numerous other composers also chose to play the viola in ensembles, including Joseph Haydn, Ludwig van Beethoven, Franz Schubert, Felix Mendelssohn, Antonin Dvorak, Benjamin Britten, and Rebecca Clarke.

Violas and violists are the target of the musical, intellectual, and moral equivalent of the blonde joke. This is probably the result of the mostly obsolete practice in nineteenth- and early twentieth-century orchestras of demoting to the viola section violinists who lose their playing ability as a result of age or lack of practice.

The term *violist* is not universally used in English; some players, generally British, prefer *viola player*.

## The viola in popular music

The viola sees limited use in popular music. It was sometimes part of popular dance orchestras in the period from about 1890 to 1930, and orchestrations of pop tunes from that era often had viola parts available. The viola largely disappeared from pop music at the start of the [big band](#) era. With the Charlie Daniels Band, Charlie Daniels has played viola instead of violin for some of the fiddling "Redneck Fiddlin' Man".

John Cale, a classically trained violist, played the instrument to great effect (amplified and often distorted) on two Velvet Underground albums, *The Velvet Underground* and *Nico and White Light/White Heat*.

Dave Swarbrick of the English Folk-Rock group Fairport Convention has been known to contribute viola among other stringed instruments to the band, most notably on the *Liege & Lief* album on the track "Medley..." where he plays violin with an overdubbed viola playing the same part an octave lower.

The viola has made a slight comeback in modern pop music; aided and abetted by string groups, Bond and Wild. In her latest album, *Lonely Runs Both Ways*, Alison Krauss uses the viola in many of her songs.

Most people will recall the melody presented by the Viola in the pop hit, *Dust in The Wind*.

# Viola concerto

The **viola concerto** is a [concerto](#) contrasting a [viola](#) with another body, usually a full [orchestra](#) or [string orchestra](#) but sometimes smaller. Early examples of the viola concerto include among others Georg Philipp Telemann's concerto in G, and several concertos by Carl Stamitz. The first concertante work to use the viola without caution — though extreme virtuosity only later became identified as **the** value desired in a concerto soloist — was the violin and viola Sinfonia Concertante of Mozart.

The viola has not been a popular instrument, and like the [cello](#) suffers from problems of projection against an orchestral ensemble. According to, for instance, Alfred Einstein among others, the essence of the concerto is not the display of virtuosity but conflict and resolution, and the viola is less suited than the piano, or even the violin, to balance itself against an orchestra that is not deliberately underused by the composer. One must consider also that viola players were often violinists retreated in ranks, and viola soloists few, until fairly recently! William Walton unleashed, though he did not necessarily begin, a more substantial output of viola works in the 20th century for newer and more capable players, and these in turn — Lionel Tertis for instance — arranged works originally for other (such as Edward Elgar's cello concerto.)

# Viola sonata

The **viola sonata** is a [sonata](#) for [viola](#), sometimes with other instruments, usually [piano](#). The earliest viola sonatas are difficult to date for a number of reasons:

- in the [Baroque](#) era, there were many works written for the viola da gamba, including sonatas (the most famous being Johann Sebastian Bach's three, now most often played on the [cello](#))
- in the [Classical](#) era and early [Romantic](#), there were few works written with viola specifically in mind as solo instrument; it was more typical to publish a work or set, like Georges Onslow's opus 16 cello sonatas, or Johannes Brahms's opus 120 clarinet sonatas in the late 19th century, that specified the viola as an alternate.
  - The Brahms may be the first repertory sonatas for the instrument, alternates with an independent life and a performance history.

# Violin

The **violin** is a bowed [stringed musical instrument](#) that has four strings tuned a perfect fifth apart. The range of the violin is from the G just below middle C to the highest notes of the [piano](#). It is the smallest and highest-tuned member of the [violin family](#), of string instruments, which also includes the [viola](#) and [cello](#). (A related bowed string instrument, the double bass, technically belongs to the similar but distinct viol family.)

A violin is sometimes informally called a fiddle, no matter what sort of music is played on it. The words "violin" and "fiddle" come from the same Latin root, but "violin" came through the Romance languages and "fiddle" through Germanic languages.

A person who plays violin is called a violinist or fiddler, and a person who makes or repairs them is called a luthier, or simply a violinmaker.

# History

The violin first emerged in northern Italy in the early 16th century. Most likely the first makers of violins borrowed from three different types of current instruments: the rebec, in use since the 10th century (itself derived from the Arab rebab), the Renaissance fiddle, and the lira da braccio. The Indian Ravanastron is also a predecessor of the violin. The earliest explicit description of the instrument, including its tuning, was in the *Epitome musical* by Jambe de Fer, published in Lyons in 1556. By this time the violin had already begun to spread throughout Europe.

It is said that the first real violin was built by Andrea Amati in the first half of the 16th century by order of the Medici family, who had asked for an instrument that could be used by street-musicians, but with the quality of a [lute](#), which was a very popular instrument among the noble in that time. Needless to say, the violin immediately became very popular, both among street-musicians and the nobility, illustrated by the fact that the French king Charles IX ordered Amati to build a whole orchestra in the second half of the 16th century.

The oldest surviving violin, dated inside, is the "Charles IX" by Andrea Amati, made in Cremona in 1564. "The Messiah" or "Le Messie" (also known as the "Salabue") made by Antonio Stradivari in 1716 remains pristine, never having been used. It is now located in the Ashmolean Museum of Oxford.

The most famous violin makers, called luthiers, between the late 16th century and the 18th century included:

- Amati family of Italian violin makers, Andrea Amati (1500-1577), Antonio Amati (1540-1607), Hieronymous Amati I (1561-1630), Nicolo Amati (1596-1684), Hieronymous Amati II (1649-1740)
- Guarneri family of Italian violin makers, Andrea Guarneri (1626-1698), Pietro of Mantua (1655-1720), Giuseppe Guarneri (Joseph filius Andreae) (1666-1739), Pietro Guarneri (of Venice) (1695-1762), and Giuseppe (del Gesu) (1698-1744)
- Antonio Stradivari (1644-1737) of Cremona
- Jacob Stainer (1617-1683) of Absam in Tyrol

It is still believed, perhaps erroneously, that at the beginning of the 18th century, the violin was built in a way that can be expressed as "perfect." It is commonly asserted that "Never since that time has a major improvement been made to the instrument", but changes *have* occurred, particularly to do with the length and angle of the neck, as well as a heavier bass bar. The majority of old instruments have undergone these modifications, and hence are in a significantly different state than when they left the hands of their makers, doubtless with differences in sound and response.

Nevertheless, instruments of approximately 300 years of age, especially those made by Stradivari and Guarneri del Gesù, are the most sought after instruments (for both collectors and performers). In addition to the skill and reputation of the maker, an instrument's age can also influence both price and quality.

# Violin construction and mechanics

## Construction

A violin typically consists of a spruce top, maple ribs and back, two endblocks, a neck, a [bridge](#), a soundpost, four strings, and various fittings, optionally including a chinrest, which may attach directly over, or to the left of, the tailpiece. A distinctive feature of a violin body is its "hourglass" shape and the arching of its top and back. The hourglass shape comprises an upper bout, a lower bout, and two concave C-bouts at the "waist," providing clearance for the bow.

The voice of a violin depends on its shape, the wood it is made from, the "graduation" (the thickness profile) of both the top and back, and the varnish which coats its outside surface. The varnish and especially the wood continue to improve with age, making the fixed supply of old violins much sought-after. Loose parts or open seams may cause buzzes and should be professionally attended to; in particular, no adhesive other than animal hide glue should ever be used on a violin. A well-tended violin can outlive many generations of players, so it is wise to take a curatorial view when caring for a violin.

The purfling running around the edge of the spruce top is said to give some resistance to cracks originating at the edge. It is also claimed to allow the top to flex more independently of the rib structure. Painted-on faux purfling on the top is usually a sign of an inferior instrument. Ideally the top is glued on with slightly diluted hide glue, to make future removal possible. The back and ribs are typically made of maple, most often with a matching striped figure, called "flame."

The neck is usually maple with a flamed figure compatible with that of the ribs and back. It carries the fingerboard, typically made of ebony, but often some other wood stained or painted black. Ebony is considered the preferred material because of its hardness, beauty, and superior resistance to wear. The maple neck alone is not strong enough to support the tension of the strings without distorting, relying for that strength on its lamination with the fingerboard. For this reason, if a fingerboard comes loose (it happens) it is vital to slacken the strings immediately. The shape of the neck and fingerboard affect how easily the violin may be played. Fingerboards are dressed to a particular transverse curve, and have a small lengthwise "scoop," or concavity, slightly more pronounced on the lower strings, especially when meant for gut or synthetic strings.

Some old violins (and some made to appear old) have a grafted scroll, or a seam between the pegbox and neck itself. Many authentic old instruments have had their necks reset to a slightly increased angle, and lengthened by about a centimeter. The neck graft allows the original scroll to be kept with a [Baroque](#) violin when bringing its neck to conformance with modern standard.

The [bridge](#) is a carefully carved piece of maple, having several purposes: its top curve holds the strings at the proper height from the fingerboard in an arc allowing each to be sounded separately by the bow. It also transmits the vibrations of the strings to the body of the violin. The sound post, or "soul post", fits precisely between the back and top, and may be moved slightly when adjusting the tone of the instrument.

The tailpiece anchors the strings to the lower bout of the violin by means of the tailgut, which loops around the endpin, which fits into a tapered hole in the bottom block. Very often the E string will have a fine tuning lever worked by a small screw turned by the fingers. Fine tuners may also be applied to the other strings, and are sometimes built in to the tailpiece.

At the scroll end, the strings wind around the tuning pegs in the pegbox. Strings usually have a colored "silk" wrapping at both ends, for identification and to provide friction against

the pegs. The tapered pegs allow friction to be increased or decreased by the player applying appropriate pressure along the axis of the peg while turning it. Various brands of peg compound or peg dope help keep the pegs from sticking or slipping.

## Strings

Strings were first made of sheep gut, stretched, dried and twisted. Modern strings may be solid steel, stranded steel, or various synthetic materials, wound with various metals.

Violinists carry replacement strings with their instruments to have one available in case a string breaks. A teacher can advise students how often to change strings, as it depends on how much and how hard one plays. Apart from obvious things, such as the winding of a string coming undone from wear, a player will generally change a string when it no longer plays "true", with a negative effect on intonation.

## Acoustics

*See also Sound production (string instruments)*

The arched shape, the thickness of the wood, and its physical qualities govern the sound of a violin. Patterns of the nodes (places of no movement) made by sand or glitter sprinkled on the plates with the plate vibrated at certain frequencies, called "Chladni patterns", are occasionally used by luthiers to verify their work before assembling the instrument.

## Sizes

Children learning the violin often use fractional sized violins,  $\frac{3}{4}$ ,  $\frac{1}{2}$ ,  $\frac{1}{4}$ ,  $\frac{1}{8}$ ,  $\frac{1}{10}$ , and  $\frac{1}{16}$ . Occasionally, even a  $\frac{1}{32}$  sized instrument is used.

The body length (not including the neck) of a 'full-size' or  $\frac{4}{4}$  violin is about 14 inches (35 cm) or smaller in some models of the 17th century. A  $\frac{3}{4}$  violin is 13 inches (33 cm), and a  $\frac{1}{2}$  size is 12 inches (30 cm). Viola size is specified as body length in inches rather than fractional sizes. A 'full-size' viola averages 16 inches (40 cm).

When determining the violin size appropriate for a child, a general rule is to have the child hold the instrument against the neck, and reach out past the end of the scroll. Some teachers feel that students can handle a size if they are able to reach around the end of the scroll and see the tips of the fingers, while others recommend smaller sizes as safer, preferring to have the scroll fall short of the student's wrist.

# Tuning

Violins are tuned by turning the pegs in the pegbox under the scroll, or by turning the fine tuner screws at the tailpiece. A violin always has pegs, but fine tuners (also called *fine adjusters*) are optional. These permit the string tension to be adjusted in very small amounts much more easily than by using the pegs. Fine tuners work by turning a small metal screw, which moves a lever that is attached to the end of the string. Fine tuners are usually recommended for younger players, fractional-sized instruments, those using high tension or metal strings, or beginners. Fine tuners are most useful with solid metal strings; since they do not stretch as much as synthetics, solid-core strings can be touchy to tune with pegs alone. Fine tuners are not useful when using gut strings; since these strings are more "stretchy", the tuners lack enough range of travel to make a significant pitch difference, and the sharp corners on the prongs may cause the string to break where the string passes over them. Most players use a fine tuner on the E-string even if the other strings are not so equipped.

The A string is first tuned to a standard [pitch](#) (usually 440 Hz) or to another instrument. (When playing with a fixed-pitch instrument such as a piano or accordion, the violin must tune accordingly.) The other strings are then tuned to each other, starting with the tuned A string, in intervals of perfect fifths by bowing them in pairs. Sometimes, a minutely higher pitch is used to tune for solo playing to give the instrument a brighter sound. After tuning, experienced players make sure that the bridge is standing straight and centered between the inner nicks of the f holes, since bridges are free to move about, being held in place only by the tension of the strings.

The tuning G-D-A-E is used for the great majority of all violin music. However, any number of other tunings are occasionally employed (for example, tuning the G string up to A), both in [classical music](#), where the technique is known as scordatura, and in some folk styles where it is called "cross-tuning." One famous example of scordatura in classical music is Saint-Saëns' *Danse Macabre*, where the solo violin's E string is tuned down to E flat to give the part an eerie dissonant sound.

Some electric violins have five, six, or even seven strings, others have the usual four. Usually the extra strings go lower, to C, F, and B flat. If the instrument's playing length, or string length from nut to bridge, is equal to a violin's (a bit less than 13 inches, or 330 mm,) it may be properly termed a violin. Acoustic 5-string instruments exist, with a scale length closer to that of a viola's; they are commonly called violas.

## Bows

A violin is usually played using a bow consisting of a stick with a ribbon of horsehair strung between the tip and frog (or nut, or heel) at opposite ends. A typical violin bow may be 29 inches (74.5 cm) overall, and weigh about 2 oz. (60 g). Viola bows may be about 3/16" (5 mm) shorter and 1/3 oz. (10 g) heavier.

At the frog end, a screw adjuster tightens or loosens the hair. Just forward of the frog, a leather thumb cushion and winding protect the stick and provide grip for the player's hand. The winding may be wire, silk, or whalebone (now imitated by alternating strips of yellow and black plastic.) Some student bows (particularly the ones made of solid fiberglass) substitute a plastic sleeve for grip and winding.

The hair of the bow traditionally comes from the tail of a "white" (technically, a grey) male horse, although some cheaper bows use synthetic fiber. Occasional rubbing with rosin makes the hair grip the strings intermittently, causing them to vibrate. The stick is traditionally made of pernambuco or the less expensive brazilwood, although some student bows are made of fiberglass. Recent innovations have allowed carbon-fiber to be used as a material for the stick at all levels of craftsmanship.

# Playing the violin

The standard way of holding the violin is under the chin and supported by the left shoulder, often assisted by a shoulder rest. (However, some cultures vary in this practice; for instance, Indian (Carnatic and Hindustani) violinists play seated on the floor and rest the scroll of the instrument on the side of their foot.) The strings may be sounded either by plucking them (*pizzicato*) or by drawing the hair of the bow across them (*arco*). The left hand regulates the sounding length of the string by stopping it against the fingerboard with the fingertips, producing different pitches.

## Left hand and pitch production

As placement of the left hand fingers on the strings is not aided by frets; players must finger the string at the right spot by skill alone, or they will sound out of tune. Good intonation comes from lots of practice.

Beginners often rely on tapes on the finger board in several places for proper left hand finger placement, but quickly abandon the tapes as they advance. Another commonly-used marking technique uses dots of typists correction fluid on the fingerboard, which wear off in a few weeks of regular practice.

The fingers are conventionally numbered 1 (index) through 4 (little finger). Especially in instructional editions of violin music, numbers over the notes may indicate which finger to use, with "O" indicating "open" string. The chart to the right shows the arrangement of notes reachable in first position.

Left hand finger placement is a matter for the ears and hand, not the eyes. That is, finger placement has strong aural and tactile/kinesthetic components; visual references are only marginally useful. Note also (not shown on this chart) that the spacing between note positions becomes closer as the fingers move up (in pitch) from the nut. The yellow bars on the sides of the chart represent three of the usual tape placements for beginners, at 1st, high 2nd, and 3d fingers.

## Positions

The placement of the left hand on the fingerboard is characterized by "positions". First position, where most beginners start (although some methods start in third position), is the most commonly used position in string music. The lowest note available in this position in standard tuning is an open G; the highest note in first position is played with the fourth finger on the E-string, sounding a B, or reaching up a half step (also known as the "extended fourth finger") to the C two octaves above middle C.

Moving the hand up the neck, so the first finger takes the place of the second finger, brings the player into *second position*. Letting the first finger take the first-position place of the third finger brings the player to *third position*, and so on. The upper limit of the violin's range is largely determined by the skill of the player, who may easily play more than two octaves on a single string, and four octaves on the instrument as a whole. The lowest position on a violin is half-position, where the first finger is very close to the nut, this position is usually only used in complex music or music with many flatted notes.

Violinists usually change positions in a first finger to third finger pattern; where the first finger is moved to the place of the third finger (ie. on the A string moved from B to D) The most logical and common shifting positions are first position to third position, and then to fifth position if necessary.

The same note will sound substantially different depending on what string is used to play it. Sometimes the composer or arranger will specify the string to be used in order to achieve the desired [tone quality](#); this is indicated in the music by the marking, for example, *sul G*, meaning to play on the G string. Playing high up on the G and D strings in particular gives a distinctively strained quality to the sound. Otherwise, moving into different positions is usually done for tactical reasons, for reaching higher notes or avoiding string crossings.

### Open strings

A special timbre results from bowing a note on an *open string*, or without touching its string with a finger. Open string notes (G, D, A, E) have a very distinct sound resulting from lack of contact by the finger. Other than low G (which can be played in no other way), open strings are usually selected for special effects. In classical music, an open string is sometimes considered to make a rather harsh sound and, in most cases, should be avoided (this is especially true of the E string which has a very metallic tone).

Playing an open string simultaneously with a stopped note on an adjacent string produces a [bagpipe](#)-like drone, often used by composers in imitation of [folk music](#). Sometimes the two notes are identical (for instance, playing a fingered A on the D string against the open A string), giving a ringing sort of "fiddling" sound.

### Double stops and drones

Double stopping is when two separate strings are stopped by the fingers, and bowed simultaneously, producing a part of a [chord](#). Sometimes moving to a higher position is necessary for the left hand to be able to reach both notes at once. Sounding an open string alongside a fingered note is another way to get a partial chord. While sometimes also called a double stop, it is more properly called a drone, as the drone note may be sustained for a passage of different notes played on the adjacent string. Three or four notes can also be played at one time (triple and quadruple stops, respectively), and, according to the style of music, the notes might all be played simultaneously or might be played as two successive double stops, favoring the higher notes.

### Vibrato

Vibrato is a technique of the left hand and arm in which the pitch of a note varies in a pulsating rhythm. While various parts of the hand or arm may be involved in the motion, the end result is a movement of the fingertip bringing about a slight change in vibrating string length. Violinists oscillate backwards, or lower in pitch from the actual note when using vibrato, since perception favors the highest pitch in a varying sound. Vibrato does little, if anything, to disguise an out-of-tune note: in other words, vibrato is a poor substitute for good intonation. Music students are taught that unless otherwise marked in music, vibrato is assumed or even mandatory. This can be an obstacle to a classically-trained violinist wishing to play in a style that uses little or no vibrato at all, such as baroque music played in period style and many traditional fiddling styles.

The "when" and "what for" of violin vibrato are artistic matters of style and taste. In acoustical terms, the interest that vibrato adds to the sound has to do with the way that the overtone mix (or tone color, or timbre) and the directional pattern of sound projection change with changes in pitch. By "pointing" the sound at different parts of the room in a rhythmic way, vibrato adds a "shimmer" or "liveliness" to the sound of a well-made violin.

### Harmonics

**Lightly** touching the string with a fingertip at a harmonic node while bowing close to the bridge can create harmonics. Instead of the normal solid tone a wispy-sounding overtone note of a higher pitch is heard. Each node is at an integer division of the string, for example half-way or one-third along the length of the string. A responsive instrument will sound numerous possible harmonic nodes along the length of the string.

Harmonics are marked in music with a little circle above the note that determines the pitch of the harmonic. There are two types of harmonics: **natural harmonics** and **artificial harmonics** (also known as **false harmonics**).

Natural harmonics are played on an open string. The pitch of the open string is called the fundamental frequency. Harmonics are also called **overtones**. They occur at whole-number multiples of the fundamental, which is called the first harmonic. The second harmonic is the first overtone, the third harmonic is the second overtone, and so on. The second harmonic is in the middle of the string and sounds an octave higher than the string's pitch. The third harmonic breaks the string into thirds, and the fourth harmonic breaks the string into fourths. The sound of the second harmonic is the clearest of them all, because it is a common node with all the succeeding even-numbered harmonics (4th, 6th, etc.). The third harmonic (and succeeding odd-numbered harmonics) are harder to play because they break the string into three (or other odd-numbered parts) and don't share as many nodes with other harmonics.

Artificial harmonics are more difficult to produce than natural harmonics, as they involve both stopping the string and playing a harmonic on the stopped note. Using the "octave frame"—the normal distance between the first and fourth fingers in any given position—with the fourth finger just touching the string a [fourth](#) higher than the stopped note produces the fourth harmonic, two octaves above the stopped note. Finger placement and pressure, as well as bow speed, pressure, and sounding point are all essential in getting the desired harmonic to sound. And to add to the challenge, in passages with different notes played as false harmonics, the distance between stopping finger and harmonic finger must constantly change.

The "harmonic finger" can also touch at a major third above the pressed note, or a fifth higher. These harmonics are less commonly used; in the case of the major third, the harmonic does not speak as readily; in the case of the fifth, the stretch is greater than is comfortable for many violinists.

Elaborate passages in artificial harmonics can be found in virtuoso violin literature, especially of the 19th and early 20th centuries. (One notable example is an entire section of Vittorio Monti's *Csárdás*.)

## Right Hand & Tone Colour

The right arm, hand, and bow are responsible for tone quality, [rhythm](#), dynamics, [articulation](#), and certain (but not all) changes in [timbre](#).

### Bowing techniques

The most essential part of bowing technique is the bow grip. It is usually with the thumb bent in the small area between the frog and the winding of the bow. The other fingers are spread somewhat evenly across the top part of the bow.

The violin produces louder notes with greater bow speed or more weight on the string. The two methods are not equivalent, because they produce different timbres; pressing down on the string tends to produce a harsher, more intense sound.

The sounding point where the bow intersects the string also influences timbre. Playing close to the bridge (*sul ponticello*) gives a more intense sound than usual, emphasizing the higher harmonics; and playing with the bow over the end of the fingerboard (*sul tasto*) makes for a delicate, ethereal sound, emphasizing the fundamental frequency. Dr. Suzuki referred to the sounding point as the "Kreisler highway"; one may think of different sounding points as "lanes" in the highway.

Various methods of 'attack' with the bow produce different articulations. There are many bowing techniques that allow for every range of playing style and many teachers, players, and orchestras spend a lot of time developing techniques and creating a unified technique within the group.

## **Pizzicato**

A note marked *pizz.* (abbreviation for *pizzicato*) in the written music is to be played by plucking the string with a finger of the right hand rather than by bowing. (The index finger is most commonly used here.) Sometimes in virtuoso solo music where the bow hand is occupied (or for show-off effect), *left-hand pizzicato* will be indicated by a "+" (plus sign) below or above the note. In left-hand pizzicato, two fingers are put on the string; one (usually the index or middle finger) is put on the correct note, and the other (usually the ring finger or little finger) is put above the note. The higher finger then plucks the string while the lower one stays on, thus producing the correct pitch.

## **Col legno**

A marking of *col legno* (Italian for "with the wood") in the written music calls for striking the string(s) with the stick of the bow, rather than by drawing the hair of the bow across the strings. This bowing technique is somewhat rarely used, and results in a muted percussive sound. The eerie quality of a violin section playing *col legno* is exploited in some symphonic pieces, notably the "witches' dance" of the last movement of Berlioz' *Symphonie Fantastique*. Some violinists, however, object to this style of playing as it can damage the finish and impair the value of a fine bow.

## **Mute**

Attaching a small metal or rubber device called a "mute" to the bridge of the violin gives a more mellow tone, with fewer audible overtones. Parts to be played muted are marked *con sord.*, for the Italian *sordino*, mute. (The instruction to play normally, without the mute, is *senza sord.*) There are also massive metal, rubber, or wooden mutes available. These are known as "practice mutes" or "hotel mutes". Such mutes are generally not used in performance, but are used to deaden the sound of the violin in practice areas such as hotel rooms. Some composers have used practice mutes for special effect, for example at the end of Luciano Berio's *Sequenza VIII* for solo violin.

# Musical styles

## Classical music

Since the [Baroque](#) era the violin has been one of the most important of all instruments in [classical music](#), for several reasons. The tone of the violin stands out above other instruments, making it appropriate for playing a melody line. In the hands of a good player, the violin is extremely agile, and can execute rapid and difficult sequences of notes.

The violin is also considered a very expressive instrument, which is often felt to approximate the human voice. This may be due to the possibility of vibrato and of slight expressive adjustments in pitch and timbre. Many leading composers have contributed to the [violin concerto](#) and [violin sonata](#) repertoires.

Violins make up a large part of an [orchestra](#), and are usually divided into two sections, known as the first and second violins. Composers often assign the melody to the first violins, while second violins play harmony, accompaniment patterns or the melody an octave lower than the first violins. A [string quartet](#) similarly has parts for first and second violins, as well as a [viola](#) part, and a bass instrument, such as the [cello](#) or, rarely, the bass.

## Jazz

The violin is used as a solo instrument in [jazz](#), though it is a relative rarity in this genre; compared to other instruments, like saxophone, trumpet, piano and guitar, the violin appears fairly infrequently. It is, however, very well suited to jazz playing, and many players have exploited its qualities well.

The earliest references to jazz performance using the violin as a solo instrument are documented during the first decades of the 20th century. The first great jazz violinist was Joe Venuti who is best known for his work with guitarist Eddie Lang during the 1920s. Since that time there have been many superb improvising violinists including Stéphane Grappelli, Stuff Smith, Ray Perry, Ray Nance, Claude "Fiddler" Williams, Leroy Jenkins, Billy Bang, Mat Maneri, Malcolm Goldstein. Other notable jazz violinists are Regina Carter and Jean-Luc Ponty.

Violins also appear in ensembles supplying orchestral backgrounds to many jazz recordings.

## Popular music

While the violin has had very little usage in [rock](#) music compared to its brethren the [guitar](#) and [bass guitar](#), it is increasingly being absorbed into mainstream pop with artists like Vanessa Mae, Bond, Linda Brava, Miri Ben-Ari, Nigel Kennedy, Yellowcard, Dave Matthews Band with Boyd Tinsley, Arcade Fire, Jean-Luc Ponty, Camper Van Beethoven, and The Who (in the coda of their 1971 song Baba O'Riley). Independent artists such as Final Fantasy and Andrew Bird have also spurred increased interest in the instrument. It has also seen usage in the [post-rock](#) genre by bands like Broken Social Scene and Hope of the States.

The hugely popular Motown recordings of the 60's and 70's relied heavily on strings as part of their trademark texture. Earlier genres of pop music, at least those separate from the

[Rock 'n' Roll](#) movement, tended to make use of fairly traditional orchestras, sometimes large ones; examples include the American "Crooners" such as Bing Crosby.

Up to the 1970s, most types of popular music used bowed strings, but the rise of [electronically created music](#) in the 1980s saw a decline in their use, as synthesized string sections took their place. Since the end of the 20th century, real strings have begun making a comeback in pop music.

Indian and Arabic pop music is filled with the sound of violins, both soloists and ensembles.

Some [folk/viking metal](#) bands use the violin in their songs (i.e. Thyrfing), and some even have a permanent violinist (i.e. Ásmegin).

One of the best-selling bands of the 1990's, the Corrs, relied heavily on the skills of violinist Sharon Corr. The violin was intimately integrated with the Irish tin whistle, the Irish hand drum (bodhran), as well as being used as intro and outro of many of their Celtic-flavored pop-rock songs.

## Indian Classical Music

The violin is a very important part of South Indian classical music ([Carnatic music](#)). It is believed to have been introduced to the South Indian tradition by Baluswamy Dikshitar. Though primarily featured as an accompaniment instrument, violin has successfully gained prominence as a solo instrument in the contemporary scenario.

On the contemporary Indian classical music scene, the child prodigy violinist from Kerala, **L. Athira Krishna**, has achieved global recognition in the genre of South Indian Classical Solo Violin Playing Genre.

The violin is also a principal instrument for South Indian film music. Film composers Ilayaraja and A. R. Rahman have used the violin very effectively in this genre. **V.S. Narasimhan** is among the undisputed violin wizards in the South Indian film industry, with many hits in the film world.

## Folk music and fiddling

Like many other instruments of classical music, the violin descends from remote ancestors that were used for [folk music](#). Following a stage of intensive development in the late Renaissance, largely in Italy, the violin had improved (in volume, tone, and agility), to the point that it not only became a very important instrument in art music, but proved highly appealing to folk musicians as well, ultimately spreading very widely, sometimes displacing earlier bowed instruments. [Ethnomusicologists](#) have observed its widespread use in Europe, Asia, and the Americas.

In many traditions of [folk music](#), the tunes are not written but are memorized by successive generations of musicians and passed on in both informal and formal contexts.

# Fiddle

When played as a folk instrument, the violin is ordinarily referred to in English as a **fiddle**.

One very slight difference between "fiddles" and ordinary violins may be seen in American (e.g., [bluegrass](#) and old-time music) fiddling: in these styles, the bridge is often shaved down so that it is less curved. This makes it easier to play double stops, and often makes triple stops possible, allowing one to play [chords](#).

## **MIDI**

The sound of a real violin can be simulated electronically with the MIDI (Musical Instrument Digital Interface) system, using electronic synthesis. Under MIDI, all instruments are assigned a number; a single violin played arco is instrument #41, where the numbering begins from #1. Though general MIDI does not allow for distinction between up bows and down bows, it is possible to differentiate between staccato and legato by adjusting note durations, which most notation software capable of outputting MIDI can handle. General MIDI also provides for regular pizzicato but not left-hand pizzicato, but in any case, under MIDI, pizzicato is at most an approximation of the actual sound.

# Violin concerto

A **violin concerto** is a [concerto](#) for solo [violin](#) (occasionally, two or more violins) and instrumental ensemble, customarily [orchestra](#). Such works have been written from the [Baroque](#) period, when the solo concerto form was first developed, up through the present day. Many major composers have contributed to the violin concerto repertoire, with the best known works including those by Bach, Beethoven, Brahms, Mendelssohn, Mozart, Sibelius, Tchaikovsky, Vivaldi, and Wieniawski.

In some violin concertos, especially from the Baroque and modern eras, the violin (or group of violins) is accompanied by a chamber ensemble rather than an orchestra—for instance, Vivaldi's *L'estro armonico*, originally scored for four violins, two violas, cello, and continuo, and Allan Pettersson's first concerto, for violin and string quartet.

# Violin family

The **Violin family** of [instruments](#) was developed in Italy in the 17th Century. It comprises three instruments: the [violin](#), [viola](#) and the [cello](#). Although usually associated with the violin family, the double bass's origins are generally believed to be of the viol family, as may be seen by its sloping shoulders compared to the violin.

Violin Viola Cello Bass (in viol family)

All [string instruments](#) share similar form, parts, construction, and function, and the viols bear a particularly close resemblance to the violin family. However, instruments in the violin family are set apart by similarities in shape, in tuning practice, and in history. They have four strings each, are tuned in fifths (the bass is tuned in fourths), are not fretted, and have four rounded bouts.

Along with the double bass, they are the most used bowed string instruments in the world today. Although all share a place in [classical music](#), they are also used (less often) in [jazz](#), [rock](#), and other types of [popular music](#), where they are often amplified, or simply created to be used as [electric instruments](#). The violin is also used extensively in fiddle music, [country music](#), and [folk music](#).

One of the most popular and standardized groupings in classical [chamber music](#), the [string quartet](#), is composed entirely of instruments from the violin family. This similarity in the manner of sound production allows string quartets to blend their tone colour and [timbre](#) more easily than less homogeneous groups. This is particularly notable in comparison to the standard [wind quintet](#), which, although composed entirely of [wind instruments](#), comprises four fundamentally different ways of producing musical [pitch](#).

# Violin sonata

A **violin sonata** is a musical composition for solo [violin](#), often (but not always) accompanied by a [piano](#) or other keyboard instrument, or by figured bass in the [Baroque](#).

Some violin sonatas, notably those by Mozart, Beethoven, and César Franck, are primarily piano works with the violin playing a lesser role.

# Violoncello concerto

A **violoncello concerto** (commonly called a **cello concerto**) is a [concerto](#) for solo [violoncello](#) with [orchestra](#) or, very occasionally, smaller groups of instruments. These pieces have been written from the time of Vivaldi and Tartini if not earlier, and continue to be written into the present day.

# Virelai

A **virelai** is a form of [medieval](#) French verse used often in poetry and [music](#). It is one of the three *formes fixes* (the others were the [ballade](#) and the rondeau), and was one of the most common verse forms set to music in Europe from the late 13th to the 15th centuries.

A virelai is similar to a rondeau. Each stanza has two rhymes, the end rhyme recurring as the first rhyme of the following stanza. The overall musical structure is almost invariably AbbaA, with the first and last sections having the same lyrics; this is the same form as the Italian ballata.

One of the most famous [composers](#) of virelai is Guillaume de Machaut (1300–1377), who also wrote his own verse; 33 separate compositions in the form survive by him. Other composers of virelai include Jehannot de l'Escurel, one of the earliest (d. 1304), and Guillaume Dufay (c.1400–1474), one of the last.

By the mid-15th century, the form had become largely divorced from music, and numerous examples of this form (as well as the ballade and the rondeau) were written, which were either not intended to be set to music, or for which the music has not survived.

## Example

"Douce Dame Jolie" by Guillaume de Machaut

Douce dame jolie,  
Pour dieu ne pensés mie  
Que nulle ait signorie  
Seur moy fors vous seulement.

Qu'adès sans tricherie  
Chierie  
Vous ay et humblement  
Tous les jours de ma vie  
Servie  
Sans villain pensement.  
Helas! et je mendie  
D'esperance et d'aïe;  
Dont ma joie est fenie,  
Se pitié ne vous en prent.

Douce dame jolie,  
Pour dieu ne pensés mie  
Que nulle ait signorie  
Seur moy fors vous seulement.

English Example:

People I Once Knew by Eric Armentrout

Thinking back a few Years, three, maybe two, I'd say, On Fifth Avenue Stood my house  
oof blue And Gray. Neighbors (I had a few) Were friends that I knew would stay.

But to my dismay They all moved away from me. I don't know where they Are living today,  
You see, But I do still pray They'll come back someday To me.

Categories: [Musical forms](#) | [Medieval music](#) | [Renaissance music](#)

# Virtual band

A **virtual band** (also known as a *virtual group* or *cartoon band*), in [music](#), is any group whose members are not flesh-and-blood musicians, but animated characters. The music is recorded by human musicians in the studio, while any video clips, stage appearances, etc, are animated using the virtual line-up. Stage appearances are complex, because they not only require pre-animated sequences, ready to play, but also need the actual musicians behind the screen, performing in perfect sync. (This can be overcome by pre-recording the set in channels, and playing back live, but this can lose that 'live' experience.)

Characters in virtual bands can be hand-drawn (like in The Archies and Gorillaz) or computer animated (like JuJu Eyeballs).

# Production

## In the studio

The recording of the music is done by the human musicians and artists, whom the virtual artists emulate. This is done using the normal in-studio recording process; see [Sound recording](#) for a detailed explanation.

In some instances, most notably The Chipmunks, and Gorillaz, manipulation of voices may be employed, either to achieve a desired vocal effect, or to make it dissimilar to the voice of the actual singer. The manipulation is done by either modifying the playback speed of the vocal track, for example speeding it up or slowing it down, or by putting it through a [synthesiser](#).

Writing and production credits may be assigned to either the virtual band, or the human writers and artists involved.

## On stage

One of two methods can be employed for live performances. The first involves animating the entire set, with little or no allowance for audience interaction, then 'performing' it as is. The major pitfall with this method is the lack of audience interaction, which can be vital during concerts. This is best suited to short performances, where audience response can be predicted.

The second, and more complex, method differs from the first in that allowance is made for a variety of responses and interaction. This means having a wide range of animated sequences ready to play, with matching spoken lines, in response to different reactions.

In both cases, extensive rehearsal is required to synchronize spoken lines and instrumentation with animated action. This can be eliminated by using pre-recorded music and speech, however doing so also weakens the actual 'live' experience.

(Some non-virtual artists and groups have employed a similar technique on some concert tours and performances. DJ Shadow, for example, on his *In Tune and On Time* tour, had pre-animated sequences, which were played on giant screens behind him while he performed the set. Again, a large amount of pre-tour planning and synchronisation rehearsal was require beforehand.)

## An example

Perhaps the most complex live performance by a virtual band was Gorillaz' performances at the MTV Europe Music Awards in Lisbon and the 2006 Grammy Awards. The group used a combination of computer-generated 3D imagery with 19th-century Pepper's Ghost technology to create life-like holograms of the band members. There are also initial plans for a Gorillaz world tour using this technology.

# History

## Early history

While the term had not officially been coined at the time, Alvin and the Chipmunks were the first virtual band to appear. Centered around the 'front-munk' Alvin, his two brothers Simon and Theodore, and their manager/father Dave Seville, their voices were created by Ross Bagdasarian, who accelerated the recording of his voice to create the distinctive sound; the process earned him two [Grammys](#) in 1959 for engineering.

The success of the Chipmunks spurred on another group, the Nutty Squirrels, to join the ranks. A scat-singing version of Bagdasarian's creation, they made the American Top 40 with their song *Uh-Oh*. Their success, however, was short-lived.

## Virtual bands from television

The Archies were the first virtual band to appear in worldwide pop charts. In 1969, The Monkees wrote Sugar Sugar, and performed it to their manager. Displeased about this (he had really hoped the group would only perform songs written by songwriters outside of the group), he took the song, and created a group who could be easily managed; basing it on the Archie comic that was popular at the time, he created the Archies.

The popularity of the group opened the door for many other cartoon bands, especially Josie and the Pussycats, The Banana Splits and Dr. Teeth and the Electric Mayhem. The release of the bands' recordings played a part (to varying degrees for each group) in increasing the popularity of their parent show, and vice versa. However, because of this, their respective successes would be limited, as the shows were eventually cancelled.

## Revival

The 1980's were largely free of virtual groups. It wouldn't be until the early 1990's, when the Chipmunks, updated to fit with the more contemporary setting, and now playing their own instruments, released a CD of covers to accompany the new show, that virtual bands would begin to make a comeback.

The first recorded use of the term *virtual band* came about in 1996, used to describe an American group called the Bot Brothers, who also used the internet as a distribution medium. The group was largely unpopular, due to their limited fanbase and bad attitude. <sup>N1</sup> This resulted in the group's splitting; they reformed a few years later with a larger band to make the Bots.

In 1999, the first Australian virtual band, JuJu Eyeballs, were unearthed. Their tenure as a band was to be brief: they had released two singles through Warner-Chappell Australia, one of which was only available through the site, before disappearing in 2001.

The media were the first to bring the term into popularity, with the appearance of Britain's Gorillaz in 2000. Formed by Blur's Damon Albarn and Tank Girl's Jamie Hewlett, and produced by Deltron 3030's Dan the Automator, the group brought the virtual bands to the musical fore again, with their scoring numerous Top 20 positions around the world, and the World Record of being the Most Successful Virtual Band.

## **New source mediums**

In 2005, dance duo Bass Bumpers produced a song featuring the very popular ringtone Crazy Frog, called *Axel F*. Sampling the ringtone, along with the original 'Axel F' theme from Beverly Hills Cop, the song made Number 1 in both England and Australia, and top 10 in many other countries.

A few months after the Crazy Frog release, to coincide the release of the new line of dolls, Bratz Rock Angelz released their first single, *So Good*. The group followed in the line of many of their real-life pop counterparts stylistically.

## **Net-based virtual bands**

The term is also now being used to describe groups of musicians who collaborate online through broadband by utilizing a content management system and local digital audio workstations. The work is sometimes released under a Creative Commons license, so musicians can share their 'samples' to create collaborative musical expressions for noncommercial purposes without ever meeting face to face.

## Notable groups

Alvin and the Chipmunks  
The Archies  
The Banana Splits  
Billy and the Boingers  
The Bots  
The California Raisins  
Crazy Frog  
The Crescendolls  
Dr. Teeth and the Electric Mayhem  
Gorillaz  
Josie and the Pussycats  
JuJu Eyeballs  
Prozzäk

# Vocal house

**Vocal [house](#)** is a musical genre that came to the fore in the late 1980s and early '90s. It is often comprised of deep soulful vocals (usually sung by female jazz divas) and a [piano](#) break, at some stage of the tune. Other samples usually included [jazz](#) loops, horns and [funk](#) basslines.

Its roots can be traced back to America, although later influences came from Italy and the Balearics.

## [House](#)

[Acid](#) - [Ambient](#) - [Chicago](#) - [Dark](#) - [Deep](#) - Dream - [Garage](#) - [Ghetto](#) - [Hard](#) - [Hip](#) - Italo - [Latin](#) - [Minimal](#) - [Microhouse](#) - Progressive - [Pumpin'](#) - [Tech](#) - [Tribal](#)

## Other [electronic music](#) genres

[Ambient](#) | [Breakbeat](#) | [Drum and bass](#) | [Electronica](#) | [Electronic art music](#) | [Hard dance](#) | [Hardcore](#) | [House](#) | [Techno](#) | [Trance](#) | [Industrial](#) | [Synthpop](#)

# Vocal range

[Human voices](#) may be classified according to their **vocal range** — the highest and lowest pitches that they can produce.

## Vocal ranges

### Female ranges

[Soprano](#)

[Mezzo-soprano](#)

[Contralto](#)

### Male ranges

[Sopranist](#)

[Alto](#)

[Tenor](#)

[Baritenor](#)

[Baritone](#)

[Bass-baritone](#)

[Bass](#)

## Vocal range defined

Despite its intuitive clarity, vocal range is not easy to define, nor is it easy to compare the vocal ranges of singers in different genres. The tonal quality of the voice is as important in determining voice type as the range of notes themselves.

The broadest definition of vocal range, given above, is simply the span from the highest to the lowest note a particular voice can produce. This broad definition, however, is quite often not the one meant when someone speaks of "vocal range." This is because some of the notes a voice can produce may not be considered "musically useful" for a particular purpose. For example, when speaking of the vocal range of a male opera singer, one usually excludes falsetto pitches, which are not used in most opera. A male doo-wop singer, on the other hand, might quite regularly deploy his falsetto pitches in performance and thus include them in determining his range.

For this reason, it is important to clearly define what is meant when discussing a vocal range. For example, one might say of a man that he has a one and a half octave range in full voice and an additional one half octave in falsetto. Similarly, when discussing the range of a woman one might say that she has a "useful" two octave range with an additional major third on the bottom that is only audible with amplification. Unfortunately, there is no standardization in this nomenclature.

## Vocal range in classical music

Vocal range is generally very important in classical music. In [opera](#), two considerations are paramount in determining vocal range: consistency of timbre across the vocal range, and ability to project the pitches (that is, to be heard clearly over an orchestra without amplification). Thus the vocal range for a man is generally determined by the pitches that he can produce in full voice - that is, excluding falsetto, which sounds too harshly different from lower notes in most men's voices. Vocal range for women is only slightly more freely determined: The same criteria broadly apply, but women of the highest voice type ([soprano](#)) can on occasion deploy their flageolet register to reach very high notes despite a typically noticeable difference in timbre. Of course, if any pitch cannot be properly projected, it is not considered part of the range.

Choral music is somewhat less stringent. In contrast to opera, the large number of voices that can be deployed in each group make it somewhat less important that each individual voice be flawlessly produced and completely audible. Thus, for example, choirs can often deploy notes that are lower than those that might be deployed in an operatic performance - no single member of the choir might be able to project such a low note individually, but taken together the note might be quite audible.

## Classification of vocal range in classical music

The following vocal range classifications are typically used in classical music (from highest to lowest). The ranges listed are prototypical but actual vocal range differs from person to person. Those listed below should not be taken as a restrictive category but as a general guide:

- [Soprano](#): C4-A5
- [Mezzo-soprano](#): A3 - F5
- [Contralto \(often abbreviated to Alto\)](#): F3 - D5
- [Tenor](#): B2 - G4
- [Baritone](#): G2 - E4
- [Bass](#): E2 - C4

The first three ranges are usually sung by women, and the last three are usually sung by men. Occasionally men will sing in the three female registers. When sung by men, they are renamed:

- Sopranist (soprano range)
- Countertenor (mezzo-soprano or contralto range)
- [Alto](#) (contralto range)

In addition to these general classifications, additional subdivisions are very commonly deployed in opera and other classical music for solo voice. There are a number of such detailed classification schemes, many of which are country-specific. See, for example, the articles on individual voice types above or the article on Fach.

### Induced vocal range

Where the above are largely achieved through practice and natural aptitude, vocal ranges can be achieved by means of physiological modification. Only the example of the castrato is particularly notable.

## Vocal range in popular music

Vocal range in popular music is usually more generously defined than in classical. Because of the use of amplification it is possible for singers to produce musically useful pitches that are much lower than might be possible for classical singers. Similarly, consistency of timbre is much less important in popular music. Thus in many popular genres falsetto is acceptable for men, deep growling pitches can be deployed, and flageolet notes (commonly referred to as the whistle register in popular music) can be freely used by any female or male who can produce them.

The importance of vocal range varies in popular music. At one extreme, to choose a well known example, genres such as [punk](#) show little concern for technical proficiency of any sort and thus no particular concern for vocal range. Similarly, many roles in the [musical theater](#), while requiring rather more skill, call for only vaguely determined voice types. At the other extreme, vocal range is considered extremely important by many singers and fans of pop and R&B. There is often intense discussion among fans of precisely what a particular singer's vocal range is, and singers or their press representatives often claim extremely wide ranges.

For these various reasons, it is extremely difficult to speak of vocal range in popular music generally. For more information, see the articles on individual genres.

## World records and extremes of vocal range

As noted above, claims of exceptionally wide vocal ranges are not uncommon among some singers. Fortunately, in 2006 the Guinness Book of Records published several categories relating to extremes of "Human vocal range." It stated the following:

### **Females**

- Greatest range: Eight octaves, G2-G10, Georgia Brown, Brazil
- Highest vocal note: G10, Georgia Brown, Brazil

### **Males**

- Greatest range: Six octaves, Tim Storms, USA
- Highest vocal note: Eb8 Adam Lopez, Australia
- Lowest vocal note: B-2 (nearly two octaves below piano's lowest note), Tim Storms, USA

Guinness also lists the highest demanded note in the classical repertoire as G6 in 'Popoli di Tessaglia,' a concert aria by W. A. Mozart and the lowest demanded note in the classical repertoire as a "Low D [three Ds below Middle C] in Osmin's aria in Mozart's *Die Entführung aus dem Serail*." This latter claim is incorrect in several ways, though. First, the low D in question is the second D below middle C, not the third. Second, though that note is the lowest demanded and commonly performed in the operatic repertoire, Leonard Bernstein's *Candide* has an optional low B (a minor third below the low D) in a bass aria of its opera house version. Finally, some choral works call for notes lower than the low D.

Another work by Mozart, namely the "Queen of the Night" aria from *The Magic Flute*, is often regarded as having the highest note in classical music - it being an F6. However, this is false.

## Bass range, the microphone, and the basso profundos of Russia

The advent of the microphone provided singers with a way to extend their range downward. This is why the lowest notes hit by basses in pop music are often much lower than any notes called for in classical repertoire. The lowest notes in opera repertoire are around D2 or C2 (for an example of this see Cesare Siepi's recording of "Seigneur, rampart et seul soutien" by Meyerbeer.) However, with amplification baritones, and even some tenors can reach these tones. To sing even lower some singers combine a technique called vocal fry or creaky voice, along with amplification to produce notes well below the normal range of the human voice. Vocal fry is the low clicking sound that vocal chords produce when pushed below their natural limit. It is commonly used in gospel quartets and a capella groups. The bass J.D. Sumner popularized the use of vocal fry in gospel, and he can be heard in recordings with the Stamps Quartet hitting notes as low as F1. The current Guinness record holder for the lowest note, Tim Storms, also uses this technique. Basses that implement this technique are often called sub-basses.

Notes produced using vocal fry are only effective when using a microphone, as they have little volume, not unlike whistle notes. Guinness is often loose with what they categorize as a "note" so extreme vocal technique is often used to produce notes in a range that the singer could not actually sing in. Vocal fry and whistle notes are techniques effective in pop music. However, there is a distinction between these techniques and the normal full voice used by singers in classical repertoire.

The lowest notes that need no amplification and are produced with normal vocal technique are sung by the basso profundo or, oktavists from Russia. Such singers sing notes as low as A1 or G1. Vladimir Pasiukov of the Male Choir of St. Petersburg, and Vladimir Miller of the Valaam Choir are two good examples of true basso profundos. Although the lowest notes called for in opera are around C2, there are Russian choral works that call for basso profundo soloists to sing notes as low as Bb1 as in Chesnokov's composition "Do Not Cast Me Off in Time of Old Age". Composers such as Rachmaninov, Alexander Gretchaninoff and the aforementioned Pavel Grigorievich Chesnokov employ basso profundo's extensively. Recordings of such basses in a choral setting can be found on almost any recording of Russian choral music, although recordings of basso profundo soloists are rare.

Side note - Tim Storms does not use the vocal fry technique for sub-bass notes, as previously mentioned. JD Sumner also did not use this technique. Where many bass singers use the fry technique, it should not be automatically assumed that all sub-bass singers employ this technique. There is a difference between vibrating ones vocal cords to produce clear tone and accurate pitch, and warbling ones vocal cords (fry technique) to "harmonize". Singers who utilize the fry technique do not have near the control of pitch or tone (when using the fry technique) than singers who do not use the fry technique to achieve sub-bass frequencies. -just one way you can tell if someone is using the vocal fry technique or not.

# Vocal trance

**Vocal trance** is a subgenre of [trance music](#), and contains highly melodic sessions, intro/outros which are similar to those of [hard trance](#) and tracks of usually about 6 to 8 minutes long.

A typical track consists of three elements. At the beginning of the track there is an intro of progressive beats, which lasts about 1-3 minutes. The melodic part (2-5min) starts incrementally, combining vocals, usually female, and melodic sound (for the most part high pitched and fast) with the bass pattern to give a great melody cycle. Finally when the outro is approaching, the melody fades out and we get the same rhythm as the intro, usually with some minor changes.

The most important defining element of vocal trance is the vocals (as implied by the name). Most of the time the vocals are high pitched, usually from a female vocalist, and is intended to create a chilling sound. In some tracks there are male vocals, but are usually confined to speaking and responding to the female vocals. It is not uncommon for vocals to repeat themselves many times, to be constant with the "loop" idea present in most [techno music](#).

Vocal trance is popular listening in Europe, notably Germany, Sweden and Great Britain. It is closely related to [uplifting trance](#).

## Examples

A short list of some vocal trance artists include:

- Andrea Montorsi Black Door - Single (2003)
- DJ Dean It's a Dream - Single (2004)
- DJ Carlo Nautilus - Single (2003)
- Beam Vs Cyrus Lifestyle - Album (2003)
- Solar Stone - Seven Cities (Armin van Buuren Vocal Mix) - 12"/MP3 Download (2002)
- The Thrillseekers featuring Sheryl Deane - Synaesthesia (Fly Away) - Single (2000)
- Andy Moor vs. Above & Beyond - Air For Life (Airwave Mix) (2005)
- Lange featuring The Morrighan - Follow Me - Single (2003)
- Lange featuring Sarah Dwyer - I Believe - Single (2003)
- Lange feat Skye - Drifting Away - Single (2001)
- Rising Star - Touch Me (Original Vocal Mix Part 1) - Single (2000)
- Angelic - Can't Keep Me Silent (Original Mix) - Single (2000)
- 4 Strings - Let It Rain (Original Vocal Mix) - Single (2003)
- 4 Strings - Diving (Original Vocal Mix) - Single (2002)
- Michael Woods - Solex (Close To The Edge) - Single (2004)
- DJ Marc Aurel - Running (DJ Marc Aurel Club Mix) - Single (2002)
- Paradise - See The Light (Original Mix) - Single (2005)
- Paradise - Wanna Be Free (Original Mix) - Single (2006)
- Deestylistic - By My Side (Gerry Cueto Mix) - Single (2003)
- Whiteroom (feat Amy Cooper) - Someday - Single (2005)
- DT8 ft. Roxanne Wilde - Destination - Single (2002)
- Corderoy - Deeper - Single (2004)
- Sun Decade - Follow You - Single (2004)
- OceanLab (feat. Justine Suissa) - Clear Blue Water
- OceanLab (feat. Justine Suissa) - Satellite - Single (2004)
- OceanLab (feat. Justine Suissa) - Sky Falls Down - Single (2002)

# Vocalese

**Vocalese** is a style or [genre](#) of [jazz singing](#) wherein [lyrics](#) are written for [melodies](#) that were originally part of an all-instrumental [composition](#) or [improvisation](#). Whereas scat singing uses improvised nonsense syllables in solos, vocalese uses [lyrics](#), either improvised or set to pre-existing instrumental solos. The word "vocalese" is a play on the musical term "vocalise" and the suffix "-ese", meant to indicate a sort of private language.

Pioneers of vocalese include King Pleasure, Eddie Jefferson and Babs Gonzalez. The best-known practitioners are probably Lambert, Hendricks and Ross, which was made up of Jon Hendricks, Dave Lambert and Annie Ross. Ross's 1952 lyrics for the song "Twisted", a blues improvisation by saxophonist Wardell Gray, are considered a classic of the genre. Latter-day performers known for vocalese include Kurt Elling, Al Jarreau, and Manhattan Transfer.

Some performers, notably Slim Gaillard, Cab Calloway and Leo Watson, combine vocalese improvisations with scat singing.

Most vocalese lyrics are entirely syllabic, as opposed to melismatic. This may lead to the use of many words sung quickly in a given phrase, especially in the case of [bebop](#).

# Vocoder

A **vocoder** (name derived from *voice coder*, formerly also called *voder*) is a speech analyser and [synthesizer](#). It was originally developed as a speech coder for telecommunications applications in the 1930s, the idea being to code speech for transmission. Its primary use in this fashion is for secure radio communication, where voice has to be digitized, encrypted and then transmitted on a narrow, voice-bandwidth channel. The vocoder has also been used extensively as an [electronic musical instrument](#). As an instrument, it is primarily used with guitars and synthesizers and produces a sound that can be described as a "talking guitar" or "talking keyboard". Vocoder are also often used to create the sound of a robot talking, as in the Styx song "Mr. Roboto".

The vocoder is related to, but essentially different from, the computer algorithm known as the "phase vocoder".

# How a vocoder works

## Vocoder theory

The [human voice](#) consists of sounds generated by the opening and closing of the glottis by the vocal cords, which produces a periodic waveform with many harmonics. This basic sound is then filtered by the nose and throat (a complicated resonant piping system) to produce differences in harmonic content (formants) in a controlled way, creating the wide variety of sounds used in speech. There is another set of sounds, known as the unvoiced and plosive sounds, which are not modified by the mouth in the same fashion.

The vocoder examines speech by finding this basic carrier wave, which is at the fundamental frequency, and measuring how its spectral characteristics are changed over time by recording someone speaking. This results in a series of numbers representing these modified frequencies at any particular time as the user speaks. In doing so, the vocoder dramatically reduces the amount of information needed to store speech, from a complete recording to a series of numbers. To recreate speech, the vocoder simply reverses the process, creating the fundamental frequency in an oscillator, then passing it through a stage that filters the frequency content based on the originally recorded series of numbers.

## Early vocoders

In order to address this, most analog vocoder systems use a number of channels, all tuned to different frequencies (using band-pass filters). The various values of these filters are stored not as the raw numbers, which are all based on the original fundamental frequency, but as a series of modifications to that fundamental needed to modify it into the signal seen in that filter. During playback these settings are sent back into the filters and then added together, modified with the knowledge that speech typically varies between these frequencies in a fairly linear way. The result is recognizable speech, although somewhat "mechanical" sounding. Vocoders also often include a second system for generating unvoiced sounds, using a noise generator instead of the fundamental frequency.

An example of an early vocoder was the **Sonovox**, which was used in a number of songs from the 1940s to the 1960s, and is used to create the voice of Casey Junior the train in *Dumbo* and *The Reluctant Dragon*, the instruments in the *Rusty in Orchestraville* recordings and the piano in *Sparky's Magic Piano*.

Also in 1964 physicist John Larry Kelly, Jr created one of the most famous moments in the history of Bell Labs by using an IBM 704 computer to synthesize speech. Kelly's voice recorder synthesizer (vocoder) recreated the song *Daisy Bell*, with musical accompaniment from Max Mathews. Arthur C. Clarke of *2001: A Space Odyssey* fame was coincidentally visiting friend and colleague John Pierce at the Bell Labs Murray Hill facility at the time of this remarkable speech synthesis demonstration and was so impressed that he used it in the climactic scene of his novel and screenplay for *2001: A Space Odyssey*, where the HAL 9000 computer sings the same song as he is being put to sleep by astronaut Dave Bowman.

## Linear prediction-based vocoders

Since the late 1970s, most non-musical vocoders have been implemented using linear prediction, whereby the target signal's spectral envelope (formant) is estimated by an all-pole IIR filter. In linear prediction coding, the all-pole filter replaces the bandpass filterbank of its predecessor and is used at the encoder to whiten the signal (i.e., flatten the spectrum) and again at the decoder to re-apply the spectral shape of the target speech signal. In contrast with vocoders realized using bandpass filterbanks, the location of the linear predictor's spectral peaks is entirely determined by the target signal and need not be harmonic, i.e., a whole-number multiple of the basic frequency.

## Modern vocoder implementations

Even with the need to record several frequencies, and the additional unvoiced sounds, the compression of the vocoder system is impressive. Standard systems to record speech record a frequency from about 500 Hz to 3400 Hz, where most of the frequencies used in speech lie, which requires 64kbit/s of bandwidth (due to Nyquist frequency). However a vocoder can provide a reasonably good simulation with as little as 2400 bit/s of bandwidth, a 26× improvement.

Several vocoder systems are used in NSA encryption systems:

- LPC-10, FIPS Pub 137, 2400 bit/s, which uses linear predictive coding
- Code Excited Linear Prediction, (CELP), 2400 and 4800 bit/s, Federal Standard 1016, used in STU-III
- Continuously Variable Slope Delta-modulation (CVSD), 16 Kbit/s, used in wideband encryptors such as the KY-57.
- Mixed Excitation Linear Prediction (MELP), MIL STD 3005, 2400 bit/s, used in the Future Narrowband Digital Terminal FNBDT, NSA's 21st century secure telephone.
- Adaptive Differential Pulse Code Modulation (ADPCM), former ITU-T G.721, 32Kbit/s used in STE secure telephone

(ADPCM is not a proper vocoder but rather a waveform codec. ITU has gathered G.721 along with some other ADPCM codecs into G.726.)

## Musical applications

For [musical](#) applications, a source of musical sounds is used as the carrier, instead of extracting the fundamental frequency. For instance, one could use the sound of a [guitar](#) as the input to the filter bank, a technique that became popular in the 1970s.

In 1970, electronic music pioneers Wendy Carlos and Robert Moog developed one of the first truly musical vocoders. A 10-band device inspired by the vocoder designs of Homer Dudley, it was originally called a spectrum encoder-decoder, and later referred to simply as a vocoder. The carrier signal came from a Moog modular synthesizer, and the modulator from a microphone input. The output of the 10-band vocoder was fairly intelligible, but relied on specially articulated speech. Later improved vocoders use a high-pass filter to let some sibilance through from the microphone; this ruins the device for its original speech-coding application, but it makes the "talking synthesizer" effect much more intelligible.

Carlos' and Moog's vocoder was featured in several recordings, including the [soundtrack](#) to Stanley Kubrick's *A Clockwork Orange*, in which the vocoder sang the vocal part of Beethoven's Ninth Symphony. Also featured in the soundtrack was a piece called "Timesteps," which featured the vocoder in two sections. Originally, "Timesteps" was intended as merely an introduction to vocoders for the "timid listener", but Kubrick chose to include the piece on the soundtrack, much to the surprise of Wendy Carlos.

In the late 1970s, vocoder began to appear in [pop music](#), for example on [disco](#) recordings. Vocoder has appeared on pop recordings from time to time ever since, but in most of cases vocoder works just as a some kind of special effect in pop music. However, many experimental electronic artists and representators of "[new age](#)" genre often utilize vocoder in a more comprehensive manner. Jean Michel Jarre (album *Zoolook*, 1984) and Mike Oldfield (album *Five Miles Out*, 1982) are good examples. There are also some artists who have made vocoder an essential part of their music. Those include the famous German group, Kraftwerk, jazz/fusion keyboardist Herbie Hancock during his late 1970s disco period, the funk band Zapp, and more recently, avant-garde-pop group Trans Am. The song "O Superman" by avant-garde musician, Laurie Anderson, is a popular recording released in 1981 that incorporates the vocoder. In 2005, artist Imogen Heap's track *Hide and Seek* used the vocoder exclusively, with zero other instrumental support.

This use of the vocoder should not be confused with the talk box guitar effect invented by Doug Forbes and popularized by Peter Frampton. In the talk box effect, amplified sound is actually fed via a tube into the performer's mouth and is then shaped by the performer's lip, tongue, and mouth movements before being picked up by a microphone. The song "Livin' on a Prayer" by Bon Jovi is a more recent recording with a talk box effect. In contrast, the vocoder effect is produced entirely electronically.

The vocoder should also not be confused with the Antares Auto-Tune Pitch Correcting Plug-In, which can also be used to achieve a robotic sounding vocal effect.

Linear prediction coding is also used as a musical effect (generally for cross-synthesis of musical timbres), but is not as popular as bandpass filterbank vocoders, and the musical use of the word *vocoder* refers exclusively to the latter type of device.

## Television and film applications

Vocoders have also been used in television and film, usually for robots or talking computers:

In Transformers, the vocal effects of Soundwave were created with vocoders. The Cylons from Battlestar Galactica used a Roland Vocoder to create their monotone voice.

A vocoder was used by Wendy Carlos for the soundtrack to Stanley Kubrick's A Clockwork Orange.

In the film "Sgt. Pepper's Lonely Heart Club Band", the robotic singing of the Computerettes in the song "Mean Mr. Mustard" was achieved by using a vocoder.

A vocoder was used in the soundtrack for the movie Donnie Darko to create tension and mystery.

The voices of the Daleks in Doctor Who are created using a ring modulator, not a vocoder.

# Vogue

**Vogue** is a form of modern dance characterized by photo model-like poses integrated with angular, linear and rigid arm, leg, and body movements. Despite efforts by the media and more specifically by Madonna, who is often credited with introducing it to mainstream popular culture, vogue as a subculture was in existence long before the release of her song, also titled "Vogue." This particular style of dance arose from the Harlem ballrooms back in the early 1930s, which was then called "performance" and has evolved into the more intricate and illusory form that is now commonly referred to as "vogue".

There are currently two distinct styles (or "schools") of vogue: Old Way (pre-1990) and New Way (post 1990). Old Way is characterized by formation of lines, symmetry, and precision in the execution of such formations and graceful, fluid-like action. New Way is characterized by a more rigid, geometric pattern movement coupled with "clicks" (limb contortions at the joints) and "arms control" (sleight of hand and wrist illusions). New Way can also be described as a modified form of mime, where imaginary geometric shapes such as a box are introduced during motion and moved progressively around the dancer's body to display the dancer's dexterity and memory. Vogue also encompasses other forms of dance and movement, namely modern jazz, ballet, gymnastics, rhythmic gymnastics, martial arts, breakdance, yoga, etc. Some dance historians even point out that breakdance and vogue evolved out of each other, with artists from both sides interacting with each other in New York City's Central Park, West Side Piers, Harlem, and Washington Square Park during the 70s and early 80s.

Voguing has evolved since its beginning and continues to be developed further as an established dance form that is practiced in gay dance clubs in New York and other big cities throughout the United States--mainly Atlanta, Philadelphia, Miami, and Chicago.

Though voguing usually takes place in gay clubs frequented by African Americans and Latin American males, it is also practiced by a small number of non-gay individuals and outside of the club scene. Formal competitions occur in the form of balls held by Houses, a term used to describe collectives of dancers and performers.

Some influential Houses to note include the House of Xtravaganza, the House of Labeija, House of Revlon, House of Ninja, House of Infiniti, House of Aviance and the House of Milan.

Furthermore, distinct styles of this art form have been directly associated with voguers such as Willi Ninja, Jose Xtravaganza, Aviance Milan, and Stiffy Revlon.

## Voice instrumental music

**Voice instrumental music** describes compositions and improvisations for the human voice. Such music treats the human voice as an instrument. It seeks to use the human voice to express and perform music without words. Although a class of [singing](#), it does not use words. The [human voice](#) is used as if it were a [musical instrument](#). The mouth produces [timbre](#) and [rhythm](#).

In many cases, people listening to songs sung in languages they do not understand are treating those songs as voice instrumentals, even if the words do have meaning in the original tongue.

## **Mediterranean-voice instrumentals**

Elaborate traditions of improvisations was and still is an important element in Turkish and Middle Eastern music traditions. Such voice music existed prior to the 1200s and the First Crusade into Palestine and the city of Jerusalem, possibly even before the year 900. The early Christian [plain songs](#) and [Gregorian chants](#) have their origins in Jewish voice instrumental music called nigun.

## Ancient voice music

Its use may even be older, considering that contemporary music and classic European music developed as a derivative of its parents, the Classic Poetry and the Myth-Drama plays from the Fertile Crescent Civilizations of Ancient Asia Minor and Northern Africa (Egypt, Rome, Persia, Mesopotamia Valley, Greece, Ethiopia, etc).

Interestingly, the modern descendants of the ancient !Kung tribes and clans of Southern Africa utilize similar traditional [music](#) techniques. That could mean the practice of musical onomatopoeia may be as old as human civilization.

## European classical - Voice instrumental music

In [Classical music](#), especially, since the music of Arnold Schoenberg, Carl Orff and Wagnerian composers, the role of voice instrumental music for solo vocalist, voices or [chorus](#), as part of the [orchestral score](#), has become very prominent.

The tradition of voice instrumental is very old and strong one in European classical music. It has its roots in the Jewish Nigun and further elaborated in the [Gregorian chants](#). The Vocal instrumental concerto and the figured bass, along with a cappella compositions, during the [baroque](#) were a form of the use of the voice as an elaborate instrument. Later on Mozart operas had many [arias](#) begin in gibberish using the voice as a tonal instrument. This led to the serious use of voice instrumental music in classical compositions.

However, it was only with the rise of orchestral [harmonic](#)-chromatic music that voice instrumental music became a forceful feature in compositions. Richard Wagner used the [voice](#) as an integral instrument of the [orchestra](#). His music interwove the human voice and the orchestral counterpoints into a structural whole. Continuing this German neo-romantic tradition was the music of Gustav Mahler. His compositions used the voice as an orchestral instrument. Even though the voices are assigned words, the essential purpose of the voice is to express the human voice beyond words and linguistic meaning. This is exemplified in the symphonic compositions Das Lied von der Erde and Eighth Symphony also called as symphony of a thousand, because of its usage of a 150 musician voice orchestra along with a 120 person symphony orchestra.

## Voice instrumental in 20th century Classical music

In 20th century classical music, one of the most prominent voice instrumental composers was the German composer Carl Orff. He composed voice instrumental music like *Carmina Burana* and *Catulli Carmina*, using voices and [choral](#) music which created forceful and primitive inspired rhythmic patterns and simple but powerful harmonic structure. The *Second Viennese School*, especially Alban Berg and Arnold Schoenberg made the elaborate use of voice as instrument in what they called as Sprechmusik and Sprechstimme. Schoenberg employed these in his music *Pierrot Lunaire*, while Berg employed it in *Wozzeck*. Their music was also called as Sprechgesang. Voice orchestra was also used in the *Kyrie* by the Swiss composer Frank Martin.

In [avant-garde music](#), voice instrumental musics became an integral aspect of aleatory music by composers like Luciano Berio and Steve Reich. The Russian saxophonist Vladimir Chekasin performed a piece called *Concerto for Voice and Orchestra*, which used the voice of Datevik Hovhannessian as a soloist instrument instead of the violin or the piano. Other concerto for voices were written by John Foulds : *Lyra Celtica: Concerto for voice and orchestra* op. 50 (1920s) and Reinhold M. Glière : *concerto for voice and orchestra* (1943).

The Polish composer Henryk Górecki composed a prominent part for voice as an instrument in his third symphony *Symphony of sorrowful songs*, evoking the Holocaust.

At present elaborate voice instrumental improvisations have become an important part of [European free improvisation](#). This is a type of European classical music that combines the flow of improvisations and the rigour of atonal music.

## Voice Transmutation in experimental Classical music

The French composer Pierre Boulez makes use of voice transmutation which he calls as *centre and absence*. In this the voice is used as an initial compositional model but which would not appear in the final form. Voice transmutation are also done by composers like Jonathan Harvey in compositions like *Mortuos plango, vivos voco* which interpolates the voice into instrument with the aid of computer techniques.

Maja Ratkje is a Norwegian vocalist and composer using various [extended techniques](#).

## Various folk traditions

A form of Voice improvisation known as Thillana is a very important feature of [Carnatic music](#) from South India.

Tuvinian throat singing often features wordless and improvised song. The sygyt technique is a particularly good example of this.

The Sámi yoik is also a predominantly wordless form of vocal expression.

The musical tradition of "mouth music" (Puir a Beul) was used in various forms of traditional music in the Anglo-Saxon and Gaelic communities.

Hasidic Jews use a form of voice improvisation called nigunim. This consists of wordless tunes vocalized with sounds such as "Bim-bim-bam" or "Ai-yai-yai!", often accompanied by rhythmic clapping and drumming on the table. Examples of this can be seen in the films *The Chosen* and *A Stranger Among Us*.

## Voice instrumentals in Jazz and Popular Music

The most common types of voice improvisation in the Western world are found in [jazz](#) which knows it as scat singing and vocalese. Louis Armstrong and Ella Fitzgerald were both famous for their scat singing, and many other major figures in jazz, from Betty Carter to Mel Torme, also use the form. In [pop music](#), doo-wop and other forms of [rhythm and blues](#) music employ it; in the Gaelic tradition, there are many terms for it, one of which is diddling. The nonsense choruses of old English [ballads](#), "Hey nonny nonny" and the like are another well known example. Some contemporary jazz musicians have used what they call voicestra, using the voice as an orchestral ensemble. Barbershop music style is also used in many a popular songs. Jazz composers like Rhiannon have concentrated on exploring the beauty of voice instrumental improvisations in [jazz music](#).

[Hip hop music](#) has a very distinct form of vocal percussion known as beatboxing. It involves creating beats, rhythms, vocal scratching and melodies using the human voice as an instrument.

The neo-[minimalist](#) Film composer James Horner wrote music with voice instrumental passages by Charlotte Church for the motion picture A beautiful mind. A vocal orchestra music is used in the motion picture Paradise Road. It presented a 50 member female singing ensemble, set on the Japanese front of World War II.

Another contemporary example is the almost entirely a cappella album, Medúlla, by Icelandic singer/songwriter Björk. It features beatboxing, choral arrangements and throat singing. "Our Prayer" by Brian Wilson and The Beach Boys is a wordless, acapella workout, featuring multiple vocal lines that intertwine and modulate into various chord shapes. Japanese singer/songwriter, Cornelius, uses the same technique on the title-track of Fantasma.

Singer Bobby McFerrin has recorded a number of albums using only his voice and body, with some tracks as voice instrumentals and others, like his infamous big hit "Don't Worry, Be Happy", consisting of a standard lyric melody backed by "instrumental" tracks also consisting of various McFerrin vocalizations. (On the same album, he performs a version of "Sunshine of Your Love" in which he replicates Eric Clapton's original guitar solo using only his voice.) McFerrin has also collaborated with classical and jazz musicians.

Voice instrumental music is featured in Pink Floyd's music; "The Great Gig in the Sky", from the album the Dark Side of the Moon. The progressive rock piece "Echoes" by Pink Floyd, also uses the voice as part of the instrumental music even though there are sparse lyrics assigned to the voice parts. Others include Yes and Queen, notably the latter's "Seaside Rendezvous" on the album A Night at the Opera.

Icelandic post-rock group Sigur Rós' untitled 2003 album features nonsensical lyrics for the entirety of the album. Singer Jón Þór Birgisson refers to this as a fictional language he calls Hopelandic.

# Onomatopoeia

Onomatopoeic music uses the mouth and vocal folds (that is, [voice](#)) as the primary musical instrument. A common musical tool in European and American cultures is a method of voice music, technically called as solfege. A solfege is a vocalized musical [scale](#) that is commonly known as *Do-Re-Mi-Fa-Sol-La-Ti*. A solfege may be sung, spoken or used in a combination. A variety of similar tools are found in scat singing of jazz, [Delta blues](#) and also [rock and roll](#) and the [ska](#) of [reggae](#) (the last which is also called Two Tone).

Categories: [Classical music](#)

# Walkaround

A **walkaround** (also spelled **walk-around** or **walk around**, or called a **horay**) was a [dance](#) from the blackface minstrel shows of the 19th century. The walkaround began in the 1840s as a dance for one performer, but by the 1850s, many dancers or the entire troupe participated. The walkaround often served as the finale to the minstrel show. Minstrels also wrote songs called "walkarounds", which were specifically intended for this dance; "Dixie" is probably the most famous example.

The dance was competitive in nature. At the start of the music, typically a fast dance song in 2/4 or 4/4 time, the dancers (who were already seated in a semicircle) stood and began clapping and slapping themselves in time ("patting Juba"). One dancer or a couple then moved downstage to the focal point of the semicircle and performed a set of elaborate dance steps, lasting for about 16 bars. Once these dancers retreated back to the semicircle, another dancer or pair of dancers took a turn. This repeated until all dancers had soloed. Finally, all the dancers broke ranks and danced the minstrel show to its conclusion. In later years, the cakewalk became integrated into the walkaround, and over time the two terms became interchangeable. The cakewalk portion of the dance was typically performed by men in drag.

Nineteenth century commentators claimed that the walkaround descended from the communal dances of African plantation slaves, dances which themselves hearkened back to religious West African dances. Modern scholars still hold this to be mostly true, claiming that the walkaround was a parody of the ring shout, a religious slave dance. The popularity of walkarounds in minstrelsy allowed the style to influence later dances, as well.

# Waltz

The **waltz** is a [ballroom](#) and [folk dance](#) in 3/4 time, done primarily in closed position. The most common basic figure of a waltz is a full turn in two measures using three steps per measure.

The waltz first became fashionable in Vienna around the 1780s, spreading to many other countries in the years to follow. The waltz, and especially its closed position, became the example for the creation of many other ballroom dances. Subsequently, new types of waltz have developed, including many folk and several ballroom dances.

## Origin

The waltz is assumed by some to be a descendant of the lavolta. This is unproved, and the fundamental differences in technique make it hard to imagine how the one could be so closely related to the other. The main reason to assume such a descent is merely that these are two of the earliest European turning dances in closed positions for which we have explicit written instructions. It is likely, however, that they could have had a common ancestor. The Laendler has also been suggested as a possible ancestor.

In the 19th and early 20th century, numerous different forms of waltz existed, including versions done in 2/4 or 6/8 (sauteuse), and 5/4 time (5/4 waltz, half and half). In the 1910s a form called the "Hesitation Waltz" incorporated pauses and was danced to fast music. In the 19th century the word primarily indicated that the dance was a turning one; one would "waltz" in the polka to indicate rotating rather than going straight forward without turning.

## Various styles of waltz

- In contemporary ballroom dance, the fast versions of the waltz are called Viennese waltz.
- International Standard Waltz has only closed figures; that is, the couple never leaves closed position.
- The American Style Waltz, in contrast to the International Standard Waltz, involves breaking contact almost entirely in some figures. For example, the Syncopated Side-by-Side with Spin includes a free spin for both partners. Open rolls are another good example of an open dance figure, in which the secondary partner alternates between the primary partner's left and right sides, with the primary partner's left or right arm (alone) providing the lead.
- The Cross Step Waltz is a newer style of waltz where the first step is a cross-step into the line of direction. This was popularized in classes at Stanford University and allows for a much richer assortment of variations.
- The [tango](#) style of dance has a "creole waltz", or Vals, which is danced in three, but with steps that are idiomatic to the tango.

Waltzes were the staple of many American musicals and films, including "Waltz in Swing Time" sung by Fred Astaire.

## War of the Romantics

The **War of the Romantics** is a term that has been used by music historians to describe the aesthetic schism that broke out among prominent musicians in the latter half of the 19th century. The principal disagreements were about musical structure, the limits of chromatic harmony, and about the value of programmatic music versus absolute music. The opposing parties crystallized during the 1850s, with the conservative circle, based in Berlin and Leipzig, centered around Johannes Brahms and Clara Schumann. Their opponents, the radical progressives, organized in Weimar around Franz Liszt and Richard Wagner (in exile in Zürich until 1861). The controversy was principally German and central European in origin; musicians from France, Italy, and Russia figured only marginally. Composers from both parties looked back upon Beethoven as their spiritual and artistic hero.

## The Leipzig conservatives

Clara Schumann, Joseph Joachim and Johannes Brahms were early key members of the conservative Leipzig-based school. This core of supporters maintained the artistic legacy of Robert Schumann who had died tragically amid mental illness in 1856. Robert Schumann (incapacitated from 1854 till his death) was an enthusiastic admirer, and occasional critic, of Liszt and Wagner in the previous decades. Schumann had been a progressive critic, editor of the influential music periodical *Neue Zeitschrift für Musik*, which he founded in 1834. Schumann was exceptional in his abilities to maintain enthusiastic, artistically fruitful friendships with the emerging vanguard of radical romantics — Liszt in particular — as well as with musical conservatives such as Mendelssohn and Gade. However, after Schumann sold the *Neue Zeitschrift für Musik* to Franz Brendel, under whose editorial leadership it became a propaganda organ for Liszt and his circle. Clara, who had long been the more conservative aesthete in the Schumann marriage, perceived the change as a slight against her husband's legacy. The young Brahms, who had been very close to the Schumanns during Robert's decline, also took up the cause. The conservative critic Eduard Hanslick was very influential on their behalf. Associated with them at one time or another were Heinrich von Herzogenberg, Friedrich Gernsheim, Robert Fuchs, and Karl Goldmark among others.

## The radical romantics

Besides Liszt and Wagner, other key figures on the Weimar/New German side of the divide included critic Richard Pohl and composers Felix Draeseke, Julius Reubke, Karl Klindworth, Hans von Bülow, William Mason, Peter Cornelius and briefly Anton Rubinstein and Joachim Raff. There were several attempts, centered around but not generally inaugurated by Liszt, to create a lasting and formal society. The *Neu-Weimar-Verein* was one attempt to form a club, which lasted a few years and had published minutes. The *Tonkünstler-Versammlung* (Congress of Musical Artists), which first met in Leipzig in June 1859, was a more fruitful attempt.

One of the central points of disagreement between these two groups of musicians concerned form and forms — very generally speaking, Liszt's "circle", and Liszt himself in composing, were perceived to prefer to write in new styles and new forms, while the Leipzig/Berlin school was regarded as preferring the forms used by the classic masters (and codified by musicologists of the early 19th century.) The increasing use of various kinds of [program music](#) (explicitly pictorial and simply suggestive) by the Weimar school, and Liszt's development of the [symphonic poem](#) reinforced this perception, as did his motto that new wine required new bottles, though exceptions were not always minor.

Hanslick was led, first by the publication of Liszt's first symphonic poems and later by the *Faust Symphony*, to publish a statement of principles, that music did not and could not represent anything outside itself — not only not realistic impressions after the manner of Hector Berlioz, but even impressions and feelings, the motto on the score of Beethoven's Sixth Symphony. It should be noted in passing that at least Wagner believed that this was closer to Liszt's intention than any more exact pictorial representation (see his "Open Letter on Liszt's Symphonic Poems", 1857, *Neue Zeitschrift für Musik* April 10 1857, which originated as a letter, Feb 15 1857 to Princess Marie von Sayn-Wittgenstein, Caroline's daughter and Liszt's effective — and treated-as — adoptive daughter, see Walker, p 231 note, paperback edition. Liszt's prefaces to the works seem to back this view up, as well.)

## The Manifesto

One significant event out of many was the signing of a *Manifesto* against the perceived bias of the *Neue Zeitschrift für Musik*. This effort, whose authors were unknown, received at first four signatures among them those of Brahms and Joachim, though more were canvassed and eventually more were obtained. Before the later signatories could put their names to the document, however, it found its way into the editorial offices of the *Berliner Musik-Zeitung Echo*, and from there was leaked to the *Neue Zeitschrift* itself, which parodied it on May 4, 1860. Two days later (Walker, p 350) it made its official appearance also in the *Berliner Musik-Zeitung Echo* with more than twenty signatures, including Woldemar Bargiel, Albert Dietrich, Carl Reinecke, and Ferdinand Hiller.

The "war" was fought with compositions, words, and even with scenes such as staged catcalls at a concert to show dislike of the musical programme or conductor. Reputations were at stake and partisans sought to embarrass their adversaries with public slights; the Weimar school held an anniversary celebration of the *Neue Zeitschrift* in Schumann's birthplace Zwickau and conspicuously neglected to invite members of the opposing party (including Clara Schumann). From the point of view of musicians on one side, it pit Brahms' increasingly effective and economical sonata form — say — against Liszt works with no form at all; as seen from the other, it put works in which — to paraphrase again the motto above, this time into an expression used by Cedric Thorpe Davie — musical form best fit musical content — against works which reused old forms without any understanding of their growth and reason. The 20th century brought a diversity of music against which the conflicts of the 19th seem like so many shades of the same color against a rainbow, and often, as Arnold Schoenberg lamented, criticism was one-note\* and one-shade in the face of a whirlwind of styles, experimentation, returns-to, but the War of the Romantics, the writing it left and the events we know, provide a very useful insight into the time and its creative artists for all of that.

As to the victor of this metaphorical war, classical works written in the 20th century were either so far away from the questions addressed for either side to be relevant — Robert Ashley's works for light come to mind as an extreme case of music for which these concerns have no relevance, but there might be pieces even more so before not so very long... — or often benefited from the thoughts and works of both. Nikolai Medtner acquired the nickname the Russian Brahms (mostly for his sure handling of sonata form, actually — his teacher Taneyev saying that he was born with it) but wrote a half-hour, one-movement sonata, op. 25/2 in e, with the internal form of a sonata exposition followed by a fantasy.

\*Schoenberg's essay — *About Music Criticism* — published in *Style and Idea*, page 194, translated by Leo Black, pub. Balmont Music Publishers 1975, paperback edition ISBN 0-520-05294-3, 1984 — remarked that while earlier critics had at least been able to discuss "the problem of whether it is effective or admissible" to reverse the order of the inner movements of a sonata structure, or to have an unusual key sequence in a work (e.g. Brahms' 2nd cello sonata, with slow movement a semitone above the main key,) these problems entirely passed modern critics by; critics could only harp on harmony, tonality, harmony. In this respect even the new profession of criticism — and in the mid-1800s professional music criticism (in newspapers, often by non-musicians, that is, as is the habit today) was very new — may have been marginally better. (Or not.)

## Books

- Alan Walker, *Franz Liszt: The Weimar Years*, ISBN 0801497213, Cornell University Press 1993. pp.338 – 367 is entitled and covers specifically *The War of the Romantics* but it is a theme elsewhere.
- Cedric Thorpe-Davie, *Musical Structure and Design*, ISBN 0486216292, Dover Publications, 1995. Still available from some retail outlets.

## Water organ

The **water organ** is a type of automatic organ blown by air aspirated by water from a natural source (e.g. by a waterfall). Consequently, it lacks bellows. In addition to aspirating air, the water sounds the organ by driving a mechanism similar to that of the Barrel organ, which has a pinned barrel carrying the musical programme.

Water organs play without human intervention once they are set in action. Ancient and modern writers have frequently confused them with the Greco-Roman Hydraulis, a type of pneumatic organ in which air was supplied by hand-operated air pumps and water was used in a device to steady the wind-pressure. Unlike the steam organ, which did employ 'wet' air, no water ever coursed through the musical pipes of the water organ.

## Mechanics

Both water and air arrive together in the camera aeolis (wind chamber). Here, water and air separate and the compressed air is driven into a wind-trunk on top of the camera aeolis, to blow the organ pipes. Two perforated 'splash plates' or 'diaphragms' prevent water spray from getting into the organ pipes.

The water, having been separated from the air, leaves the camera aeolis at the same rate as it enters. It then drives a water wheel, which in turn drives the musical cylinder and the movements attached. To start the organ, the tap above the entry pipe is turned on and, given a continuous flow of water, the organ plays until the tap is closed again.

Many water organs had simple wind-pressure regulating devices. At the Palazzo del Quirinale, the water flows from a hilltop spring (once abundant, now only sufficient to play the organ for about 30 minutes at a time), coursing through the palace itself into a stabilizing 'room' some 18 metres above the camera aeolis in the organ grotto. This drop provides sufficient wind to power the restored six-stop instrument.

Among Renaissance writers on the water organ, Salomon de Caus was particularly informative. His book of 1615 includes a short treatise on making water organs, advice on tuning and registration, and many fine engravings showing the instruments, their mechanisms and scenes in which they were used. It also includes an example of suitable music for water organ, the madrigal *Chi farà fed' al cielo* by Alessandro Striggio, arranged by Peter Philips.

## History

Water organs were described in the texts of Ctesibius (3rd century bce), Philo of Byzantium (3rd century bce) and Hero of Alexandria (c62 ce). Like the water clocks (clepsydra) of Plato's time, they were not regarded as playthings but might have had a particular significance in Greek philosophy, which made use of models and simulacra of this type. Hydraulically blown organ pipes were used to imitate birdsong, as well as to produce the awe-inspiring sound emitted by Memnon's statue at Thebes. For the latter, solar heat was used to syphon water from one closed tank into another, thereby producing compressed air for sounding the pipes.

Arab and Byzantine engineers developed, among other pieces, an automatic water organ (described by the Banu Musa in their 9th-century treatise; see Farmer, 1931), and a 'musical tree' at the palace of Khalif al-Muqtadir (ruled 908–32). By the end of the 13th century hydraulic automata had reached Italy and the rest of Western Europe. During the Renaissance water organs again acquired magical and metaphysical connotations among followers of the hermetic and esoteric sciences. Organs were placed in gardens, grottoes and conservatories of royal palaces and the mansions of rich patricians to delight onlookers not only with music but also with displays of automata – dancing figurines, wing-flapping birds and hammering cyclopes – all operated by projections on the musical cylinder. Other types of water organ were played out of sight and were used to simulate musical instruments apparently being played by statues in mythological scenes such as 'Orpheus playing the viol', 'The contest between Apollo and Marsyas' and 'Apollo and the nine Muses'.

The most famous water organ of the 16th century was at the Villa d'Este in Tivoli. Built about 1569–72 by Lucha Clericho (Luc de Clerc; completed by Claude Venard), it stood about six metres high under an arch, and was fed by a magnificent waterfall; it was described by Mario Cartaro in 1575 as playing '[madrigals](#) and many other things'. It was also provided with a keyboard. G. M. Zappi (*Annalie memorie de Tivoli*, 1576) wrote: 'When somebody gives the order to play, at first one hears trumpets which play awhile and then there is a consonance .... Countless gentlemen could not believe that this organ played by itself, according to the registers, with water, but they rather thought that there was somebody inside'. Besides automatically playing at least three pieces of music, it is now known that the organ was also provided with a keyboard.

Other Italian gardens with water organs were at Pratolino, near Florence (c. 1580), Isola de Belvedere, Ferrara (before 1599), Palazzo del Quirinale, Rome (built by Luca Biagi in 1598, restored 1990), Villa Aldobrandini, Frascati (1620), one of the Royal Palaces at Naples (1746), Villa Doria Pamphili, Rome (1758–9). Of these only the one at the Palazzo del Quirinale has survived. Kircher's illustration in *Musurgia universalis* (1650), long thought to be a fanciful representation of a hypothetical possibility, has been found to be accurate in every detail when compared to the organ grotto at the Quirinale, except that it was reversed left to right. There are still traces of the instrument at the Villa d'Este but the mineral-rich water of the river which cascades through the organ grotto has caused accretions which have hidden most of the evidence from view.

In the early 17th century water organs were built in England; Cornelius Drebbel built one for King James I (see Harstoffer, 1651), and Salomon de Caus built several at Richmond while in the service of Prince Henry. There was one in Bagnigge Vale, London, the summer home of Nell Gwynn (1650–87), and Henry Winstanley (1644–1703), the designer of the Eddystone Lighthouse, is thought to have built one at his home in Saffron Walden, Essex. After the marriage of Princess Elizabeth to the Elector Palatine Prince Friedrich V, de Caus laid out for them the gardens at Heidelberg Castle which became famous for their beautiful

and intricate waterworks. A water organ survives in the gardens at Heilbronn, Württemberg, and parts of one at the Wilhelmshöhe gardens in Kassel. The brothers Francini constructed waterworks and organs at Saint Germain-en-Laye and Versailles, which reached new heights of splendour and extravagance.

By the end of the 17th century, however, interest in water organs had waned. As their upkeep was costly they were left to decay and were soon forgotten; by 1920 not one survived (the so-called water organ at Hellbrunn Castle, Salzburg, is a pneumatic organ driven by hydraulically-operated bellows).

Their mechanism was subsequently misunderstood until the Dutch engineer Van Dijk pointed out in 1954 that air was supplied to the water organ by aspiration, which was the same method used in forges and smelting works in the 16th and 17th centuries. Aspiration is the process by which air is drawn into an opening into which water flows. For the water organ, a small pipe is arranged so that one end is open to the air and the other extends into a larger pipe that contains flowing water supplied by a stream, pond or stabilizing reservoir. The longer the vertical drop of the water, the more forceful the suction will be and the greater the volume of air sucked in.

# West Coast hip hop

**Stylistic origins:** Form of [hip hop music](#) that combines the elements of Dancehall toasting with the rhythms of [R&B](#), [Reggae](#), [disco](#), and [funk](#).

**Cultural origins:** Early-1980s, California, United States

**Typical instruments:** Prominent [Bass](#) - [rapping](#) - [drum machine](#) - [Sampler](#) - [synthesizer](#)

**Mainstream popularity:** Popular throughout the early-to-mid 1990s, declined during the remainder of the decade up to the 2000s with varying degrees of mainstream exposure

[Alternative hip hop](#) - [electro hop](#) - [G-Funk](#) - [Hyphy](#) - [Latin rap](#) - [Mobb Music](#)

Los Angeles - Long Beach - San Francisco (Bay Area) - Oakland - Seattle

[Gangsta Rap](#)

**West Coast hip hop**, also known as **California hip hop** or **West Coast rap**, is a style of [hip hop music](#) that originated in California in the 1980s. It has since grown into a subgenre of hip hop and has developed several creative centers, most of which are in California.

These centers of West Coast hip hop is: The Los Angeles area, but can also include the greater San Francisco area (also known as the The Bay (Area) ), Oakland/Berkeley, Vallejo, and Seattle.

## Origins and Early Success

The West Coast scene got its start during the early 1980s as [hip hop music](#) first gained national appeal, and established itself in California in general (and in Los Angeles and the Bay Area in particular). Early hardcore/gangsta rap performers included Too \$hort, who put out three independent albums during the 1980's before his 1988 major-label debut, "Born to Mack," went gold. His next four albums all went platinum. In Los Angeles during the same period, artists like King Tee and Ice-T gained prominence, while World Class Wreckin' Cru, Egyptian Lover and the Arabian Prince innovated a style called [electro hop](#) (or simply *electro*), essentially a hybrid of [dance music](#) and rap - following the lead of Afrika Bambaataa, who had originally created hip hop by mixing together reggae, funk, and German techno. However, hip hop purists refused to accept electro hop, and it had all but disappeared by the mid-1990s.

The so-called "[gangsta rap](#)" movement also originated in California in the 1980's, serving as a sharp contrast to electro hop and other lighter forms of hip hop. [Gangsta rap](#) achieved a huge success until the mid of the 1990s. Ice-T's "6'n da Mornin" (1986) received some national exposure. Ice-T's seminal 1987 recording Rhyme Pays was a landmark for the genre, and N.W.A.'s N.W.A. and the Posse came out shortly thereafter, making waves among hip hop listeners nationwide.

In 1988, the now-legendary West Coast group N.W.A. released their blockbuster, Straight Outta Compton, and put the West Coast on the hip hop map. Their sound was influenced by hardcore, [metal](#)-tinged rap performers like Ice-T, Latino music commonly found in the ghettos of East L.A., and 70's [soul music](#) and [p-funk](#). *Straight Outta Compton* united these sounds with minimalistic beats and blunt, hard-hitting lyrics filled with references to (and, often, promotions of) violence, hedonism, and the criminal lifestyle.

It has been suggested that the West Coast movement gained early recognition in Los Angeles partly due to the city's affiliation with the entertainment industry where most of the major record companies and labels reside.

West Coast hip hop also received vital early contributions from groups based in the Bay Area, and Oakland in particular. Too Short, for instance, was and is a giant in the genre, and MC Hammer was one of the first "pop-rap" national superstars. Both artists began their rap careers on the streets of Oakland, and the radically different paths their careers have taken are indicative of the fracturing of hip hop culture into multiple sub-genres over the last twenty years.

Seattle, Washington has also had an active scene from very early on, though their only major commercial success thus far has been Sir Mix-a-lot of "Baby got back!" fame.

## The First Great Divide: East vs. West

With the nationwide success of N.W.A., the West Coast had finally established a style that matched the intensity and grit of the hip hop that was coming from the East Coast at the time. In gangsta rap, the West Coast scene had a voice that could compete with Public Enemy, KRS-One, and other East Coast powerhouses. Although N.W.A. would eventually crumble and its ranks diminish, its remaining members continued to build on the foundation the group had laid.

Two of N.W.A.'s most prominent members, Ice Cube and Dr. Dre, both launched successful solo careers after the group's dissolution. Ice Cube's style was often more militant, angry, racially charged, and political than Dr. Dre's, and his lyrics and delivery earned him two platinum albums and a score of copycat artists. Dr. Dre's style, dubbed "[g-funk](#)" or "Gangsta Funk," was slower and more melodic, with heavy basslines topped by flutes and [p-funk](#) samples, and finished with a slurring, often whimsical lyrical delivery. Dr. Dre's debut album, *The Chronic* (1992), is widely considered to be a seminal work in the genre and not only established the sound of West Coast hip hop (then primarily gangsta rap) for years to come, but also launched the careers of several key West Coast hip hop artists, including Snoop Doggy Dogg, Dat Nigga Daz, Kurupt, Nate Dogg and Warren G.

While the beginnings of the rivalry between coastlines can be traced back to N.W.A., it took a personal beef between two of gangsta rap's greatest prodigies to fully capture the nation's attention. Tupac Shakur (2Pac), previously a dancer and second-string rapper with Digital Underground, delivered his debut album "*2Pacalypse Now*" in 1991 to surprising acclaim. While he was working on "*Me Against the World*" (1994), he was shot by muggers in the lobby of a New York City recording studio that The Notorious B.I.G. and Sean "Puff Daddy" Combs were also allegedly at. While serving prison time for sexual assault, 2Pac accused The Notorious B.I.G. and Sean Combs, amongst others, of orchestrating the shooting. This series of events sparked an intercoastal war between Bad Boy Entertainment (owned by Combs) and Death Row Records (owned by Suge Knight, who had arranged for 2Pac's parole and posted a \$1.4M bail to sign the rapper).

The tension between Death Row and Bad Boy increased as both labels released a series of scathing tracks blatantly filled with insults, threats, and accusations targeted at the opposing labels. One of the most famous diss tracks that came out of the conflict was 2Pac's "*Hit 'Em Up*," in which he claims to have slept with The Notorious B.I.G.'s wife Faith Evans and attacks the famed rapper's street credibility. During this period of time, almost every incident in both rappers' personal lives was linked to the other, as the feud snowballed into hip hop's biggest story. The rivalry ended when 2Pac was fatally shot in 1996, a slaying that, not surprisingly, The Notorious B.I.G. was widely suspected to be responsible for. In an incident that may or may not be connected to the rivalry, The Notorious B.I.G. was also fatally shot in a similar fashion to Shakur, exactly six months after the fatal shooting of his West Coast rival.

Knight was eventually arrested on various unrelated charges, Death Row Records crumbled as Dr. Dre departed to form Aftermath Entertainment, and Snoop Dogg left to join No Limit Records. Gangsta rap disappeared from the national spotlight and the resulting void was filled by east-coast pop-rap acts such as Puff Daddy, Ma\$e, and actor/musician Will Smith. By 1997, West Coast hip hop had gone underground.

## The Second Great Divide: Commercial vs. Underground

An oft-cited reason for the decline of the West Coast scene in the late 1990's was that by that time it had been split into two almost totally unconnected factions. While [Gangsta Rap](#) artists like E-40 and Snoop Dogg - along with all of their countless imitators - continued to fight for access to the mainstream, the so-called Conscious Hip Hop scene on the West Coast adopted a more do-it-yourself ethos, disdaining commercial success. The aftereffects of the West Coast scene's "great divide" of the late 1990's can still be felt today: as a result of the split, major West Coast cities like San Francisco and Los Angeles are now home to not one but multiple hip hop scenes, which are differentiated from each other as much by their politics as by their music.

In the late 1990's, the West Coast's Underground Hip Hop scene began to gain national and international prominence as artists like Spearhead, Blackalicious, Zion i, Aceyalone, Del tha Funkee Homosapien, Hieroglyphics, Of Mexican Descent, Jurassic 5, The Coup, Dilated Peoples, Ozomatli, and many others (most of whom self-identify as "conscious" artists, and all of whom include overtly political messages in their music) gained worldwide fame without ever being signed to major labels.

Other West Coast artists, such as San Francisco's Emcee Lynx, took the political aspect of their music a step further and became active participants in - and de-facto spokespeople for - various social movements, something that has not happened to any significant degree in any of the U.S.'s other regional rap scenes.

Despite the emergence of the Underground movement as a major competitor at the turn of the century, West Coast Gangsta rap is still alive and well, although the sound and feel of the music has changed remarkably since the G-Funk era. Snoop Dogg and Dr. Dre continue to be major players in the national mainstream, but local gangsta rap artists like E-40, The Frontline, Andre Nickatina continue to struggle for name recognition, having enjoyed less commercial success than their more politically-minded counterparts.

## The Third Generation of the West Coast

West Coast rap seems to be on going a third generation of artists. The Game's album "The Documentary" along with a well publicized beef with 50 Cent has received more attention to the west coast. Some hip hop writers believed that the genre was on the brink of another intercoastal rivalry, between the artists of G-Unit Records (East Coast) and The Black Wall Street Records (West Coast). The Game, owner of The Black Wall Street Records, is currently "beefing" with 50 Cent, owner of G-Unit Records, over his dismissal from the G-Unit roster and 50 Cent's subsequent slander of The Game on New York public radio. Since that initial incident, artists from both labels have released underground recordings rife with insults and threats targeted at the opposing labels. In any case, the beef between The Game and 50 Cent is not likely to have an impact any where near as deep as that created by the split between 2Pac and B.I.G, because neither 50 nor The Game command anywhere near the loyalty or respect enjoyed by either Pac or Biggie, and their beef seems to have died down. The Game's success has prompted new interest in the west coast (although to what extent is heavily disputed). Since The Game released the Documentry, artist like G-Malone, Bishop Lamont, JT The Bigga Figga, Eastwood, and Ya Boy have all received much buzz over there signings/music. The Bay area also seems to be picking up steam with there brand of Hyphy music, prompted by long time veteran E-40.

After the success of his latest album R&G (Rhythm & Gangsta) The Masterpiece Snoop Dogg convoke the elder long-famed west side artist including the Bay Area into a meeting called the Western Conference on July 4th, 2005. They agreed to join forces again and to end long standing beefs between each other in hopes of helping west coast music back to its once reigning place. It served as occasion for several members to announce cease-fire in their beefs including the reconciliation of Tha Dogg Pound, Jayo Felony and Snoop, The Game and JT the Bigga Figga. The headcount was about 60-70 people during the event. Snoop Dogg offered his label Doggystyle Records to be "engine" of the movement, and that he will promote it with his name.

On 22 April, 2006 the west side showed cohesion by appearing in the video shoot for the Dogg Pound single Cali Iz Active in the Elysian Park, Los Angeles.

# West Coast Swing

**West Coast Swing (WCS)** is a [partner dance](#) derived from [Lindy Hop](#). It has the soul of a street dance but has been tamed by [ballroom dance](#) studios. Within the spectrum of partner dances, WCS is one of the most difficult and one of the most improvisational.

It is easily recognized by a distinctive elastic look that results from its narrow slot.

## History

It is believed that the origins of the WCS are in Savoy style Lindy. Dean Collins moved to California in 1930s and introduced the dancing scenes there to [Lindy Hop](#), which that took a firm hold on the West Coast through the 30s and 40s. When swing fell out of mainstream's consideration as pop music around the 50s and was replaced by rockabilly, dancers on the West Coast began using swing moves to the new pop music, thus changing the dance and bringing about the variation now known as West Coast Swing.

Step sheets from ballroom studios reveal that this particular style was known under different names, such as "Sophisticated Swing" and "Western Swing", until it took on the name "West Coast Swing".

In 1988, West Coast Swing was pronounced the Official State Dance of California (see [external links](#)).

## West Coast Swing vs. Lindy Hop

West Coast Swing is believed to have evolved from [Lindy Hop](#), though both have evolved into different dances for different musical tastes since the fork. There is still a large amount of crossover between the two dances and between the various styles.

The key differences of WCS from Lindy Hop are:

### Slot

The follower travels back and forth along a shoulder width rectangle, called the slot, with respect to the leader. The leader is more stationary but will move in and out of the slot depending on the pattern led. A general rule is that the leader leaves the slot only to give way for the follower to pass him.

Various reasons have been given for the slotted style. One reason is that when all followers dance in lines, club owners could pack many more dancers onto the floor. Another reason was that in Hollywood, film makers wanted dancers to stay in the same plane, to avoid going in and out of focus.

### Music

WCS was originally danced to sixteen count [Blues](#) music, rather than the [Jazz](#) from the early part of the 20th century. In practice, WCS may be danced to almost any music in 4/4 time. Such diverse musical genres as Soul, [Funk](#), [Rock and Roll](#), Pop, and [Disco](#) may be found in a typical evening of WCS dancing. In recent years, most WCS venues have seen a greater proportion of contemporary music played as opposed to blues. While some may lament the departure of WCS from its roots, others view this trend as another step in the continued evolution of the dance.

## Classic WCS

The style of WCS that matches the "classic" WCS music featured by swung eighths. In this style the "split-beat" steps are typically counted as: "1 a2"; "3 a4"; "a3 4"; etc. Here "a" denotes the intermediate beat "swung" away from the strict middle position and splitting the beat approximately 2:1. For the comparison, the "a" in "1a2" of Samba rhythm splits the quarter note 3:1, i.e., it "splits off" a 1/16, so it is "straight" in the sense of binary note duration nomenclature.

## Funky WCS

A more contemporary style of WCS that matches [American pop music](#), which has square [rhythms](#). In this style the "split-beat" steps may well be counted in strict time: "1&2"; "3&4"; "&34"; etc., to match the music.

The Classic WCS elements of standard step patterns were modified or replaced. For example, the anchor step, the cornerstone of the classic WCS, is often replaced by hook-replace-side triple-step. This was a short lived replacement, however, as it was realized that this terminal step destroyed any semblance of connection that a proper anchor step provided. Better staying power was afforded body motions such as ripples and pops, which some professional dancers have incorporated as a permanent part of their styling.

The "Funky WCS" classification in recent years has fallen by the wayside with the communal realization that WCS done to contemporary music is no different from WCS done to straight up [blues](#). With the exception of footwork, funky and classic styling may be performed to any genre of music.

## "True" WCS vs. ballroom WCS

Here lies an ironic controversy. It is argued that WCS in its modern form was documented and elaborated by Lauré Haile of Arthur Murray Ballroom Dance Studios (franchise). Afterwards it broke away to evolve on its own. A renewed interest in WCS encouraged ballroom studios to include it in their curricula.

Unfortunately, the original technique and style of this swing dance is being levelled out by the "averaged" ballroom technique of mass consumption, as it happened with many other dances such as Samba, Cha Cha Cha, and East Coast Swing. While abuse of improperly taught Cuban hip motion in "ballroom WCS," lack of understanding of swung eighths, and dancing rehearsed patterns strung one after another without paying much attention to musical phrasing are among frequent complaints of "true" WCS dancers, the main bone of contention is the Coaster Step variation of the anchor step.

The Coaster Step was actually in vogue during the early days of WCS when the dance closely resembled Lindy in connection and style. As WCS evolved further, it was found that the Coaster Step was detrimental to the connection between lead and follow, hence the ascension of the now ubiquitous anchor step where both partners step and end up with one foot behind and to the side of the other. However, some ballroom studios continue to teach WCS with coaster steps as termination steps due to the fact that the instruction they choose to hew to (i.e. videotapes that are bought to teach the instructors) have ideas long dismissed by the general WCS community.

## Beginning dancers

Beginning dancers generally focus on simple moves as they gain understanding of the dance. There are plenty of beginning WCS lessons available in any city. Often there are lessons before dances, but due to the difficulty of the dance prospective students may want to take longer classes (5-10 weeks). They may also want to try different teachers, to find what teaching and dance style best suits them.

Typical beginners must concentrate much on being where they are supposed to be-- including their feet or hands. Unfortunately, many teachers neglect to teach their students the importance of leading and following.

The next step, ironically, is to re-learn all that you know. Moves are to be led and followed, which is typically not what a beginner has been doing. Once one is comfortable dancing the basic patterns, it is time to learn to lead/follow them. This is the time when most people want to learn more complicated moves, and they often put off learning to lead/follow in order to do that. At some point it will become clear that all moves are just recombinations of the fundamentals or cribbed from some other dance.

The beginner is encouraged to attend a nearby regular dance that caters to West Coast Swing dancers to be exposed to a wide range of lead and follow styles. For most urban areas in the United States, a WCS dance club may be a good place to start. For those beginners who want to witness a better mix of leaders/followers, attending a regional or even national WCS dance convention is the next step. This last is often expensive in time and money.

## Moves

Unlike many other dances, WCS does not have a single basic step. The footwork however remains the same for all beginners and consists of:

- Lead: 1 step back with the left foot, 2 step back with right foot, 3&4 triple step and step forward with the left foot, 5&6 triple step.
- Follow: Same steps, opposite feet.

A few basic moves that any WCS dancer should know are listed below, and performed with the same step-step-triple-triple pattern.

### Open Position

- **Underarm Pass:** A six count basic where the follower is led to the other end of the slot, passing the leader underarm on the right.
- **Left Side where the follower is led to the other end of the slot, the couple passing the on their right.**
- **Sugar Push:** A six count basic where the follower, facing the leader, is led from the end of the slot to a one or two hand hold, then led back to the same end of the slot.
- **Tuck Turn:** This is like a Sugar Push in 6 counts, but the lead raises the left arm signaling the follower turn under their own arm (an inside turn).

### Closed Position

- **Return to Close:** In six counts, the follower is led 3/4 of the way around the leader into closed position.
- **Starter Step:** Two triple steps in closed position to begin the dance, so that the leader and follower can get in sync with each other.
- **Throw Out:** A six count basic where the follower is led from the closed position to open. Leads: Triple-step left, triple-step right, step forward with left and follow starts to move forward as well, push from frame of follow out down to the end of the slot.

## Whips

Whips are the backbone of WCS that lead into more advanced stylings. The East Coast Swing equivalent would be Charleston kicks.

- **Whip:** This 8 count basic resembles [Lindy Hop](#). The follower starts at one end of the slot and is led around the lead, to the same end of the slot she started. However there is one fundamental difference from the Lindy Hop Swing Out. The follower stays in her slot, pivoting, then coming back to where she started. The leader steps in and out of the slot, creating a less circular, and more elastic move.

## Style

Beginning dancers should focus on keeping smooth footwork while doing patterns to the beat of the music.

## Advanced dancers

Advanced dancers will break the rules and won't remember what patterns they've just done. Rather than lead or follow pattern after pattern, both leaders and followers shorten or extend counts, play with the music, and express themselves with the dance.

### Advanced moves

Advanced West Coast Swing moves are merely variations of the basic moves done by using two hands connected, changing hands, and utilizing stops and reversal.

Some specially named advanced moves are:

- **Sugar Tuck:** Like a sugar push, but ends with a 2 count underarm turn.
- **Cement Mixer**
- **Basket Whip:** Two hands together to start, lead performs an inside turn with the left arm to the 'Sweetheart' position facing the same direction as the follow, then pulls the follow backwards to her original position pulling the left arm over the follow's head to unwind them.
- **Man around the Woman**
- **Woman around the Man**
- **Reverse Whip**
- **Reverse Close**
- **Swivel Walks**
- **Chicken Walks** aka: Lindy swivels
- **Octopus**

### Example dance

1. Sugar Push, taking both hands.
2. Tuck Turn in place.
3. Underarm Turn with hand change.
4. Underarm Turn, taking both hands.
5. Double Underarm turn with both hands.
6. Underarm turn, catch in whip.
7. Repeat.

### Style

Advanced dancers syncopate their footwork to match the music and turn their bodies to interesting angles to flow more gracefully.

Footwork variations include kick ball changes, sailor shuffles, flea hops, slides and applejacks.

Those advanced dancers who want to add more spice to their dancing may learn leverage moves that put one or both partners in extension. Some examples are leans, dips and splits. Contrary to what the casual observer might see, most dancers will keep their

balance while performing such moves and will rely on their partners sparingly to keep them from falling over.

## Western music (North America)

**Western Music**, directly related to the old English, Scottish, and Irish folk [ballads](#), was originally composed by and about the people settling and working in the American West and western Canada. Mexican music, especially in the American Southwest, also somewhat influenced its development. [Country music](#) had similar origins but developed in the Appalachians to suit the people of that region.

## An account of Western Music

Western music was first brought to national attention by John Lomax in his 1910 publication, *Cowboy Songs and Other Frontier Ballads*. With the advent of radio and recording devices the music found an audience previously ignored by music schools and Tin Pan Alley. Many Westerners preferred familiar music about themselves and their environments.

With the romanticization of the cowboy in the following decades, the music attracted a much greater audience. Hollywood and New York City began composing fully orchestrated four-part harmonies for their motion pictures and recordings, something far from its folk roots but still Western. In its heyday, the 1930s and 1940s, the most popular recordings and musical radio shows such as the National Barn Dance of the era were of Western music. [Western swing](#) also developed during this era.

By the 1960s, Western music was in decline. Relegated to the Country and Western genre by the marketing agencies, popular Western recording stars released albums to only moderate success. Rock and Roll dominated music sales and the Hollywood recording studios dropped most of their Western artists. Caught unawares by the boom in Country and Western sales from Nashville that followed, Hollywood rushed to cash in. In the process, *Country and Western* music lost its regionalism and most of its style. Except for the label, much of the music was indistinguishable from *Rock and Roll* or *Popular*. Some Western music traditionalists resent the blurring of "*Western*" in a *Country and Western* category that no longer represents them, but the name is too well ingrained to be changed.

Still, many Westerners prefer music about themselves, their culture, and the land around them. Older music is still available at retail stores in major population centers, through mail-order, or by the internet. New Western music is constantly written and recorded, and performed all across the American West and western Canada.

Traditional Western Music used the voice, and the guitar, with other instruments as to the musician's taste, with one major exception: Percussion and percussive sounds were missing from most if not all performances. This article links to a very traditional version of *Home on the Range* that is done in traditional Western music style. Modern Western Music pays more heed to time signatures, emphasis and beat. Much western music with a percussive flavor is [Western Swing](#), and not traditional Western. Many traditional performers tried to create the image of a working cowboy, and therefore avoided instruments that could not be carried on a horse. Today this has been diluted significantly, and even Riders in the Sky have a bunkhouse bass which carries some of the rhythm on their [Western Swing](#) numbers.

## Western Music

Traditional ballads include; Home on the Range, Sweet Betsy from Pike, Ceilito Lindo, Red River Valley, and Streets of Laredo.

Songs during the height of popularity include; Cool Water, Cattle Call, Tumbling Tumbleweeds, Carry Me Back to the Lone Prairie, Happy Trails, and Back in the Saddle Again.

Artists include; Bob Nolan and the Sons of the Pioneers, Tex Ritter, Rex Allen, Roy Rogers, and Gene Autry. Riders in the Sky are actively recording a mix of Western and [Western Swing](#) and have won [Grammy Awards](#) for their work with Disney on Toy Story 2 and Monsters, Inc.

# Western swing

**Western swing** is, first and foremost, a style of [jazz](#). It is dance music with an up-tempo beat and a decidedly Southwestern United States regional flavor. It consists of an eclectic combination of country, cowboy, polka, and folk music, blended with a jazzy "[swing](#)", with a tip of the hat to New Orleans [jazz](#) and Delta [blues](#), and played by a hot string band often augmented with drums, saxophones, pianos and, notably, the pedal steel guitar.

It originated in the dance halls, road houses and county fairs of small towns throughout the Lower Great Plains in the 1920's and 1930's. With the advent of radio broadcasting, it gained a much wider following and reached its "golden age" in the post-WWII era of the mid-forties — reflecting the waxing and waning of the more mainstream [big-band](#) sound. Spade Cooley coined the term 'Western swing' in the early 1940's.

Notable bands from the early era included:

- Al Dexter and His Troopers
- The Light Crust Doughboys
- Bob Wills and The Texas Playboys
- Milton Brown and his Brownies
- The Southern Melody Boys
- The High Flyers
- The Tune Wranglers
- Adolph Hofner and his San Antonians
- Floyd Tillman
- Bill Boyd and the Cowboy Ramblers
- Dude Martin and His Roundup Gang
- Spade Cooley and His Orchestra
- Deuce Spriggs and His Orchestra
- Tex Williams and the Western Caravan
- "Texas" Jim Lewis and His Lone Star Cowboys
- Hank Thompson and His Brazos Valley Boys
- Bill Haley and the Saddlemen (later - Bill Haley and the Comets)
- The Forth Worth Doughboys
- Doug Bine and his Dixie Ramblers
- Jimmie Revard and his Oklahoma Playboys
- The Washboard Wonders
- Cliff Bruner's Texas Wanderers
- Buddy Jones
- Sons of the Pioneers
- Smokey Wood and the Wood Chips
- Hank Penny and his Radio Cowboys
- W. Lee O'Daniel and his Hillbilly Boys
- Porky Freeman
- Carolina Cotton (yodeler who sang with several Western Swing groups)
- Ocie Stockard and the Wanderers

Later bands and artists of the genre (or influenced by it):

- Asleep at the Wheel
- Merle Haggard & the Strangers
- Willie Nelson
- Waylon Jennings
- Riders in the Sky
- Commander Cody and his Lost Planet Airmen
- The Hot Club of Cowtown
- Wayne Hancock

The Red Dirt Rangers  
Don Walser and the Pure Texas Band

# Whale song

**Whale song** is the sounds made by whales to communicate. The word "[song](#)" is used in particular to describe the pattern of regular and predictable sounds made by some species of whales (notably the humpback) in a way that is reminiscent of human singing.

The mechanisms used to produce sound vary from one family of cetaceans to another. Marine mammals, such as whales, dolphins, and porpoises, are much more dependent on sound for communication and sensation than land mammals are, as other senses are of limited effectiveness in water. Sight is limited for marine mammals because of the way water absorbs light. Smell is also limited, as molecules diffuse more slowly in water than air, which makes smelling less effective. In addition, the speed of sound in water is roughly four times that in the atmosphere at sea level. Because sea-mammals are so dependent on hearing to communicate and feed, environmentalists and cetologists are concerned that they are being harmed by the increased ambient noise in the world's oceans caused by ships and marine seismic surveys.

## Production of sound

Humans produce sound by expelling air through the larynx. The vocal cords within the larynx open and close as necessary to separate the stream of air into discrete pockets of air. These pockets are shaped by the throat, tongue, and lips into the desired sound.

Cetacean sound production differs markedly from this mechanism. The precise mechanism differs in the two major sub-families of cetaceans: the *Odontoceti* (toothed whales—including dolphins) and the *Mysticeti* (baleen whales—including the largest whales, such as the Blue Whale).

### Toothed whale sound production

Toothed whales do not make the long, low-frequency sounds known as the whale song. Instead they produce rapid bursts of high-frequency clicks and whistles. Single clicks are generally used for echolocation whereas collections of clicks and whistles are used for communication. Though a large pod of dolphins will make a veritable cacophony of different noises, very little is known about the meaning of the sound. Frankell (1998) quotes one researcher characterizing listening to such a school as like listening to a group of children at a playground.

The multiple sounds themselves are produced by passing air through a structure in the head rather like the human nasal passage called the phonic lips. As the air passes through this narrow passage, the phonic lip membranes are sucked together, causing the surrounding tissue to vibrate. These vibrations can, as with the vibrations in the human larynx, be consciously controlled with great sensitivity. The vibrations pass through the tissue of the head to the melon, which shapes and directs the sound into a beam of sound for echolocation. Every toothed whale except the sperm whale has two sets of phonic lips and is thus capable of making two sounds independently. Once the air has passed the phonic lips it enters the vestibular sac. From there the air may be recycled back into the lower part of the nasal complex, ready to be used for sound creation again, or passed out through the blowhole.

The French name for phonic lips—*museau de singe*—translates to "monkey lips," which the phonic lip structure is supposed to resemble. New cranial analysis using computed axial and single photon emission computed tomography scans in 2004 showed that, at least in the case of bottlenose dolphins, air may be supplied to the nasal complex from the lungs by the palatopharyngeal sphincter, enabling the sound creation process to continue for as long as the dolphin is able to hold their breath (Houser et al., 2004).

### Baleen whale sound production

Baleen whales do not have phonic lip structure. Instead they have a larynx that appears to play a role in sound production, but it lacks vocal chords and scientists remain uncertain as to the exact mechanism. The process, however, cannot be completely analogous to humans because whales do not have to exhale in order to produce sound. It is likely that they recycle air around the body for this purpose. Cranial sinuses may also be used to create the sounds, but again researchers are currently unclear how.

## **Purpose of whale-created sounds**

While the complex and haunting sounds of the Humpback Whale (and some Blue Whales) are believed to be primarily used in sexual selection (see section below), the simpler sounds of other whales have a year-round use. While toothed dolphins (including the Orca) are capable of using echolocation (essentially the emission of ultra-sonic beams of sound waves) to detect the size and nature of objects very precisely, baleen whales do not have this capability. Further, unlike some fish such as sharks, a whale's sense of smell is not highly developed. Thus given the poor visibility of aquatic environments and the fact that sound travels so well in water, human-audible sounds play a role in such whales' navigation. For instance, the depth of water or the existence of a large obstruction ahead may be detected by loud noises made by baleen whales.

# The song of the Humpback Whale

Two groups of whales, the Humpback Whale and the subspecies of Blue Whale found in the Indian Ocean, are known to produce the repetitious sounds at varying frequencies known as whale song. Marine biologist Philip Clapham describes the song as "probably the most complex [songs] in the animal kingdom" (Clapham, 1996).

Male Humpback Whales perform these vocalizations only during the mating season, and so it is surmised the purpose of songs is to aid sexual selection. Whether the songs are a competitive behavior between males seeking the same mate, a means of defining territory or a "flirting" behavior from a male to a female is not known and the subject of on-going research. Males have been observed singing while simultaneously acting as an "escort" whale in the immediate vicinity of a female. Singing has also been recorded in competitive groups of whales that are composed of one female and multiple males.

Interest in whale song was aroused by researchers Roger Payne and Scott McVay, who analysed the songs in 1971. The songs follow a distinct hierarchical structure. The base units of the song (sometimes loosely called the "notes") are single uninterrupted emissions of sound that last up to a few seconds. These sounds vary in frequency from 20 Hz to 10 kHz (the typical human range of hearing is 20 Hz to 20 kHz). The units may be frequency modulated (i.e., the pitch of the sound may go up, down, or stay the same during the note) or amplitude modulated (get louder or quieter). However the adjustment of bandwidth on a spectrogram representation of the song reveals the essentially pulsed nature of the FM sounds.

A collection of four or six units is known as a sub-phrase, lasting perhaps ten seconds (see also phrase (music)). A collection of two sub-phrases is a phrase. A whale will typically repeat the same phrase over and over for two to four minutes. This is known as a theme. A collection of themes is known as a song. The whale will repeat the same song, which last up to 30 or so minutes, over and over again over the course of hours or even days. This "Russian doll" hierarchy of sounds has captured the imagination of scientists.

All the whales in an area sing virtually the same song at any point in time and the song is constantly and slowly evolving over time. For example, over the course of a month a particular unit that started as an "upsweep" (increasing in frequency) may slowly flatten to become a constant note. Another unit may get steadily louder. The pace of evolution of a whale's song also changes—some years the song may change quite rapidly, whereas in other years little variation may be recorded.

Whales occupying the same geographical areas (which can be as large as entire ocean basins) tend to sing similar songs, with only slight variations. Whales from non-overlapping regions sing entirely different songs.

As the song evolves it appears that old patterns are not revisited. An analysis of 19 years of whale songs found that while general patterns in song could be spotted, the same combinations never recurred.

Humpback Whales may also make stand-alone sounds that do not form part of a song, particularly during courtship rituals. Finally, Humpbacks make a third class of sound called the feeding call. This is a long sound (5 to 10 s duration) of near constant frequency. Humpbacks generally feed co-operatively by gathering in groups, swimming underneath shoals of fish and all lunging up vertically through the fish and out of the water together. Prior to these lunges, whales make their feeding call. The exact purpose of the call is not known, but research suggests that fish do know what it means. When the sound was played back to them, a group of herring responded to the sound by moving away from the call, even though no whale was present.

Some scientists have proposed that humpback whale song may serve an echolocative purpose, such as Mercado & Frazer (2001), but has been subject to disagreement (e.g. Au, Frankel, Helweg, & Cato, 2001).

## Other whale sounds

Most baleen whales make sounds at about 15–20 hertz. However, marine biologists at the Woods Hole Oceanographic Institution reported in the *New Scientist* in December 2004 that they had been tracking a whale in the North Pacific for 12 years that was "singing" at 52 Hz. The scientists are currently unable to explain this dramatic difference from the norm; however, they are sure the whale is a baleen and extremely unlikely to be a new species, suggesting that currently known species may have a wider vocal range than previously thought.

Most other whales and dolphins produce sounds of varying degrees of complexity. Of particular interest is the Beluga (the "sea canary") which produces an immense variety of whistles, clicks and pulses.

## Human interaction

Though some observers suggest that undue fascination has been placed on the whales' songs simply because the animals are under the sea, most marine mammal scientists believe that sound plays a particularly vital role in the development and well-being of cetaceans. It may be argued those against whaling have anthropomorphized the behaviour in an attempt to bolster their case. Conversely pro-whaling nations are perhaps disposed to downplay the meaning of the sounds, noting for example that little account is taken of the "moo" of cattle.

Researchers use hydrophones (often adapted from their original military use in tracking submarines) to ascertain the exact location of the origin of whale noises. Their methods allow them also to detect how far through an ocean a sound travels. Research by Dr Christopher Clark of Cornell University conducted using thirty years worth of military data showed that whale noises travel up to 3,000 km. As well as providing information about song production, the data allows researchers to follow the migratory path of whales throughout the "singing" (mating) season.

Prior to the introduction of human noise production, Clark says the noises may have travelled right from one side of an ocean to the other. His research indicates that ambient noise from boats is doubling each decade. This has the effect of halving the range of whale noises. Those who believe that whale songs are significant to the continued well-being of whale populations are particularly concerned by this increase in ambient noise. Other research has shown that increased boat traffic in, for example, the waters off Vancouver, has caused some Orca to change the frequency and increase the amplitude of their sounds, in an apparent attempt to make themselves heard. Environmentalists fear that such boat activity is putting undue stress on the animals as well as making it difficult to find a mate.

## Whale song in fiction

The song of Humpback Whales was a significant plot element of the film *Star Trek IV: The Voyage Home*. The purpose of whale song was the main plot device in the book *Fluke*, or, *I Know Why the Winged Whale Sings* by Christopher Moore. Whale song is also a factor in the worldview of uplifted dolphins in David Brin's *Uplift* and *Uplift Storm* trilogies, comprising elements of religion, philosophy, cosmology and poetry.

# Whistle

A **whistle** is a one-note [woodwind instrument](#) which produces sound from a stream of forced air. (For the sound produced with the mouth, see whistling and whistled language.)

Many types exist, from small police and sports whistles (also called pea whistles), to much larger train whistles, which are steam whistles specifically designed for use on locomotives and ships. Although whistles have a musical characteristic (for example train whistles sound a minor-seventh musical chord) whistles are not usually considered 'musical' in the sense of being able to play a chosen melody, but mainly the small whistles can also be used as a - very shrill and loud - noise and rhythm instrument. However, musical whistles exist, including any of several 2-octave musical instruments known as tin whistles (sometimes known as pennywhistles or low whistles), as well as the calliope (an array of separately actuable steam whistles), [organ](#) pipes and the recorder. Pea whistles are used in [jazz](#) and Latin music as a [percussion instrument](#).

The whistle works by causing the smooth flow of air to be split by a narrow blade, sometimes called a fipple, creating a turbulent vortex which causes the air to vibrate. By attaching a resonant chamber to the basic whistle, it may be tuned to a particular note and made louder. The length of the chamber typically defines the resonant frequency. A whistle may also contain a small light ball, usually called the pea, which rattles around inside, creating a chaotic vibrato effect that intensifies the sound. Japanese bird whistles use several small balls and are half filled with water in order to reproduce the sound of a [bird song](#).

A steam whistle works the same way, but using steam as a source of pressure: such whistles can produce extremely high sound intensities.

Sometimes, unintentional whistles can be set up. A common one is the opened sunroof of a car: air passing over the top of the vehicle can, at certain speeds, strike the back edge of the sunroof, creating a very low frequency whistle which is resonated by the closed interior of the car. Since the sound frequency is infrasonic, around 4 Hz, the effect is very uncomfortable for occupants, who feel the vibration rather than hear it. Such low frequencies can induce nausea, headache, disorientation and dizziness. The effect can be prevented by opening a side window a few inches. Subsonic whistles have also been developed for use as weapons, or to deliberately create a sense of uneasiness in an enemy.

## Industrial whistles

Industrial whistles are used for signalling and timekeeping both on railroad and ships, and in factories. Most of these whistles were steam powered and not standardized. Individual locomotives could be identified by their whistles. At noontime in industrial areas up into the 1950s whistles of every pitch could be heard, as each factory had a boiler and a whistle, if not full steam power.

Railroads in particular used elaborate whistle codes for communication both within the train and with other trains. These methods are maintained today with motor-powered air horns. Trucks also use air horns, especially since they often have air brakes and so there is already a source of compressed air on board.

Train whistles generally produce three or four different frequencies at the same time, to produce a non-major chord, that is distinct, loud, and low in pitch.

Whistles are often used as warning devices or as safety devices serving to attract attention to the user. Some cyclists use a whistle as a substitute for a [bell](#) or horn. It should be noted, however, that many jurisdictions require that the warning device be permanently attached to the bicycle.

# Whistled language

**Whistled languages** differ according to whether the spoken language is tonal or not, with the whistling being either tone or [articulation](#) based. Tonal languages are stripped of articulation, leaving only suprasegmental features such as duration and tone, and when whistled retain the spoken melodic line. In non-tonal languages, some of the articulatory features of speech are retained, though the normally timbral variations imparted by the movements of the tongue and soft palate are transformed into [pitch](#) variations. (Busnel and Classe 1976: v) Thus whistled languages convey phonemic information solely through tone, length, and, to a lesser extent, stress, and many phonemic distinctions of the spoken language are lost. "All whistled languages share one basic characteristic: they function by varying the frequency of a simple wave-form as a function of time, generally with minimal dynamic variations (but see Cowan 1948 see Mazateco), which is readily understandable since in most cases their only purpose is long-distance communication." (ibid: 32)

Languages communicated by whistling are relatively rare, but are known from around the world. One example is the Silbo on the island of La Gomera in the Canary Islands, which maintains Spanish's five vowels, but reduces its consonants down to four. Others exist or existed in all parts of the world including Turkey (Kusköy "Village of the Birds"), France (the village of Aas in the Pyrenees), Mexico (the Zapotecs of Oaxaca), South America (Pirahã), Asia (the Chepang of Nepal), and New Guinea. They are especially common and robust today in parts of West Africa, used widely in such populous languages as Yoruba and Ewe. Even French is whistled in some areas of western Africa.

In continental Africa, speech may be conveyed by a whistle or other musical instrument, most famously the "talking drums". However, while drums may be used by griots singing praise songs or for inter-village communication, and other instruments may be used on the radio for station identification jingles, for regular conversation at a distance whistled speech is used. As two people approach each other, one may even switch from whistled to spoken speech in mid-sentence.

In the Greek village of Antia, the entire population knows how to whistle their speech, and whistled conversations are also carried on at close range.

As the expressivity of whistled speech is limited compared to spoken speech, whistled messages typically consist of stereotyped or otherwise standardized or set expressions, are elaborately descriptive, and often have to be repeated. However, in languages which are heavily tonal, and therefore convey much of their information through pitch even when spoken, such as Mazatec and Yoruba, extensive conversations may be whistled.

In Africa and indigenous Mexican communities, whistled language is used only by men.

Whistled languages are *normally* found and used in locations with abrupt relief created by difficult mountainous terrain, slow or difficult communication (no telephones), low population density and/or scattered settlements, and other isolating features such as sheepherding and cultivation of hillsides (ibid: 27–8). The main advantage of whistling speech is that it allows the speaker to cover much larger distances (typically 1–2 km but up to 5 km) than ordinary speech, and this is assisted by the relief found in areas where whistled languages are used. In practice, many areas with such languages work hard to preserve their ancient traditions, in the face of rapidly advancing telecommunications systems in many areas.

A whistled tone is essentially a simple oscillation (or sine wave), and thus timbral variations are impossible. Normal articulation during an ordinary lip-whistle is relatively easy though the lips move little causing a constant of labialization and making labial and labiodental consonants (p, b, m, f, etc.) impossible (ibid: 3). "Apart from the five vowel-phonemes — and even these do not invariably have a fixed or steady pitch — all whistled speech-sound realizations are glides which are interpreted in terms of range, contour, and steepness." (ibid: 8)

In a non-tonal language, segments may be differentiated as follows:

Vowels are replaced by a set of relative pitch ranges  
Stress is expressed by higher pitch or increased length  
Consonants are produced by pitch transitions of different lengths and height, plus the presence or absence of occlusion. ("Labial stops are replaced by diaphragm or glottal occlusions.")

In the case of Silbo Gomero, such strategies produce five vowels and four consonants.

Though whistled languages are not secret codes or secret languages (with the exception of a whistled language used by ñañigos terrorists in Cuba during Spanish occupation (ibid: 22)), they may be used for secretive communication among outsiders or other who do not know or understand the whistled language though they may understand its spoken origin. Supposedly, in Aas during World War II farmers were nearly caught watering down their milk but police were unable to find any evidence as the farmers were warned by whistled messages of the police approaching and were able to prepare. There are similar stories of La Gomera (ibid: 15).

The following list is of languages that exist or existed in a whistled form, or of ethnic groups that speak such languages:

- Americas
  - Mexico: Amuzgo, Chinantec, Chol, Kickapoo, Mazateco, Nahuatl, Otomi, Tepehua, Totonac, Zapotec.
  - Bolivia: Siriono
  - Brazil: Pirahã
  - Alaska: Yupik
- Asia
  - Myanmar: Chin
  - Nepal: Chepang
- Europe
  - France (village of Aas, Pyrenees): Spanish language
  - Turkey: Kuskoy
  - Greece (village of Antia on the island of Euboea)
- West Africa: Bafia, Bape, Birifor, Bobo, Burunsi, Daguri, Diola, Ewe, Fongbe, Marka, Ngwe, Tshi, Ule (among others).
  - Spain (La Gomera, Canary Islands): "Silbo Gomero"
- Oceania
  - New Guinea: Gasup, Binumarien

## **Wild track**

**Wild track**, also known as wild sound and wild lines, is an audio recording intended to be synchronized with film or video but recorded separately. Generally, the term "wild track" refers to sound recorded on location, such as sound effects gathered when the cameras were not rolling or extra takes of lines performed for audio only.

## Reasons to record wild track

- When only the sound is needed, not the image; for example, recording a scream that will be heard off-camera.
- When it is impossible to get good sound and video in the same take; for example, when actors are in a situation (such as the middle of a field in wide shot) that makes boom recording impractical and no wireless mics are available.
- When a take was good visually but there was a sound disturbance, and repeating the entire take is impractical.
- To obtain room tone (the background noise of a location) which is necessary for post-production sound editing.

Note that wild track is considered something of a "cheapie" solution to these problems, and a big-budget production is more likely to use studio-recorded sound in these situations, as its quality is more controllable and predictable than wild track.

## **Procedures related to wild track**

- Dubbing, Automated Dialogue Replacement, in which actors read their lines in a studio setting to match lip movements already filmed.
- Voiceover, in which a voice track is used but not synchronized with onscreen action.
- Foley, in which sound effects are created in a studio.

## Wind instrument

A **wind instrument** is a [musical instrument](#) that contains some type of resonator (usually a tube), in which a column of air is set into vibration by the player blowing into (or over) a mouthpiece set at the end of the resonator. The pitch of the vibration is determined by the length of the tube and by manual modifications of the effective length of the vibrating column of air.

## Techniques for obtaining ranges of notes

- opening and closing holes in the side of the tube to adjust the effective length of the vibrating air column (this can be done by covering the holes with fingers or pressing a [key](#) which then closes the hole). This is most common on woodwind instruments.
- engaging valves which re-route the air through additional tubing. This increases the total tube length, thereby lowering the fundamental pitch. Used on [brass instruments](#).
- lengthening the tube with a sliding mechanism (as on the [trombone](#))
- making the column of air vibrate at different harmonics.

# Types of wind instruments

Wind instruments fall into one of the following categories:

- [Brass instruments](#)
- Woodwind instruments

Although brass instruments were originally made of brass and woodwind instruments have traditionally been made of wood, the material used to make the body of the instrument is not always a reliable guide to its family type. For example, the [saxophone](#) is typically made of brass but is classified as a woodwind instrument due to the fact that it has a reed. On the other hand, the [cornett](#) (not to be confused with the brass instrument [cornet](#)) and serpent, although made of wood (or PVC pipe in the case of modern serpents), are in the family of brass instruments because the vibration which originates the sound is done with the lips of the player.

A more accurate way to determine whether an instrument is brass or woodwind is to examine how the player produces sound. In brass instruments, the player's lips vibrate, causing the air within the instrument to vibrate. In woodwind instruments the player either: 1. causes a reed to vibrate, which agitates the column of air (as in a [clarinet](#) or [oboe](#)), 2. blows against an edge or fipple (as in a recorder), or 3. blows across the edge of an open hole (as in a [flute](#)).

In the [Hornbostel-Sachs](#) scheme of [musical instrument classification](#), wind instruments are classed as [aerophones](#).

# Wind quintet

A **wind quintet**, also sometimes known as a woodwind quintet, is a group of five wind players (most commonly [flute](#), [oboe](#), [clarinet](#), horn and [bassoon](#)). The term also applies to a composition for such a group.

Unlike the [string quartet](#) with its homogeneous blend of color, the instruments in a wind quintet differ from each other considerably in technique, idiom, and [timbre](#). The modern wind quintet sprang from the ensemble favored in the court of Joseph II in late 18th century Vienna: 2 clarinets, 2 horns, 2 oboes, and 2 bassoons. The influence of Haydn's chamber writing suggested similar possibilities for winds, and advancements in the building of these instruments in that period made them more useful in small ensemble settings, leading composers to attempt smaller combinations.

However, it was Antoine Reicha's 24 quintets, begun in 1811, and the 9 quintets of Franz Danzi that established the genre, and their pieces are still standards of the repertoire.

Though the form fell out of favor in the latter half of the 19th century, there has been renewed interest in the form by leading composers in the 20th century, and today the wind quintet is a standard chamber ensemble, valued for its versatility and variety of tone color.

# Wonky techno

**Wonky techno** is a relatively new term for a style of [techno music](#) that is based around breaking from a formulaic 4-4 beat structure and experimenting with new sounds and rhythms. The sound is often distorted, stuttering, broken and warped, with a lot of influence from [breakbeat](#) and electro. At one end of the scale wonky techno can be very funky music well-suited to the dancefloor; at the other end it can be very experimental and abstract.

The origins of term 'wonky techno' is under some dispute with no exact confirmed first usage. Most commonly, the term is thought to originate from Jerome Hill, who collected tunes of this type in a section marked "Wonky", whilst managing a (now closed) record shop in London called Trackheads. Other record shops use terms such as 'experimental' or 'quirky'.

The scene is fairly small but growing, especially in East Berlin. Nights such as Uglyfunk and Monox in the UK attract a friendly crowd and are well attended. A key resource for wonky artists and fans of the scene is Cristian Vogel's No-Future Community, organised as part of his labels Mosquito, Sleep Debt and Rise Robots Rise.

Producers of the wonky sound are artists such as Cristian Vogel, Si Begg, Neil Landstrumm, T.Raumschmiere, Tobias Schmidt, 3D!t, Dave Tarrida, Jason Leach, Cannibal Cooking Club, Crystal Distortion (formally of Spiral Tribe), Michael Forshaw, Mascon, Fugo, Bass Invaders, Bill Youngman, Mark Hawkins and Syntax Error.

Wonky techno labels include Neue Heimat, Sativae, Input-Output, MidoTonal, Chan'n'Mikes, Subhead, Don't, Scandinavia, Sub:Strata, Uglyfunk, Shitkatapult, Mental.Ind, Mercurochrome, Feinwerk and Novamute.

Wonky /wong'kee/ adj. *To not be the same in size; skew-whiff; to be offset; broken; to be weird; to be strange or goofy; to be warped from its original shape; behaviour seemingly crazy, humorous or amusingly perverse.*

Category: [Techno music genres](#)

## Woodwind instrument

A **woodwind instrument** is a [wind instrument](#) in which sound is produced by blowing through a mouthpiece against an edge or by a vibrating reed, and in which the pitch is varied by opening or closing holes in the body of the instrument. As the name implies, they were originally made of wood.

## Types of woodwind instrument

- Single-reed instruments use a reed, which is a thinly sliced piece of cane or plastic that is held against the aperture of the mouthpiece with a ligature. When air is forced between the reed and the mouthpiece, the vibrations create the sound. Single reed instruments include the [clarinet](#) and [saxophone](#) families of instruments.
- Double-reed instruments use two precisely cut, small pieces of cane joined together at the base. The finished, bound reed is inserted into the top of the instrument and vibrates as air is forced between the two pieces of bound cane. There are two sub-families:
  - *Exposed* double reed instruments, where the reed goes between the player's lips. The [oboe](#), cor anglais (also called english horn) and [bassoon](#) make up the more popular instruments within this family.
  - *Capped* double reed instruments, where there is a cap covering up the reed with a hole in that the player just blows through. This family includes most [bagpipes](#) and the crumhorn.
- [Flutes](#), in which the sound is produced by blowing against an edge. There are two sub-families:
  - *Open* flute family, where the player uses his/her lips to form the stream of air which goes directly from the players lips to the edge, e.g. the transverse [flute](#). Modern flutes are usually made of silver plated brass, nickel plated brass, solid silver, or gold.
  - *Closed* flute family, where the instrument forms and directs the stream over the edge. This family includes [whistle](#) and the recorder family.

One interesting difference between woodwind and [brass instruments](#) is that woodwind instruments are *non-directional*. This means that the sound produced propagates in all directions with approximately equal volume. Brass instruments, on the other hand, are highly directional, with most of the sound produced traveling straight outward from the bell. This difference makes it significantly more difficult to record a woodwind instrument accurately. It also plays a major role in some performance situations, such as in marching bands.

## World music

**World music** is, most generally, all the [music](#) in the world (Bohman 2002, Nidel 2004, p.3). More specifically, the term is currently used to classify and market recordings of the many genres of non-western music which were previously described as "[folk music](#)" or "ethnic music". Succinctly, it can be described as "local music from out there" (*fRoots* magazine, quoted in N'Dour 2004, p.1), or "someone else's local music" (*Songlines* magazine). The academic study of world music is called [ethnomusicology](#).

## Terminology

In essence, the term "world music" refers to any form of music that is not part of modern mainstream Western commercial [popular music](#) or [classical music](#) traditions, and which typically originates from outside the cultural sphere of Western Europe and the English-speaking nations. The term became current in the 1980s as a marketing/classificatory device in the media and the music industry, and it is generally used to classify any kind of "foreign" (i.e. non-Western) music.

In musical terms, "world music" can be roughly defined as music which uses distinctive ethnic [scales](#), modes and musical inflections, and which is usually (though not always) performed on or accompanied by distinctive traditional ethnic instruments, such as the kora (African lute), the steel drum, the [sitar](#) or the digerdoo.

Most typically, the term "world music" has now replaced "folk music" as a shorthand description for the very broad range of recordings of traditional indigenous music and song from the so-called Third World countries.

Although it primarily describes traditional music, the world music genre also includes popular music from non-Western urban communities (e.g. South African "township" music) and non-European music forms that have been influenced by other "third world" musics (e.g. Afro-Cuban music), although Western-style popular song sourced from non-English-speaking countries in Western Europe (e.g. French pop music) would not generally be considered world music.

Examples of popular forms of world music include the various forms of non-European classical music (e.g. Japanese koto music and Hindstani [raga](#) music), eastern European folk music (e.g. the village music of Bulgaria) and the many forms of folk and tribal music of the Middle East, Africa, Asia, Oceania and Central and South America.

World music is generally agreed to be traditional, folk or roots musics of any culture that is created and played by indigenous musicians or that is "closely informed or guided by indigenous music of the regions of their origin" (Nidel 2004, p.2).

The broad category of "world music" includes isolated forms of ethnic music from diverse geographical regions. These dissimilar strains of ethnic music are commonly categorized together by virtue of their indigenous roots. Over the last century, the invention of sound recording, low-cost international air travel and common access to global communication among artists and the general public has given rise to a related phenomenon called "[cross-over](#)" music.

Musicians from diverse cultures and locations can now readily access recorded music from around the world, see and hear visiting musicians from other cultures and visit other countries to play their own music, creating a melting pot of stylistic influences.

While communication technology allows greater access to obscure forms of music, the pressures of commercialisation also present the risk of increasing musical homogeneity, the blurring of regional identities, and the gradual extinction of traditional local music-making practices.

## Cultural appropriation in western music

World music as a cultural-economic phenomenon is inextricably linked with the invention of sound recording and the development of the international recording industry, but the background to its emergence covers the whole span of modern Western musical history.

Since at least the [Renaissance](#), musicians, composers, music publishers (and, in the 20th century, radio stations and recording companies) have been part of a wide-ranging and continuous process of cultural appropriation that developed in the wake of the European colonisation of America, Africa, Asia and Oceania. In this process, styles, forms and influences from non-Western music -- especially novel melodies, rhythmic patterns or harmonic structures -- were discovered, appropriated, adapted and incorporated into mainstream Western popular music.

This appropriation process has a long history in European art music, which bears numerous traces of the adoption of fashionable European popular and folk dances into the classical genre. Dance styles like the allemande, the pavane, the galliard and the gavotte -- often derived from popular folk dances -- were just four among scores of "dance crazes" that swept the courts of Europe during the [Renaissance](#) and early [Baroque](#).

However, by the time Bach and Händel were writing their great instrumental works during the late Baroque, the rhythms and timings of these dances had been already been appropriated, formalised and incorporated into the structure of elite European 'art' music. This trend continued in 18th and 19th century with folk-dance crazes like the [mazurka](#), the [waltz](#) and the [polka](#).

One well-known example of cultural appropriation into the European classical genre arose from the 18th century fad known as "Orientalism", in which music, architecture, costume and visual arts from "Oriental" cultures (including the Turkish empire, India, China and Japan) became highly fashionable. One of the most enduring artefacts of this fad is the third movement of Mozart's popular Piano Sonata No. 11 in A major, K. 331, known as the Rondo alla turca ("rondo in the Turkish style").

Two other well-known 19th century examples of this fad are the popular Gilbert & Sullivan comic opera *The Mikado* and the Puccini opera *Madama Butterfly*, both of which exploited the craze for all things Japanese that followed in the wake of the United States' forcible opening-up of Japan to western trade in 1854.

One of the earliest examples of [crossover music](#) -- can be found in the music of French composer Claude Debussy. In 1899 the French government staged the great Paris Exposition, an event that was to have profound effects on many areas of western art and music. Debussy visited the exposition and it was here that he first heard gamelan music performed by Sundanese musicians. He was transfixed by the hypnotic, layered sound of the gamelan orchestra and reportedly returned to the Dutch East Indies pavilion over several days to listen to the Indonesian musicians perform and to study the structure and tuning of this novel musical form. His exposure to gamelan music had a direct influence on the composition of his famous Nocturnes for piano.

But, as in the case of Debussy, some of this long process of appropriation also had an educative effect, and by the 1960s Western audiences were beginning to move beyond the confines of the Western musical tradition and explore traditional music from other countries and continents, and as Eurocentric cultural and social biases began to be broken down during the Sixties, music from other cultures gained greater acceptance.

The key factor in this transition was the invention of sound recording, but it was also greatly influenced by the wide-ranging program of collection of European traditional folk music by 19th and early 20th century European classical composers and musicologists. This process was, at first, simply one facet of the multifocal 19th century passion for

collection and classification, but it was given greater impetus by the growing awareness that the devastating impact of Western urban-industrial culture was decimating traditional cultures.

This collection activity took on some aspects of a crusade, as musicologists raced to preserve vanishing musical artefacts before they were lost to history. This view was a key motivation for the ethnologists who collected and preserved examples of Australian Aboriginal music, since it was widely believed at the time that the Aboriginal "race" and Aboriginal culture would eventually die out.

Musicologists and leading composers like Antonin Dvořák, Zoltan Kodaly and Bela Bartok made strenuous efforts to collect and record local forms of European folk music and folk song, and many folk music melodies and other musical features were absorbed into the mainstream classical tradition. A good example of this process was the enduringly popular suites of "Hungarian Dances" by Dvořák and Johannes Brahms.

During the 19th century this collection program was necessarily restricted to the written notation of melodies, lyrics and arrangements, but it was transformed in the early 20th century by the invention of sound recording and the development of portable cylinder and disc recording equipment, enabling musicologists for the first time to capture this music in actual performance, and the new technology was eagerly adopted by musicologists in Europe and America.

This growing archive of "folkloric" recordings remained largely within the confines of academia until after World War II. But in America, these collection programs -- notably those sponsored by the Library of Congress -- were to have an incalculable influence on the development of the international popular music industry.

Folk-music collectors like the great Alan Lomax worked assiduously for decades to find and record examples of almost every facet of native American, African-American and European-American folk music, and the work of these many scholars, enthusiasts and collectors preserved the sound of many legendary "folk" performers and thousands of hours of priceless song and music from the American folk music tradition.

This musicological program was again revolutionised in the early 1950s by the new technology of magnetic tape recording, which for the first time allowed music collectors to make very stable, long-duration, high-fidelity studio and field recordings. The concurrent introduction of the LP audio disc format, which could hold as much as thirty minutes of continuous music per side, allowed many such "folk music" recordings to be released into the consumer market for the first time. The availability of high-quality portable tape recorders was the key development that led to the inception of Elektra Records enormously influential Nonesuch Explorer Series, which was launched in 1967 with an LP of Indonesian folk music, *Music from the Morning of the World*.

These "folk" LPs -- notably those of early 20th century [blues](#) music -- were to bring about a radical change in the style and direction of late 20th century popular music. This process is exemplified by the huge directional change in [rock music](#) that came about when young British and American musicians (like Eric Clapton) heard the now-legendary recordings of an obscure Mississippi blues musician called Robert Johnson.

Another fascinating aspect of the changes in the cultural appropriation process can be found on the music of Dvořák, which itself was greatly influenced by his collection and study of the folk music of his native Bohemia. In the 1892 Dvořák was invited to become the director of the National Conservatory of Music in New York City; the period he spent in America, and especially his exposure to native American and African-American music, led to the creation of his most famous and popular symphonic work, the *Symphony No. 9*, subtitled "From the New World".

This is arguably another very early example of the so-called [crossover music](#) genre, but interestingly, it also had an influence on the development of American popular music. Part of the symphony's enduring appeal is due to the nostalgic main melody in the second movement, which is said to have expressed Dvořák's homesickness for Bohemia. Remarkably, this melody was later appropriated into the formative [bluegrass](#) genre as the basis for the song "Goin' Home" (attributed to William Arms Fisher); it soon became a bluegrass standard and was later adapted into a popular spiritual-style song.

## The 1900s

Beginning around the turn of the 20th century, the invention of sound recording and motion pictures enabled American mass-entertainment culture began to develop into a major global economic and cultural force.

Simultaneous with this process, two emerging streams of non-Western music -- [African-American music](#) and Latin music -- were discovered by American and European audiences, and they were rapidly appropriated by the mainstream music industry. Over the next hundred years these two broad genres were to have a massive transformative effect on the structure of popular music and the direction of the music industry.

In the 1890s working-class dancers, composers and musicians in the Boca area of Buenos Aires in Argentina invented a daring and sensual new dance style which was dubbed the [tango](#). It took Argentina by storm and after reaching New York during World War I it became an international sensation, aided by a plethora of tango recordings and crystallised by the famously steamy tango scene in Rudolph Valentino's legend-making 1921 film *The Four Horsemen of the Apocalypse*.

More or less simultaneous with the tango craze, a novel African-American style known as [ragtime](#) emerged in the United States, epitomised by the music of virtuoso pianist-composers Scott Joplin and Eubie Blake. Ragtime introduced African-derived syncopated ("ragged") rhythms into Western music and enjoyed a tremendous international vogue over the next twenty years, as well as exerted a huge influence on the subsequent development of [jazz](#).

Ragtime and then early jazz transformed American popular music -- the work of songwriters like George Gershwin and Irving Berlin was crucially shaped by their appropriation of influences from African-American music -- and these genres also strongly influenced many European classical composers, especially the French composers Erik Satie, Claude Debussy and Maurice Ravel.

In terms of their influence on almost every facet of 20th century popular music, the successive historical genres of [African-American music](#) have, as a group, been the most significant of all the "exotic" genres appropriated into Western music. Just as they influenced each other, [gospel music](#), [ragtime](#), [blues](#), [jazz](#), [R&B](#) and [rock'n'roll](#) were also successively appropriated into mainstream Western popular music -- usually almost as soon as each became known as a definable genre. It is undeniable that the various genres of African-American music have, collectively, exerted a greater influence over the development and direction of Western mass-market popular recorded music than any other force.

Alongside the emergence of jazz, beginning around 1915, Hawaiian music reached the mainstream pop market in the United States. The Hawaiian style (or, more often, western imitations of it) became a major music fad, retaining a significant audience following from the 1930s to the 1950s. Hawaiian music was itself a complex mixture of European, native Hawaiian and other Polynesian influences. This is well demonstrated by the work of one of the founders of the genre, Queen Lili'uokalani (1838-1917), the last Queen of Hawaii before the Hawaiian monarchy was overthrown. A musician and composer, she is credited as the composer of the unofficial Hawaiian anthem "Aloha 'Oe". Lili'uokalani indeed wrote the lyrics and arranged the music but in fact she appropriated the tune from a Croatian folk song called "Sidi Mara na kamen studencu".

In the 1930s, following the establishment of the jazz genre in the 1910s and 1920s, the "Latin invasion" that had begun with the tango took off again when American jazz, dance music and popular song was revolutionised by the "discovery" of other traditional "Latin" folk music forms from the Caribbean, Central America and South America.

Latin music had a crucial impact on the direction of postwar jazz and popular song. It is undeniable that the use of Latin rhythms in modern instrumental jazz, pioneered by musicians like Duke Ellington and Dizzy Gillespie, rapidly became an essential part of the rhythmical repertoire of jazz, providing composers and musicians with a vastly enhanced repertoire of beats and metres. During the Thirties and Forties, newly appropriated Latin music genres created a series of music movements and dance crazes, including the merengue, the samba and the [rumba](#).

In 1944 The Andrews Sisters covered "Rum and Coca-Cola", a song originally recorded by Jamaican musician Lord Invader in the 1930s. The Andrews Sisters' version sparked a new fad for this infectious new style, calypso. The craze reached its apex of popularity in the mid-1950s with the release of the hugely successful Harry Belafonte single *Banana Boat Song* and Belafonte's million-selling 1956 LP *Calypso*. Calypso also had a strong influence on the mainstream folk music boom of the late Fifties and early Sixties, which in turn became one of the major springboards for the development of world music as a genre.

In the late 1950s, repeating the impact of the tango, a seductive new music style called *bossa nova* emerged from Brazil and it soon swept the world, exerting a huge effect over the course of Western pop and jazz over the next decade and beyond.

Nothing better illustrates the lasting impact of *bossa nova* than the archetypal bossa nova song, "The Girl From Ipanema", written in 1962 and best known from the languid 1963 bilingual crossover version by Stan Getz, João Gilberto and Astrud Gilberto. Thanks largely to the enormous worldwide popularity of this single, "The Girl From Ipanema" now ranks as the second most-recorded song of all time, surpassed only by Paul McCartney's "Yesterday".

Bossa nova was also an important influence on the shortlived but very popular British-originated music craze known as Merseybeat, the pop style epitomised by the early songs of The Beatles, which combined popular song structures and rock'n'roll instrumentation with rhythmic inflections taken from bossa nova.

Influences from African music also began to appear in the 1950s. This process included one of the more controversial examples of cultural appropriation process, exemplified by the pop song "The Lion Sleeps Tonight". A version of this song was an American #1 hit for pop band The Tokens in 1961, and it was credited to American writers, but in fact "The Lion Sleeps Tonight" was actually an unacknowledged rewrite of the song "Mbube", written and recorded by South African musician and composer, Solomon Linda, in 1939.

"Mbube" had been a major local hit for Linda and his band, The Evening Birds, reputedly selling 100,000 copies there, but its success at the time was entirely confined to South Africa. Some years later, a copy of Linda's recording reached the renowned American musicologist Alan Lomax; he passed it on to his friend Pete Seeger, who fell in love with it, and it was Seeger who was mainly responsible for popularising the song in the West.

Seeger recorded a version of the song with his noted folk group The Weavers in 1952, retitling it "Wimoweh" (an inaccurate transliteration of the song's original Zulu refrain, "uyimbube"), although at this point it should be noted that the politically-aware Seeger did give Linda a partial credit in the Weavers' arrangement of the song. The Weavers scored a US Top 20 hit with their studio version, and had further success with a live version of the song included on their influential 1957 live album, recorded at Carnegie Hall, which led to it being covered by The Kingston Trio in 1959.

The Weavers' Carnegie Hall version of "Wimoweh" became a favourite song of The Tokens -- they used it as their audition piece when they were offered a contract with RCA Records -- and this led to them recording it as their first RCA single. However, it was at this point that the lyrics were re-written by the band's producers -- who took full credit for the song -- and it would be several decades more before the full story of the appropriation of Linda's work became widely known. Sadly, by then Linda had long since died in poverty.

## The early Sixties: Folk meets Pop

After World War II a small but growing market developed for Western folk music and recordings of non-Western music, and this was supplied by specialist record labels such as Folkways Records, Elektra Records and Nonesuch Records in the USA and, later, Disques Cellier in Switzerland. Such labels were typically small "boutique" operations or minor specialist imprints of large companies, which released albums of non-Western traditional classical music, folk songs and indigenous music.

This market was fostered by the co-called "folk boom" of the 1950s and early 1960s, in which artists and groups like Pete Seeger and The Weavers explored the traditional songs and sounds of English-language folk music and re-interpreted them for the mass audience. In America, this process was massively influenced by the "discovery" of the treasure-trove of recordings of African-American music that had been made over the previous decades. Another more overtly political factor, and one that should not be overlooked in this case, is that many folk musicians were deeply involved in the struggle for civil rights for black Americans, and their championing of black music to white audiences was an integral and hugely influential part of this campaign.

This exploratory process also led many musicians to begin investigating folk music from non-Western cultures -- as in the case of Solomon Linda's "Mbube". In each case, these processes of discovery and appropriation were made considerably easier by the increasing availability of LP recordings of "ethnic" music.

This process had a definite cumulative effect, but it is fair to say that, until the late 1960s, "ethnic"/"folkloric" music remained more or less a specialist interest. Some "exotic" influences inevitably filtered through to the mass market -- as in the case of "The Lion Sleeps Tonight" -- but in general these were mostly Western re-interpretations, and very little original music produced outside of the mainstream Western popular music recording industry managed to break into the pop music market or achieve significant sales until the late 1960s.

As noted above, prior to the Sixties, many classical musicians and composers had also written and/or performed music that experimented with combining western musical styles and influences from non-Western musical traditions, but this too was essentially an elite 'art' activity and gained little mass recognition.

Mass market acceptance of what we now call "world music" grew dramatically as a result of the pop music explosion of the 1960s and early 1970s. During this period, adventurous pop, rock, progressive and jazz musicians and producers attempted, with varying degrees of success, to create fusions of conventional English-language popular music with instrumental and compositional influences from exotic musical genres. Their interest in these "ethnic" musics, combined with their enormous personal popularity, encouraged a growing number of record buyers to seek out recordings of non-Western music.

A prototype of this fusion of pop and world music in the late Sixties can be seen in the [folk-rock](#) phenomenon of the mid-1960s. Underlying this development was the fact that many leading American and English pop-rock musicians of the period -- Roger McGuinn, Bob Dylan, Jerry Garcia, Donovan -- had begun their musical careers on the folk scene.

Interestingly, although the core of the "folk" genre at this time was traditional Anglo-American folk song, mainstream folk music was still appropriating new "non-Anglo" influences like calypso and black South African popular music. Another notable feature of the folk scene at this time was that it was also common at that time to include African-American music as part of the broader folk genre, and as a result many legendary black American performers like Leadbelly were able to perform side-by-side with white

performers like Dylan and Pete Seeger at American folk scene's peak annual event, the Newport Folk Festival.

Folk-rock was in part an attempt to broaden the language of mainstream pop by incorporating the more "serious" lyrical approach and political awareness of postwar folk. Folk-rock as a genre effectively began in 1964 with the release of The Byrds' electrified cover version of Bob Dylan's "Mr Tambourine Man", in which The Byrds cleverly combined the pop-rock instrumentation and close harmonies made popular by The Beatles with elements of the Anglo-American folk genre.

The huge success of The Byrds' version of "Mr Tambourine Man" spawned scores of cash-in imitations, but folk-rock continued to expand and diversify over the next few years. English acts such as Donovan, Fairport Convention and Steeleye Span combined pop-rock arrangements with songs, stylings and instruments drawn directly from traditional English and Celtic folk music. Alan Stivell (Brittany) began the same work in the mid 60's . In America (and also in Australasia and Canada), pop-rock acts like The Grateful Dead, The Byrds and The Flying Burrito Brothers moved folk-rock in a different direction. Drawing on their folk roots, and inspired by the hugely influential late Sixties albums by Bob Dylan and The Band, they fused pop and rock with American [country music](#) and [bluegrass](#) music, creating the genre known as [country rock](#).

Although these trends in what might be termed "folk-pop-fusion" were all significant in their own way, and they were clearly part of the process of cultural appropriation, such experiments by popular musicians, and the availability of recorded collections of "authentic" performances of English and American folk music, began to lead many curious listeners to explore these genres. This in turn would pave the way for the development of the "world music" concept in later years.

## 1965-1967: from "Norwegian Wood" to Monterey Pop

Pop musicians first began to move outside the Western tradition in the mid-Sixties, when they started mixing Western electric pop with influences taken from the traditional music of India. Although the results were sometimes risible, this proved to be the most influential fusion of pop and "folk" music of the entire period, specifically because it was the first significant attempt to mix Western popular music with a completely non-Western musical tradition.

Although they were by no means the only people at that time who were following this course, much of the credit for the creation of the World Music genre, and for the rapid expansion of Western mass-audience interest in non-Western music, must be accorded to The Beatles, and especially to their lead guitarist, the late George Harrison.

In early 1965, during a tour of America, David Crosby of The Byrds introduced Harrison to the sitar and the traditional classical music of India. Harrison was captivated by the sound of the instrument; he soon became profoundly interested in Indian music, culture and spirituality, and he began taking sitar lessons from renowned Indian sitar virtuoso Ravi Shankar.

Harrison's background in African-American music forms had given him a solid grounding in the techniques of [improvisation](#) that are central to the genre. Like jazz and blues, the largely improvised nature of Hindustani classical music, its strong reliance on rhythm and percussion, and the extended nature of the [raga](#) form were all features that Harrison was able to recognise, appreciate and begin to explore.

In October 1965 Harrison broke new musical ground when he played a [sitar](#) on the Beatles' recording of the John Lennon song "Norwegian Wood (This Bird Has Flown)", from their 1965 LP Rubber Soul. Other musicians were attempting similar fusions at the time -- Brian Wilson, for example, used a koto on one of the songs on his classic Pet Sounds LP, recorded at around the same time -- but no other single recording had the instant and worldwide impact of "Norwegian Wood".

It was the first time a western pop song had used a sitar in its arrangement, and for many Western listeners it was undoubtedly the first time they ever heard the instrument. In the wake of the song's release, the sitar became the new "in" sound for pop recordings, and an American guitar company even manufactured an electric sitar-guitar designed to simulate the sound of the sitar.

More importantly, "Norwegian Wood" sparked a major craze for the classical music of India in general and for the work of Ravi Shankar in particular, with the direct result that recordings by Shankar and other Indian classical musicians began to sell in large quantities for the first time. Tape recording and the LP were crucial to the popularisation of this music, since a typical [raga](#) performance could last twenty minutes or longer, and popular appreciation of this music would have been impossible without the long duration and high fidelity provided by the LP format.

In 1966 Harrison took his "Indi-psych-pop" synthesis a step further with the highly original song "Love You To" (from the seminal Revolver LP), which featured a sinuous Indian-influenced melody and an innovative arrangement consisting solely of Indian instruments and performed by expatriate Indian musicians living in London. The peak of Harrison's Indian synthesis project was the epic track "Within You Without You" (1967) from Sgt. Pepper's Lonely Hearts Club Band, recorded at Studio Two, Abbey Road by Harrison and an ensemble of musicians from the Asian Music Circle in London.

Another obvious trace of Harrison's immersion in Indian music was the fact that "Within You, Without You" also broke new ground (at least in the pop scene) with its length,

clocking in at over six minutes. Harrison also recorded in India with Indian instruments and musicians when producing the soundtrack music for the 1968 film *Wonderwall*; he was given a free reign by the film's director and the music he created was reportedly intended as a sort of "primer" of the styles of Indian instrumental music that Harrison was exploring, but regrettably the film did not have a wide release at the time and Harrison's soundtrack remains little known outside the realm of Beatles obsessives.

Although not quite as influential as "Norwegian Wood", the 1965 song "See My Friends" by The Kinks is another significant Western pop song of the period that shows the unmistakable influence of Indian music. In this case, according to writer Ray Davies, the song's arrangement was inspired by a stopover in India during the band's first trip to Australia in 1965, when during an early-morning walk, he heard local fisherman singing a traditional chant, part of which he incorporated into the song's sinuous melody line; Davies' exposure to Hindustani raga music is also evident in the sitar-like quality of the guitar accompaniment.

1967 was a pivotal year for the development of the genre. In June the three-day Monterey International Pop Festival, the world's first rock festival, was held in California, and it was attended by approximately 200,000 people. Alongside the legendary English and American pop and rock acts, the bill also featured black South African jazz trumpeter Hugh Masekela and Ravi Shankar, who opened the climactic Sunday concert, and whose presence at the festival was almost entirely due to the influence of George Harrison. Shankar's performance at Monterey was without question the most important concert of his entire career in the West -- it was seen by tens of thousands of people that day, and thanks to the fact that the entire festival was recorded and filmed, millions more around the world heard it on record and/or saw it on film in the years that followed.

The other major landmark that year was the launch of the hugely influential Nonesuch Explorer Series by the American Elektra Records label. This first Explorer LP, a collection of Balinese folk music entitled *Music From the Morning of the World*, launched a growing catalogue of high-fidelity field recordings of the music of other cultures. The Nonesuch Explorer series is now recognised as one of the most important commercial collections of world music and several excerpts from Nonesuch recordings were included on the Voyager Golden Record that was sent into deep space aboard the Voyager 1 and Voyager 2 space probes in 1977.

## 1968-1986: Joujouka to Graceland

In 1968 Rolling Stones guitarist Brian Jones recorded the Master Musicians of Joujouka in the village of Joujouka in northern Morocco. Jones died the following year but the LP was released in 1971 on Rolling Stones Records. Although there was some criticism of the electronic treatments Jones applied to the recordings in post-production, the LP was one of the first recordings released in the pop market that showcased traditional [Arabic music](#).

Another important landmark in the growth of the world music genre, and one which is often overlooked, came in 1970 with the popular Simon & Garfunkel single "El Condor Pasa", taken from their multi-platinum selling *Bridge Over Troubled Waters* LP. The theme was endlessly copied and used all over the world, for instance in parody about downed F117a plane El kondor pada, and many other. Like Harrison's use of sitar, Paul Simon's use of Andean folk instruments (including the [pan flute](#)) was a pop music "first". His evocative English-language adaptation of a traditional 18th century Peruvian folk melody by Jorge Michelberg (notated in 1916 by Peruvian composer Daniel Alomias Robles) gave many listeners their first taste of the flavour of Peruvian folk music, and when the song was released as a single it became a hit in many countries, earning a Top Twenty placing (#18) on the American charts.

Also in 1970, Breton singer and musician Alan Stivell recorded his first professional album, *Reflets* ("Reflections"), a fusion of Celtic musics with rock, western classical, and other influences. His instrumental album *Renaissance of the Celtic Harp* increased the popularity of that instrument, and promoted the fusion of Celtic music with other music, as did the European best-selling live album recorded at the Paris Olympia. His 1979 *Symphonie Celtique* mixed the same elements, but brought the classical elements to the fore. He continues to experiment with different combinations of these elements, especially on *1 Douar* ("One Earth").

In 1975 there were several important "popular" releases that gained wide recognition and exposed pop audiences to new musical influences. In February, Led Zeppelin released an ambitious "Arab-pop fusion" song, the ten-minute epic "Kashmir", from their *Physical Graffiti* LP. The song was strongly influenced by composer Jimmy Page's interest in Arabic music. Although its length made it an unlikely hit, the song became a firm favourite on American FM radio stations and was even played on Australian pop radio. Although Led Zeppelin has quite fairly been criticised for their repeated uncredited appropriations of the work of black American blues musicians like Willie Dixon, and while "Kashmir" is a clear example of cultural appropriation, like "El Condor Pasa" it did have the positive effect of opening the ears of many fans to a previously unknown realm of non-Western music.

In November that year Joni Mitchell released her LP *The Hissing of Summer Lawns*, featuring the innovative track "The Jungle Line", which mixed traditional African drumming and [synthesiser](#). For this recording, Mitchell was accompanied by the musical group The Warrior Drums of Burundi, who were visiting America at the time.

Two other musical events in 1975 which had a significant impact on the development of World Music can both be largely credited to Marcel Cellier, owner of the Swiss record label Disques Cellier.

That year Cellier released the dazzling *Le Mystere Des Voix Bulgares*, the first volume of an eventual three-album series of recordings of Bulgarian vocal folk music, performed by the Bulgarian State Radio Choir and Trio Bulgarka. In the years that followed, particularly after the album's re-release through the British 4AD Records label, the Bulgarian Voices album became a significant cult hit in many countries and created a huge groundswell of interest in this thrilling form of eastern European folk music, leading to the 1980s

collaboration between Trio Bulgarka and acclaimed British singer-songwriter Kate Bush on her 1989 album *The Sensual World*.

Cellier's other big hit of 1975 was *Flutes De Pan et Orgue* ("Pan Flute and Organ"), a 1971 recording of traditional Hungarian [pan flute](#) music, performed by virtuoso Romanian pan flautist Gheorge Zamfir, and accompanied by Cellier himself on organ. The international vogue for Zamfir's music is largely due to Australian film director Peter Weir. His 1975 film *Picnic at Hanging Rock*, one of the most successful Australian feature films of the period, featured evocative music from the Cellier disc on the soundtrack, and the film's success created widespread interest in Zamfir and his music.

The popularisation of the album was, ironically, the inadvertent outcome of a frustrated plan. Weir had been introduced to Zamfir's music a few years earlier, and when he began production on *Picnic* he decided to use pan flute music on the soundtrack; he approached Zamfir to compose original music in the same style, but Zamfir declined, so Weir was obliged to return to the music he had originally heard and licence some of the tracks from the Cellier LP. The irony is that, although it made him internationally famous, Zamfir would have made far more money from the publishing rights if he had composed the original music Weir wanted -- since all but one of the tracks on the Cellier LP were credited to the ubiquitous "trad. arr. ...".

Leading up to the watershed year of 1987, another very significant field of musical appropriation was the appropriation the Jamaican music style known as [reggae](#). In its first appearance in western pop, reggae was a significant example of "crossover" music, since it was widely popularised in England by Jamaican-born singer-songwriter Bob Marley, who was one of the genre's main founders, and its rapidly growing popularity in Britain was greatly assisted by the fact that there was by that time a large number of 'black' migrants from the Caribbean who had settled in England. Internationally, however, the most successful appropriator-adaptors of reggae for mainstream pop audiences was the hugely successful British band The Police, who scored a string of hit singles and LPs in the late 1970s and early 1980s with finely-crafted pop songs played in a reggae style, such as "Walking On The Moon".

In 1986 Paul Simon re-emerged as a catalytic figure when he returned to the "world music-pop-fusion" concept he had first essayed on "El Condor Pasa" back in 1970. His hugely influential, multi-million selling *Graceland* album bore the unmistakable stamp of Simon's recent discovery of South African "township" music but more importantly, he was decided to record the album with leading South African session musicians and the vocal group Ladysmith Black Mambazo. These musicians also performed on the subsequent concert tours, as did two other special guests, exiled South African music legends Miriam Makeba and Hugh Masekela.

Simon received some criticism for his decision to record in South Africa (which at the time was still being economically boycotted by most Western nations) but his championing of township music focussed enormous attention on South Africa and its indigenous musical traditions, as well as the struggle against apartheid. There is no doubt that the success of *Graceland* was directly responsible for a massive upsurge of Western interest in the music of southern Africa, as well as making Ladysmith Black Mambazo into international stars.

## After 1987: WOMAD and beyond

The origins of the term World Music in relation to the selling of this type of [music](#) began in 1982 when World Music Day (Fête de la Musique) was initiated in France. World Music Day is celebrated on the 21st of June every year since then. On Monday 29th June 1987 a meeting of interested parties gathered to capitalise on the marketing of this genre.

Arguably popular interest was sparked with the release in 1986 of Paul Simon's Graceland album. The concept behind the album was to express his own sensibilities using the sounds which he had fallen in love with listening to artists from Southern Africa, including Ladysmith Black Mambazo and Savuka. But this project and the work of Peter Gabriel and Johnny Clegg amongst others had to some degree introduced non-western music to a wider audience and this was an opportunity which could not be ignored.

Before 1987, although World Music undoubtedly had a following and with this potential market opening up, it was difficult for interested parties to sell their music to the larger music stores; although specialist music stores had been important in developing the genre over many years, the record companies, broadcasters and journalists had been finding it difficult to build a following because the music itself seemed too scarce. They were eyeing the [Jazz](#) and Classic markets, watching them develop a cross-over audience and decided that the best way forward would be to collective strategy to bring the music to a wider audience.

At the outset of the 1987 meeting, the musician Roger Armstrong advised why something needed to be done; "(He) felt that the main problem in selling our kind of material lay with the U.K. retail outlets and specifically the fact that they did not know how to rack it coherently. This discouraged them from stocking the material in any depth and made it more difficult for the record buyers to become acquainted with our catalogues."

The first concern of the meetings was to select the umbrella name that this 'new' music would be listed under. Suggestions included 'World Beat' and prefixing words such as 'Hot' or 'Tropical' to existing genre titles, but 'World Music' won after a show of hands, but initially it was not meant to be the title for a whole new genre, rather something which all of the record labels could place on the sleeves of records in order to distinguish them during the forthcoming campaign. It only became a title for the genre after an agreement that despite the publicity campaign, this wasn't an exclusive club and that for the good of all, any label which was selling this type of music would be able to take advantage.

Another issue which needed to be addressed was the distribution methods which existed at the time. Most of the main labels were unhappy with the lack of specialist knowledge displayed by sales persons which led to poor service; there was also a reluctance amongst many of the larger outlets to carry the music, because they understandably liked larger releases which could be promoted within store. It was difficult to justify a large presentation expense if the stock going into stores was limited.

One of the marketing strategies used in the vinyl market at the time was the use of browser cards, which would appear in the record racks. As part of the World Music campaign it was decided that these would be a two colour affair designed to carry a special offer package; to aid the retailer a selection of labels would also be included (presumably for shelf or rack edging).

In an unprecedented move, all of the World Music labels co-ordinated together and developed a compilation cassette for the cover of the music magazine NME. The overall running time was ninety minutes, each package containing a mini-catalogue showing the other releases on offer. This was a smart move as NME reader are often seen as discerning listeners and it was important step to get them on board.

By the time of that second meeting it was becoming clear that in order for the campaign to be successful, it should have its own dedicated press officer. They would be able to juggle the various deadlines and also be able to sell the music as a concept to not just the national stations but also regional [DJs](#) who were keen to expand the variety of music they could offer. They were seen as a key resource as it was important for 'World Music' to be seen as something which could be important to people outside London - most regions after all had a similarly rich folk heritage which could be tapped into. A cost effective way of achieving all this would be a leafleting campaign.

The next step was to develop a World Music chart, gathering together selling information from around fifty shops, so that it would finally be possible to see which were big sellers in the genre - allowing new listeners to see what was particularly popular. It was agreed that the NME could again be involved in printing the chart and also Music Week and the London listings magazine City Limits. It was also suggested that Andy Kershaw might be persuaded to do a run down of this chart on his show regularly.

And so October of 1987 was designated 'World Music' month. A music festival, 'Crossing the Border' was held at the Town & Country Club, London and it was the start of the winter season for both WOMAD and Arts Worldwide. The main press release stressed the issues inherent in the campaign:

"Since the early Eighties the enthusiasm for music from 'outside' Western pop culture has been steadily mounting. More and more international artists, many of whom are big stars in their own countries, are coming here on tour. They started off, like The Bhundu Boys, playing small clubs and pubs, but now many acts are so popular that they are packing out larger venues.

"The excitement and word-of-mouth appeal is backed up by radio - World of Music on Voice of America, Transpacific Sound Paradise on WFMU, The Planet on Australia's ABC Radio National, DJ Edu presenting D.N.A: DestiNation Africa on BBC Radio 1Xtra, Adil Ray on the BBC Asian Network, Andy Kershaw's show on BBC Radio 3 and Charlie Gillett's show on the BBC World Service to name but seven... and the demand for recordings of non-Western artists is surely growing. This is where the problems can start for the potential buyer of 'World Music' albums - the High Street record shop hasn't got the particular record, or even a readily identifiable section to browse through, it doesn't show in any of the published charts, and at this point all but the most tenacious give up - and who can blame them?"

Today, mainstream music has adopted many of the features of world music, and artists such as Shakira and the members of the Buena Vista Social Club have reached a much wider audience. At the same time world music has been influenced by [hip hop](#), [pop](#) and [jazz](#). Even heavy metal bands such as Tool and Nile have incorporated world music into their own. Some entertainers who cross over to recording from film and television will often start with World music; Steven Seagal is a recent example.

World music radio programs these days will often be playing African hip hop or [reggae](#) artists, [crossover](#) Bhangra and Latin American jazz groups, etc. Public radio and webcasting are an important way for music enthusiasts all over the world to hear the enormous diversity of sounds and styles which, collectively, amount to World Music. The BBC, NPR, and ABC (Australian Broadcasting Corporation) are rich sources for World Music where it is possible to listen online as well as read about the artists and history of this genre.

## Criticisms of the Genre

Some musicians and curators of music have come to dislike the term "world music." On October 3, 1999, David Byrne, the founder of the Luaka Bop music label, wrote an editorial in The New York Times explaining his digression. To many including Byrne, "world music" is a catchall name for non-western music of all genres. As such, it changes its own market. The labeling and categorization of other cultures as "exotic" is argued to attract an insincere consumership and deter other potential consumers. Critics of the term propose eliminating the category and integrating the records into existing "western" genres, be it folk, pop, jazz, classical, hip hop or otherwise.

## **NPR's *World Cafe***

The NPR website for *World Cafe* says: "*World Cafe* showcases an eclectic blend, from rock and world music to folk and alternative country."

## Festivals

There are many World Music festivals and jazz/folk/roots/new age crossover events. A small selection is represented here:

- FloydFest in Floyd, Virginia, USA. Has featured artists from a wide diversity of styles including Ani DiFranco, Geno Delafosse & French Rockin' Boogie, Trumystic, Nickel Creek and Akoya Afrobeat Ensemble.
- The WOMAD Foundation puts on festivals in different countries all around the world and which have last year included artists such as Youssou N'Dour, Robert Plant and Jaojoby
- The Festival in the Desert takes place every year at Essakane, near Timbuktu, in Mali, West Africa and has achieved international status in spite of the difficulties of reaching its location.
- Stern Grove festival is a San Francisco celebration of musical and cultural diversity. Examples: Lucinda Williams, John Doe, Ojos de Brujo, O-Maya, Ladysmith Black Mambazo, the Funk Brothers and also symphony orchestras and operatic stars.

## Music labels

Luaka Bop, David Byrne's music label  
Real World Studios, Peter Gabriel's music label  
Dancing Turtle Flash-based site  
Rough Guide series  
Folkways series  
Primary Music Label's Site  
Tropical Music WorldMusic label  
Crammed Discs  
6 Degree Records

## World music market

The **world music market** is the global market for the commercial trade of [music](#). As of 2006, this market is dominated by the "Big Four record labels": Universal Music Group, Sony BMG Music Entertainment, EMI Group, and Warner Music Group. These companies control around 70% of the world music market and around 85% of the United States music market, demonstrating the concept of oligopoly within the [music industry](#).

## Terminology and business structure

The term "record label" when referring to the Big Four is a misnomer, as they are actually corporate umbrella organizations called *business groups*. A *music group* is a business group consisting of music related companies, and is typically owned by an international conglomerate *holding company*, which often has non-music divisions as well. A music group controls and consists of music publishing companies, record (sound recording) manufacturers, record distributors, and [record labels](#). A record label is a company that manages sound recording-related brands and trademarks (both of which are also called labels); coordinates the production, marketing, licensing, and copyright protection of sound recordings and videos; and maintains contracts with recording artists and their managers. Record companies (manufacturers, distributors, and labels) may also comprise a *record group* which is, in turn, controlled by a music group.

Record companies and music publishers that are not under the control of the Big Four are generally considered to be *independent*, even if they are large corporations with complex structures. Some prefer to use the term *indie label* to refer to only those independent labels that adhere to an arbitrary, ill-defined criteria of corporate structure and size, and some consider an indie label to be almost any label that releases non-mainstream music, regardless of its corporate structure.

## Reported statistics

The global market was estimated at \$30-40 billion in 2004. Total annual unit sales (CDs, [music videos](#), mp3s) in 2004 were 3 billion.

According to an IFPI report published in August 2005, the big four accounted for the following percentages of retail music sales:

- Universal Music Group (France/USA based) — 25.5%
- Sony BMG Music Entertainment (Japan/Germany based) — 21.5%
- EMI Group (UK based) — 13.4%
- Warner Music Group (USA based) — 11.3%
- independent labels — 28.4%

Prior to December 1998, the industry was dominated by the "Big Six": Sony Music and BMG had not yet merged, and PolyGram had not yet been absorbed into Universal Music Group. After the PolyGram-Universal merger, the 1998 market shares reflected a "Big Five", as follows, according to MEI World Report 2000:

- Universal Music Group including PolyGram — 21.1%
- Sony Music — 17.4%
- EMI — 14.1%
- Warner Music Group — 13.4%
- BMG — 11.4%
- independent labels — 22.6%

In 1918, worldwide sales of phonograph/gramophone records were estimated at 100 million units.

## Albums sales and market value

The following table shows album sales and market value in the world in the 1990s–2000s,

| <b>N</b> | <b>Country</b> | <b>Album Sales Share</b> | <b>Share of World Market</b> |
|----------|----------------|--------------------------|------------------------------|
| 1        | USA            | 37-40%                   | 30-35%                       |
|          | EU             | 30-32%                   | 31-34%                       |
| 2        | Japan          | 9-12%                    | 16-19%                       |
| 3        | UK             | 7-9%                     | 6.4-9.1%                     |
| 4        | Germany        | 7-8%                     | 6.4-8.3%                     |

## Miscellaneous

In its June 30, 2000 annual report filed with the SEC, Seagram reported that Universal Music Group was responsible for 40% of worldwide [classical music](#) sales over the preceding year.

Category: [Music industry](#).

# Xylophone

The **xylophone** (from the Greek meaning 'wooden sound') is a [musical instrument](#) in the [percussion](#) family which probably originated in Indonesia (Nettl 1956, p.98). It consists of wooden bars of various lengths that are struck by a plastic, wooden, or rubber mallet. Each bar is tuned to a specific pitch of the [chromatic scale](#). The arrangement of the bars is similar to the layout of the [piano](#) keyboard.

The xylophone has a brighter tone than its cousin the marimba, and the notes have less sustain. Modern xylophones include resonating tubes below the bars. A xylophone with a range extending downwards into the marimba range is called a xylorimba.

The xylophone features in a number of [classical](#) pieces, with the *Danse macabre* (1874) by Camille Saint-Saëns, and "Fossils" from the same composer's *Carnival of the Animals* (1886) being two of the better known. An early use of the xylophone in a [symphony](#) is found in Gustav Mahler's Symphony No. 6. The xylophone was popularized in America in the early 20th century with the rising popularity of [ragtime](#) music, most notably through the works and virtuosity of xylophonist George Hamilton Green.

# Zither

The **zither** is a musical [string instrument](#), mainly used in [folk music](#). Like many other string instruments, acoustic and electric forms exist; in the acoustic version, the strings are stretched across the length of the soundbox, and neither version has a neck. They can be divided into two classes, the **fretted ("concert") zithers** and **fretless zithers**. A musician that plays them is called **zitherist** or **zither player**. (For much more on fretless zithers, see the external link below.)

The name *zither* may be derived from the arabic word kithara (BJ+'1)), an instrument from classical times used in Ancient Greece and later throughout the Roman Empire.

In entertainment, the zither is perhaps most famous for its role in providing the [soundtrack](#) of the classic film noir *The Third Man*. It is also used by multi-instrumentalist Laraaji on the third release of Brian Eno's Ambient series, Ambient 3: Day of Radiance. In more popular music, Shirley Abicair, the well known Australian born singer, popularised the zither when she used it widely as accompaniment in her popular TV shows, live performances and recordings in Britain in the 1950's and 1960's. Today, Jerusalem-based multi-instrumentalist Bradley Fish has the most widely distributed musical loops of various zithers in a multitude of styles on Sony Digital Pictures.

The word *zither* is also used to describe a large family of stringed instruments in which the strings do not extend beyond the sounding box. This family includes the hammered dulcimer, the psalteries, and the Appalachian dulcimer.

# Zoomusicology

**Zoomusicology** is a field of [musicology](#) and zoology or more specifically, zoosemiotics. Zoomusicology is the study of the [music](#) of animals, or rather the musical aspects of sound or communication produced and received by animals. Zoomusicologist Dario Martinelli describes the subject of zoomusicology as the "aesthetic use of sound communication among animals." George Herzog (1941) asked, "do animals have music?" François-Bernard Mâche's *Musique, mythe, nature, ou les Dauphins d'Arion* (1983), includes a study of "ornitho-musicology" using a technique of Nicolas Ruwet's *Langage, musique, poésie* (1972), paradigmatic segmentation analysis, shows that [birdsongs](#) are organized according to a repetition-transformation principle. One purpose of the book was to "begin to speak of animal musics other than with the quotation marks" (Mâche 1992: 114), and he is credited by Dario Martinelli with the creation of zoomusicology.

In the opinion of Jean-Jacques Nattiez (1990), "in the last analysis, it is a human being who decides what is and is not musical, even when the sound is not of human origin. If we acknowledge that sound is not organized and conceptualized (that is, made to form music) merely by its producer, but by the mind that perceives it, then music is uniquely human." According to Mâche, "If it turns out that music is a wide spread phenomenon in several living species apart from man, this will very much call into question the definition of music, and more widely that of man and his culture, as well as the idea we have of the animal itself." (Mâche 1992: 95)

Shinji Kanki composes music for dolphins according to conventions found in dolphin music or found to please dolphins in his *Music for Dolphins (Ultrasonic Improvisational Composition) for underwater ultrasonic loudspeakers* (2001).

Zoomusicology may be distinguished from ethnomusicology, the study of human music. Zoomusicology is most often biomusicological, and biomusicology is often zoomusicological.

Composers have evoked or imitated animal sounds in compositions including Jean Phillippe Rameau's *The Hen* (1706?), Camille Saint-Saens's *Carnival of the Animals* (1886), Olivier Messiaen's *Catalogue of the Birds* (1956-58), and Pauline Oliveros's *El Relicario de los Animales* (1977). (Von Gunden 1983, p.133)

### Other topics

[Electronic musical instrument](#) – Computer music

**4-beat** (also known as **hardcore** or **happy hardcore**) is a [breakbeat](#) style of [music](#) circa 1993, that evolved from [breakbeat hardcore](#) emanating from the United Kingdom rave scene. Due to the sheer scale of the United Kingdom rave scene, this particular music was largely self contained in England where it was almost entirely produced and played.

Breakbeat hardcore was originally referred to a simply *hardcore* by ravers in England. As such, this evolved style was also alternatively known as *hardcore* or *happy hardcore* — the latter meaning a happier variant of this aforementioned breakbeat styled hardcore, thus happy hardcore (i.e. *happy breakbeat*). [Darkcore](#) was the short lived counter movement to happy that occurred at the same time.

The name happy hardcore should *not* be confused with other things that are also referred to as [happy hardcore](#), as that term is much shared (and overused) across the world to describe different sounding things that have their own development.

Also in this article, 4-beat is not a musical term commonly used to describe a drum beat time signature found in most types of modern music, but is rather a specific name used to describe a breakbeat music style.

## Characteristics

For an alias, individual nicknames of [DJs](#) rather than recording under a band name would be common. These same artists would be widely found DJing on the English rave circuit. These individual artists would also collaborate with other individuals under joint releases with & or *versus* designations.

Much like its [hardcore](#) predecessor, there was a number of uncredited white labels released, created by unknown producers.

Typical characteristics for 4-beat are for compositions to be around a tempo of 150 to 170 BPM (beats per minute). At the core of these compositions would be a fast looped, sometimes complex rolling sampled breakbeat, along with a combined bass drum every four beats to the bar - hence the name of 4-beat.

These rolling chopped breakbeats were not too dissimilar to those found in jungle music. A deep sub bassline could also be found to work with the breakbeats, though not as prominent as found in jungle. Both 4-beat and jungle styles would be common under one roof at raves during the early-to-mid-1990s.

Tracks would have a somewhat basic keyed happy sounding chord before bursting into an Italo house inspired catchy [piano](#) melody. This would be the hook of the record, where rave crowds would respond by making noise by blowing whistles or air horns. This could be accompanied by weeping and uplifting strings.

If any vocals were used, they would certainly be female and likely be just short several second parts sampled from other records. In most cases these would not be performed by a vocalist paid to perform many [lyrics](#).

High pitched samples due to the fast tempo of tracks could be found in this music but not in every release. It's deemed more of a stereotype associated to this style.

Due to other influences - largely to the [bouncy techno](#) style - its inherent breakbeats and sub basslines would later become surplus to requirements by 1996.

# History

## Terminology

### 4-beat

Whilst ambiguous as a term, 4-beat only indicated that this style - unlike jungle music and its earlier [breakbeat hardcore](#) predecessor - used a common if somewhat insignificant four beats to the bar bass drum complementing the obligatory breakbeats. 4-beat does not mean it was void of breakbeats - a common error assumed by most.

*Artists at the forefront of this style refused to call the style as happy hardcore, rather they used the 4-beat term. DJ Seduction - a leading English producer since 1991 - said that, "House led to hardcore, which led to Drum N Bass and 4-beat (I hate calling it Happy Hardcore)" in a 1995 interview.*

Several record labels including Impact, Techstep Records (London) and United Dance Recordings, displayed the 4-beat logo on their artwork alongside the "recognised form of 4-beat" slogan. This logo may also have been used on records to easily distinguish this and jungle music in record shops.

### Happy hardcore

In England, [hardcore](#) was the terminology used to describe their breakbeat driven rave music style of the early 1990s, with happy being used to distinguish the happier variant of this breakbeat hardcore music, thus happy hardcore (i.e. *happy breakbeat*). This term was however less favoured by producers creating this music who instead used 4-beat or even just plain hardcore. [Darkcore](#) was the short lived counter movement to happy that occurred at the same time.

*DJ Sy - another artist at the forefront of this movement - said, "'happy" hardcore (what a f\*\*\*ing stupid name - always makes me think of "nappy" hardcore) of '94 onwards..."*

Even though this likely is the first ever case of happy hardcore being used to describe any style of music, the term [happy hardcore](#) has been much overused across the world in the 21st century to describe many different sounding things that in all likelihood have nothing to do with the original definition as described in this article.

These two terms have all more or less since become deprecated to describe this music due to the style and its large rave scene following being no more. *Oldskool hardcore* has since become a favoured term in the 21st century to describe this style, though both the original terms are still used by purists.

# 20th century classical music

## History of European art music

|                     |               |
|---------------------|---------------|
| <u>Medieval</u>     | (476 – 1400)  |
| <u>Renaissance</u>  | (1400 – 1600) |
| <u>Baroque</u>      | (1600 – 1760) |
| <u>Classical</u>    | (1730 – 1820) |
| <u>Romantic</u>     | (1815 – 1910) |
| <b>20th century</b> | (1900 – 2000) |

## Contemporary classical music

**20th century classical music**, the classical music of the 20th century, was extremely diverse, beginning with the late Romantic style of Sergei Rachmaninoff and the Impressionism of Claude Debussy, and ranging to such distant sound-worlds as the complete serialism of Pierre Boulez, the simple triadic harmonies of minimalist composers such as Steve Reich, and Philip Glass, the musique concrète of Pierre Schaeffer, the microtonal music adopted by Harry Partch, Alois Hába and others, and the aleatoric music of John Cage.

Among the most prominent composers of the 20th century were Béla Bartók, Gustav Mahler, Richard Strauss, Giacomo Puccini, Claude Debussy, Charles Ives, Edward Elgar, Arnold Schoenberg, Sergei Rachmaninoff, Sergei Prokofiev, Igor Stravinsky, Dmitri Shostakovich, Benjamin Britten, Aaron Copland and Carl Nielsen. Classical music also had an intense cross fertilization with jazz, with several composers being able to work in both genres, including George Gershwin. An important feature of 20th century concert music is the existence of the splitting of the audience into traditional and avant-garde, with many figures prominent in one world considered minor or unacceptable in the other. Composers such as Anton von Webern, Elliot Carter, Edgard Varèse, Milton Babbitt, and Luciano Berio have devoted followings within the avant-garde, but are often attacked outside of it. As time has passed, however, it is increasingly accepted, though by no means universally so, that the boundaries are more porous than the many polemics would lead one to believe: many of the techniques pioneered by the above composers show up in popular music by The Beatles, Pink Floyd, Mike Oldfield, Nirvana, Radiohead, R.E.M. and in film scores that draw mass audiences.

It should be kept in mind that this article presents an overview of 20th century classical music and many of the composers listed under the following trends and movements may not identify exclusively as such and may be considered as participating in different movements. For instance, at different times during his career, Igor Stravinsky may be considered a romantic, modernist, neoclassicist, and a serialist.

The 20th century was also an age where recording and broadcast changed the economics and social relationships inherent in music. An individual in the 19th century made most music themselves, or attended performances. An individual in the industrialized world had access to radio, television, phonograph and later digital music such as the CD.

## Romantic style

Particularly in the early part of the century, many composers wrote music which was an extension of 19th century [Romantic music](#). [Harmony](#), though sometimes complex, was tonal, and traditional instrumental groupings such as the [orchestra](#) and [string quartet](#) remained the most usual. Traditional forms such as the [symphony](#) and [concerto](#) remained in use. (See [Romantic Music](#))

Many prominent composers — among them Dmitri Kabalevsky, Dmitri Shostakovich and Benjamin Britten — made significant advances in style and technique while still employing a melodic, harmonic, structural and textural language which was related to that of the 19th century and quite accessible to the average listener.

Music along these lines was written throughout the 20th century, and continues to be written today. Some other twentieth-century composers of works in a more-or-less-traditional idiom include:

- Samuel Barber
- Leonard Bernstein
- Aaron Copland
- John Corigliano
- George Gershwin
- Henryk Górecki
- Howard Hanson
- Roy Harris
- Alan Hovhaness
- Gustav Holst
- Aram Khachaturian
- Colin McPhee
- Sergei Rachmaninoff
- Jean Sibelius
- Ralph Vaughan Williams

[Minimalist](#) composers such as Philip Glass can also be said to evoke some sense of nineteenth-century melodic and harmonic language, but depart radically in structure and texture, harmony, ideas, development, counterpoint and rhythm.

Many other 20th century composers took more experimental routes.

# Modernism

*Main article:* [Modernism](#)

Modernism is the name given to a series of movements (See [Modernism](#)) arising out of the idea that the 20th century presented a new basis for society and activity, and therefore art should adopt this new basis, however construed, as the fundamental of aesthetics. Modernism took the progressive spirit of the late 19th century, its love of rigor and of technical advancement, and unhinged it from the norms and forms of late 19th century art. To take one example, architect Frank Lloyd Wright did his drafting work with tools, not because he could not draw freehand, but because "the machine was the coming thing, therefore I wanted to make beauty with the machine". Various movements in 20th century music, including neo-classicism, serialism, experimentalism, conceptualism can be traced to this idea.

## The "Second Viennese School", atonality and serialism

(See [atonality](#))

Arnold Schoenberg is one of the most significant figures in 20th century music. His early works are in a late Romantic style, influenced by Richard Wagner and Gustav Mahler, but he later abandoned a tonal framework altogether, instead writing freely atonal music — he is often reckoned to have been the first composer to have done so. In time, he developed the twelve-tone technique of composition, intended to be a replacement for traditional tonal pitch organisation. His pupils Anton Webern and Alban Berg also developed and furthered the use of the twelve-tone system and were notable for their use of the technique in their own right. They together are known, colloquially, as the Schoenberg "trinity" or the [Second Viennese School](#). This name was created to imply that this "New Music" would have the same effect as the "First Viennese School" of Haydn, Mozart and Beethoven.

Schoenberg's music and that of his followers was very controversial in its day, and remains so to some degree now. Many listeners found, and still find, his music hard to follow, lacking a sense of definite melody. Nonetheless, works such as *Pierrot Lunaire* continue to be performed, studied and listened to, while many of the contemporary works which were considered more acceptable have been forgotten. A larger measure of the reason for this is that the style he pioneered was very influential, even among composers who continued to compose tonal music. Many composers have since written music which does not rely on traditional tonality.

The twelve-tone technique itself was later adapted by other composers to control aspects of music other than the pitch of the notes, such as dynamics and methods of attack, creating completely [serialised](#) music. Milton Babbitt created his time point system, where the distance in time between attack points for the notes is serialized also, while some composers serialized aspects such as register or dynamics. The "pointillistic" style of Webern — in which individual sounds are carefully placed within the piece such that each has importance — was very influential in the years following World War II among composers such as Pierre Boulez and Karlheinz Stockhausen. Ironically, after years of unpopularity, the twelve tone technique became the norm in Europe during the 50's and 60's, but then experienced a backlash as generations of younger and older composers returned to writing tonal music, either in a [neoclassical](#), [romantic](#), or [minimalist](#) vein. Stravinsky, who studied as a young man with Nikolay Rimsky-Korsakov, became a

modernist, then a neoclassicist, and ultimately became a serialist upon Schoenberg's death.

## Free dissonance and experimentalism

In the early part of the 20th century modernist composers such as George Antheil and others produced music that was shocking to audiences of the time for its disregard or flaunting of musical conventions. Charles Ives quoted popular music, often had multiple or bitonal layers of music, extreme dissonance, and seemingly unplayable [rhythmic](#) complexity. Henry Cowell performed his solo piano pieces by strumming or plucking the inside of the piano, knocking on the outside, or depressing tone clusters with his arms or boards. Edgard Varèse wrote highly dissonant pieces that utilized unusual sonorities and futuristic, scientific sounding names; he also dreamed of producing music electronically. Charles Seeger enunciated the concept of dissonant counterpoint, a technique used by Carl Ruggles, Ruth Crawford-Seeger, and others. Igor Stravinsky and Serge Diaghilev fled the riot that greeted The Rite of Spring and Vaslav Nijinsky's choreography. Darius Milhaud and Paul Hindemith explored bitonality. Amadeo Roldán brought music written specifically for percussion ensemble into the classical tradition; he was soon followed by Varèse and then others. Kurt Weill wrote the popular Threepenny Opera entirely in the popular idiom of German cabarets. Modernist composers being the avant-garde, they often wrote atonally, sometimes explored [twelve tone technique](#), used liberal amounts of dissonance, quoted or imitated [popular music](#), or somehow provoked their audience.

## Neoclassicism

*Main Article:* [Neoclassicism \(music\)](#)

Neo-classicism, in music, means the movement in the 20th century to return to a revived "common practice" harmony, mixed with greater dissonance and rhythm, as the basic point of departure for music. Igor Stravinsky, Paul Hindemith, Sergei Prokofiev and Béla Bartók are usually listed as the most important composers in this mode, but also the prolific Darius Milhaud and his contemporary Francis Poulenc.

Neo-classicism was born at the same time as the general return to rational models in the arts in response to World War I. Smaller, more spare, more orderly was conceived of as the response to the overwrought emotionalism which many felt had herded people into the trenches. Since economics also favored smaller ensembles, the search for doing "more with less" took on a practical imperative as well. Stravinsky's L'Histoire du Soldat is thought of as a seminal "neo-classical piece", as are his Dumbarton Oaks Concerto and his "Symphonies of Wind Instruments", as well as his Symphony in C. Stravinsky's neo-classicism culminated with his opera Rake's Progress, with the book done by the well known modernist poet, W. H. Auden.

Stravinsky's rival for a time in neo-classicism was the German Paul Hindemith, who mixed spiky dissonance, polyphony and free ranging chromaticism into a style which was "useful". He produced both chamber works and orchestral works in this style, perhaps most famously "Mathis der Maler". His chamber output includes his Sonata for French Horn, an expressionistic work filled with dark detail and internal connections.

Neo-classicism found a welcome audience in America, the school of Nadia Boulanger promulgated ideas about music based on their understanding of Stravinsky's music. Students of theirs include neo-classicists Elliott Carter (in his early years), Aaron Copland, Roy Harris, Darius Milhaud, Astor Piazzolla and Virgil Thomson.

Neo-classicism's most audible traits are melodies which use the tritone as a stable interval, and coloristically add dissonant notes to ostinato and block harmonies, along with the free mixture of polyrhythms. Neo-classicism won greater audience acceptance more

quickly, and was taken to heart by those opposed to atonality as the true "modern" music. Neo-classicism also embraced the use of [folk musics](#) to give greater rhythmic and harmonic variety. Modernists such as the Hungarians Béla Bartók and Romantically inclined Zoltán Kodály and the Czech Leoš Janáček collected and studied their native folk musics which then influenced their

# Post-modernist music

## Post-modernism's birth

Post-modernism can be said to be a response to modernism which asserts that the products of human activity — particularly manufactured or created by artifice — are the central subject for art itself, and that the purpose of art is to focus people's attention on objects for contemplation, as composer-critic Steve Hicken explained it. This strain of modernism looks backward to the dada school of art exemplified by Duchamp, and to the collage of "concrete" music, as well as experiments with electronic music by Edgard Varèse and others. However, post-modernism asserted that this was the primary mode of human existence, an individual aswim in a sea of the products of people.

John Cage is a prominent figure in 20th century music whose influence steadily grew during his lifetime, and who is regarded by many as the founder of post-modernist music. Cage questioned the very [definition of music](#) in his pieces, and stressed a philosophy that *all* sounds are essentially music. Cage in the "silent" 4'33" presents the listener with his idea that the unintentional sounds are just as musically valid as the sounds originating from an instrument. Cage also notably used [aleatoric music](#), and "found sounds" in order to create an interesting and different type of music. His music not only rested on his argument that there was no "music" or "noise" only "sound", and that combinations of found sound were musical events as well - but on the importance of focusing of attention and "framing" as essential to art. (See [Post-Modernism](#))

Cage, though, has been seen by some to be too avant-garde in his approach; for this reason, many find his music unappealing. Interestingly, the seeming opposite of Cage's indeterminism is the overdetermined music of the serialists, which both schools have noted produce similar sounding pieces, yet many serialists, such as Pierre Boulez and Karlheinz Stockhausen have used aleatoric processes. Michael Nyman argues in *Experimental Music* that minimalism was a reaction to and made possible by both serialism and indeterminism. (See also [experimental music](#))

Post-modernism reached music and painting at very similar moments, on one hand, the sparseness, purity, love of mechanism, abstraction and the grid which are very modernist traits were preserved, as was the emphasis on personalizing style and experimentalism. However, post-modernism rejected the hermeneutic stance - the need to be "in" on the joke as it were - of modernism. Instead post-modernism took the popular and pared down as its aesthetic guide. One of the first movements to overtly break with the modernist took inspiration from Cage's work, and its emphasis on layering sounds: Minimalism.

## Minimalism

*Main article:* [Minimalist music](#)

Many composers in the later 20th century began to explore what is now called [minimalism](#). The most specific definition of minimalism refers to the dominance of process in music — where fragments are layered on top of each other, often looped, to produce the entirety of the sonic canvas. Early examples include Terry Riley's *In C* and Steve Reich's *Drumming*. Riley is seen by some as the "father" of [minimalist music](#) with *In C*, a work comprised of melodic cells that each performer in an ensemble plays through at their own rate. The minimalist wave of composers — Terry Riley, Mike Oldfield, Philip Glass, Steve

Reich, and La Monte Young to name the most prominent — wanted music to be "accessible" to ordinary listeners, and wanted to express concrete specific questions of dramatic and music form, not hidden in layers of technique, but very overtly. One key difference between minimalism and previous music is the use of different cells being "out of phase" or determined by the performers; contrast this with the opening of *Das Rheingold* by Richard Wagner which, despite its use of triadic cells, has each part controlled by the same impulse and moving at the same speed.

Minimalist music is often contentious amongst traditional listeners. Its critics find it to be overly repetitive and empty while proponents argue that the static elements that are often prevalent draw more interest to small changes. Minimalism has, however, inspired and influenced many composers not usually labeled "minimalist" such as Karlheinz Stockhausen and György Ligeti. Composers such as Arvo Pärt, John Tavener, and Henryk Górecki, whose *Symphony No. 3* was the highest selling classical album of the 1990s, have found great success with what has been called "Holy Minimalism" in their deeply felt religious works.

The next wave of composers working in this tradition are not called "Minimalist" by some, but are by others. These include opera composer John Adams and his student Aaron Jay Kernis. The expansion of minimalism from process music, to music which relies on texture to hold together the movement of the music has created a wider diversity of compositions and composers.

## Electronic music

*Main article:* [Electronic art music](#)

Technological advances in the 20th century enabled composers to use [electronic](#) means of producing sound. This took several forms: some composers simply incorporated electronic instruments into relatively conventional pieces. Olivier Messiaen, for example, used the ondes martenot in a number of works.

Other composers abandoned conventional instruments and used magnetic tape to create music, recording sounds and then manipulating them in some way. Pierre Schaeffer was the pioneer of such music, termed [Musique concrète](#). Some figures, such as Karlheinz Stockhausen, used purely electronic means to create their work. In the United States of America, Milton Babbitt used the RCA Mark II Synthesizer to create music. Sometimes such electronic music was combined with more conventional instruments, Stockhausen's Hymnen, Edgard Varèse's *Déserts*, and Mario Davidovsky's *Synchronisms* offer a few examples (although *Déserts* is sometimes performed today without the tape part).

Oskar Sala, created the non-musical soundtrack for Alfred Hitchcock's film *The Birds*, using the trautonium electronic instrument he helped develop. Morton Subotnick provided the electronic music for the film *2001: A Space Odyssey*.

Some well known electronic works generally regarded as in the classical tradition include "Film Music" by Vladimir Ussachevsky, *A Rainbow in Curved Air* and *Shri Camel* by Terry Riley, "Silver Apples", "The Wild Bull", and "Return" by Morton Subotnick, Sonic Seasonings and Switched-On Bach by Wendy Carlos, "Light Over Water" by John Adams, Aqua by Edgar Froese, and *Poème électronique* by Edgar Varèse.

Iannis Xenakis is another modern composer who used computers and electronic instruments, including one he invented, in many compositions. Some of his electronic works are gentle ambient pieces and some are savage sonic violence. Composers such as Alvin Lucier, Gordon Mumma, and David Tudor created and performed live electronic music, often designing their own electronics or using tape. A number of institutions sprung up in the 20th century specialising in electronic music, with IRCAM in Paris perhaps the best known.

The influences of minimalists such as Steve Reich (in particular 'Drumming') are clear in much of the work of DJ Spooky showing a perfect example of the crossover between 20th century classical, and electronic music such as [trip-hop](#) and even [trance](#) and [drum n bass](#).

## Jazz-influenced composition

A number of composers combined elements of the [jazz](#) idiom with classical compositional styles. Notable examples include:

- George Gershwin, Rhapsody in Blue
- Claude Debussy, Golliwog's Cakewalk (from Children's Corner, 1908)
- Igor Stravinsky's Ragtime for 11 instruments (1918)
- Paul Hindemith, 1922 Suite für Klavier
- Kurt Weill, Threepenny Opera (1928)
- Ernst Krenek, Jonny spielt auf (1926)
- Bruce Arnold, A Few Dozen (1955)
- Elie Siegmeister, Clarinet Concerto (1956)

## Other

"New Complexity" is a current within today's European contemporary avant-garde music scene. Composers are Brian Ferneyhough, James Dillon and Michael Finnissy. Another prominent development is the extension of instrumental technique and timbre, for instance in the music of Helmut Lachenmann and Salvatore Sciarrino. Another notable movement is [spectral music](#). Prominent spectral composers include Tristan Murail and Gérard Grisey, and the 'post-spectral' composers Kaija Saariaho and Magnus Lindberg.

# A & R

**Artist and repertoire (A&R for short)** is a [music industry](#) term that refers to the division of a [record label](#) that is responsible for scouting and developing talent. The A&R department is the link between the recording artist/act and the record label, and is often required to handle contractual negotiations, find [songwriters](#) and record producers for the act, and schedule recording sessions.

One of the A&R department's main jobs is sorting through the plethora of [demo tapes](#) sent by hopeful [musicians](#) to the label. A&R departments typically only accept solicited demos, or ones from business contacts that they are familiar with.

In some more artistic record labels, creativity is encouraged and songwriting and record producing is done by the artists.

Examples of A&R people include

- Dr Dre
- Simon Cowell
- Brad Delson
- Ian Dickson
- Mark Holden
- Mitch Miller
- Chuck Paugh
- Frankie Vega
- Ben Watt

Some A&R people have literally changed the face of modern music, John H. Hammond for example, had a long and rich career discovering some of the biggest names in music. Artists he discovered, signed and even occasionally produced included Billie Holiday, Bob Dylan, Bruce Springsteen, Aretha Franklin and many others. Other A&R people with similar track records include Clive Davis and Lenny Waronker.

**Aboriginal rock** is a rather nebulous term for a style of [music](#) which mixes traditional [rock music](#) elements ([guitar](#), [drums](#), [bass](#) etc) with the instrumentation of Indigenous Australians (Didjeridu, clap-sticks etc). Performed almost exclusively by Indigenous bands - although some Anglo-Australians feature in some bands - the resulting sound is both hard-edged and eerily timeless.

Musical groups, Us Mob and No Fixed Address through their participation in the movie Wrong Side of the Road (there was a Soundtrack 1981) gave wide public profile to Indigenous disadvantage in urban Australia.

By far the most famous band in this style is Yothu Yindi. Featuring vocals by Mandawuy Yunupingu, Yothu Yindi demonstrate the other important by-product of the Aboriginal rock mix - politicised lyrics. Major hits like 1993's "Treaty" unequivocally speak out on political issues relevant to Aboriginal people, while other songs relate more generally to Aboriginal culture.

Another major band has been the Warumpi Band, with whom Australia's Midnight Oil has toured frequently. The Warumpi Band focus more on the Aboriginal aspects of the music, rather than the rock sound of Yothu Yindi.

More recently, Aboriginal bands have adapted other styles such as rap metal (NoKTuRNL).

# Absolute music

**Absolute music**, less often **abstract music**, is a term used within the [classical music](#) field to describe [music](#) that is not explicitly "about" anything, non-representational or non-objective. Absolute music has no words and no references to stories or images or any other kind of extramusical idea. It is also known in classical contexts as abstract music and is in contrast to [program music](#). The view of absolute music as music "for its own sake" derives from Kant's aesthetic disinterestedness from his *Critique of Aesthetic Judgment* (Ashby 2004, p.7).

Carl Dahlhaus describes absolute music as music without a "concept, object, and purpose."

## Is all music absolute music?

- "Music has no subject beyond the combinations of notes we hear, for music speaks not only by means of sounds, it speaks nothing but sound."

-Eduard Hanslick, quoted by Wolfgang Sandberger (1996) in the liner notes to the Juilliard String Quartet's album of Janacek and Berg's program music, *Intimate Letters*. Sony Classical SK 66840.

# Abstract hip hop

**Abstract hip hop** is a subgenre of [alternative hip hop](#) that differs from other [hip hop music](#) largely in the content of the [lyrics](#). In stark contrast to [gangsta rap](#), which deals with living in poor urban neighborhoods and real or imagined aspects of gang life, abstract hip hop deals with topics that usually have no association with the hip hop culture. In fact, the lyrics know virtually no boundaries, ranging to the completely abstract (hence the name). Many see it as more of an experiment in the rapping art form than an integral part of the hip hop scene.

One might expect that abstract hip hop, being less associated with a particular subculture, would be more widely accessible to the general public. On the contrary, due to a lack of commercialization, abstract hip hop is largely unknown outside the alternative hip hop scene. However, critics outside the hip hop community often see abstract hip hop as an overwhelmingly positive influence, lacking the perceived misogyny and violence of gangsta rap.

Some abstract hip hop labels well-known in the underground scene are Definitive Jux and Anticon.

# Accompaniment

In [music](#), **accompaniment** is the art of playing along with a soloist or [ensemble](#), often known as the lead, in a supporting manner as well as the music thus played. An **accompaniment figure** is a gesture used repeatedly in an accompaniment, such as:

- Alberti bass and other arpeggios
- ostinati or riffs

[Harmonic](#) accompaniment is music played to accompany a [melody](#) line; it is usually [chordal](#) and played by such instruments as (acoustic or electric) [guitar](#), [piano](#), [organ](#) and [bass guitar](#), but it can also be played by instruments that ordinarily play the melody, such as the [violin](#). In most tonal music the melody and accompaniment are written from and share the same group of pitches, while in much [atonal](#) music the melody and accompaniment are chosen from entirely separate groups of pitches, often from different hexachords.

An **accompanist** is one who plays an accompaniment. A number of [classical](#) pianists have become famous as accompanists rather than soloists; the best known example is probably Gerald Moore, well known as a [Lieder](#) accompanist.

Notated accompaniment may be indicated obbligato (obliged) or ad libitum (at one's pleasure).

**Dialogue accompaniment** is a form of call and response in which the lead and accompaniment alternate, the accompaniment playing during the rests of the lead and providing a drone or silence during the main melody or vocal. (van der Merwe 1989, p.320)

Basso continuo is a form of notation used especially in [Baroque music](#) accompaniment parts.

# Accordion

An **accordion** is a [musical instrument](#) of the handheld bellows-driven [free reed aerophone](#) family, sometimes referred to as [squeezeboxes](#).

The accordion is played by compression and expansion of a bellows, which generates air flow across reeds; a keyboard controls which reeds receive air flow and therefore the tones produced.

## Physical description

Modern accordions consist of a body in two parts, each generally rectangular in shape, separated by a bellows. On each part of the body is a [keyboard](#) containing buttons, levers or [piano](#)-style keys. When pressed, the buttons travel in a direction perpendicular to the motion of the bellows (towards the performer). Most, but not all modern accordions also have buttons capable of producing entire [chords](#).

The related [concertina](#) differs in that its buttons never produce chords and travel parallel to the travel of the bellows (towards the opposite end of the instrument); there are also differences in the internal materials, construction, mechanics, and tone color, but the basic principles of sound production are identical.

# History

The accordion is one of several European inventions of the early 19th century that used free reeds driven by a bellows; notable among them were:

- The Aeoline, by German Bernhard Eschenbach (and his cousin, Caspar Schlimbach), 1810.
  - Was a piano with added aeoline register.
  - Aeoline Harmonika and Pysharmonika are very similar names at that time.
    - Aeoline and Aura were first without bellows or keyboard.
- The Hand Physhamonika Anton Haeckel 1818 Hand type mentioned in music newspaper 1821.
- The [flutina](#), by Pichenot Jeune, ca. 1831
- The [concertina](#), patented in two forms (perhaps independently):
  - Carl Friedrich Uhlig, 1834.
  - Sir Charles Wheatstone, examples built after 1829, but not patented until 1844

An instrument called **accordion** was first patented in 1829 by Cyrill Demian in Vienna (Interestingly, the original patent shows the name "eoline" crossed out and replaced with "accordion" in different handwriting). Demian's instrument bore little resemblance to modern instruments: It only had a left hand keyboard; the right hand simply operated the bellows. One key feature for which Damian sought the patent was the sounding of an entire chord by depressing one key. His instrument also could sound two different chords with the same key: one for each bellows direction (press, draw); this is called a *bisonoric* action.

At that time in Vienna, mouth harmonicas with "Kanzellen" (chambers) had already been available for many years, along with bigger instruments driven by hand bellows. The diatonic key arrangement was also already in use on mouth-blown instruments. Demian's patent thus covered an accompanying instrument: an accordion played with the left hand, opposite to the way that contemporary chromatic hand harmonicas were played, small and light enough to for travellers to take with them and use to accompany singing. The patent also described instruments with both bass and treble sections, although Demian preferred the bass-only instrument owing to its cost and weight advantages.

The musician Adolph Müller described a great variety of instruments in his 1833 "Schule für Accordion". At the time, Vienna and London had a close musical relationship, with musicians often performing in both cities in the same year, so it is possible that Wheatstone was aware of this type of instrument and may have used them to put his key-arrangement ideas into practice.

Jeune's flutina resembles Wheatstone's concertina in internal construction and tone color, but it appears to complement Demian's accordion functionally. The flutina is a one-sided bisonoric melody-only instrument whose keys are operated with the right hand while the bellows is operated with the left. When the two instruments are combined, the result is quite similar to diatonic button accordions still manufactured today.

Further innovations followed and continue to the present: Various keyboard systems have been developed; voicings (the combination of multiple tones at different octaves) have been developed, with mechanisms to switch between different voices during performance; different methods of internal construction to improve tone, stability and durability, and so on.

The instrument was popularized in the United States by Count Guido Deiro who was the first piano accordionist to perform in Vaudeville. Accordion is the main instrument in the musette style of ballroom music in France (a style now largely out of fashion) and in the

1950s [chanson](#) singing, which has a revival in the form of neo-realism. Today, the accordion is largely used in the Southern Brazil (state of Rio Grande do Sul) by the traditional music groups. They play [Polkas](#), Chamamés, [Milongas](#), [Tangos](#), Chacareras and other 3/4 compasses. The main kind of accordion used in this region, is the 120 basses. But they also use the 4, 8 basses and the bandoneon. Main accordion players from Rio Grande do Sul: Luciano Maia, Arthur De Faria, Leonel Gomez, Edilberto Bérghamo, Renato Borgetti, and others.

## Button accordions

On **button accordions** the [melody](#)-side [keyboard](#) consists of a series of buttons (rather than [piano](#)-style keys.) There exists a wide variation in keyboard systems, tuning, action and construction of these instruments.

**Diatonic button accordions** have a [melody](#)-side keyboard that is limited to the notes of [diatonic scales](#) in a small number of [keys](#) (sometimes only one). The [bass](#) side usually contains the principal [chords](#) of the instrument's key and the root notes of those chords.

Almost all diatonic button accordions (e.g.: melodeon) are bisonoric, meaning each button produces two notes: one when the bellows is compressed, another while it is expanded; a few instruments (e.g.: garmon') are unisonoric, with each button producing the same note regardless of bellows direction; still others have a combination of the two types of action: *See Hybrids below.*

A **chromatic button accordion** is a type of button accordion where the melody-side keyboard consists of uniform rows of buttons arranged so that the pitch increases [chromatically](#) along diagonals. The bass-side keyboard is usually the Stradella system, one of the various free-bass systems, or a converter system. Included among chromatic button accordions is the Russian bayan. Sometimes an instrument of this class is simply called a **chromatic accordion**, although other types, including the piano accordion, are fully chromatic as well. There can be 3 to 5 rows of treble buttons. In a 5 row chromatic, two additional rows repeat the first 2 rows to facilitate options in fingering. Chromatic button accordions are preferred by many [classical music](#) performers, since the treble keyboard with diagonally arranged buttons allows a greater range than a piano keyboard configuration.

Various cultures have made their own versions of the accordion, adapted to suit their own music. Russia alone has several, including the bayan, Garmon, Livenka, and Saratovskaya Garmonika.

Various **hybrids** have been created between instruments of different keyboards and actions. Many remain curiosities, only a few have remained in use. Some notable examples are:

- The Schrammel accordion, used in Viennese chamber music and Klezmer, which has the treble keyboard of a chromatic button accordion and a bisonoric bass keyboard, similar to an expanded diatonic button accordion.
- The schwyzerörgeli or Swiss organ, which has a (usually) 3-row diatonic treble and 18 unisonoric bass buttons in a bass/chord arrangement (actually a subset of the Stradella system), that travel parallel to the bellows motion.
- The trikitixa of the Basque people has a 2-row diatonic, bisonoric treble and a 12-button diatonic unisonoric bass.
- In Scotland, the favoured diatonic accordion is, paradoxically, the instrument known as the British Chromatic Accordion. While the right hand is bisonoric, the left hand follows the Stradella system. The elite form of this instrument is generally considered to be the German manufactured "Shand Morino", produced by Hohner with the input of the late Sir Jimmy Shand.

## Stradella bass system

The **Stradella Bass System** uses rows of buttons arranged in a circle of fifths; this places the principal major chords of a key in three adjacent rows. Each row contains, in order: A major third (the "counter-bass" note), the root note, the major chord, the minor chord, the seventh chord, and the diminished seventh chord.

Depending on the price, size or origin of the instrument, some rows may be missing completely or in different positions. In most Russian layouts the diminished seventh chord row is moved by one button, so that the C diminished seventh chord is where the F diminished seventh chord would be in a standard Stradella layout; this is done in order to achieve a better reachability with the forefinger.

Common configurations are:

- "12 Bass" goes from Bb; to A (the third to eighth column in the picture above), and only has root note and major chords.
- "24 Bass" goes from Eb; to E, and has root note, major and minor chords
- "32 Bass" goes from Eb; to E, and has root note, major, minor and seventh chords
- "40 Bass" goes from Eb; to E, and has root note, "counter-bass" note, major, minor and seventh chords
- "48 Bass" goes from Eb; to E, and has all six rows
- "60 Bass" goes from Db; to F#;, and has root note, "counter-bass" note, major, minor and seventh chords
- "72 Bass" goes from Db; to F#;, and has all six rows
- "80 Bass" goes from Cb; to G#;, and has root note, "counter-bass" note, major, minor and seventh chords
- "96 Bass" goes from Cb; to G#;, and has all six rows
- "120 Bass" goes from Bbb; (i.e. low G) to A#; — that's 20 columns — with all six rows.

## Free bass systems

There are various free bass systems in use; most consist of a rotated version or mirror image of one of the melody layouts used in chromatic button accordions. One notable exception is the Titano line of converter bass, which repeats the first two bass rows of the Stradella system one and two octaves higher moving outward from the bellows.

Skillful use of the free bass system enabled the performance of classical piano music, rather than music arranged specifically for the accordion's standard chorded capability. Beginning in the 1960s, competitive performance on the accordion of classical piano compositions, by the great masters of music, occurred. Although never mainstreamed in the larger musical scene, this convergence with traditional classical music propelled young accordionists to an ultimate involvement with classical music heretofore not experienced.

Many modern and avant-garde composers (such as Sofia Gubaidulina, Luciano Berio, and Magnus Lindberg,) have written for the free bass accordion and the instrument is becoming more frequently integrated into new music chamber and improvisation groups.

## Related instruments

# Acid Brass

**Acid Brass** is the name given to a pioneering style of music inspired by Turner-Prize-winning artist Jeremy Deller. As the title suggests, it is a fusion of Brass and Acid, mixing the traditional brass sound with Acid's [minimalistic](#), pounding rhythms.

Acid Brass began in 1997 as a collaboration between Deller and the Stockport-based Fairey Brass Band. Deller saw a connection between the two apparently disparate genres, viewing them as "two authentic forms of folk art rooted in specific communities". The music has since been taken all over the world, and will be performed by the Fairey Band before a London crowd of 25000 in July 2005.

## Albums

The original **Acid Brass** album of 1997 was released on the Blast First label and featured versions of dance classics such as A Guy Called Gerald's "Voodoo Ray", Rhythim Is Rhythim's "Strings Of Life" and 808 State's "Pacific 202". The original studio album was recorded at the BBC North's sound studios on Oxford Road in Manchester, whilst a live version was recorded on 1st March 1997 at the Liverpool Institute of Performing Arts.

Categories: [Music genres](#)

## Acid house

**Acid house** is a variant of [house music](#) characterized by the use of simple tone generators with tempo-controlled resonant filters. It began in the mid-1980s, when producers of house music discovered that they could create interesting sounds with the Roland TB-303 analogue bass synthesizer by tweaking the resonance and frequency cut-off dials as they played. Acid house music became a central part of the early [rave](#) scene in the U.K., and the yellow smiley became its emblem.

# Etymology

There are conflicting accounts about how the term "acid" came to describe this new style of house music. The explanations that have surfaced include the following:

- *It is a celebratory reference to LSD* — some feel that early producers of the new style of house music, as well as people at [nightclubs](#) where the music was played, enjoyed the drug and its interaction with the music. No citations are available to confirm or deny this explanation. Genesis P-Orridge, principal member of the experimental music collective Psychic TV, is believed by some to be a primary source of this claim. P-Orridge made various claims of responsibility for inventing the term and the style of music, but at least one former member of Psychic TV disputes all of the claims, and in an interview in the 1999 documentary *Better Living Through Circuitry*, P-Orridge admitted that it was a clerk in a Chicago record shop who used the word "acid" to describe the most experimental, bizarre house records that were on hand and that P-Orridge asked to be shown. In the interview, P-Orridge reported having an epiphany, while listening to those records, that the music was not very psychedelic, except by virtue of its tempo. Afterward, the music and imagery of Psychic TV records was very deliberately influenced by the acid house style and was quite celebratory of LSD in particular. P-Orridge later claimed to have been the first to introduce psychedelic elements to the music.
- *It is a celebratory reference to psychedelic drugs in general* — some feel that Ecstasy (MDMA) was more popular and prevalent than LSD among musicians and nightclub patrons in the mid-1980s. No citations are available to confirm or deny this explanation. There are many citations of Ecstasy being prevalent in post-Chicago U.S. nightclub and UK rave party scenes of the late 1980s, but acid house had already been named by then.
- *It was used in Chicago, at the time, to describe the squelchy sounds of the TB-303 bass synthesizer* — some consider these sounds to be harsh and caustic, like acid, and/or they associate the sounds with "bubbling acid" sound effects and imagery as might be used in cinematic depictions of laboratories. While it is true that the term was applied in the 1990s and beyond to music that used the TB-303 in a similar way to the way the device was used in acid house, no citations are available to confirm or deny this explanation as being relevant to the advent of acid house itself.
- *It was used in Chicago, at the time, to describe house music in the style of "Ron Hardy's Acid Track"*. — Before Phuture's "Acid Tracks" was given a title for commercial release, it was played at a nightclub by DJ Ron Hardy and was called "Ron Hardy's Acid Track" by some, because it was so "hot" (immediately popular) that it "burned the dance floor like acid". Phuture's title followed, and the term Acid House came into common parlance to describe house music with similar affectations, without regard to possible drug influence. No citations are available to confirm or deny this explanation.
- *It was used in Chicago, at the time, to describe house music that contained many samples of other recordings* — the use of such samples was considered unscrupulous by some, so it is believed by some that the term "acid" or "acid burning" was merely meant to have a harsh, unpleasant connotation. This explanation, sometimes including aspects of the others, has been widely repeated in the press and even in the British House of Commons. However, there are at least two reasons why it may not be true: 1. Early house music producers did borrow sounds from each other's recordings, but the majority of acid house music tended to consist of fully original compositions. 2. In

1991, U.K. Libertarian advocate Paul Staines wrote, "*I made up this explanation at a press conference held to launch the Freedom to Party Campaign at the Conservative Party conference in October 1989. I was attempting to desperately play down the drug aspect in a forlorn attempt to discourage anti-party legislation, reasoning that the British public might accept massive noisy parties, but thousands of teenagers on drugs were definitely not acceptable. This, incidentally, is the most successful lie I have ever told. Japanese music journalists have solemnly repeated it to me in the course of interviews and from MTV to ITN it has been broadcast as a fact. Only once was I caught out, when at a seminar held at the DMC World Disc Jockey Mixing Championships, a DJ from Chicago stood up and told the 1,000 or so people in the hall that I was talkin' a complete load of fuckin' bullshit—which I was.*" However, some feel that Staines, like Genesis P-Orridge, is not a reliable source of information.

Regardless of its actual origins, once the term *acid house* was coined and began to appear alongside these varying explanations, many participants at acid house themed events made the psychedelic drug connotations a reality. This coincided with an increasing level of scrutiny and sensationalism in the mainstream press, although conflicting accounts about the degree of connection between acid house music and drugs continued to surface.

## Notable acid house artists

808 State - British outfit from Manchester, formed in 1989. Their first album, Newbuild, was acid house, and occasional acid house influences appear in later tracks.

Adonis - For We're Rockin Down The House.

A Guy Called Gerald - For the single "Voodoo Ray".

Aphex Twin - For his early acid house, with new acid house Analord series in 2005 drawing on the same methodology as early acid house.

The KLF - Pioneers of the "stadium house" sound, which mixes acid house with hip-hop, pop, and stadium rock/chant influences.

Leftfield

Phuture - Chicago-based group of acid house pioneers, formed in 1985 and best known for their classic 1987 single "Acid Tracks", which defined the genre and was its first "track".

Psychic TV - Led by Throbbing Gristle member Genesis P-Orridge, for albums such as Jack The Tab (1988). The term "acid house" appeared on the cover of their 1988 single "Superman".

The Shamen - Psychedelic techno act formed in Aberdeen, Scotland in 1986. One of the first groups to bring acid house and techno into the pop mainstream.

Luke Vibert - Modern acid house using computer emulation in Reason software

# Acid jazz

**Acid jazz** (also known as **groove jazz** or more recently **club jazz**) is a [musical genre](#) that combines [jazz](#) influences with elements of [soul music](#), [funk](#), [disco](#) and also 90s English dance music, particularly repetitive beats and modal harmony. It developed over the 1980s and 1990s and could be seen as taking the boundary crossing of [jazz fusion](#) onto new ground.

One of the aims of acid jazz is to return jazz to its roots in dancing halls; therefore, it incorporates "catchy", "groovy" sounds.

## Origins

The early origins of the genre relate to a 1970s funk revival movement initiated in the discos of England in the mid-1980s. This revival movement was called Northern Soul. In this movement, [DJs](#) competed against each other to find the rarest grooves--mainly from forgotten 70s soul and funk.

There are various legends running of how the name *Acid Jazz* was created. Gilles Peterson is normally credited for having invented the "acid jazz" name, when a fellow DJ showed Peterson a new [Acid House](#) record that had just been released. When he showed the record to Gilles Peterson, he replied, "if that is Acid House, then this is Acid Jazz".

## **Acid jazz in the international context**

In the United States notable acid-jazz groups have included Groove Collective and Solsonics; although during the 1990s the major contributions from the US related to jazz dance were predominantly in jazz-house (from labels such as 8 Ball Records) and jazz-rap, particularly by artists such as A Tribe Called Quest, Blacksheep, De la Soul, and the Jungle Brothers. From Japan, notable artists included United Future Organization who released 'I Love my Baby: My Baby Loves Jazz' as well as a cover of Grady Tate's 'Moondance'; another prominent artist from Japan was the female vocalist, Monday Michiru. From the UK, Repercussions who had a top hit, Promise me nothing. Other more recent artists and groups who have produced music in this genre include Mother Earth, Mr. Scruff, Visit Venus, Praful, and Down to the Bone.

# Acid rap

**Acid rap** is a [subgenre](#) of [hip hop music](#) pioneered by Detroit rapper Esham Attica Smith, also known as Esham the Unholy and referred to as "The Godfather" of Acid Rap. The style of music is best described as a cross between [hardcore gangsta rap](#) and violent horror films and has been at times mislabeled as Horrorcore. It also features heavy use of samples from rock artists' leading to an influence on [nu metal](#) or rap metal and [rapcore](#).

Other well known Detroit artists, such as Eminem, D12 and Insane Clown Posse also cross over into this genre. Kid Rock was influenced by the mixture of rap and hard rock used by Esham the Unholy. Esham the Unholy also formed a band called NATAS (Nation Ahead of Time and Space).

# Acid rock

**Acid rock** is a form of [psychedelic music](#) and was the first form of it to achieve popular acclaim. The term *acid rock* was much used in its heyday, but has fallen into disuse except for putting this music into its historical perspective.

The term refers to a type of music meant to be experienced in conjunction with lysergic diethylamide, or LSD, commonly called "acid". Characterized by an off-beat style and sometimes strange sound/musical effects, acid rock often settles into a hypnotic groove wherein a listener (and possibly even the band) can "get lost" within a song. For example, the Grateful Dead would perform while on acid, and once they started improvising within a song (or "[jamming](#)"), the song could conceivably go on forever. One song, "Dark Star", largely improvised, would sometimes last 5 minutes, but other times it went on for nearly an hour.

Notable examples of acid rock tracks and singles include:

- White Rabbit (Jefferson Airplane, 1967).
- When the Music's Over (The Doors, 1967).
- The End (The Doors, 1967)
- Hole In My Shoe (Traffic, 1967).
- See Emily Play (Pink Floyd, 1967).
- Interstellar Overdrive (Pink Floyd, 1967).
- Arnold Layne (Pink Floyd, 1967)
- Strawberry Fields Forever (The Beatles, 1967).
- Lucy in the Sky with Diamonds (The Beatles), 1967).
- In-A-Gadda-Da-Vida (Iron Butterfly, 1968).
- Dark Star (Grateful Dead), 1968).
- Summertime Blues (Blue Cheer), 1968).
- Incense and Peppermints (Strawberry Alarm Clock, 1967).
- Space Oddity (David Bowie, 1969).

# Acid techno

**Acid techno** is the term used to describe a style of [techno](#) that originated in the London squat party scene in the mid 1990s. It is characterised by heavy use of the Roland TB-303 for bass and lead sounds, a less repetitive sound than many other forms of techno (early influences included the German [acid trance](#) scene) and an irreverent, often-political attitude seen in the titles and samples used in many of its tracks; many of the scene's originators had originally been part of the [punk](#) scene. Early labels included Stay Up Forever, Smitten and Routemaster.

While acid techno originated mainly in the London scene, it soon spread across the UK and then internationally and is today popular in many countries. Propellerhead Software developed the RB-338 ReBirth softsynth (with twin TB-303 panels and two drum machines) to emulate the unique sound of hardware which is no longer in production. However despite this it still continues to be mainly a fairly underground form of music with little commercial impact, and is often seen to be synonymous with the Squat party scene.

Over the last few years acid techno has evolved away from a predominantly 303-based sound into a much broader sub-genre of techno that still retains its dancefloor-friendly ethos, 'London' sound and lack of pretention. Newer labels such as Hydraulix, Cluster, 4x4 Records, RAW and Powertools reflect this newer sound.

The majority of acid techno producers are DJs as well. Some of the more notable London-based producers are all part of the Stay Up Forever Collective:

- The Liberator DJs (Chris, Aaron and Julian)
- DAVE The Drummer (Henry Cullen)
- Lawrie Immersion
- Geezer (Guy McAffer)
- Rowland The Bastard
- Ant

# Acid trance

A style of [trance music](#) utilising the acid sound. The trademark sound of "acid" is produced with a Roland TB-303 by playing a sequenced melody while altering the instrument's filter cutoff frequency, resonance, envelope modulation, and accent controls. This real-time tone adjustment was not part of the instrument's original intended operation.

A descendant of [acid house](#), since the genre of trance had not yet been invented during the advent of acid house (or acidhouse).

# Acousmatic music

**Acousmatic music** is a specialised sub-set of [electroacoustic music](#). It is created using non-acoustic technology, exists only in recorded form in a fixed medium, and is composed specifically to be heard over loudspeakers. The musical material is not restricted to the sounds of [musical instruments](#) or voices, nor to elements traditionally thought of as 'musical' ([melody](#), [harmony](#), metrical [rhythms](#), and so on), but rather admits any sound, acoustic or synthetic, and any way of combining or juxtaposing sounds, as potentially musical.

The term *acousmatic* to describe this kind of music was first used in 1974 by the French composer François Bayle. It derives from the akusmatikoi, the outer circle of Pythagoras' disciples who only heard their teacher speaking from behind a veil. In a similar way, one hears acousmatic music from behind the 'veil' of loudspeakers, without seeing the source of the sound.

Acousmatic composers use this invisibility of sound sources as a positive aspect of the creative process, in one of two ways. The first is to separate the listener from the visual and physical context of the sounds being used, in order to permit a more concentrated and abstract form of listening unencumbered by the real-world associations or 'meaning' of the sounds. This form of listening is known as reduced listening (a term coined by the acousmatic music pioneer Pierre Schaeffer), and it allows both acoustic and synthetic sounds to be used to create an abstract musical discourse the focus of which is the detail of individual sounds, and the evolution and interaction of these sounds. The second approach is to deliberately evoke real-world associations by using identifiable sounds (real world objects, voices, environments) to create mental images in sound.

Although these two contrasting approaches are in some ways diametrically opposed, they may nevertheless be combined in order to exploit the tension that exists between them.

# Acoustic guitar

An **acoustic guitar** is a modern form of [guitar](#) descended from the [Classical guitar](#), but generally strung with steel strings for a brighter, louder sound. Much heavier construction is required to withstand the added tension. Sometimes the term **steel-stringed guitar** or **folk guitar** is used to differentiate from the classical guitar. The term "acoustic guitar" is a retronym, since before the invention of the [electric](#) instrument, "guitar" meant only the non-amplified variety.

There are many different variations on the construction of and materials used in acoustic guitars. More expensive guitars feature solid wood tops (often spruce), sides and backs (often Indian rosewood, maple, or mahogany). Lower-priced guitars can combine solid tops with laminated backs and/or sides. Entry-level guitars are usually made entirely of laminated wood. Necks are generally made of mahogany (either Philippine or Honduras), and fingerboards are usually made of dense tropical hardwoods such as rosewood or ebony. The various combinations of the different woods and their quality, along with design and construction elements (for example, how the top is braced) are among the factors affecting the [timbre](#) or "tone" of the guitar. Due to decreasing availability and rising prices of the premium-quality woods, many manufacturers have begun experimenting with alternate species of woods or more commonly available variations on the standard species. For example, some makers have begun producing models with redcedar or mahogany tops. Some have also begun using non-wood materials, such as plastic or graphite. Most luthiers and experienced players agree that a solid top is the most important factor in the tone of the guitar, and that solid backs and sides can also contribute to a pleasant sound, although laminated sides and backs are acceptable alternatives. Some [jazz](#) players prefer laminated backs and sides (please see [Guitar](#) for more details on the construction of acoustic guitars).

Another style of acoustic guitar is the archtop guitar. This is most commonly used by swing and jazz players, and often incorporates electronics in the form of a pickup.

There are several prominent American makers of acoustic guitars. Martin, Guild, Taylor, and Gibson are known for both the quality and price of their instruments. The Selmer-Maccaferri Guitar is an unusual looking guitar played by Django Reinhardt style musicians, distinctive by its "D" hole or longitudinal oval soundhole.

The standard tuning for an acoustic guitar is EADGBE (low to high), although many players, particularly fingerpickers, use alternate tunings, such as "Open G" (DGDGBD), "open D tuning" (DADF#AD), or "Drop D" (DADGBE).

One variation on the standard acoustic guitar is the 12 string guitar, which sports an additional doubling string for each of the traditional six strings. This guitar was made famous by artists such as Huddie Leadbetter (a.k.a. Leadbelly), Pete Seeger, and Leo Kottke.

Throughout the 20th century the predominant forms of music played on the most common type of acoustic guitar (the flattop steel-string guitar) remained relatively stable and included acoustic [blues](#), [country](#), [bluegrass](#), [folk](#), and several genres of [rock](#). In the last decade or two more intricate fingerstyle guitar music, rooted in [classical music](#), [Celtic music](#), and American styles and characterized by musicians such as **Al Petteway**, **Alex de Grassi**, and Pierre Bensusan, has become popular enough that several luthiers have been experimenting with redesigning the acoustic guitar. These flat top steel-string guitars are constructed and voiced more for classical-like fingerpicking and less for chordal accompaniment. Luthiers such as **Kevin Ryan**, **Stefan Sobell**, and **George Lowden** have increasingly focused their attention on the needs of fingerstylists and have developed unique guitars for this style of playing.

# Aerophone

An **aerophone** is any [musical instrument](#) which produces sound primarily by causing a body of air to vibrate, without the use of strings or membranes, and without the vibration of the instrument itself adding considerably to the sound. It is one of the four main classes (class 4) of instruments in the original [Hornbostel-Sachs](#) scheme of [musical instrument classification](#).

Hornbostel-Sachs divides aerophones by whether vibrating air is contained in the instrument itself or not.

The first class (**41**) includes instruments where the vibrating air is *not* contained by the instrument itself, such as the bullroarer. Such instruments are called *free aerophones*. This class includes [free reed](#) instruments, such as the [harmonica](#), but also many instruments unlikely to be called wind instruments at all by most people, such as [sirens](#) and whips.

The second class (**42**) includes instruments where the vibrating air *is* contained by the instrument. This class includes almost all the instruments generally called [wind instruments](#) in the west, such as the [flute](#), the [oboe](#) and the [trumpet](#).

Additionally, very loud sounds can be made by explosions directed into, or being detonated inside of resonant cavities. Instruments such as the calliope (and steam whistle), as well as the pyrophone might thus be considered as class 42 instruments, despite the fact that the "wind" or "air" may be steam or an air-fuel mixture.

# Aesthetics of music

The **aesthetics of music** or **musical aesthetics** is the quality and study of the beauty and enjoyment (plaisir and jouissance), the aesthetics, of [music](#).

[Music](#) has the ability to affect our emotions, intellect, and our psychology; [lyrics](#) can assuage our loneliness or incite our passions. As such, music is a powerful art form whose aesthetic appeal is highly dependent upon the culture in which it is practiced.

Some of the aesthetic elements expressed in music include [lyricism](#), [harmony](#), hypnotism, emotiveness, temporal dynamics, resonance, playfulness, and colour (see musical development).

# History

In the eighteenth century, music was considered to be so far outside the realm of aesthetic theory (then conceived of in visual terms) that music was barely mentioned in William Hogarth's treatise, *The Analysis of Beauty*. He considered [dance](#) beautiful (closing the treatise with a discussion of the minuet), but treated of music only insofar as it could provide the proper accompaniment for the dancers.

In the nineteenth century, in the midst of the great revolution in taste known as [romanticism](#), there arose the view that music should and could express ideas, images, even a whole plot. In 1832, for example, Robert Schumann wrote to his brothers that his piano work *Papillons* was "intended as a musical representation" of the final scene of a novel by Jean Paul, *Flegeljahre*.

By the end of that century, psychologist William James gave the auditory and optical sensations equal billing in his discussion of aesthetics. But he also took a detached view of the classical/romanticist disputes.

"Complex suggestiveness, the awakening of vistas of memory and association, and the stirring of our flesh with picturesque mystery and gloom, make a work of art romantic," he wrote. "The classic taste brands these effects as coarse and tawdry, and prefers the naked beauty of the optical and auditory sensations, unadorned with frippery or foliage."

A group of [modernist](#) writers in the early twentieth century (Walter Pater, Ezra Pound) believed that music was essentially pure for a reason that seems contrary to Schumann's assertion: it was pure because it didn't represent, i.e. it didn't make reference to anything beyond itself. In a sense, they wanted to bring poetry closer to this characteristic of music. (Bucknell 2002)

Although there have always been dissenters from this view, notably Albert Schweitzer, who argued against the alleged 'purity' of music in a classic work on Bach, it still maintains a hold on some.

Theodor Adorno suggested that culture industries churn out a debased mass of unsophisticated, sentimental products which have replaced the more 'difficult' and critical art forms which might lead people to actually question social life. False needs are cultivated in people by the culture industries. These are needs which can be both created and satisfied by the capitalist system, and which replace people's 'true' needs - freedom, full expression of human potential and creativity, genuine creative happiness. Thus, those who are trapped in the false notions of beauty according to a capitalist mode of thinking, are only capable of hearing beauty in dishonest terms.

In 2003, the philosopher Dewitt Parker restated the purity theory of modernism, writing that music "moves wholly in a world of its own, a world of pure feeling, with no embodiment save only sound. It may express terror, but not terror over this or that; joy, but whether the joy that comes from sight of the morning or of the beloved, it cannot tell." Yet, Dewitt Parker is writing somewhat against the idea that music expresses nothing of its own.

Recent remarks by American composer John Kenneth Graham reflect the traditional view concerning beauty and what will remain for posterity. He writes, "So long as there is meaning in the lives of those who enjoy order in sound, there will remain a symbolic language of the emotions, accessible to all who live in the present day. While it has been the task of many modernists to work to destroy that common language so as to bolster their own notions of beauty in music, that has not diminished the common man's ability to distinguish that "which he likes." It is precisely the sterile and banal nature of modern musical technique which assures its ultimate demise - in other words, its failing ability to communicate."

## Bad music

Simon Frith (2004, p.17-9) argues that, "'bad music' is a necessary concept for musical pleasure, for musical aesthetics." He distinguishes two common kinds of bad music; the *Worst Records Ever Made* type, which include:

- "Tracks which are clearly incompetent musically; made by singers who can't sing, players who can't play, producers who can't produce,"
- "Tracks involving genre confusion. The most common examples are actors or TV stars recording in the latest style,"

and "rock critical lists," which include:

- "Tracks that feature sound gimmicks that have outlived their charm or novelty,"
- "Tracks that depend on false sentiment (...), that feature an excess of feeling molded into a radio-friendly pop song."

He later gives three common qualities attributed to bad music: inauthentic, [in] bad taste (see also: kitsch), and stupid. He argues that "The marking off of some tracks and genres and artists as 'bad' is a necessary part of popular music pleasure; it is a way we establish our place in various music worlds. And 'bad' is a key word here because it suggests that aesthetic and ethical judgements are tied together here: not to like a record is not *just* a matter of taste; it is also a matter of argument, and argument that matters." (p.28)

## African American music

**African American music** (also called **black music**, formerly known as **race music**) is an umbrella term given to a range of musical genres emerging from or influenced by the culture of African Americans, who have long constituted a large ethnic minority of the population of the United States. They were originally brought to North America to work as slaves in cotton plantations, bringing with them typically polyphonic [songs](#) from hundreds of ethnic groups across West and Sub-Saharan Africa. In the United States, multiple cultural traditions merged with influences from [polka](#), [waltzes](#) and other European music. Later periods saw considerable innovation and change, and in the 21st century, African American genres have become some of the most dominant in mainstream popular music.

## 19th century

The influence of African Americans on mainstream American music began in the 19th century, with the advent of blackface minstrelsy. The [banjo](#) became a popular instrument, and African-derived rhythms were incorporated into popular songs by Stephen Foster and other songwriters. In the 1830s, the Great Awakening led to a rise in Christian fundamentalism, especially among African Americans. Drawing on traditional work songs, African American slaves originated began performing a wide variety of Spirituals and other Christian music. Many of these songs were coded messages of subversion against slaveholders, or which signalled escape.

During the period after the Civil War, the spread of African American music continued. The Fisk University Jubilee Singers toured first in 1871. In the following years, the Hampton Students and professional jubilee troupes formed and toured. The first black musical-comedy troupe, Hyers Sisters Comic Opera Co, was organized in 1876. (Southern 221)

By the end of the 19th century, African American music was an integral part of mainstream American culture. [Ragtime](#) performers like Scott Joplin became popular and some soon became associated with the Harlem Renaissance and early civil rights activists.

## Early 20th century

The early part of the 20th century saw a constant rise in popularity of African American [blues](#) and [jazz](#). As well as the developments in the fields of visual arts, the Harlem Renaissance of the early 20th century lead to developments in music .

White and Latino performers of both genres existed, and there had always been cross-cultural communication between the United States' races. Jewish klezmer music, for example, was a noted influence on jazz, while Jelly Roll Morton famously explained that a "Latin tinge" was a necessary component of good music. African American music was often sanitized for white audiences, who would not have as readily accepted black performers, leading to genres like [swing music](#), a pop-based outgrowth of jazz.

On the stage, the first musicals written and produced by African Americans to appear on Broadway debuted in 1898 with *A Trip to Coontown* by Bob Cole and Billy Johnson. In 1901, the first known recorded of black musicians was that of Bert Williams and George Walker; this set featured music from Broadway musicals. The first black opera was performed in 1911 with Scott Joplin's *Treemonisha*. The following year, the first in a series of annual black symphony orchestra concerts were performed at Carnegie Hall. (Southern 221, 222)

The return of the black musical to Broadway occurred in 1921 with Sissle and Blake's *Shuffle Along*. In 1927, a concert survey of black music was performed at Carnegie Hall including jazz, spirituals and the symphonic music of W.C. Handy's Orchestra and Jubilee singers. The first major film musical with a black cast was King Vidor's *Hallelujah* of 1929. The first Symphony by a black composer to be performed by a major orchestra was William Grant Still's *Afro-American Symphony* with the New York Philharmonic. African American performers were featured in operas such as *Porgy and Bess* and Virgil Thompson's *Four Saints in Three Acts* of 1934. Also in 1934 William Dawson's *Negro Folk Symphony* became the second African American composer's work to receive attention by a major orchestra with its performance by the Philadelphia Orchestra. (Southern 361)

## Mid 20th century

By the 1940s, [cover versions](#) of African American songs were commonplace, and frequently topped the charts, while the original musicians found little success. Popular African American music at the time was a developing genre called [rock 'n' roll](#), whose exponents included Little Richard and Jackie Brenston. The following decade saw the first major crossover acts, with Bill Haley and Elvis Presley performing [rockabilly](#), a rock and country fusion, while black artists like Chuck Berry and Bo Diddley received unprecedented mainstream success. Presley went on to become perhaps the first watershed figure in American music; his career, while never extremely innovative, marked the beginning of the acceptance of musical tastes crossing racial boundaries among all audiences. He was also the first in a long line of white performers to achieve what some perceive as undue fame for his influence, since many of his fans showed no desire to learn about the pioneers he learned from. The 50s also saw doo wop become popular.

The late 1950s also saw vastly increased popularity of hard [blues](#) from the earliest part of the century, both in the United States and United Kingdom. A secularized form of American [gospel music](#) called [soul](#) also developed, with pioneers like Ben E. King and Sam Cooke leading the wave. Soul and R&B became a major influence on [surf](#), as well as the chart-topping [girl groups](#) like The Angels and The Shangrilas, only some of whom were white. Black divas like Diana Ross & the Supremes and Aretha Franklin became 60s crossover stars. In the UK, British blues became a gradually mainstream phenomenon, returning to the United States in the form of the British Invasion, a group of bands led by The Beatles who performed classic-style R&B, blues and pop with both traditional and modernized aspects.

The British Invasion knocked most other bands off the charts, with only a handful of groups, like The Mamas & the Papas, maintaining a pop career. Soul music, in two major highly-evolved forms, remained popular among blacks. [Funk](#), usually said to have been invented by James Brown, incorporated influences from psychedelia and early [heavy metal](#). Just as popular among blacks and with more crossover appeal, album-oriented soul revolutionized African American music with intelligent and philosophical lyrics, often with a socially aware tone. Marvin Gaye's What's Going On is perhaps the best-remembered of this field.

## The 1970s and 1980s

The 1970s saw a general decline in the popularity of black bands. Album-oriented soul continued its popularity, while musicians like Smokey Robinson helped turn it into Quiet Storm music. Funk evolved into two strands, one a pop and soul fusion pioneered by Sly & the Family Stone, and the other a more experimental psychedelic and metal fusion led by George Clinton and his [P-Funk](#) ensemble.

Black musicians achieved generally little mainstream success, though African Americans had been instrumental in the invention of [disco](#), and some artists, like Gloria Gaynor and Kool & the Gang, found crossover audiences. White listeners preferred [country rock](#) bands, singer-songwriters and, in some subcultures, [heavy metal](#) and [punk rock](#).

The 1970s also saw, however, the invention of [hip hop music](#). Jamaican immigrants like DJ Kool Herc and spoken word poets like Gil Scott-Heron are often cited as the major innovators in early hip hop. Beginning at block parties in Harlem, hip hop music arose as one facet of a large subculture with rebellious and progressive elements. At block parties, [DJs](#) spun records, most typically funk, while MCs introduced tracks to the dancing audience. Over time, DJs began isolating and repeating the percussion breaks, producing a constant, eminently dance-able beats, which the MCs began improvising more complex introductions and, eventually, lyrics.

In the 1980s, black pop artists included Michael Jackson, Lionel Richie, Whitney Houston, and Prince, who sang a type of pop dance-soul that fed into [New Jack Swing](#) by the end of the decade. These artists are the most successful of the era. Hip hop spread across the country and diversified. [Miami bass](#), Chicago [hip house](#), Los Angeles [hardcore](#) and DC go go developed during this period, with only Miami bass achieving mainstream success.

At the very end of the decade, however, two groups crossed over to white audiences. Public Enemy's politically revolutionary lyrics found more controversy than hip hop had previously seen, while N.W.A. simultaneously placed [West Coast hip hop](#) at the top of the genre's charts and popularized [gangsta rap](#).

## The 1990s and 2000s

The end of the 20th century and the dawn of the new millennium brought us some of the most controversial African American music. Hip Hop and R&B are the most popular genre of music by African Americans in this time.

Contemporary [R&B](#), as the post-disco version of soul music came to be known as, remained popular throughout the 1980s and 1990s. Male vocal groups in the style of soul groups such as The Temptations and The O'Jays were particularly popular, including New Edition, Boyz II Men, Jodeci, Blackstreet, and, later, Dru Hill and Jagged Edge. Girl groups, including TLC, Destiny's Child, and En Vogue, were also highly successful. Destiny's Child would go on to be the highest selling female vocal group of all time.

Singer-songwriters such as R. Kelly, Montell Jordan, D'Angelo, and Raphael Saadiq of Tony! Toni! Toné! were also significantly popular during the 1990s, and artists such as Mary J. Blige and BLACKstreet popularized a fusion blend known as [hip-hop soul](#). D'Angelo's Marvin Gaye/Stevie Wonder-inspired sound would lead to the development of [neo soul](#), popularized in the late 1990s/early 2000s by artists such as Lauryn Hill, Erykah Badu, India.Arie, and Musiq.

By the 2000s, R&B had shifted towards an emphasis on solo artists, including Usher and Alicia Keys, although groups such as B2K and Destiny's Child continued to have success. The line between hip-hop and R&B became significantly blurred by producers such as Timbaland and Lil Jon, and artists such as Lauryn Hill, Nelly, and Andre 3000, who, with partner Big Boi, helped popularize Southern hip hop music as OutKast.

"Urban music" and "urban radio" are race-neutral terms which are synonymous with hip hop and R&B and the associated hip hop culture which originated in New York City. The term also reflects the fact that they are popular in urban areas, both within black population centers and among the general population (especially younger audiences).

In February 2004, plans were announced for a Smithsonian affiliated Museum of African-American music to be built in Newark, New Jersey. Groundbreaking is planned for 2006.

## African hip hop

[Hip hop music](#) has been popular in **Africa** since the early 1980s due to widespread American influence. The first hip hop group from Africa was Black Noise, a group from Cape Town, South Africa. They began as a graffiti and breakdance crew until they started emceeing around 1989. The government of South Africa's apartheid era tried to ban rap due to its part in the struggle for the freedom of all races. Later the government made hip hop legal in 1993 by playing rap music on radio and rap videos on T.V.

In 1985 hip hop reached Senegal, a French-speaking country in West Africa. Some of the first Senegalese rappers were M.C. Lida, M.C. Solaar, and Positive Black Soul, who mixed rap with Mbalax, a type of music that has been played in West Africa for centuries. During the late 1980s-early 1990s rap started to escalate all over Africa. Each region had a new type of style of hip hop. Rap elements are also found in Kwaito, a new genre based on [house music](#) which developed in South Africa in the 1990s.

## African reggae

[Reggae](#) is a kind of Jamaican [popular music](#) that has spread to much of the world, especially including Africa. There are many African reggae musicians with a wide fanbase both on the continent and abroad. Three well-known African reggae artists are Alpha Blondy, Majek Fashek and Lucky Dube.

Bob Marley, a world-famous Jamaican reggae musician, performed in Harare, Zimbabwe in 1980; that concert is often credited as the beginning of reggae in Africa.

# Afro prog

**Afro prog** is a genre of [progressive rock](#) music with a distinct African cultural or subcultural flavor. This term first appeared on usenet in an Italian language progressive rock discussion forum in 1999.

In the late 60s, artists around the world were experimenting with combining established styles of music like [classical](#), [jazz](#) and afro-cuban with [rock](#) music in very progressive ways. Musicians of African heritage were also combining African and African American styles with [rock](#) in a progressive fashion. This worldwide trend in rock music was something that reached its peak in the early 70s and then faded out of mainstream attention. Any such eccentric artists these days are considered on [progressive rock](#) music forums on the internet and rarely get any attention in widely distributed music journals. **Afro prog** artists are as few and far between as artists in other [progressive rock](#) niches like zuehl and canterbury. Recently in 2005 Afroprog has seen a resurrection in the San Francisco Bay Area through the band The Flux.

Bands considered to be Afro Prog are Assagai, Mandrill, The Flux and Osibisa among others. These bands were active in the early 70s; the heyday of progressive rock music.

# Afrobeat

**Afrobeat** is a combination of Yoruba music, [jazz](#), and [funk rhythms](#), fused with African [percussion](#) and vocal styles, popularized in Africa in the mid to late 1960s.

Afrobeat's most famous artist was the Nigerian multi-[instrumentalist](#) and bandleader Fela Kuti, who coined the term Afrobeat, constructed the musical structure and shaped the political context of the genre. He launched afrobeat in Lagos in 1968.

Afrobeat also has influences from high-life music, a style of African pop-jazz. Kuti had earlier played this type of music with the Koola Lobitos band.

Characteristics of Afrobeat are:

- [Big bands](#): A large group of musicians playing various instruments (Fela Kuti's band in the 80s *Egypt 80* featured 80 musicians);
- Energy: Energetic, exciting and with high tempo, polyrhythmic percussion;
- Repetition: The same musical movements are repeated many times;
- Improvisation: Performing without set music;
- Combination of genres: A mixture of various musical influences.

Afrobeat originated from the southern part of Nigeria in the 60s, influenced probably by the American [free jazz](#) movement. Fela Anikulapo Kuti went through experimenting different forms of music - first by highlife jazz, and then other forms of contemporary music of the time and local African harmonies and rhythms, taking different elements and combining, modernizing and improvising those rhythms.

Politics is essential to the genre of Afrobeat, since the founder Fela Kuti was deeply concerned in social criticism to pave way to social change. The message can be described as confrontational and controversial, which can be related to the political climate of most of the African countries in the 60s, which dealt with political injustice and military corruption while recovering from the transition from the colonial governments to self-determination.

As the genre spread throughout the African continent, many bands took up the style in the 60s and 70s. The recordings of these bands and their songs were hardly heard or exported to outside the originating countries and can be classified rare.

Jazz musicians have always been attracted to afrobeat. From Roy Ayers in the seventies to Randy Weston in the nineties there have been collaborations which have resulted in albums like *Africa Centre of the World* by Roy Ayers released on the polydor label in 1981. In 1994 Branford Marsalis the American jazz saxophonist would include samples of Fela's "Beast of No Nation" in his *Buckshot LeFonque* album.

Afrobeat has profoundly influenced important contemporary producers like Brian Eno who credits Fela Kuti as an influence.

New generation DJs of the 2000s who have fallen in love with both Kuti's material and other rare releases have made compilations and remixes off of these recordings, thus re-introducing the genre to new generations of listeners and fans of afro-pop and groove.

Post-Fela, the Afrobeat scene is spreading and the music seems to have taken root on the global music scene. There is a diverse group of bands influenced by the music operating out of different countries. A list of acts to watch would definitely include Femi Kuti (Fela's first son and a saxophonist) and the positive force, Ayetoro (a group led by Nigerian piano player/composer Funsho Ogundipe), Antibalas (Brooklyn, New York based multiracial afrobeat band formed by baritone saxophonist Martin Perna) and finally, Tony Allen the man who held the drum chair during Fela's productive Africa 70 phase.

# Afro-Cuban jazz

**Afro-Cuban jazz** is a variety of [Latin jazz](#), which was started by Dr. Obdulio Morales in the 1930's, (Cuba). Other well-known variant of Latin jazz is Brazilian jazz. Afro-Cuban jazz was played in the U.S. directly after the [bebop](#) period, while Brazilian jazz became more popular in the 1960s and 1970s.

Afro-Cuban Latin Jazz includes salsa, merengue, songo, son, [mambo](#), and cha cha cha.

Afro-Cuban started as a movement after the death of Charlie Parker. The one starting the Afro/Jazz fire was Mongo Santamaria (Afro/Blue) putting together Yorubas (patterns and instruments). Bebop musicians like Dizzy Gillespie and Billy Taylor started Afro-Cuban bands at later, also Miles Davis and John Coltrane jumped in the trend by doing some recording in the genre. Gillespie's work was mostly with big bands of this genre. While the music was influenced by Cuban and Puerto Rican musicians like Tito Puente, there were many Americans who were drawing upon Cuban rhythms for their work.

Categories: [Jazz genres](#)

# Afro-rock

**Afro Rock** is a style of [music](#) which relies heavily on the use of Western [string instruments](#) ([electric guitars](#) and bass) and guitar effects played with a rock feel, but played in an african plucked style. The additional use of percussion helps refine and identify the music as African, while the vocal style is rock. Afro Rock is a form of highly rhythmic and danceable [Rock music](#) because, as one artist said, "the black man always wants to shake his waist."

# Aggrotech

**Aggrotech**, also referred to more recently as **Terror EBM** and sometimes as **Hellektro** (a corruption/portmanteau of 'hell' and 'elektro'), is a term that surfaced in the mid-1990s to describe an evolution of electro-industrial typified by somewhat harsh song structures, aggressive and generally uptempo beats and lyrics of a militant, pessimistic or explicit nature. Typically, the vocals are distorted to sound hoarse, harsh and without tone. Artists also frequently use atonal melodic structures.

The style had mostly died out by the end of the decade with the rise of [synthpop](#) and [futurepop](#) in the alternative electronic scene, but has experienced a recent surge in popularity and proliferation as both aggrotech and [power noise](#) have become more common at [goth/industrial](#) clubs.

## Artists

Examples of artists that could be considered aggrotech include Aghast View, Suicide Commando, Wumpscut, Psyclon Nine, Hocico, Dulce Liquido, Amduscia, Tactical Sekt, Virtual Embrace, Aslan Faction, Grendel, Agonoize, Panzer AG and Unter Null. Older acts such as Aghast View and Wumpscut have more recently restructured their format into a mellower, less edgy style of music, while new acts like Psyclon Nine, Agonoize and Virtual Embrace have revitalized the genre to an extent.

### Industrial

**Aggrotech** - Coldwave - [Dark electro](#) - [Electronic body music](#) - [Futurepop](#) - [Industrial metal](#) - [Industrial rock](#) - Industrial techno - [Noise](#) - [Power noise](#)

### **Other [electronic music genres](#)**

[Ambient](#) | [Breakbeat](#) | [Drum and bass](#) | [Electronica](#) | [Electronic art music](#) | [Hard dance](#) | [Hardcore](#) | [House](#) | [Techno](#) | [Trance](#) | [Industrial](#) | [Synthpop](#)

## Air de cour

The **Air de cour** was a popular type of secular vocal music in France in the very late [Renaissance](#) and early [Baroque](#) period, from about 1570 until around 1650. From approximately 1610 to 1635, during the reign of Louis XIII, this was the predominant form of secular vocal composition in France.

The earliest examples of the form are for solo voice accompanied by [lute](#); towards the end of the 16th century, four or five voices are common, sometimes accompanied (or instrumental accompaniment may have been optional); and by the mid 17th century, most airs de cour were again for solo voice with accompaniment. Beginning in 1608, airs de cour were often taken from ballets de cour, a form of ballet which was quickly becoming popular at the French court.

Musically they were strophic, i.e. successive verses of the text were set with similar music. While the earlier music, especially that for multiple voices, was polyphonic, after about 1610 the music usually was homophonic, sung syllabically and without [meter](#), with a clear influence from the *musique mesurée* which developed in Paris around 1570. Collections exist which deviate considerably from these trends, however; several printers specialized in polyphonic airs de cour throughout the early 17th century, and there are eight volumes published by Le Roy & Ballard which are monophonic—for a single voice with *no* accompaniment.

Airs de cour show surprisingly little influence from the Italian early Baroque trends of monody and the [madrigal](#), either in its polyphonic or its [concertato](#) form. This is all the more surprising as Italian musicians often worked in France, and the polyphonic and concertato forms of madrigal were being deeply influential in Germany at the same time. Emotional expression in the airs de cour, compared to that of the contemporary Italian madrigalists, is cool, classical and reserved, in keeping with contemporary French taste. Vocal range of the music is usually limited to one octave; dissonance and chromaticism are rare; and the overall simplicity of expression is striking.

The influence of the air de cour extended beyond France. Collections were published in Germany, and more importantly in England, where translations were rather popular, as attested by the several publications and copies. The air de cour influenced the development of the English ayre.

The atmosphere of these songs is very different to the English lute song, and the lute technique has some novel features. There are notated *strummings* with the 1st finger, both up and down. There have been several articles on the finer points of this and what the notation means in the English and French Lute Society Journals.

# Album

An **album** is a collection of related audio tracks, released together commercially in an audio format to the public.

The term "record album" originated from the fact that 78 RPM gramophone or phonograph disc records were kept together in a book resembling a photo album. The first collection of records to be called an "album" was Tchaikovsky's "Nutcracker Suite", release in April 1909 as a four-disc set by Odeon records. It retailed for 16 shillings — about £15 in today's money.

In 1948, Columbia produced the first 12", 33 1/3 RPM microgroove record made of vinylite. With a running time of 23 minutes per side, these new records contained as much music as the old-style album of records and, thus, took on the name "album". For many years, the standard industry format for popular music was an album of 12 songs, originally the number related to payment of composer royalties.

Today, with the decreasing popularity of the vinyl record, the term "album" is applied to any [sound recording](#) collection, including CD, MiniDisc, and cassette. Even a set of tracks released at the same time for distribution on an online music download site is sometimes referred to as an album.

Due to the large capacity of new media, the matter of how long an album should be is open to debate. According to the rules of the British Charts, a recording counts as an album if either it has at least four tracks or lasts more than 20 minutes. Sometimes shorter albums are referred to as [EPs](#), an abbreviation of extended play, "extended" meaning longer than a single. The term "mini-album" may also be used.

Returning to the older meaning of the term, there are now albums of compact discs: collections of CDs in a single package. If such a collection is packaged in a box, it is known as a [box set](#).

# Aleatoric music

**Aleatoric music** (or **aleatory**) is [music](#) in which some element of the [composition](#) is left to chance or some primary element of a composed work's realization is left to the determination of its performer(s). The term became known to European composers through lectures by acoustician Werner Meyer-Eppler at Darmstadt Summer School in the beginning of the fifties. According to his definition, "aleatoric processes are such processes which have been fixed in their outline but the details of which are left to chance". **Chance music** is preferred by some composers.

The term—deriving from the Latin word *alea*, meaning "dice"—has come to be associated most often with procedures in which the chance element involves a relatively limited number of possibilities. The French composer Pierre Boulez was largely responsible for popularizing the term, using it to describe works that give the performer certain liberties with regard to the sequencing and repetition of parts, an approach pioneered by avant-garde American composer-theorist Henry Cowell. The term was intended by Boulez to distinguish his work from pieces composed through the application of chance operations by John Cage and Cage's aesthetic of indeterminate music or indeterminacy. Cage's *Music of Changes* (1951) is the first piece to be conceived largely through random procedures (Randel 2002, p.17).

Among examples of aleatory music, Klavierstück XI by Karlheinz Stockhausen features a number of elements to be performed in changing sequences, certain orchestral works of Witold Lutosławski contain music where the orchestral ensemble is not precisely dictated, and in some works by Krzysztof Penderecki characteristic sequences are repeated quickly, producing a kind of oscillating sound.

An early genre of composition that could be considered a precedent for aleatoric compositions were the *Musikalische Würfelspiele* or Musical Dice Games, popular in the late 18th and early 19th century. (One such dice game is attributed to Wolfgang Amadeus Mozart.) These games consisted of a sequence of musical measures, for which each measure had several possible versions, and a procedure for selecting the precise sequence based on the throwing of a number of dice.

There has been considerable confusion of the terms aleatory and indeterminate / chance music. One of Cage's pieces, *HPSCHD*, itself composed using chance procedures, uses music from Mozart's *Musikalisches Würfelspiel*, referred to above, as well as original music. He also generally used coin-tossing and other procedures depending on designs involving a pre-defined number of choices to be made. Still, both the aesthetic aims as well as the number of elements controlled by chance make the two methods clearly different. Douglas Hofstadter, writing in *Gödel, Escher, Bach*, thus punningly characterises some of the musical compositions of John Cage by using the acronym CAGE to stand for Composition of Aleatorically Generated Elements, in contrast to a Beautiful Aperiodic Crystal of Harmony (or BACH).

Some aleatoric music, such as that of the Mangabros, is inspired by the book *The Dice Man* by Luke Rhinehart.

One of the most striking modern examples of aleatoric music occurs during Eric Whitacre's piece *Cloudburst*. The song uses aleatoric music to evoke a storm; singers repeat certain words at random through several sections.

Most modern software and hardware music composition tools, synthesizers, and signal processors ("effects") provide "randomization" features to foster aleatoric composition within specified parameters. In some synthesizers, signal processors, and sequencers, randomization can be applied to almost any parameter of sound synthesis, signal processing, or scoring. This technique is employed frequently in modern electronic music.

**Open form** and **mobile form** [musical forms](#) where the order of [movements](#) or [sections](#) is indeterminate or left up to the [performer](#). Roman Haubenstock-Ramati composed a

series of influential "mobiles" such as *Interpolation* (1958).

# Alegrías

**Alegrías** is a [flamenco](#) style, which has a rhythm consisting of 12 beats. It is similar to Soleares. Its beat emphasis is as follows: 1 2 **[3]** 4 5 **[6]** 7 **[8]** 9 **[10]** 11 **[12]**. Alegrías originated in Cádiz. It is one of the cante chico forms of flamenco. The word Alegrías literally means "joys."

One of the structurally strictest forms of flamenco, a traditional alegrías must contain each of the following sections: a salida (entrance), paseo (walkaround), silencio (similar to an adagio in ballet), castellano (upbeat section) zapateado (footwork) and bulerías (upbeat section whose accent begins on the 1 of each bar as opposed to the 12).

Categories: [Flamenco styles](#)

# All-women band

**All-women bands** and **Girl bands** are [musical groups](#) in which women [sing](#) and play all the [instruments](#). They are distinct from [girl groups](#), where the women sing but do not play any instruments.

Although women have long been a part of the musical landscape, with composers such as Anna Amalia, Princess of Prussia and sister of Frederick The Great writing music in the 1700s and, more recently, Germaine Tailleferre of [Les Six](#) (which included Erik Satie) who worked with Jean Cocteau, as well as composing for the theatre and dance troupes, it was in the 1900s, with the commencement of the [Big Band](#) and [Swing](#) era, that all-women bands began to emerge. Perhaps the best-remembered of such orchestras is the International Sweethearts of Rhythm.

But it was with the advent of [Rock and Roll](#) that groups comprised solely of women began to flourish. As evidenced by numerous compilations, particularly of [garage bands](#), during the 1960s many women were playing in bands, although few were signed to major labels and so did not come to the forefront of public attention. However, records by all girl bands on smaller, regional labels are being rediscovered and are highly prized by collectors today. For instance, Feminine Complex released their self-titled album in the 1960s; in the 1990s it was rereleased on CD by independent label Teen Beat. One of the strangest groups from the 60s is undoubtedly The Shaggs, a group of sisters who, with limited mastery of their instruments, as well as song structures, ended up creating their own, unique, musical language and are revered as 'outsider' musicians today, with a devoted cult following.

Among the earliest all-women rock bands to be signed were Goldie and the Gingerbreads, to Atlantic Records in 1964, and Fanny in 1969 when Mo Ostin signed them to Warner Brothers Records. The Roche sisters, Terre and Margaret/Maggie, recorded their first major-label album in 1975; their younger sister Suzzie joined them to form the Roches and to record (usually with male session musicians) and tour (usually without supporting musicians; all three play guitar and other instruments). Also in 1975, the Canadian duo of sisters, Kate and Anna McGarrigle, recorded the first of a string of albums. Joan Jett's first group the Runaways were also an early commercially successful, hard-edged all-women (or, indeed, all-girl, since all were in their mid-teens) band, releasing their first album in 1976; other members included Michael Steele, then known as Mikki Steele, and Lita Ford.

Meanwhile, in the 1970s, a number of feminist [folk music](#)-based performers began fostering a Women's Music Movement; a number of women moved between the more-traditional folk festivals and the women's gatherings, including some of the members of the 1980s all-women bluegrass band Blue Rose. More recently, another bluegrass and related-music all-women group, Uncle Earl, have been touring the festival circuit (apparently named in honor of bluegrass pioneer Earl Scruggs).

[Punk](#), a progression in some ways of the garage rock of the 1960s, naturally included all-women bands just as garage rock had in the 1960s and opened the door wider for women with a desire to perform, spawning groups such as the Raincoats, the Slits, and Lilliput. Some well-known otherwise all-women bands had men in the band at times, particularly but not limited to drummers.

Meanwhile, two bands had a very large commercial and pathbreaking effect in the early and mid 1980s; both came from the LA punk/garage scene, though did best commercially with the work most slickly distant from their roots. The Go-Go's and the Bangles were the first all-women rock bands to find sustained success; each had a sequence of three major-label albums in the first segment of their careers, released not a few hit singles apiece, and inspired not a few other young women, both positively and, perhaps, negatively (as when the Bangles ended the first phase of their collective career as very nearly a chorus, playing

fewer of their own instrumental tracks on each album in turn and on guest appearances on television). Both bands have released reinvigorated reunion albums in the 2000s: the Go-Go's' *God Bless the Go-Go's* (2001) and the Bangles' *Doll Revolution* (2003).

With the resurgence of interest in [pop-punk](#) bands in the US in the early 1990s, L7 became very popular, while demonstrating onstage and in interviews a self-confident "bad girl" attitude at times, always willing to challenge assumptions about how an all-women band should behave. Although it could be debated whether the existence of all-women bands is inherently political or not, many groups comprised of women have set forth with a political aim in mind. Particularly in the 1990s, Riot Grrl groups such as Bratmobile and (the not all-female) Bikini Kill have addressed feminist and other socio-political issues they feel are inherent in the estate of the women's band. Other punk bands, such as Spitboy and its successor Instant Girl, have been less comfortable with the some of the childhood-centered issues of much of the Riot Girl esthetic, but nonetheless also have dealt explicitly with feminist and related issues. All-women Queercore bands, such as Tribe 8 and Team Dresch, also write songs dealing with matters specific to women and their position in society.

Courtney Love, leader of Hole, has said that it is impossible to find a female bass guitarist. This is belied by her own former bassist Melissa Auf der Maur, famous and impressive bassists such as:

- Tina Weymouth of Talking Heads and Tom Tom Club
- Me'shell Ndegeocello
- D'Arcy Wretzky of the Smashing Pumpkins
- Kim Deal of the Pixies and the Breeders
- Kim Coletta of Jawbox (retired).
- Jo Bench of Bolt Thrower
- Sean Yseult of White Zombie
- Rayna Foss-Rose (and later Nadja Peulen) of Coal Chamber
- Kim Gordon of Sonic Youth
- Paz Lenchantin of A Perfect Circle
- Lorna Doom of The Germs

Regardless of her view, it is doubtful that it would be difficult to find women playing any manner of instrument today (the punk band Women of Destruction/Estrojet throughout the 1990s featured an accordionist), as all-women bands continue to proliferate.

# Alternative country

**Alternative country** is a term applied to various subgenres of [country music](#).

The term can refer to several ideas. Most generally, any musician who plays a type of [country music](#) different from the prevailing trend can be said to play "alternative country". By this standard, for example, the Bakersfield sound was alternative in the 1950s, and the Lubbock, Texas musicians were alternative in the 1960s.

In the 1990s however, "alternative country" came to refer to a disparate group of musicians and singers operating outside the traditions and industry of mainstream country music. In general these musicians eschewed the high production values and pop outlook of the Nashville-dominated industry, to produce music with a [lo-fi](#) sound, frequently informed with a strong [punk](#) and [rock & roll](#) aesthetic, bending the traditional rules of country music. Lyrics are often bleak, gothic or socially aware. Otherwise, the musical styles of artists that fall within this genre often have little in common, ranging from traditional American folk tunes and [bluegrass](#), through [rockabilly](#) and honky-tonk, to music that is indistinguishable from mainstream rock or country. Indeed many alternative country artists come from punk and rock backgrounds. This already broad labelling has been further confused by alternative country artists disavowing the movement, mainstream artists declaring they are part of it, and the retroactive claiming of past or veteran musicians as alternative country. No Depression, the most well known magazine of the genre, declares that it covers "alternative-country music (whatever that is)".

Despite this confusion, it is generally agreed that alternative country resulted from two opposing influences. The first is traditional American country music, the music of working people, preserved and celebrated by practitioners such as Woody Guthrie, Hank Williams and The Carter Family. The second is [country rock](#), the result of fusing country music with an aggressive [rock & roll](#) sound. The artist most commonly identified as the originator of country rock is Gram Parsons (who referred to his sound as "Cosmic American Music"), although Jason and the Scorchers, and Steve Earle are frequently identified as important innovators. These two styles merged in Uncle Tupelo's 1990 LP No Depression, the first widely recognized modern alternative country record (though the first Freakwater EP appeared in 1989). The band Whiskeytown continued in this tradition and lead singer Ryan Adams continues to shape the genre to this day in his solo career.

Alternative country is popularly referred to, especially in print, as "alt-country" or sometimes "alt.country". The genre is also referred to under a large number of other names, including "americana", "trashcan americana", "insurgent country", "neotraditional", "no depression", "cowpunk", "progressive country", "regressive country", "lo-fi country", "[roots rock](#)", "twang core", "rural contemporary", "country-punk", "y'allternative", "hick rock", "alternative country-rock" and many others.

## Alternative dance

**Alternative dance** (known primarily as **indie dance** in the United Kingdom) is a term used for the genre of music combining elements of [dance-pop](#) (or other forms of electronic [dance music](#) such as [house](#) or [techno](#)) and [alternative rock](#) genres such as [indie pop](#). Alternative dance music is typically predominantly electronic, with programmed beats from [drum machines](#) or sampled drum loops and sequenced [synthesizer](#) melodies, and thus musically very similar to commercial dance-pop. The [indie](#) element is most prevalent in the songwriting; unlike much dance music, alternative dance typically contains lyrics, and, as in indie pop or [indie rock](#), these are often more thematically complex and/or less polished than those of commercial pop.

It could be argued that the seeds of alternative dance were sewn when New Order, inspired by Kraftwerk and the New York club scene, started combining sequenced electronic elements with their often dark and uncommercial lyrics. (Their best-selling single, "Blue Monday," is a prime example of this.) Other Manchester bands, such as the Stone Roses and the Happy Mondays continued the tradition of combining traditionally guitar-based indie music with electronic instrumentation and production; this culminated in the Madchester scene.

Alternative dance gained in popularity after the Second Summer of Love, when the sounds of [Acid House](#) music had filtered through to and influenced the sounds of chart pop. Various people from an indie background soon adapted the equipment and techniques of [dance-pop](#), combining it with a more astute and less populist songwriting sensibility. Well-known examples of this movement include Saint Etienne and Dubstar.

As both the financial costs and levels of musical virtuosity required to make passable-sounding electronic music drop under the influence of technological improvements, and people who grew up listening to electronic pop take up music, the electronic style epitomised by alternative dance is increasingly becoming the mainstream of independent music, with the once dominant guitar-based form of pop that dominated low-budget independent recordings now becoming just another subgenre.

## Alternative hip hop

**Alternative hip hop** or **Underground rap** is a [style](#) of [hip hop music](#) distinguished by artists who are not recognized by major record labels, or who choose to express their talent in an "underground" atmosphere. Often, positive lyrics are a hallmark of alternative hip hop, which detract from the materialistic and sexually fueled lyrics of mainstream hip hop. Although some listeners may associate live instrumentation with alternative hip hop, this distinction is invalid because popular rap acts such as J-Kwon use live instruments as well. Alternative hip hop artists generally have not achieved the same level of mainstream success that commercial rap and other forms of the genre have seen, although they are often critically acclaimed. Interestingly, alternative hip hop has developed differently from virtually every other [musical genre](#), with its originators (De La Soul, A Tribe Called Quest) being more popular than later innovators (Guru, Mos Def, Common). This is why some consider alternative hip hop more a trend than a rigid genre within hip hop.

The term "alternative hip hop", coined by music scholars, can be considered something of a misnomer: artists labeled as "alternative hip hop" musicians usually record and perform in styles that are more closely related to the original concepts and styles of hip hop music and hip hop culture, as opposed to their more popular commercial counterparts. DJ Kool Herc, the inventor of hip hop music, once said in an essay about hip hop, that "it's not about keeping it real. It's about keeping it right." In this sense, many would argue that alternative hip hop might not be so much an alternative as much as it is a continuation of the original concepts and ideals of hip hop.

## The late 1980s

Alternative hip hop is usually said to have begun with De La Soul's landmark *3 Feet High and Rising* (1989, 1989 in music). The trio's distinctive style, mixing unique sampling sources (such as The Turtles and Johnny Cash) with spacey, hippie-ish lyrics and a sense of humor, made the album a commercial and critical success. With its inclusion of pre-recorded bits from outlandish sources, such as a French language instruction tape, the release foreshadowed the self-referential sampling kaleidoscope that would soon envelop hip hop (and pop music in general).

In addition to *3 Feet High and Rising*, influential singles were released one year previously, in 1988 (see 1988 in music), by Gang Starr ("Words I Manifest") and Stetsasonic ("Talkin' All That Jazz"); these two singles fused hip hop with jazz in a way never done before, and helped lead to the development of [jazz rap](#).

1989 also saw the release of:

- Def Jef's landmark *Just a Poet With a Soul*, which included Etta James, an influential 1960s soul singer on one track

- Gang Starr's debut, *No More Mr. Nice Guy*, which is often considered the first LP to mix hip hop and jazz

- Jungle Brothers' critically acclaimed second album *Done By the Forces of Nature*, which included dance beats and achieved some mainstream success

- Queen Latifah's feminist tract *All Hail the Queen*.

## Early 1990s

During the early 1990s, mainstream hip hop was dominated by the West Coast G-Funk (like Dr. Dre and Snoop Doggy Dogg). Other artists found success difficult to achieve, though some East Coast acts, such as Puff Daddy's empire of East Coast hip hop artists (Bad Boy Records) gained chart success (Mary J. Blige's 1992 *What's the 411?*) as well as critical success (Nas's 1994 *Illmatic*), though rarely both at the same time.

## The Underground Emerges

While [gangsta rap](#) dominated the charts, the East Coast alternative sound began to lose its luster. Strangely enough, underground hip hop, as we know it today, was born on the streets of South Central Los Angeles, best represented by the seminal Freestyle Fellowship. Consisting of members Aceyalone, Mikah 9, P.E.A.C.E., and Self Jupiter, the Freestyle Fellowship married conscious lyrics with spectacular, jazz-like rhyme cadences. Their "To Whom It May Concern" and "Innercity Griots" albums remain as the most influential albums in the history of underground hip hop. Furthermore, the DIY ethic of selling tapes and CDs "out of the trunk" to record stores and directly to fans would soon be adopted by the underground rappers around the world.

Spurred by the Freestyle Fellowship, other West Coast artists like The Pharcyde (*Bizarre Ride II the Pharcyde*, 1992) and the Disposable Heroes of Hiphoprisy (*Hypocrisy Is the Greatest Luxury*, 1992) also rose to prominence in the field. Despite the popularity of Bay Area Booty Rapper Too Short, Oakland gave birth to underground artists Del tha Funkee Homosapien (cousin to [Gangsta Rapper](#) Ice Cube) and Souls of Mischief with their seminal album ("*'93 'til Infinity*"). Alongside these West Coast groups were generally more popular East Coast groups like A Tribe Called Quest (*People's Instinctive Travels and the Paths of Rhythm*, 1990) and Gang Starr (*Step in the Arena*, 1991). International groups, like Britain's The Brand New Heavies (*Heavy Rhyme Experience, Vol. 1*, 1992) and Massive Attack (*Blue Lines*, 1991) helped combine hip hop with [R&B](#) and [electronica](#), respectively.

A Tribe Called Quest's 1991 album *The Low-End Theory* is regarded as one of the most influential recordings in alternative hip hop, especially with its timely indictment of the perceived commercializing and demoralizing effects of the music industry, then tearing hip hop apart into multiple competing genres, all rushing to sell out for mainstream success; the album also tackles subjects like date rape and rap feuds. *The Low End Theory* includes the legendary upright bassist Ron Carter and the Leaders of the New School (which included future superstar Busta Rhymes).

While A Tribe Called Quest and De La Soul are considered jazz-rappers, the pioneer of an actual fusion between the two genres is unquestionably the Freestyle Fellowship. Their collaborations with live jazz bands, including the likes of Horace Tapscott, date back to 1990. This inspired other artists like Guru, whose 1993 *Jazzmatazz, Vol. 1* was a critically acclaimed solo debut with live jazz backing. A jazz band including Lonnie Liston Smith, Roy Ayers, Branford Marsalis and Donald Byrd solos in the background while Guru (and guests like the Senegalese-French MC Solaar) raps.

Stubbornly insisting on sticking to their themes and ideas, alternative hip hop artists were able to incorporate elements of virtually every form of music around at the time.

Meanwhile, [Christian hip hop](#) group and pioneering [Southern rap](#) crew Arrested Development scored big with 1992's *3 Years, 5 Months and 2 Days in the Life of...*, which put Southern hip hop on the map. The album was particularly successful with non-hip hop

fans, listeners who were turned off by the macho posturing of many other groups, and who wanted a safer alternative. Arrested Development's focus on peace and love and groovy beats made them relatively accessible, though their devout Christianity (reflected in the lyrics) also made them unattractive to some audiences.

## Genres related to alternative hip hop

*Alternative hip hop* generally refers to a specific style of hip hop that is opposed to the mainstream sounds of [gangsta rap](#). However, certain other hip hop fusion genres are closely related to this genre, including a mixture of 1970s-style [soul music](#) and hip hop called [neo soul](#).

### Neo soul

Hip hop also influenced [R&B](#) music in the 1990s. By the time hip hop began to enter the mainstream, R&B was rapidly losing its most legendary artists. While Michael Jackson, Prince, Tina Turner and Whitney Houston remained popular, the genre was seen as stunted and atrophied. Soon after, hip hop began to dominate what mainstream audiences thought of as African-American music with the release of Dr. Dre's blockbuster *The Chronic*. R&B became less popular among mainstream audiences, and several of the groups achieving commercial success mostly failing to find critical acclaim. The groups that did succeed incorporated hip hop beats and doo wop influences; these include Guy (*The Future*, 1990) and Boyz II Men (*Cooleyhighharmony*, 1991). Mary J. Blige's *What's the 411?* from 1992 was especially innovative, and led to a style of [R&B](#) called [hip hop soul](#) that was popular during the early to mid 1990s.

During the mid- to late 90s, the hip hop soul sound was blended with a retro 1970s [soul music](#) feel, resulting in a new genre called *neo soul*. Widely regarded as a pioneer of the genre, D'Angelo's 1995 *Brown Sugar* was profoundly influential in its development, while a group of female artists like Erykah Badu (*Baduizm*, 1997), Lauryn Hill (*The Miseducation of Lauryn Hill*, 1998) and Macy Gray (*On How Life Is*, 1999) began its popularization soon after. Around and immediately after the turn of the decade, a second wave of female artists moved neo soul into the mainstream, especially Alicia Keys' *Songs in A Minor* (2001), as well as India.Arie's *Acoustic Soul* (2001) and Jill Scott's *Who Is Jill Scott?: Words and Sounds, Vol. 1* (2000). Critical reviews were mixed, with many listeners feeling that neo soul had lost its pioneering edge for middle-class shallow idealism.

## The end of the 1990s

In spite of neo soul gaining mainstream acceptance, gangsta hip hop artists like Jay-Z (Reasonable Doubt, 1996) and DMX (...And Then There Was X, 1999) still dominated the charts as the end of the millennium neared. Critics and listeners regarded alternative hip hop as going through a lull, as even mainstays like A Tribe Called Quest (Beats, Rhymes and Life, 1996) released lackluster albums.

Many observers feel that Dr. Octagon's seminal 1996 album Dr. Octagonecologist revitalized hip hop's underground; Company Flow's Funckrusher Plus is another album cited as redefining the genre. Del tha Funkee Homosapien paired with Kool Keith's (aka Dr. Octagon) producer Dan the Automator to make Deltron 3030, who pushed the boundaries of hip hop to other universes and times. Alternative hip hop soon began to lose its recent stylings for a return to Native Tongues-style [old school](#) with [hardcore](#) and [jazz](#) elements mixed in. The hip hop band, The Roots were among the leaders of the second alternative hip hop wave, dropping several critically acclaimed albums in the mid to late 90s, including Do You Want More?!!!??! (1995), Illadelph Halflife (1996), and the breakthrough, Things Fall Apart in 1999. On the West Coast, Ozomatli's self titled 1998 release fused latin and funky beats with hip hop in a groundbreaking way.

Mos Def and Talib Kweli's 1998 Black Star also contributed greatly to this evolution, with its return to Native Tongues-style old school hip hop. Mos Def's solo debut, Black on Both Sides (1999), quickly established him as a darling of alternative media for its incendiary politics, while Kweli's solo career took some time to get off the ground; as he didn't appear until 2000's Reflection Eternal, with partner Hi-Tek. Pharaoh Monch's Internal Affairs, his 1999 solo debut after leaving Organized Konfusion, also added more gangsta and hardcore hip hop elements to the mix.

Following in the footsteps of the Freestyle Fellowship were Jurassic 5 (Jurassic 5 EP) and Dilated Peoples (The Platform), who continued mixing [funk](#) and [hip hop music](#) to critical acclaim and popular rejection. The Bay area gave birth to highly experimental artists like Blackalicious with Nia, as well as Lyrics Born, Lateef the Truth Speaker, and the Hieroglyphics Crew.

This period was also the high point for Hip Hop's DJ scene. The Invisibl Skratch Piklz and artists such as Cut Chemist, Dan the Automator, DJ Shadow, Mix Master Mike, DJ Qbert, and many others put a lasting stamp on [turntablism](#) and its emerging genre.

## Post-2000 alternative hip hop

After the turn of the millennium, as the United States (still by far the world capital of hip hop) found itself confronted by the War on Terror, lyrics grew increasingly anti-mainstream, with some advocating radical actions on the behalf of various anarchist and socialist ideas. The cover for the album Party Music (2001) by the openly marxist band, The Coup, proved controversial after the September 11, 2001 attacks due to its depiction of the duo holding a stick of dynamite and a detonator, ready to blow up the World Trade Center (though the band itself had been well known in alternative hip hop circles since the early 1990s); other groups like Dead Prez (Let's Get Free, 2000), Mr. Lif with his EP, Emergency Rations, and Emcee Lynx (The Black Dog EP, 2003, and The UnAmerican LP, 2004) similarly raised controversy with militant and confrontational lyrics.

Though most of these bands could be considered "political hip hop" for their lyrical focus, the early 2000s also saw futuristic or apocalyptic rappers like Cannibal Ox, El-P, Del Tha Funkee Homosapien and Aesop Rock.

In the new millennium a new "sub-genre" arose from the West Coast, spearheaded by underground rap producer Daddy Kev (famed for his work with the Freestyle Fellowship). With artists like Busdriver, AWOL One, The Shape Shifters, cLOUDDEAD, and Themselves, the music became known as avant-hop, prog-hop or indie-hop. These MCs and DJs blend their rhymes and beats with an electronica, post-rock or indie crossover. Additionally, artists such as the Bay Area's Zion I have incorporated Trip Hop sounds while continuing to identify their music as underground hip hop, and Oregon band PO2 define their music as "[synth-hop](#)".

# Alternative metal

**Alternative metal** is an eclectic form of [rock music](#) that gained popularity in the early 1990's alongside [grunge](#). In many instances, it can be accurately described as a fusion of [heavy metal](#) and [alternative rock](#), especially the [indie rock](#) of the 1980's. It is characterized by some heavy metal trappings (most notably heavy riffs), but usually with a pronounced [experimental](#) edge, including unconventional [lyrics](#), odd time signatures, unusual technique, a resistance to conventional approaches to heavy music, and an incorporation of a wide range of influences outside of the metal music scene.

## Overview

The term is used as a very loose categorization, but is usually used to describe artists playing a style of metal which is considered either a unique approach to metal music or difficult to define as strictly metal or alternative. Faith No More is a good example of a band in which both criteria apply.

Heavy metal is an essential component of the music, but it was very different from the [thrash](#) underground of the 1980s. Initially alternative metal appealed mainly to alternative rock fans since virtually all 80s alt-metal bands had their roots in the American [indie](#) underground scene. Alt-metal bands commonly emerged from [hardcore punk](#) (Corrosion of Conformity), [post-punk/gothic rock](#) (Jane's Addiction), [noise rock](#) such as the "pigfuck" sound of Big Black and Sonic Youth (Helmet, White Zombie), [grunge](#) (The Melvins, Soundgarden), [industrial music](#) (Ministry, Nine Inch Nails), and other movements in the indie underground scene, although it was not uncommon for bands to incorporate a wide variety of influences (such as Soundgarden, who lists Bad Brains, Bauhaus, and the Butthole Surfers as major influences). These bands never formed a distinct movement or scene; rather they were bound by their incorporation of traditional metal influences and openness to experimenting with the form, usually by way of their eclectic influences and uncommon approaches. For example, Jane's Addiction utilized performance art and a bohemian aesthetic, Corrosion of Conformity, The Melvins and the now defunct [grunge](#) band Soundgarden had a fondness for subverting '70s metal, and Faith No More injected [funk](#) and [rap music](#) into their brand of alternative metal, while Primus incorporates [funk](#), [progressive rock](#), elements of [thrash metal](#) and [punk rock](#), and an obscure Residents-esque touch in to their form of the genre.

The grunge movement of the early 1990s, which itself was a combination of 70's metal like Led Zeppelin and Black Sabbath and underground punk, helped increase the audience for such bands, and these artists were as comfortable playing to alternative rock fans on various Lollapalooza line-ups (itself founded by Jane's Addiction frontman Perry Farrell) as they were opening for metal bands like Metallica. With the changing of the musical landscape by the popular breakthrough of alternative rock, "alternative metal" became a new phrase used to describe bands in the early 1990s who managed to make relevant Nirvana era music that, as metal historian Ian Christe states, was "heavy without necessarily being metal". Newer bands emerged in this era with their distinctive takes on metal: White Zombie, Nine Inch Nails and Ministry started the [industrial](#) wave, combining [techno](#)-like beats and heavy guitars, Tool immersed itself in prog-rock influences, Rage Against the Machine was as informed by [hip hop](#) and [post-punk](#) agitprop such as Gang of Four as it was by metal, and Helmet molded a background in jazz and noise-rock/post-hardcore influences into a highly influential strand of intense rock music.

As the 90s progressed, alternative metal's sound became more standardized as newer bands drew inspiration for the same collective set of influences that included RATM, Korn, Nine Inch Nails, and Helmet. Helmet in particular, with its downtuned riffs and aggressive dissonance, created the sonic template for the [nu metal](#) movement. The chief distinctions between alternative metal and nu metal, aside from the generic sound, are the latter's tenuous (or even non-existent) connection to the underground rock scene and the DIY ethos that informed the musical approaches of past alternative metal bands, as well as the reluctance of alternative metal bands to explicitly align themselves under the heavy metal banner.

## Alternative metal subgenres

As the term "alternative metal" was used to refer to bands with a unifying characteristic despite their tendency towards different sounds, subgenres of alternative metal, unifying bands with other sonic and aesthetic similarities, occurred.

### Funk metal

*Main article: [Funk metal](#).*

Bands who fused [funk](#) and heavy metal styles were referred to as **funk-metal**. These bands, who often also drew upon [hip-hop](#) and [punk](#) as influence, started cropping up in the mid-80s. Extreme, who were influenced by the era's focus on [glam metal](#), lost popularity when public focus changed to grittier music and appearance. However, this did not diminish the growing popularity of the style's instigators, such as Faith No More (formed 1982) or Red Hot Chili Peppers (formed 1983). These are generally considered the first alternative metal bands. Primus was another popular funk metal band. Funk metal continued to grow in popularity until the 90s, when its final popular act, Rage Against the Machine, would become one of the biggest influences on nu metal.

### Industrial metal

*Main article: [Industrial metal](#).*

**Industrial metal** was another substyle that came into being in the 80s. [Industrial](#) bands like Ministry started the style by incorporating hard guitars on their 1988 album *The Land of Rape and Honey*. Within a year, the style was found all over the world. KMFDM also started using metal guitars and departed from their electronic industrial roots, and the [goth](#) scene spawned a range of acts who, following Ministry's lead, fused their [gothic rock](#), [punk rock](#), [heavy metal](#) and industrial tendencies to solidify the genre. Fear Factory, an industrial death metal band, formed in 1990, and like Rage Against the Machine became a staple influence of nu metal. The style is the most surviving of alternative metal, particularly in Germany, with bands like Rammstein and Megaherz leading a still-thriving scene.

### Punk metal

*Main article: [Crossover thrash](#).*

Bands with a basis in [punk rock](#) also adopted heavy metal influences. Although punk and metal had cross-pollinated since the original '77 punk explosion (other crossover genres include [Grindcore](#), [Speed metal](#), [Thrash metal](#), [Metalcore](#) and [Grunge](#)), a particular wave of bands with a root in [hardcore punk](#) evolved a tendency towards metal. This movement was led by Corrosion of Conformity, but also included Suicidal Tendencies and Stormtroopers of Death. As well as being an influence on nu metal, particularly its riffing, this subgenre also inspired a later wave of metalcore bands.

### Other styles

Alternative metal bands sometimes also had a basis in [gothic rock](#) (it is important to note, however, that gothic rock-alternative metal bands are entirely separate from the metal subgenre [gothic metal](#)) or [post-punk](#), [indie rock](#), [noise rock](#) and [grunge](#). These bands, however, were all from a specifically [alternative rock](#) background, and so were not assigned substyles but simply referred to as **alternative metal**.

[History](#) - [Indie \(music\)](#)

The terms **alternative rock** and **alternative music**<sup>[1]</sup> were coined in the 1980s to describe [punk rock](#)-inspired bands which didn't fit into the mainstream genres of the time. At times it was used as catch-all phrase for rock music from underground artists in the 1980s and, ironically, mainstream [rock music](#) in general in the 1990s and 2000s. More specifically, it is made up mostly of genres that appeared in the 1980s and became popular or well known by the 1990s, such as [indie rock](#), [grunge](#), [gothic rock](#), and college rock. Most alternative bands were unified by their collective debt to the style and/or ethos of punk, which laid the groundwork for underground and alternative music in the 1970s. Though the genre is considered to be rock, some of its genres were influenced by [folk music](#), [reggae](#), [techno](#) and [jazz music](#) among other genres.

## Overview

In the early 1980s a handful of college radio stations, like Danbury, Connecticut's WXCI, and WPRB in Princeton, NJ, and Brown University's WBRU broadcast alternative rock in the United States. Most commercial stations ignored the genre. It was played extensively in the UK, particularly by DJs such as John Peel (who championed alternative music on BBC Radio 1), Richard Skinner, and Annie Nightingale. American college DJs such as Jon Solomon of WPRB echoed the alternative wave as early as 1986 on his daily radio shows. As such, alternative rock became more popular in the mid-1980s, it spread widely to other college radio stations, leading to the use of the name "college rock" in the United States. In the UK, it became the predominantly popular form of rock for young people, and many alternative bands had chart success. Finally, in the late 1980s in North America, commercial stations such as Boston, Massachusetts's WFNX began playing alternative rock. Outside of North America, Double J, a government-funded radio station in Sydney, Australia and the Melbourne based independent radio station 3RRR began broadcasted alternative rock throughout the 1980s. In 1990, Double J, now known as Triple J, began broadcasting nationally, albeit with what some perceived as a "watered down" format.

Notable alternative bands of the early to mid 1980s include R.E.M., Sonic Youth, The Replacements, and Hüsker Dü from the United States, and New Order, The Smiths, The Cure, and The Jesus and Mary Chain from the United Kingdom. As the decade progressed, various alternative movements emerged and gained popularity. The late 80s saw the rise of indie, shoegazing, and Madchester in the UK, while the US underground scene and college radio were dominated by college rock bands like Pixies, Dinosaur Jr, and Throwing Muses as well as post-punk survivors from Britain.

Although these groups never generated spectacular album sales, they exerted a considerable influence on the generation of musicians who came of age in the 80s. Alternative music and the rebellious, DIY ethic it espoused became one of the inspirations for [grunge](#), an alternative sub-genre created in the 80s that launched a large movement in mainstream music in the early 90s. The year 1991 was to become a significant year for alternative rock and in particular grunge, with the successful release of Nirvana's second and most successful album Nevermind, Pearl Jam's breakthrough debut Ten, Soundgarden's Badmotorfinger, and Red Hot Chili Peppers' Blood Sugar Sex Magik. Led by the popularity of Nirvana, the grunge movement took alternative rock into the mainstream. While "alternative" was simply an umbrella term for a diverse collection of underground rock bands, Nirvana and similar groups gave it a reputation for being a distinct style of guitar based rock which combined elements of punk and [metal](#); their creation met with considerable commercial success.

By the mid-90s, alternative was synonymous with grunge in the eyes of the mass media and the general public, and a supposed "alternative culture" was being marketed to the mainstream in much the same way as the hippie counterculture had in the 1960s (the existence of any such culture is debatable, and is often seen by some fans of the music to have been a creation of the media). Thus, many wildly popular [post-grunge](#) bands such as Third Eye Blind and matchbox twenty were labeled as "alternative" rock. Nevertheless, alternative bands who were leery of broad commercial success developed [indie rock](#), a new genre that espoused a return to the original ethos of alternative music.

In the first decade of the 21st century, mainstream rock has continued to evolve beyond alternative's 80s roots and low-fidelity ethos. Today's most popular rock music acts, typified by youth-oriented modern rock groups such as Linkin Park, incorporate complex electronic beats and highly produced albums, but owe a heavy debt to their [metal](#) and [grunge](#)

influences. In spite of being influenced by alternative rock, many fans of the genre do not see these bands as being alternative, but instead as part of the [nu metal](#) genre.

In 2005 the sound of alternative rock returned to the mainstream with the popularity of indie rock and post-punk revival artists such as Modest Mouse and Franz Ferdinand. This revival has caused a big stir in the rock music community and has opened the door for the renewed interest in such classic alternative bands as New Order and The Creatures.

## Footnotes

1. The term "alternative music" is particularly favored over "alternative rock" in British English (although the boundaries of the genre are slightly blurred with the inclusion of [electronic music](#) and [hip-hop](#)), while "alternative rock" is favored in American English. The term underground music is sometimes also used, though more often used in reference to the music of little-known artists. Additionally, "indie" is commonly used in the UK as a synonym for alternative rock.

# AltNuMet

Nu metal (or Alternative metal) is a controversial fusion of [heavy metal](#), [alternative rock](#), and [hip hop](#). Nu Metal is characterized primarily by its lyrical themes, but is also defined by its mixed use of simplified metal aspects, rhythmic innovation and syncopation primary to hip hop, and sometimes a pronounced experimental edge.

Nu metal bands feature a broad range of approaches to the genre, including aggressive vocals (rapped, shouted, or sung), drop-tuned guitars that can be clean or distorted used to play a variety of styles synthesizing several musical forms, a funk, or, metal based rhythm section, the occasional DJ techniques such as turntables and sampling, and sparse keyboarding or sequencer programming. Generally speaking, the emphasis is on either communicating feelings of angst and hostility, or motivating a crowd to move with the beat - many bands opting to do both at once.

The term Nu Metal is used as a broad and loose definition, but is usually used to describe artists playing a style of metal which is considered not strictly metal, alternative rock, or hip hop. Faith No More are an example of this category, with their 'unconventional' metal sound, with the musics composition including elements of funk and rap music. Some artists of this category such as The Melvins and Meshuggah, take a more avant-garde approach to their music, including unconventional lyrics, odd time signatures, and unusual technique, while others have a more conventional but unique style such as Tool, Rage Against The Machine, Helmet, and Mudvayne.

The popularity of such music in the late 1990s led to widespread negative associations with the phrase "nu metal", particularly due to commercialisation, and many nu-metal fans and artists reject the term, which has become almost an all-purpose musical insult. A related term, mallcore, is used similarly to dismiss aggressive music that may appear to be calculated to appeal to young teenagers.

## Style

Beyond the pronounced hip hop and alternative rock influence, nu metal has like most forms of [heavy metal music](#) proven somewhat difficult to define using common knowledge. Some fans and musicians have a firm concept of the genre and its constructs, but others reject such categorization as unnecessary, limiting, useless or wrong.

Some heavy metal fans do not consider nu metal a form of [heavy metal music](#) at all, arguing the genre is too diluted from what they consider "true" heavy metal. Nu metal [guitarists](#), for example, typically forsake traditional metal guitar technique, such as soloing and often use riffs quite different from those most commonly associated with what is expected of metal bands.

It is also not commonly accepted as metal because of the lyrics that usually deal with what teenagers face because some metal fans feel that metal is about strength, not weakness. Other heavy metal fans reject these arguments, citing [rock music](#)'s long history of incorporating disparate elements--including [jazz](#), [experimental music](#) and [world music](#), out of curiosity, genuine appreciation for other [musical genres](#), or both. Moreover, little objection has historically been raised to [doom metal](#) (a genre which lacks high-speed guitar pyrotechnics) or [power metal](#) (whose high fantasy image is often less threatening than nu-metal angst). It is possible that some of the anti-nu-metal backlash might be due to the genre's significant success as a popular music genre. In general, the rise of nu metal, as with most genres fusing other metal genres, has helped to cause severe divisions in the worlds metal communitys and remains a source of much animosity and debate among heavy metal fans.

Categorization of specific artists as "nu metal" is difficult, considering the widespread mistrust of the term among artists and fans alike, and the "edges" being blurred as to whom nu-metal bleeds into other genres. In general, the artists in question are mostly American bands that found their first success in through the 1990s, with other artists immediately shaping their sound to resemble the new groove-driven metal, leaving its influence still felt today. For example, the American [metalcore](#) scene of the early 2000s owes much to nu metal, as do recent releases from artists like Metallica and In Flames.

## The popularization of the genre

The birth of nu-metal can in part be pinpointed to the earliest Lollapalooza music festivals in the 1990's which increased the exposure of bands who performed brands of metal and metal-influenced music that had little to do with traditional genre approaches. The funk of Primus and The Red Hot Chili Peppers, the [hip hop](#) crossover of Rage Against the Machine and Fishbone, as well as the experimental rock of Tool have been mentioned numerous times by nu-metal bands who gained mass-media exposure at the end of the millennium.

Another essential part of nu metal's birth was the grunge movement of the early 1990s, which itself was a combination of [classic metal](#) bands like Led Zeppelin and Black Sabbath with underground punk. This helped increase nu metal's audience and popularity, as many of the bands were as comfortable playing to alternative rock fans on various Lollapalooza line-ups (itself founded by Jane's Addiction frontman Perry Farrell) as they were opening for larger metal bands like Metallica. With the exposure granted by the popular breakthrough of alternative rock, newer bands emerged with their distinctive takes on metal: White Zombie, Nine Inch Nails and Fear Factory started the [industrial metal](#) wave, Tool immersed themselves in prog-rock influences, Rage Against the Machine was as influenced by hip hop and post-punk agitprop such as Gang of Four as it was by [heavy metal](#), and Helmet molded a background in [jazz](#) and [noise-rock/post-hardcore](#) influences into an influential strand of intense rock music.

As the 90s progressed, nu metal's sound became more standardized as newer bands drew inspiration for the same collective set of influences including RATM, Korn, Nine Inch Nails, and Helmet. Helmet in particular, with its downtuned riffs and aggressive dissonance, created the sonic template for nu-metal.

Although Nine Inch Nails and Ministry are viewed more often as [industrial rock](#) or [industrial metal](#), their presence has also lived up as origin to nu-metal bands that would appear later, such as Marilyn Manson, Rob Zombie, Orgy, Dope, Static-X and Powerman 5000 (fronted by Rob Zombie's/Cumming's younger brother). All of these bands have shown themselves to follow the same fusion of metal aspects with other genres that nu metal holds reign to, with the inclusion of industrial/techno influenced beats, rhythms and sequencers.

## Grunge, Post-Grunge and Nu-Metal

After Kurt Cobain's death in 1994, the viability of other bands in the [grunge](#) scene would follow: Alice In Chains' appearances would be sporadic due to Layne Staley's reclusive (and eventually fatal) drug addiction, Soundgarden would record only one more full-length, "Down on the Upside", before splitting up the following year, and Pearl Jam would scrap the rainy bleakness of "Ten" in favor of more politically-focused rock songs, mostly taking form as a side-project with singer Eddie Vedder.

Perhaps more than any other musical definition, Grunge is the most recognizable ancestor of nu-metal; the quick jolts of distorted guitar chords, tortured vocals and lyrics of angst have found clear public display in signature nu-metal artists, including those with a reputation for initiating "hip hop" into their sound.

The most apparent offspring to Grunge is [Post-Grunge](#), which is often quickly dismissed as nu-metal. Whether it is or isn't is a subject of debate or matter of opinion. However, arguments on both sides are usually valid.

Days of the New is perhaps the first post-grunge band with a sound that best defines the groups that would precede: Mostly acoustic riffs, and a less iconoclastic, more radio-driven mentality likelier to appeal to an older, mainstream audience. Creed, Nickelback and 3 Doors Down are nondebatable examples of post-grunge bands.

Others, such as Cold, Staind, and Puddle of Mudd have been seen as both, since the song paces are usually faster, the guitars are louder, and the consumer field is generally younger and usually a fan of what could comfortably be defined as "nu-metal".

# Sounds, constructs, and lyrics

## Lyrical themes

Specifically, [lyrics](#) of most [nu-metal](#) bands reflect on the stresses and mishaps of everyday life from the eyes of a teenager. Topics range from childhood alienation and abuse, socio-economic status, relationship/marital difficulties, dealing with feelings of stress/anxiety/depression and unprovoked anger at one's peers/family members..

Drug use, particularly marijuana and heroin, is also mentioned, usually in an celebratory or sarcastic manner. There is usually a fine line drawn for the latter, as a few prominent singers (and sometimes other band members) admitted to extremely hardcore drug addiction in the past and use music as "therapy" to denounce, or in some cases promote, their days before they quit using their chosen drug.

Political progressivism and activism is a least common item, but still noticeable in many [nu-metal](#) bands, especially those that either influenced or started the genre in the early 1990's. More often, this is usually discussed candidly rather than in songs.

## Vocals

In the 1990s, many bands began to mix rapping and other vocal techniques with traditional heavy metal guitar and drum sounds. As a result, fans and music journalists needed to differentiate between the more traditional heavy metal music and this "new breed" of bands who were using samples, [DJs](#), rapping, and [drum machines](#) in a way that made their music distinct. "New metal" was the name given to the genre, quickly evolving into the trendier spelling "nu metal," and a genre was vaguely defined.

Nevertheless, some distinction is usually maintained between bands that use rapping vocals, and those that don't. Bands featuring rap vocals are sometimes loosely called Rap Metal, or, [Rapcore](#), both terms used by fans to depict a combination of singing, screaming, and/or rapping (for example, the vocals of Limp Bizkit and Linkin Park). Furthermore, some nu metal artists use no rapping at all.

Tool has been a recognizable origin for some nu-metal vocal styles, if not nu-metal in general. Although dedicated fans distance the band as "different" and "progressive" compared to other popular rock acts, Chevelle's Pete Loeffler, Inner Surge's Steve Moore, Taproot's Stephen Richards and even Limp Bizkit's Fred Durst have cited Maynard James Keenan's signature "drone" style as an influence.

## [Guitar](#)

While other metal genres were very guitar-based, with intricate guitar solos and complex riffs forming an important part of most songs, nu metal generally emphasizes the guitar as a rhythmic instrument. The riffs often consist of only a few different [notes](#) or power chords played in rhythmic, syncopated patterns. To emphasize this rhythmic "pulse," nu metal guitarists generally make liberal use of palm muting, a technique which itself blurs the boundary between a melodic note and rhythmic note. Unlike classic eighties thrash however, these palm mutes are widely spaced out and blend easily into the surrounding riffs. Another common tactic is the use of de-tuned strings (in drop-D or lower, sometimes

adding a seventh string) whose lower [pitch](#) creates a thicker, more resonant sound. Many nu metal guitarists occasionally use natural harmonics. The opening riff of Linkin Park's "One Step Closer" is a representative example of many of the above techniques. Guitar solos are generally not part of nu-metal songwriting, though some bands do use them, such as Adema, Inner Surge, Saliva and System of a Down. When they are used, solos in nu metal generally rely on blues based scales, as opposed to the more technical solos of other metal genres. Another aspect of nu-metal guitar work is the use of electronic effects. Usually outboard effects pedals are manipulated to enhance simple single note riffs or add to simple to play chord riffs. Luminaries of nu metal such as Korn, Deftones, and Limp Bizkit have all utilized this trait in their work. Helmet has been cited as one of the biggest nu metal guitar influences, along with Machine Head (band), Prong and Fear Factory.

## [Bass](#)

The speed and skill of a bassist in most metal genres plays a large part of outcome in the band's sound, complementing percussive tempos (and occasionally the guitar riffs) to add a strong rhythm to the tone.

In nu-metal, however, the bass is often the primary instrument, with guitarwork acting as a backing instrument, or sample in some cases, for a more "hip-hop geared" nu-metal.

Although the nu-metal "bass line" is hard to classify, the "slap style" style made popular by Michael Balzary, Billy Gould and Les Claypool would be forefront in the styles of latterday bassists like Justin Chancellor, Reginald Arvizu and Sam Rivers, who would follow in becoming influences themselves.

The nu-metal bass is also slower than most other metal genres, strutting a funkier, louder sound more geared towards making people dance and move with the beat, than to complement the other instruments. Some people have said that Nu Metal's bass often competes in volume with the bands vocalist.

## [Drums](#)

Nu-metal drummers usually play in the vein of basic 4/4 beats (some say this could be from the hip hop influence) but often reach beyond patterns used in other metal genres, for more syncopated beats, such as Eastern [dance](#) rhythms (as played by John Dolmayan of System of a Down), jazz drumming, and the complex breakbeats of hip hop. One of the most important aspects of nu-metal drumming, and the music in general, is that the tempo rises above the established 'alternative' midtempo range on a songs chouras. This is an almost universal rule with Slipknot and System of a down being two rare exceptions. Also, many notable nu-metal bands feature a DJ who provides sampled "beats" and other effects. Two of the more famous nu-metal DJs are DJ Lethal and Joe Hahn.

# Alto

In [music](#), an **alto** or **contralto** is a [singer](#) with a [vocal range](#) somewhere between a [tenor](#) and a [mezzo-soprano](#). The term is used to refer to the deepest female singing voice, or one of the highest male voices. A typical alto will have a range from around the F below middle C to the E a tenth above middle C (i.e. F3-E5); at the bottom of their range, altos sound almost like [tenors](#). Some altos have even larger ranges; from the C below middle C to the C two octaves above (C3-C6 if middle C is C4). In four part [choral](#) harmony, the alto is the second highest voice. Altos originally sang from music written in the alto clef, but now use the treble clef.

Although both men and women may have voices in the alto range, the word is usually used to mean a female singer. However, choirs singing [early music](#) frequently include adult male altos, also called countertenors. In English church usage, the term *alto* is sometimes exclusively used to mean a boy with this range, while **contralto** is used for a female singer. However, this is not done consistently, and for most practical purposes, *alto* and *contralto* can be thought of as synonyms (the phrase "boy alto" can be used if there is a chance of misunderstanding). A few popular music enthusiasts define the contralto and alto separately, as the contralto having an especially dark range, from the D above low C to Tenor C, which is essentially a female of tenor range, while alto is a voice with a range from F below middle C to the F an eleventh above middle C, and is closer to the [mezzo-soprano](#). The majority however define contralto and alto as synonyms, and assign the adjectives light and dark, with a dark alto being a female of tenor range, while a light alto, commonly referred to as simply alto, to include mezzo-sopranos as well.

In medieval polyphony the principal voice was the [tenor](#). When additional voices were added, they were called *contratenor*, "against the tenor." When two such voices were added they were called *contratenor alto* and *contratenor bassus*, indicating *high* and *low* respectively. So *alto* essentially means *high voice*.

Contraltos are fairly rare in [opera](#) (and in general), since there is very little work that was written specifically for them. Most of the time, contralto roles are limited to maids, mothers and grandmothers, but they do occasionally get notable roles, with witches being the most common outside of the three former roles. (A common saying among contraltos is that they're only allowed to play "witches, bitches, or britches.") Baroque opera features a large number of alto roles, often these were written for castrati, nowadays they are sung by countertenors

The word alto is often applied to instruments to indicate their range in relation to other instruments of the same group. In common usage, particularly among [jazz musicians](#), the word has become synonymous with the alto [saxophone](#). In US usage the alto horn is an Eb saxhorn, a [brass instrument](#).

## Ambient house

**Ambient house**, a mix between [house music](#) and [ambient music](#) is a music style that describes itself as dreamy, chill out and quiet music. Ambient house usually has no beats but can have an underlying rhythm. Pioneering work was done in the 1970s and 1980s by people like Brian Eno and Klaus Schulze. In the end of the 1980s, when [house music](#) was born, people like Mix Master Morris, Dr. Alex Paterson and Pete Namlook filled the chill out rooms of house parties with music where people could relax from dancing.

## Key albums

Sueño Latino - Sueño Latino (1989) (single)  
Jimmy Cauty - Space (1990)  
The KLF - Chill Out (1990)  
Biosphere - Microgravity (1991)  
The Orb - Adventures Beyond the Ultraworld (1991)  
The Irresistible Force (Mix Master Morris) - Flying High (1992)  
Juno Reactor - Transmissions (1993)  
Pete Namlook - Air (1993)  
Tetsu Inoue - Ambient Otaku (1994)  
FFWD - FFWD (1994)  
The Future Sound Of London - My Kingdom (1996)

## Ambient noise

**Ambient industrial** is a hybrid genre of [ambient](#) and [industrial music](#); the term industrial being used in the original experimental sense, rather than in the sense of [industrial metal](#) or [EBM](#). Ambient industrial makes use of Industrial principles such as use of [anti-music](#), extra-musical elements and shock tactics, but wields these elements with more subtlety. Additionally, ambient industrial often has strong occultist tendencies, with a particular leaning toward Chaos Magick (the image of the Black Sun is one that comes up repeatedly in post-Industrial music), often giving the music a highly ritualistic flavor.

Ambient industrial is one of several directions that post-Industrial music took on after the breakup of Throbbing Gristle (the founders of Industrial as an art movement) in 1981 ended the Industrial period proper. Indeed, the last material that TG recorded, at least in the studio, *Journey Through a Body* and *In the Shadow of the Sun*, was ambient industrial work and pointed to the direction that several of TG's offshoots (most notably Coil and CTI) would take.

Among the many artists who work in this area are Coil, CTI, Lustmord, Hafler Trio, Nocturnal Emissions, Zoviet France, PGR, Thomas Köner, Controlled Bleeding, and Deutsch Nepal. It is important to note, however, that many of these artists are very eclectic in their output, with much of it falling outside of ambient industrial per se.

A "typical" ambient industrial work (if there is a such thing) might consist of evolving dissonant harmonies of metallic drones and resonances, extreme low frequency rumbles and machine noises, perhaps supplemented by gongs, percussive rhythms, bullroarers, distorted voices and/or anything else the artist might care to sample (often processed to the point where the original sample is no longer recognizable). Entire works may be based on radio telescope recordings (*Arecibo Trans-Plutonian Transmissions*), the babbling of newborn babies (Nocturnal Emissions *Mouths of Babes*), or sounds recorded through contact microphones on telegraph wires (Alan Lamb's *Primal Image*).

## Ambient noise

**Ambient noise** is a subgenre involving the construction of "noisescapes", that is, soundscapes created out of walls of extreme noise. Closely related to [noise music](#) and power electronics, this anti-music may not strike the uninitiated listener as being very close to ambient music. To those more familiar with noise, these works have a distinct ambient quality that distinguishes them from the harsh noise of Merzbow or Whitehouse. An example would be the distorted low-frequency/high-volume sonics of Daniel Menche, which are evocative of the cthonic sounds of a subway tunnel, an underground boiler-room in a factory, or the afterburner of a jet engine. Other examples of ambient noise would be works by Aube, Arcane Device, some work by NON, and some of PGR's collaborations with noise artists like Merzbow.

## Subgenres

[Dark ambient](#) - [Dronology](#) - [Lowercase](#)

## Fusion genres

[Ambient house](#) - [Illbient](#) - [Psybient](#) - [Ambient industrial](#)

**Ambient music** is a loosely defined [musical genre](#) that incorporates elements of a number of different styles - including [jazz](#), [electronic music](#), [new age](#), [rock and roll](#), modern [classical music](#), [reggae](#), [traditional](#), [world](#) and even [noise](#).

" *Ambient Music must be able to accommodate many levels of listening attention without enforcing one in particular; it must be as ignorable as it is interesting.* "

— Brian Eno (*Music for Airports* liner notes , September 1978)

## Overview

The earliest electronic soundscape music and theories come from the work of Pierre Schaeffer who followed the futurists in classifying music into categories such as man made, natural, short and long. He made some of the first electronic music using record players and natural sounds, and cutting up tape, making the first experimental music use of recording and magnetic tape. Even his work can be seen as preempted by Shopenhauer's ideas of 'soundworlds', literally worlds made up entirely of sounds. Karlheinz Stockhausen created pioneering electronic musical experiments later in 1955, and these two (amongst others) lay the groundwork for ambient music to appear decades later when music technology had developed.

The term "ambient music" was first coined by Brian Eno in the late 1970s to refer to music that would envelop the listener without drawing attention to itself, that can be either "actively listened to with attention or as easily ignored, depending on the choice of the listener" (Eno, who describes himself as a "non-musician" termed his experiments in sound as "treatments" rather than as traditional performances). Hence, Brian Eno is considered the father of ambient music: his 1978 release *Ambient 1: Music for Airports* includes a manifesto describing this music. Although having coined the word "ambient", he is also quick to reference the works and influence of Erik Satie. Eno coined the term in an essay to distance his work from elevator music and Muzak, it is more often similar to mood music or an ambient background in movie and radio sound effects. Often listeners will forget they are listening to ambient music, which is one of the biggest attractions of the genre. It can be any musical style, including jazz, electronic music and modern classical music.

Some of the works of the 20th century French composer Erik Satie, today best known for his *Trois Gymnopédies* suite, can be regarded as predecessors of modern ambient music. He referred to some of his music as "Musique d'ameublement" ('furniture music', or more literally, 'music for the furniture' and 'music to mingle with knives and forks', referring to something that could be played during dinner and would simply create an atmosphere for that activity rather than be the focus of attention. Similarly some of the works of the French composer Edgard Varèse, who used the theremin extensively in his compositions as well as atonal techniques and non-standard time signatures, can also be viewed as predecessors of ambient music. John Cage created the ultimate ambient work with his *4'33"*, three periods of silence first played on the piano, which make the audience listen to the ambient sound surrounding them. Cage inspired minimalist composers such as La Monte Young, Morton Feldman, Terry Riley, Steve Reich and Philip Glass also influenced Eno's groundbreaking style, and ambient music can be seen as a kind of minimalism.

Early albums by Pink Floyd (such as *Ummagumma* and *Meddle*) and by the "kosmische music"-oriented [krautrock](#) artists, like Tangerine Dream, Popol Vuh, and Cluster have greatly influenced the genre. Among the first [electronic](#) ambient albums were *Affenstunde* (1970) and *In Den Garten Pharaos* (1971) by Popol Vuh. Another important album was *Sonic Seasonings* (1972) by Wendy Carlos. Other early artists such as Klaus Schulze (a former member of Tangerine Dream and Ash Ra Tempel), Jean-Michel Jarre, and Kraftwerk in the 1970s and 1980s were influential. In the 1970s, some ambient, krautrock, and other musicians who were influenced by new age spirituality created the eclectic genre known as [New Age music](#), selling millions independent from the mainstream music industry by direct order or new age shops. By the 1980s, New Age music had become so much better known than ambient music, that ambient was taken as a synonym for "New Age", and many ambient musicians deliberately took on new age themes to market themselves to this audience.

Beginning in the 1980s, Ambient music influenced some pop bands (examples can be found among instrumentals by New Order, Simple Minds and U2). Later, electronic dance music and synth pop merged in many artists' works with the dreamy, meandering sound of Eno-style ambient music. Under the guise of various styles, this new genre sometimes referred to as [ambient house](#), ambient techno, ambient dub, [IDM](#), ambience, or simply "ambient" in common use, saw the birth of a new wave of artists like The Orb, Aphex Twin, the Irresistible Force, and Geir Jenssen's Biosphere.

Early Warp records artists, (as well as later ones such as Aphex Twin), FSOL Future Sound of London (Lifeforms, ISDN) Autechre, (Incunabula, Amber), Boards of Canada, Massive Attack, Portishead, and The KLF all took a part in popularising and diversifying ambient music. There are now a dizzying array of different sub-genres, festivals, websites, discussion lists, clubs, labels and artists making new, interesting, original music.

## Derivative forms and sub-genres

### Organic ambient music

Organic ambient music is characterised by integration of [electronic](#), electric, and acoustic musical instruments. Aside from the usual electronic music influences, organic ambient tends to incorporate influences from [world music](#), especially drone instruments and hand [percussion](#). Organic ambient is intended to be more harmonious with nature than with the [disco](#). Some of the artists in this sub-genre include Robert Rich, Steve Roach, Vidna Obmana, O Yuki Conjugate, James Johnson, Loren Nerell, Numina, and Tuu.

Some works by ambient pioneers such as Brian Eno, which use a combination of traditional (such as piano) and electronic instruments, would be considered organic ambient music in this sense. In the 70's and 80's Klaus Schulze often recorded string ensembles and performances by solo [cellists](#) to go along with his extended [Moog synthesizer](#) workouts.

### Nature inspired ambient music

The music is composed from samples and recordings of naturally occurring sounds. Sometimes these samples can be treated to make them more instrument-like. The samples may be arranged in repetitive ways to form a conventional musical structure or may be random and unfocused. Sometimes the sound is mixed with urban or "found" sounds. Examples include much of Biosphere's *Substrata*, Mira Calix's insect music and Chris Watson's *Weather Report*. Some overlap occurs between organic ambient and nature inspired ambient. One of the first albums in the genre, Wendy Carlos' *Sonic Seasonings*, combines sampled and synthesized nature sounds with ambient melodies and drones for a particularly relaxing effect.

### Dark ambient

*Main article:* [Dark ambient](#)

[Dark ambient](#) is a general term for any kind of ambient music with a "dark" or dissonant feel, but often involves extensive use of digital reverb to create vast sonic spaces for frightening, bottom-heavy sounds such as deep drones, gloomy male chorus, echoing thunder, and distant artillery. It has a relentlessly gothic feel. Lustmord's collaboration with Robert Rich *Stalker* epitomizes this sub-genre. Related styles include **ambient industrial** and **isolationist ambient**.

### Ambient industrial

*Main article:* [Ambient industrial](#)

Ambient industrial is a hybrid genre of ambient and [industrial music](#); the term industrial being used in the original experimental sense, rather than in the sense of [industrial metal](#) or [EBM](#). A "typical" ambient industrial work (if there is a such thing) might consist of evolving dissonant harmonies of metallic drones and resonances, extreme low frequency rumbles and machine noises, perhaps supplemented by gongs, percussive rhythms, bullroarers, distorted voices and/or anything else the artist might care to sample (often processed to the point where the original sample is no longer recognizable). Entire works may be based on radio telescope recordings, the babbling of newborn babies, or sounds recorded through contact microphones on telegraph wires.

Among the many artists who work in this area are Coil, CTI, Lustmord, Susumu Yokota , Hafler Trio, Nocturnal Emissions, Zoviet France, PGR, Thomas Koner, Controlled Bleeding, and Deutsch Nepal. It is important to note, however, that many of these artists are very eclectic in their output, with much of it falling outside of ambient industrial per se.

## Isolationist ambient music

Also known as **isolationism**. The term was popularized in the mid-1990s by the British magazine *The Wire* and the *Ambient 4: Isolationism* compilation from Virgin, this began as more or less a synonym for ambient industrial, but also inclusive of certain post-techno streams of ambient, such as Autechre and Aphex Twin. The Sombient label is now the primary purveyor of isolationist ambient, in particular with the "drones" compilation series. Some of the artists known for this style of ambient music include Robert Fripp.

## Other 'less ambient' ambient styles

There are many other styles which identify themselves as ambient music. There is information on these styles on other pages, but many artists who are not in the new age world of music making produce albums which mix beatless ambient music with downtempo electronica, so the categories have blurred edges. Chill out (music) is generally linked to club culture and is sometimes used as a term which includes ambient music as a subset of itself. UK techno developed in particular at Warp Records in Sheffield, where previous electronic pioneers such as Cabaret Voltaire and Autechre laid the groundwork for ambient techno to develop, and for Aphex Twin and Boards of Canada to develop later. From this scene developed ambient dub and ambient techno. [Intelligent Dance Music](#) is another term synonymous with this scene. Electroacoustic and acousmatic music are 'classical' art music forms that use electronic sound creation instead of or alongside acoustic instruments. [Glitch](#) music is a subset of this work. Some club groups have made live ambient music, mixing dub techniques and styles with ambient textures and dance grooves, for example artists such as Sonic State, Junkielover, the Orb, Chillage People, H.U.V.A. Network, Solar Fields, The Starsound Orchestra, and the Kuma Mela Project.

## Ambrosian chant

**Ambrosian chant** (also known as **Milanese chant**) is the liturgical [plainchant](#) repertory of the Ambrosian rite of the Roman Catholic Church, related to but distinct from [Gregorian chant](#). It is primarily associated with the Archdiocese of Milan, and named after St. Ambrose much as Gregorian chant is named after Gregory the Great. It is the only surviving plainchant tradition besides the Gregorian to maintain the official sanction of the Roman Catholic Church.

# History

The history of Milan as a center for religious music goes back to St. Ambrose. Ambrose is not known to have composed any of the Ambrosian chant repertory, much as Gregory the Great is not known to have composed any Gregorian chant. However, during his fourth-century tenure as Bishop of Milan, he is credited with introducing hymnody from the Eastern Church into the West. Ambrose composed original hymns as well, four of which still survive, along with music which may not have changed too much from the original melodies. In his writings, Ambrose refers only to the performance of antiphonal [psalms](#), in which solo singing of psalm verses alternated with a congregational refrain called an *antiphon*.

Over time, the Milanese liturgy developed into the Ambrosian rite, which shares more in common with the Gallican and Mozarabic rites than with the Roman. Ambrosian chant developed to meet the particular needs of the Ambrosian liturgy. Although the Ambrosian rite is liturgically related to other rites and Ambrosian chant is musically related to other plainchant traditions, different categories of chant, different chant texts, and different musical styles make Ambrosian chant a distinct musical repertory. By the 8th century, this chant was attested to be normative across northern Italy, perhaps reaching into southern Italy as well.

Between the 8th and 13th centuries, however, the Carolingian chant commissioned by Charlemagne developed into what we now know as [Gregorian chant](#), which began to influence and eventually replace most of the other Western plainchant traditions. By the 12th century, the [Mozarabic](#), Gallican, Celtic, Old Roman, and [Beneventan chant](#) traditions had all been effectively superseded by Gregorian chant. Ambrosian chant alone survived, despite the efforts of several Popes over a period of several centuries to establish Gregorian hegemony. A chronicle by the Milanese historian Landolphus from around the year 1000 recounts a legend that two Sacramentaries, one Gregorian and one Ambrosian, were placed on an altar to see which chant had divine acceptance; miraculously, both books opened simultaneously, showing both were equally acceptable.

Ambrosian chant did not wholly escape Gregorian influence. The earliest 8th-century fragments, and the more complete chantbooks from the 11th and 12th centuries that preserve the first recorded musical notation, show marked differences between the Gregorian and Ambrosian repertories. Later additions to the Ambrosian repertory, whose style differs from the earlier chants, may reflect Gregorian influence. Although St. Charles Borromeo fought to keep the Ambrosian rite intact during Spanish occupation, a contemporary edition of Ambrosian chant, published by Perego in 1622, attempts to categorize the Ambrosian chants into the eight Gregorian [modes](#), which is not generally accepted as an accurate reflection of the actual musical practice of the time.

Ambrosian chant has survived to the present day, although its use is now limited primarily to the greater part of the Archdiocese of Milan and environs, parts of Lombardy, and parts of the Swiss Diocese of Lugano. Most recently, it survived the changes to the liturgy established by Vatican II, in part due to the prior tenure of Pope Paul VI as Archbishop of Milan.

## General characteristics

Ambrosian chant is largely defined by its role in the liturgy of the Ambrosian rite, which is more closely related to the northern "Gallic" liturgies such as the Gallican rite and the Mozarabic rite than the Roman rite. Musically, however, Ambrosian chant is closely related to the [Gregorian](#) and Old Roman chant traditions. Many chants are common to all three, with musical variation.

Like all [plainchant](#), Ambrosian chant is monophonic and a cappella. In accordance with Roman Catholic tradition, it is primarily intended to be sung by males, and many Ambrosian chants specify who is to sing them, using phrases such as *cum Pueris* (by a boys' choir) and *a Subdiaconis* (by the subdeacons).

Stylistically, the Ambrosian chant repertoire is not generally as musically uniform as the Gregorian. Ambrosian chants are more varied in length, ambitus, and structure. Even within individual categories of chant, Ambrosian chants vary from short and formulaic to prolix and melismatic, and may be freely composed or show significant internal [melodic](#) structure. Its most distinctive feature compared with other plainchant repertoires is a significantly higher amount of stepwise motion, which gives Ambrosian melodies a smoother, almost undulating feel. In manuscripts with musical notation, the neume called the *climacus* dominates, contributing to the stepwise motion. Jazzier, more ornamental neumes such as the *quillisma* are nearly absent from the notated scores, although it is unclear whether this reflects actual performance practice, or is simply a consequence of the relatively late musical transcription.

The Gregorian system of modes does not apply to Ambrosian chant. Although there are no b-flats indicated in the musical notation, it seems likely that they were understood, based on Guido d'Arezzo's description of the "*more perdulcis Ambrosii*."

Nearly all of the texts used in Ambrosian chant are biblical prose, not metrical poetry, despite Ambrose having introduced Eastern hymnody to the West. Ambrosian chant serves two main functions in the Ambrosian liturgy: to provide music for the chanting of the [Psalms](#) in the monastic Offices, and to cover various actions in the celebration of the Mass.

## Chants of the Office

The Office chants of the Ambrosian repertoire are still largely unresearched, so only preliminary evaluations have been made.

The minor hours have little of musical interest: some [hymns](#), and the simplest of reciting tones only. The main chants of the Office are those of Matins, Vespers and the Vigils.

The [Psalms](#) are sung at Matins and Vespers in a rotating schedule so that all 150 Psalms are chanted every two weeks. The Psalms are each sung to a *psalm tone*, with a simple antiphon between each verse. The system of psalm tones in Ambrosian chant differs in several respects from the Gregorian system of psalm tones. In the Gregorian system, psalm tones are based on the mode of the antiphon. Ambrosian chants, including psalm antiphons, do not conform to the Gregorian system of modes. Each Ambrosian psalm antiphon belongs to one of four different *series* depending on its final pitch. Within each series, there are several possible psalm tones corresponding to the predominant pitch of the antiphon, which may or may not correspond to the "dominant" pitch of Gregorian modes. Finally, each psalm tone is given a cadential formula that lets the tone segue smoothly back into the antiphon. This system results in a much larger number of possible psalm tones in Ambrosian chant than exists in Gregorian chant. Structurally, psalm tones in Ambrosian chant consist of an incipit, a recitation formula, and a cadence, lacking the mediant flex found in Gregorian psalm tones.

Other Vespers chants include the *Psallendae* and the *Antiphonae in choro*. *Psallendae* comprise the largest category of Ambrosian Office chants. Two *Psallendae*, similar to the Marian antiphons of Gregorian chant, are performed on the more solemn Vespers, to cover processions. They conclude with one of several recitation tones that segue into the *Gloria Patri*. *Antiphonae in choro* are similar in style, but have no psalm or verse.

*Responsoria* occur in both Matins and Vespers. Their names often identify who is to sing them: the boys' choir, the deacon, the subdeacons, and so on. A Responsorium usually consists of a refrain called a respond, a verse, and a repetition of an expanded part of the respond. These expansions contain some of the longest melismas of the Ambrosian chant repertoire, which often contain complex repeat structures.

Vespers begin with a chant called the *Lucernarium* and end with the *Completorium*. The word *Lucernarium* harkens back to the original function of Vespers as a time of lighting lamps, and the texts of *Lucernaria* usually contain some reference to light, such as *Quoniam tu illuminas*, *Paravi lucernam*, and *Dominus illuminatio*. Stylistically, *Lucernaria* and *Completaria* vary. Some are *proper*, specific to certain feasts, while others are *ordinary* and can be used throughout the year. They range from highly elaborate chants to simple reciting tones. There are relatively few *Lucernaria* and *Completaria*; four *Completaria* are used for all but three days of the year.

# Chants of the Mass

The Mass is the Christian celebration of the Eucharist. Plainchant occurs prominently in the Mass for several reasons: to communally affirm the faith, to expand on the scriptural lessons, and to cover certain actions. The chants of the Mass divide into the ordinary, whose texts are invariable, and the proper, whose texts change depending on the feast. There are several differences between the Ambrosian rite and the Roman rite, which are reflected in the Ambrosian and Gregorian chant traditions.

## Ordinary chants of the Mass

The ordinary chants consist of the *Laus Missa* or Gloria, the Symbolum, and the Sanctus. The Symbolum corresponds to the Credo in the Roman rite. Unlike Gregorian chant, there is no Agnus Dei nor *Ite missa est*, and the Kyrie does not exist as a separate category of chant.

Only a small number of each of these ordinary chants exist: four Gloria melodies, four Sanctus melodies, and just one melody for the Symbolum. The Symbolum melody is quite simple, just a slightly ornamented reciting tone. Of the four Gloria melodies, one is simple like the Symbolum melody, one is an expanded version of the simple melody, and one is a freely composed syllabic and neumatic melody consisting of only one or just a few pitches per syllable. The fourth melody is elaborately melismatic. All four melodies segue into a very simple threefold Kyrie chant.

Only two of the few Sanctus melodies are regularly used, both fairly simple.

## Proper chants of the Mass

The *Ingressa* corresponds to the Introit in the Roman rite. Unlike the Introit, the *Ingressa* has no psalm verse or doxology. While the Introit fills in the time that the celebrant processes to the altar, the *Ingressa* is sung during the censing of the altar.

The next three proper chants follow and amplify three readings from Scripture. The Psalmellus follows the Prophecy, the Old Testament reading, and corresponds to the Gregorian Gradual. The Post Epistolam or Alleluia follows the reading of the Epistle, and corresponds to the Gregorian Alleluia. Ambrosian Alleluias show an even higher degree of adaptation, reusing melodies for the texts of different feasts, than do the Gregorian Alleluias. Unlike the Gregorian Alleluia, the Ambrosian Alleluia kept an extended repeat called the jubilus. During penitential periods, the Post Epistolam is replaced by the Cantus, which corresponds to the Gregorian Tract. The Cantus melodies belong to a common type, related to the Old Roman and [Beneventan chant](#) traditions. The chant following the final lesson, from the [Gospel](#), is the *Post Evangelium*, which has no counterpart in the Roman Rite.

The *Offertorium* is sung during the bringing of gifts to the altar, corresponding to the Gregorian Offertory. While the Gregorian Offertories had lost their verses by the 12th century, some Ambrosian Offertoria retained their verses, every bit as complex as their defunct Gregorian counterparts.

The *Confractorium* is sung during the breaking of the bread, which has no counterpart in Gregorian chant. Finally, the *Transitorium*, so called because it originally involved the transfer of a book to the opposite side of the altar, corresponds to the Gregorian

Communion. Many Transitorium texts are direct translations of Greek originals, although the melodies are not demonstrably Byzantine.

The Ingressa, Post Evangelium, Confractorium, and Transitorium never have verses, while the other chants may have responds and verses, up to three verses for some Cantus melodies. The Psalmellus, Post Evangelium, Offertoria, and Transitoria sometimes show complex repeat structures.

## Amen break

The "**Amen break**" (usually pronounced /ˈɛjɪmbrɛk/) is one of the most frequently used sampled [drum](#) loops in jungle and [drum and bass](#) music. It consists of 16 beats of the drum [break](#) lifted from the song "Amen, Brother" as performed by the 1960s [funk/soul](#) outfit The Winstons. The song is an uptempo instrumental rendition of an older [gospel music](#) classic. The Winstons' version was released as a B-side of the 45 rpm [7"](#) vinyl single "Color Him Father" in 1969 on Metromedia, and is currently available on several compilations and on a 12" vinyl rerelease together with other songs by The Winstons. It is unknown, but doubtful, whether the drummer, G.C. Coleman, has received any royalties for the sampling of his drum part.

The Amen break can be found in many different forms: looped straight as in oldschool jungle, or entirely dismembered and rearranged as in some tunes by artists who have started a new subgenre of hyper-edited drum and bass. These artists include Squarepusher, Aphex Twin, ShyFX, and also in some crossgenre artists such as DJ Axera and Gomanda; it is used in literally thousands of [drum and bass](#) songs and (notably) many [hip hop](#) tunes, such as NWA's "Straight Outta Compton". The Amen break has also been used by more well-known musical acts including Perry Farrell and Nine Inch Nails, and can even be heard in the background of car commercials and television shows such as The Amazing Race and Futurama.

The Amen break's popularity probably lies in both the rough, funky, compressed style that the drums are recorded in as well as the "swing" and "groove" of the drummer who originally played the solo. The original song is also quite fast, making it more suitable for uptempo music genres such as jungle and drum-and-bass. A few other popular drum and bass breaks are sampled from Lyn Collins' "Think About It", Bobby Byrd's "Hot Pants – I'm Coming, Coming, I'm Coming" (Bonus Beats), James Brown's "Funky Drummer", and The Incredible Bongo Band's "Apache".

## American classical music

**American classical music** is music written in the United States but in the [European classical music](#) tradition. In many cases, beginning in the 18th century, it has been influenced by American folk music styles; and from the 20th century to the present day it has often been influenced by [folk](#), [jazz](#), [blues](#), and [pop](#) styles.

Jazz music is sometimes referred to as American classical music, mainly by jazz musicians. They feel that, being as jazz originated in America, jazz is the true American classical music.

## Beginnings

If "classical" can be taken to mean what it often in fact means, "serious", then the earliest American classical music consists of part-songs used in religious services during Colonial times. The first music of this type in America were the psalm books, such as the Ainsworth Psalter, brought over from Europe by the settlers of the Massachusetts Bay Colony. The first music publication in English-speaking North America — indeed the first publication of any kind — was the Bay Psalm Book of 1640.

Many American [composers](#) of this period worked (like Benjamin West and the young Samuel Morse in painting) exclusively with European models, while others, such as William Billings, Supply Belcher, Daniel Read, Oliver Holden, and Justin Morgan, also known as the First New England School, developed a native style almost entirely independently of European models. Many of these composers were amateurs, and many were singers: they developed new forms of sacred music, such as the fusing tune, suitable for performance by amateurs, and often using harmonic methods which would have been considered bizarre by contemporary European standards. Some of the most unusual innovators were composers such as Anthony Philip Heinrich, who received some formal instrumental training but were entirely self-taught in composition. Heinrich traveled extensively throughout the interior of the young United States in the early 19th century, recording his experiences with colorful orchestral and chamber music which had almost nothing in common with the music being composed in Europe. Heinrich was the first American composer to write for symphony orchestra, as well as the first to conduct a Beethoven symphony in the United States (in Lexington, Kentucky in 1817).

## **Second New England School**

During the mid to late 19th century, a vigorous tradition of home-grown classical music developed, especially in New England. The composers of the Second New England School included such figures as George Whitefield Chadwick, Amy Beach, Edward MacDowell, and Horatio Parker, who was the teacher of Charles Ives. Many of these composers went to Europe — especially Germany — to study, but returned to the United States to compose, perform, and acquire students. Their intellectual and stylistic descendants, such as Howard Hanson, Walter Piston, and Roger Sessions, and have remained through the 20th and into the 21st centuries in the major universities in the cities of the northeast and elsewhere.

# Joplin

African-American composer Scott Joplin was one of the most significant self-defined classical composers of the late 19th and early 20th centuries. Although first revived after the end of the Jim Crow era by William Bolcorm as the inventor of the popular genre [ragtime](#), it is clear from Joplin's Maple Leaf Rag and his opera Treemonisha, that he intended to join a classical tradition.

A "popular" song maintains consistency, but the Maple Leaf rag explores tonality and pacing, and Treemonisha set itself to a serious subject, which for Joplin was the betterment of his people as a nation.

## 20th century

In the early 20th century, George Gershwin was greatly influenced by [African American music](#); however, this was during an era of legally enforced "Jim Crow" segregation during which his music perhaps enjoyed undue fame owing to the refusal of white listeners to listen to music that formed Gershwin's sources. On the other hand, he created a convincing synthesis of music from several traditions once considered to be irreconcilable, and which continues to enjoy enormous popularity.

Many of the major classical composers of the 20th century were influenced by folk traditions, none more quintessentially, perhaps, than Aaron Copland. Other composers adopted features of folk music, from the Appalachians, the plains and elsewhere, including Roy Harris, William Schuman, David Diamond, and others. Yet other early to mid-20th century composers continued in the more experimental traditions, including such figures as Charles Ives, George Antheil, and Henry Cowell.

## Glass

In the 1980s, after a period during which self-defined American "classical" composers like John Cage adopted atonal structures and thought of themselves less American than Modern composers, Philip Glass revived tonality and traditional genres, such as opera in works like *Einstein on the Beach*. Glass re-created a semi-mass market for "classical" music, made in America because audiences outside of an avant-garde had simply refused to sit still for Modernist, [atonal](#) music, whether from America or Europe.

A pessimist model, shared by Aldous Huxley and Theodor Adorno, of the classical tradition in Europe was that it peaked with Beethoven. Aldous Huxley believed that subsequent classical music was vulgarized with the re-entry of the unsublimated erotic, and Adorno believed that commodification entered with Wagner.

The problem for "American classical music" is that it flourished much after Beethoven and was informed by a declining tradition. Gershwin and Copland gave it new life in a similar fashion to the "national" classical composers of Europe like Sibelius and Bartok, by injecting folk themes.

But by Glass's time, American folk had ceased to be a viable option since the "folk" listened to electronically based music. Glass, in order to gain a mass audience, used a stratagem of "prettification" very similar to that of Igor Stravinsky, who while he adopted some Modernist practices, sugar-coated its severity.

A Time magazine article of the 1980s describes "happy sighs" of the American audience during the first notes of a Glass concert, for in the 1980s it was no longer quite fashionable to be patient with atonality, and it had become fashionable in classical circles to demand more immediate gratification.

## American folk music

**American folk music**, also known as Americana, is a broad category of music including [country music](#), [gospel](#), old time music, jug bands, Appalachian folk, [blues](#), Tejano and Cajun and [Native American music](#). The music is considered "American" because it is either native to the United States or there varied enough from its origins that it struck musicologists as something distinctly new; it is considered "roots music" because it served as the basis of music later developed in the United States, including [rock and roll](#), [rhythm and blues](#), and [jazz](#).

Roots musical forms reached their most expressive and varied forms in the first two to three decades of the 20th century. The Great Depression and the Dust Bowl were extremely important in disseminating these musical styles to the rest of the country, as [Delta blues](#) masters, itinerant honky tonk singers and Latino and Cajun musicians spread to cities like Chicago, Los Angeles and New York. The growth of the [recording industry](#) in the same approximate period was also important; increased possible profits from music placed pressure on artists, songwriters and label executives to replicate previous hit songs. This meant that fads like Hawaiian slack-key guitar never died out completely as rhythms or instruments or vocal stylings were incorporated into disparate genres. By the 1950s, all the forms of roots music had led to pop-oriented forms. Folk musicians like the Kingston Trio, pop-Tejano and Cuban-American fusions like [boogaloo](#), chachacha and [mambo](#), blues-derived [rock and roll](#) and [rockabilly](#), pop-gospel, doo wop and [R&B](#) (later secularized further as [soul music](#)) and the [Nashville sound](#) in country music all modernized and expanded the musical palette of the country.

Notable roots musicians include Woody Guthrie, Son House, Blind Lemon Jefferson, Leadbelly, Mahalia Jackson, Washington Phillips, Fiddlin' John Carson (1868 - 1949) and Jean Ritchie (b 1922). More recent musicians who occasionally or consistently play roots music include Keb' Mo', Béla Fleck, Iron & Wine, and Ricky Skaggs. Additionally, the soundtrack to the 2000 comedy film *O Brother, Where Art Thou?* is exclusively roots music, performed by Alison Krauss, The Fairfield Four, Emmylou Harris, Norman Blake and others. The 2003 film *A Mighty Wind* is a tribute to (and parody of) the folk-pop musicians of the early 1960s.

American roots music was the subject of a documentary series on PBS in 2001.

# American hip hop

**America** was the starting place of **hip hop**, a cultural movement that was developed in the 1970s in New York City, among primarily African American and Puerto Rican audiences. For many years, [hip hop](#) remained known only in a few neighborhoods in New York, but it began to spread to nearby urban areas like Philadelphia and New Jersey. By the end of the decade, hip hop was known in many of the United States' most populous cities.

During the early to mid-1980s, hip hop underwent regional diversification, while New York-based [East Coast hip hop](#) attained the first national recognition for recorded hip hop. Cities like Miami, Los Angeles, Washington D.C., Detroit, Atlanta and Chicago developed their own styles, incorporating local influences.

Beginning with N.W.A., [West Coast rap](#), based out of Los Angeles, became a mainstream success. For the first time, New York was not the only city on the hip hop map. The two were rivals in many ways, fueling the East Coast-West Coast rivalry. In the late 1990s, many cities saw their own scenes find popular acclaim. These included Atlanta, St. Louis and New Orleans.

# The East Coast

*Main article:* [East Coast hip hop](#)

## Baltimore

With a somewhat disappointing hip hop scene, Baltimore's biggest claim to fame in rap is its status as the boyhood home of the legendary Tupac Shakur, who attended the Baltimore School for the Arts. There is a scene in Baltimore that is often referred to as Baltimore House. While not traditional hip hop, it incorporates hip hop as well as [house](#) and [drum and bass](#) influences. It is also the birth place of DMX

## Boston

Boston is the hometown of Guru of the East Coast trailblazers, Gang Starr. Other Boston hip hop acts include Mr. Lif and Akrobatik of the Perceptionists, Bell Biv DeVoe, Benzino, and New Jack Swing legend Bobby Brown.

## New Jersey

The African-American neighborhoods of Newark, New Jersey and Jersey City produced many rappers in the early-to-mid 1990s East Coast boom, the most famous of which were Redman and The Fugees. Other Jersey artists include Chino xl, Apache, Artifacts, Joe Budden, and Lords of the Underground. Sugarhill Gang, who achieved fame for their early rap hit "Rapper's Delight" (1979), was based in Englewood, New Jersey, as was their label, Sugar Hill Records.

## New York City

*Main articles:* [East Coast hip hop](#)

New York City (specifically the Bronx) was the birthplace of hip hop, and all of its prime early movers, such as DJ Kool Herc, Grandmaster Flash and Afrika Bambaataa grew up and began performing there. The city also produced all of the style's early stars, like LL Cool J and Kurtis Blow. Other influential artists from this era that have endured through the ages are KRS One, Public Enemy, Run-DMC and the Beastie Boys. By the beginning of the 1990s, however, the West Coast had eclipsed New York in popular success. This began a rivalry which culminated in the deaths of New York MC Notorious B.I.G. and West Coast rapper Tupac Shakur. In 1993 the pioneering Wu-Tang Clan emerged, and have continued to be influential to independent street hip hop. By the middle of the decade, Puff Daddy reinvigorated East Coast rap to popular acclaim with a very pop-oriented approach to hip hop. The East Coast also bred several hard-edged stars during this time, like Busta Rhymes, DMX and Nas, culminating in the breakthrough of Jay-Z late

in the decade. New York also produced a vital underground in the Native Tongues Posse, led by [alternative hip hop](#) crew A Tribe Called Quest. 50 Cent & his G-Unit clique is one of few successful rappers/groups of the 21st century.

## **Philadelphia**

Philadelphia has produced a few of the most hard-edged rappers, including Schoolly D and Kurupt. DJ Jazzy Jeff and the Fresh Prince were one of the first to put Philly on the map. It also famous for early 2000s mainstream acts such as Beanie Sigel, Eve, Freeway, State Property, The Roots, and Cassidy. The Philly hip hop scene has very unique style and slang; The term "jawn" is used as a universal interjection.

## **Washington, D.C.**

Washington, D.C. is best known for its distinct dance music called go go, which arose as a fusion of [funk](#) with rapping. Chuck Brown is the best-known performer of go go.

## Midwest

### Chicago

The first Chicago hip hop record was the "Groovy Ghost Show" by Casper, released in 1980 and a distinctively Chicago sound began by 1982, with Caution and Plee Fresh. Chicago also saw the development of house music (a form of electronic dance music) in the early 1980s and this soon mixed with hip hop and began featuring rappers; this is called hip house, and gained some national popularity in the late 1980s and early 90s. The Chicago underground scene produced several major acts, beginning with Paris.

Despite having the second-largest African-American population in the nation (after Detroit, in percent), only now with Kanye West, Common, and Boo and Gotti, is the Windy City beginning to receive mainstream attention.

Two Chicago rappers, Twista and Rebel XD, were Guinness Book record holders in the category "Fastest Rap MC" (though of the pair, only Twista has released a CD).

### Cleveland

One of the most influential hip hop groups on Ohio and Midwest hip hop in general have been the Bone Thugs-N-Harmony.

### Detroit

Detroit's earliest forays into recorded hip hop were in the field of [ghettotech](#), a fusion of [techno music](#) and [Miami bass](#). Later, nationally-renowned performers such as Insane Clown Posse, Kid Rock, Eminem, D12, Obie Trice, Slum Village and Royce Da 5'9" made Detroit an industry center.

### Minneapolis

Atmosphere (band) is one of Minnesota's most prominent hip hop groups.

### St. Louis

Nelly & the St. Lunatics, Chingy and J-Kwon are of few well-known rappers.

# The South

Main article: [Southern hip hop](#)

## Atlanta

In the late 1990s, a wave of Atlanta-based performers like Goodie Mob and Outkast gained some national renown. By the early 2000s, Outkast had become critical darlings and the Southern rap-inspired Dirty South style was a major component of popular hip hop. Atlanta is currently the most productive hip hop city with the biggest names being Killer Mike, Ludacris, Lil Jon, and Young Jeezy.

## Houston

Houston first came on to the national scene in the early 1990s with the violent and disturbing stories told by the Geto Boys.

In the mid 2000s Houston exploded into the forefront of Southern hip hop, with commercially successful acts like Mike Jones, Slim Thug, Lil Flip, and Paul Wall. UGK now calls Houston home and has been an enormously influential influence on southern hip hop since the 1990s. One of Houston's up-and-comers is Chamillionaire.

## Memphis

Memphis is credited as the original source of the [crunk](#) sound that spread across the South in the 2000s, with 1990s groups like Three 6 Mafia and 8Ball & MJG. Young Buck is so far the only known rapper from another major city of Tennessee: Nashville.

## Miami

Miami is best-known for a bass-heavy form of hip hop called [Miami bass](#). It had a brief brush with national fame in the late 1980s, aided by a censorship controversy surrounding the crew 2 Live Crew. Trick Daddy and Trina are other well-known rappers, as well as latino rapper Pitbull. Jin was also from Miami, but moved to New York City.

## New Orleans

Before Atlanta's takeover around 2001, the most popular scene in the South was New Orleans, led by Master P's No Limit Records and the Cash Money Millionaires. Cash Money's 1999 hit Bling Bling created a national catchphrase. Well-known rappers are Lil' Wayne & Master P, & his son Lil' Romeo.

The future of New Orleans rap is in jeopardy due to the aftermath of Hurricane Katrina, which has directly affected many local rap personalities.

## **Oklahoma**

Litefoot, the most prominent Native American rapper, is based in Tulsa, and operates the record label Red Vinyl.

# The West and West Coast

Main article: [West Coast hip hop](#)

## Los Angeles

In the early 1980s, recorded hip hop from Los Angeles began. There were two styles. One was [hardcore hip hop](#) vocalists, like Ice-T, King Tee and Toddy Tee, while the others performed a kind of electronic [dance music](#) called [electro hop](#); these included the Arabian Prince, Egyptian Lover and World Class Wreckin' Cru.

Though there was no major acclaim until the very end of the 80s, West Coast artists did grown in stature during the middle of the decade. These hits included Ice-T's "6'n da Mornin'" (1986), one of the first [gangsta rap](#) songs, and Toddy Lee's "Batter". Ice-T's Rhyme Pays (1987) brought critical acclaim for the West Coast. With the success of N.W.A. and the Posse soon after, West Coast hip hop moved quickly towards the mainstream. N.W.A.'s Straight Outta Compton completely the transition to the forefront of American popular hip hop, but it was 1992's The Chronic by Dr. Dre that established the style's permanence. Death Row Records was the prominent west coast record label. Founded by Suge Knight the label included Dr. Dre, Snoop Dogg and Tupac Shakur. Another notable west coast group from the time was Latin group Cypress Hill who like Ice-t, also dabbled in the alternative rock scene.

*The Chronic* was the beginning of what was known as [G-funk](#), and came to include such stars as Snoop Doggy Dogg and Warren G. Its release came at a pivotal period, simultaneous with the release of Nirvana's Nevermind, and American music went through a watershed moment. There was a backlash against the late 1980s heavy metal bands, which were seen as cheap and formulaic. Nirvana and Dr. Dre shared an anti-establishment attitude which resonated with the country's youth.

Since Eazy-E & Tupac died, [West Coast rap](#) died down a bit with the exceptions of elderstatesmen Dr. Dre and Snoop Dogg as well as Xzibit. Recently the West Coast has made a comeback with The Game and his debut The Documentary.

## Long Beach

Long Beach is a neighbor city next to LA's hip hop scene where gangsta rap and [G-funk](#) dominated. It is the home of stars such as Snoop Dogg, Warren G, Nate Dogg, The Dogg Pound and The Eastsidaz.

## Oakland/Bay Area

Oakland, California is the center of arguably the most artistic and intellectual hip hop scene in the country. The Bay Area's reputation is largely based on alternative acts such as Souls of Mischief, Blackalicious, Zion I, and Del Tha Funkee Homosapien. The Bay Area is also the adopted hometown of the late Tupac Shakur, who is regularly listed as one of, if not the, greatest rappers of all time. It is also the hometown of other rappers such as Too Short, MC Hammer, and Mac Dre. In current times, the Bay Area is home to

the "Hyphy" Movement, featuring uptempo club songs from artists like E-40, Keak da Sneak, Federation, and The Team. Yukmouth is also a great Bay Area Rapper.

## Seattle

Seattle's rap scene is similar to Oakland's more intellectual style. It briefly gained national prominence in 1991 with Sir Mix-A-Lot's novelty hit "Baby Got Back".

The Guinness Book record holder for Fastest Rap MC is the Seattle-based No Clue (Ricky Brown), breaking the record previously held by Chicago rapper Rebel XD. Brown rapped 723 syllables in 51.27 seconds on his track "No Clue" at B&G Studios, Seattle, on January 15, 2005.

# American march music

**American march music** is march music written and/or performed in the United States of America.

## History

The true "march music era" existed from 1850 to 1940's as it slowly became shadowed by the coming of [jazz](#). Earlier marches, such as the ones from Ludwig Van Beethoven, Wolfgang Mozart, and George Frideric Handel tended to be part of a [symphony](#) or a movement in a [suite](#). Despite the age of these marches, the history it holds and its performance in the United States, they are generally not thought of as "typical American march music".

## Marches and the Military Band

It is said that the origins of march music began before the Gunpowder Age during which armies would maintain their troops' morale by marching with music playing, whether that be from the beat of a [drum](#) or fife. American march music showed during the Revolutionary War and earlier wartime conflicts, in which a fife and snare drum would play while the troops marched to battle. This is why it can be said that march music is a military's music.

While the tradition of soldiers playing music while marching into battle had ended soon after the American Civil War (mid 1800's), military bands continued to perform marches during related ceremonies and other events. This actually spawned a whole new tradition of playing marches as a source of entertainment.

## Marches and the Concert Band

Around the late 1800's and early 1900's, most towns, organizations, theaters and even companies would have their own band. These bands, currently known today as [community bands](#), would perform their music at special events much like the military band, but would often play at simple scheduled concerts and tours (such as the traditional gazebo concerts). By this time, published marches were plentiful due to prolific composers such as John Philip Sousa, Karl L. King and Henry Fillmore. Marches became a staple in the repertoire of these concert bands and can hence explain how the popularity of the march spread so rapidly across the world.

## Marches and the Circus

Marches were further popularized with performances by circus bands. During the same period of the community band/concert band, circuses such as the Barnum & Bailey's Circus, and the Ringling Bros. Circus would have live music being performed by their own bands. The marches played were often a special variety of the march known descriptively as "Screamers", "Two-Steps", and "Cake Walks". These marches served the purpose of exciting the crowd while circus acts were taking place.

## Marches and the Marching Band

Again, during the same period college marching bands were also beginning to form. It is a fact that march composers would often dedicate marches to university bands. Marches were performed during half-time shows and pep-rallies. Marches were indeed heard everywhere.

## **The John Philip Sousa Revolution**

American composer John Philip Sousa did indeed strongly revolutionize the march. His overall prolific writing of said quality marches added that much to its popularity. According to Sousa researcher Paul Bierley, Sousa's marches were gems of simplicity and understatement, with rousing counterpoint and overall energy. Sousa also is said to have standardized the traditional march form (see below) and added considerably to the easy-listening genre of music.

### **The Stars and Stripes Forever**

American march music was forever immortalized with Sousa's The Stars and Stripes Forever, a patriotic march which soon became the official march of the United States of America.

## March Music Composers

Most march composers come from the United States or Europe, and have some sort of musical background to them. The most popular march composers existed in the late 1800's and early 1900's, mainly because modern march dedicators are hard to come by. The following is list of march music composers whose marches are frequently performed in the United States.

Russell Alexander (1877-1915)  
Kenneth Alford (1881-1945) "The British March King"  
Edwin Eugene Bagley (1857-1922)  
C. L. Barnhouse (1865-1929)  
Hermann Louis Blankenburg (1876-1956)  
Henry Fillmore (1881 - 1956) "The Trombone King"  
Julius Fucik (1872-1916) "The Czech March King"  
Edwin Franko Goldman (1878-1956) "The American Bandmaster"  
Robert B. Hall (1858-1907) "The New England March King"  
Getty H. Huffine (1889-1947)  
Arthur W. Hughes (ca.1870-ca.1950)  
Fred Jewell (1875-1936) "The Indiana March King"  
Karl L. King (1891 - 1971) "The Iowa March King", "The Circus Music King"  
Alex F. Lithgow (1870-1923) "Invercargill"  
Frank H. Losey (1872-1931) "The Pennsylvania March King"  
Johann Gottfried Piefke (1815-1884) Prussian composer of military music  
J. J. Richards (1878-1956) "The Long Beach March King"  
William Rimmer (1862-1936)  
Sam Rydberg (1885-1956) "The Swedish March King"  
Roland F. Seitz (1867-1946) "The Parade Music Prince"  
George Dallas Sherman (1844-1927)  
John Philip Sousa (1854 - 1932) "The March King"  
Carl Albert Hermann Teike (1864-1922)

## Famous Marches

The following is a list of popular marches from around the world that are frequently performed in the United States. They are in alphabetical order for easy reading.

- "*Old Comrades (Alte Kameraden)*" - Carl Teike
- "*American Patrol*" - W. Frank Meacham, copyrighted March 30, 1885
- "*Americans We*" - Henry Fillmore, published in 1929
- "*Bandology*" - Eric Osterling
- "*Barnum and Bailey's Favorite*" - Karl L. King, composed in 1913
- "*The Big Cage*" - Karl L. King, Copyright 1934
- "*Blaze Away!*" - Abe Holzmänn
- "*The Billboard*" - John N. Klohr
- "*Brighton Beach*" - William Latham
- "*Brooke's Chicago Marine Band*" - Roland F. Seitz
- "*The Chicago Tribune*" - W. Paris Chambers
- "*The Chimes of Liberty*" - Edwin F. Goldman
- "*Colossus of Columbia*" - Russell Alexander
- "*Colonel Bogey*" - Kenneth J. Alford
- "*Combination March*" - Scott Joplin
- "*Coronation March*" from *Le Prophète* - Giacomo Meyerbeer
- "*Crusade for Freedom*" - J.J. Richards
- "*E Pluribus Unum*" - Fred Jewell
- "*El Capitan*" - John Philip Sousa
- "*Emblem of Unity*" - J.J. Richards
- "*Entry of the Gladiators*" (Thunder and Blazes) - Julius Fucik, composed 1897
- "*The Footlifter*" - Henry Fillmore
- "*The Gallant Seventh*" - John Philip Sousa
- "*Hands Across the Sea*" - John Philip Sousa, composed 1899
- "*Imperial March*" - John Williams
- "*In Storm and Sunshine*" - John C. Heed
- "*Independientia*" - Robert B. Hall
- "*Invercargill*" - Alex F. Lithgow, composed in 1900
- "*The Klaxon*" - Henry Fillmore, composed in 1929
- "*Königgrätzer Marsch*" - Johann Gottfried Piefke
- "*Lassus Trombone*" - Henry Fillmore
- "*The Liberty Bell*" - John Philip Sousa, composed 1893
- *March from A Little Suite* - Trevor Duncan
- "*March Grandioso*" - Roland F. Seitz
- "*The Melody Shop*" - Karl L. King
- "*Men of Ohio*" - Henry Fillmore
- "*The National Emblem*" - Edwin E. Bagley
- "*Official West Point March*" - Philip Egner
- "*On the Mall*" - Edwin F. Goldman
- "*On the Square*" - Frank Panella
- "*On the Quarter Deck*" - Kenneth J. Alford
- "*Our Director*" - Frank E. Bigelow
- "*Pomp and Circumstance*" no. 1 - Edward Elgar
- "*Preußens Gloria*" ("Prussia's Glory") - Johann Gottfried Piefke

- *"The Purple Carnival"* - Harry Alford
- *"The Purple Pageant"* - Karl L. King
- *"Radetzky March"* - Johann Strauss Sr.
- *"Repasz Band"* - Chas. C. Sweeley
- *"Robinson's Grand Entree"* - Karl L. King
- *"Salutation"* - Roland F. Seitz
- *"Semper Fidelis"* - John Philip Sousa
- *"The Screamer"* - Fred Jewell
- *"The Southerner"* - Russell Alexander
- *"Stars and Bars"* - Robert Jager
- *"The Stars and Stripes Forever"* - John Philip Sousa, composed Dec 25, 1896
- *"The Tenth Regiment"* - Robert B. Hall
- *"The Thunderer"* - John Philip Sousa
- *"Under the Double Eagle (Unter dem Doppeladler)"* - Josef F. Wagner, composed 1902
- *"Up the Street"* - Robert G. Morse
- *"Washington Greys"* - Claudio S. Grafulla, composed in 1861
- *"The Washington Post March"* - John Philip Sousa, composed 1889
- *"The Watch on the Rhine"* - Franz von Blon

# Musicality and the March Music Form

Most marches are musically uplifting, driving, and rollicking. Some can be very emotional, poetic, or even somber. Some can be extremely subtle, while others can be brash and powerful. This topic discusses the musicality aspect of marches; what actually makes up a march, and gives it an ongoing drive. Generalities (the word "most") will be used frequently because as alluded to before, marches can differentiate greatly, especially those of different styles. See "See Also" at the bottom of the page for more information.

## Meter

The majority of marches are written in duple meter, meaning they have two beats per measure. In fact, only a handful of marches are written otherwise, usually in 4/4, but still using the same tempo (see below).

The following is a list of meters used in marches:

- $2/2$  or **cut-time** (indicated by a letter "c" with a slash through it. This literally represents common time being cut in half, hence the name "cut time"). Marches written in cut-time have a clear upbeat/downbeat feel. In layman's terms, a cut-time march has a strong "oom-pah" sound to it. Many cut-time marches utilize heavy syncopation to create rhythmic interest. Because passing tones in most cases are shorter, cut-time marches tend to sound "faster" than other marches in a different meter. The most famous cut-time march would probably be The Stars and Stripes Forever by Sousa.
- $6/8$  marches are played in two, meaning the dotted-quarter note gets the beat and there are two of them in a measure. If the composer wants a triplet feel to the march,  $6/8$  is used. In other words,  $6/8$  marches have a more dance-like swing feel to them, which is more prominent and exaggerated than its cut-time cousin. A  $6/8$  march can be distinguished immediately by recognizing its common "da-bah-da-bah" or "DA-da-DA-da" sound. The most famous  $6/8$  march would probably be The Washington Post March, also by Sousa.
- $2/4$  is much like cut-time, except that fewer notes appear in a measure, since the quarter note now gets the beat instead of the half note but there still is only two beats per measure. Marches written in  $2/4$  tend to be for the sake of the performer, as it is, for the most part, easier to read at faster tempos. Many European marches are written in  $2/4$ , and almost all American galops are as well. These galops are played at a very fast tempo, making it sound as if there was one beat to a bar.
- $4/4$  marches are rarely seen, as it is almost pointless to use with a fast tempo. However, some slow marches, such as dirges, utilize  $4/4$ . Robert Jager also uses  $4/4$  with his popular quick march, "Stars and Bars".

## Tempo

The tempo of a march is surprisingly varied. While most bands perform marches in their own tempo, most marches are quick (faster than a [waltz](#), as fast as or slower than a

[polka](#)). As alluded to before, most march [composers](#) did not designate a specific tempo on their manuscripts. However, that is not to say the march music composer is random with his/her tempo while conducting the march. For example, John Philip Sousa conducted his marches using around 120 beats per minute. Most European march composers, however, conducted their marches in a slower style, using around 100 beats per minute. There are, however, many and notable exceptions: see concert march and screamer.

## Key

For the sake of band performers, especially altos, marches are typically written in flat keys. The keys of Concert F, Bb, and Ab are the most frequently used. (NOTE: These refer to the key the march *begins* in, not the modulated key in the trio (see below).

## The March Music Form

Most marches follow a fairly strict structure. This structure is known as the march music form. The march music form's origins can be derived from the sonata form, as it shares similar ideas of contrasting sections. The true march music form was not utilized until the start of the march music era, and was eventually standardized by none other than John Philip Sousa. While the march music form varies tremendously amongst different styles of the march, all marches must have the following:

- Different sections, or strains.
- Several separate melodies.
- A contrasting section known as the trio.

The following two march forms are the most popular and frequently used by march music composers.

### ***The Military March Form***

The military march can be heavily credited to John Philip Sousa. He is said to have standardized the military march form, and it is used in over half of his marches.

- The first section is called the **Introduction (I)** or [fanfare](#) and is either 4, 8, or 16 bars long. The introduction is typically played in *marcato* style, typically using forte dynamics to catch the attention of the listener. Compared to the other sections of a march, the introduction usually the shortest part. Most introductions utilize chromatic scales and contrary motion counterpoint. This is discussed below. The introduction is commonly based on the V chord for the purpose of creating tension which naturally leads into the next section (See Harmonic Progressions below)

Click [here](#) to listen to the introduction of "The Thunderer" by John Philip Sousa. Sound clips are in MIDI format.

- The next section is commonly called the **first strain**, as it is the first prominent melody of the march. The first strain is typically 8 or 16 bars long with 4-measure phrases. The first strain can be in either major or minor mode and can use any

variety of dynamics, instrumentation and modulations. Typically this strain utilizes similar motifs in its phrases, and sounds more rhythmically straightforward than the next section. After the first playing of the strain, it is repeated once, sometimes with added parts such as counter-melodies.

- The **second strain** can be 8, 16, or 32 bars long and is the second primary melody of the march. This strain may use somewhat different instrumentation or may alter the relative dynamics of the different parts. In terms of phrasing, it also uses 4-measure phrases, but with more varied motifs. This makes the second strain's melodies sound more "stretched out". For example, many second strains utilize more whole notes than the first strain. For a good example, listen to The Stars and Stripes Forever. The second strain is usually repeated once like the first, but some marches omit this repeat.
- *In some marches, a short **introduction to the trio** is heard. This introduction to the trio can be a repeat of the first introduction, a whole new separate melody played by the whole band, a fanfare by the brasses, or a percussion soli (drum rolloff). "Semper Fidelis" by Sousa, for example, has this. Another example of this is found in **Twin Eagle Strut**, by Zane Van Auken.*
- The third (or technically fourth or fifth) primary melody in a march is called the **trio**. The trio is described as the *main melody* of the march. It is often played legato style in a softer dynamic, and features woodwinds more than brass. Sousa often used clarinets and euphoniums in lower tenor register in his trios. The trio is the most contrasting section, often containing variations of motifs heard in the previous two strains. The trio melody is often repeated once at a softer dynamic, or not repeated at all and goes right to the next section. In almost all cases, the trio modulates to the subdominant key of the march, meaning one flat is added to the key signature. Again, this is for the purpose of contrast and makes the trio more memorable to the listener. The fact that the key is now flatter also offers a more relaxing feel for those trios with softer instrumentation. For marches starting in minor keys, the trio is usually modulates to the relative major. This key is maintained to the end of the piece.
- Next comes the **breakstrain** (sometimes called the dogfight or interlude), making it the 4th main melody heard. This strain is loud, intense and marcato. The break strain's purpose can be found in its title. The breakstrain literally breaks a gap between the trio sections. It offers contrast to the usually softer trio melodies, and generates excitement for the listener. Most breakstrains resemble a conversation between the upper woodwinds and the low brass. The final measures of the breakstrain typically contain tension-building chords or chromatic motifs.
- After the breakstrain, the trio is heard again, either for one last time or and the 2nd (or third) time. If the trio after the breakstrain is the last, it is usually played in the same style as the first trio. Sometimes this trio has added counter-melodies or obbligatos. After this trio, the breakstrain is played again, then moves on to the final trio. The final trio is known as the **grandioso**. It is typically much louder than the previous playing(s) of the trio and utilizes all sections of the band, bringing everything to a close. The grandioso is considered the most exciting section of the march and serves the purpose of instilling the trio melody into the mind of the listener. The grandioso sometimes adds yet another counter-melody or obbligato, such as the one in The Stars and Stripes Forever. The last measure of the march sometimes contains a *stinger*, a I chord played in unison on the upbeat after a quarter rest. Not all

marches carry a stinger; the *National Emblem* march is a famous march not to have an ending stinger.

- In some military marches, such as "U.S. Field Artillery" by John Philip Sousa, there is only **one playing of the breakstrain**, resulting in only two "playings" of the trio.

Therefore, the Military March Form is this: **I-AA-BB-C(C)-Br-C-Br-C(Grandioso)**

- Examples of military marches include: *The Stars and Stripes Forever* by John Philip Sousa, *Barnum and Bailey's Favorite* by Karl L. King, and *On the Mall* by Edwin F. Goldman

### **The "Regimental" March Form**

Another popular (and perhaps older) march style is the regimental march, or review march. There are a few key differences between a typical military march and a regimental march.

- **The introduction, first and second strains are typically that of a military march.** However, some utilize a much longer introduction.
- Instead of a breakstrain after the trio, a regimental march has a **completely new strain (D)**, which still uses the modulated key). This strain has similar characteristics of a second strain, and is almost always repeated once.
- Because the regimental march is considerably shorter than a military march (due to its lack of a third trio repeat and breakstrain), it is often played by marching bands in parades (hence the name "review march").

Therefore, the "Regimental" march form is this: **I-AA-BB-CC-DD**

- Examples of "regimental" marches include: *Semper Fidelis* by John Philip Sousa, *Men of Ohio* by Henry Fillmore, and *Robinson's Grand Entry* by Karl L. King.

### **Other Forms and Styles**

- Some marches, typically those written specifically for marching and/or youth bands, **have no breakstrain or 'D' section at all**. They simply have one repeat of the trio (typically in the grandioso style), and then the march ends (Form: **I-AA-BB-CC**). Examples of these marches include "*Our Director*" by F.E. Bigelow, and "*Gallant Marines*" by Karl L. King.
- Many earlier and European marches **recapitulate back to the beginning of the march**. These marches typically did not use the Military March Form, but rather a shorter form such as the one directly above or the regimental march form. In other words, after either the final trio, or 'D' section, the march would start over again. Once it has done that, repeats are ignored, and ends after the second strain. Codas are rare, but sometimes used as well. The tradition of recapitulating marches ended at the start of the march music era. For example, John Philip Sousa abandoned this technique with all of his marches. In fact, only Victor Herbert was one of the last American composers that still used recapitulation during the march music era. Examples of these marches include: "*Under the Double Eagle*" by Wagner and "*The Serenade*" by Victor Herbert.

## Phrasing

The basic (and vague) definition of a march is a piece of music based upon a regular repeated drum/rhythmic pattern. Therefore, what makes a march recognizable is its phrases. Almost all quickstep marches consist of four-measure phrases, typical ending with a whole note either creating or resolving melodic tension (see Progressions) followed by a pickup note (see Pickups). It can be said that this rather "basic" framework is what makes marches melodically "pleasing". Some marches have more noticeable phrases than others. Karl King's marches for example have very clear-cut phrases with said whole notes and pickups. John Philip Sousa however tended to use practically seamless phrasing.

## Chords and Harmonic Progression

The basic nature of all music is to harmonically "setup and resolve" tension. Marches are no different. In fact, most marches use seemingly basic progressions and chords for the purpose of sounding melodically pleasing, and unchallenging (listening wise). However, that's not to say march composers did not utilize certain extended techniques.

Consider "Semper Fidelis" by John Philip Sousa. The following is the chord progression and included MIDI file of the first strain.

The progression is as follows. Note, each barred section represents one measure, for a total of 16 measures.

- |G7| |G7| |C| |C| |G7| |G7| |C| |C| |G7| |G7| |C| |C|C#dim| |G| |G| |D7| |G7|

"Semper Fidelis" first strain begins with a very simple V-I progression, creating a wave-like sense of tension and relief. Note its use of dominant seven chords to make the V chord stronger. This extension is used in many marches. Towards the end however, the progression gets more harmonically interesting. In the middle of the measure before the trumpet "fanfare", the chord alters to C#dim instead of remaining on C as before. Because the C#dim chord does not exist in the key of C, it is known to be "chromatically leading". This chord "leads" into the V chord (G), which is then followed by a D7 chord. A D chord in the key of C would be the ii chord, and all ii chords must be minor. However, the D chord in this case is not minor. Rather, it is known as a secondary dominant, in which a minor chord (typically the ii chord) is made major. The secondary dominant tonicizes a chord other than the I. In other words, a secondary dominant naturally leads into a chord other than the first (I chord). In this case, it leads into the V (G7).

The following is the chord progression and included MIDI file of the second strain..

The progression is as follows. Note, each barred section represents one measure, for a total of 16 measures.

- |C| |F|G7| |C| |C| |G7| |G7| |C| |C|G7| |C| |F|E7| |Am| |Ab7| |C| |C| |G| |C|

As with most second strains, this one features more rapidly changing chords. Note the use of the IV chord, used in marches to create a very "uplifting" and lyrical sound which will tend to resolve back to the I chord or proceed into the V chord, as it does here. At measure ten, where it restates the main theme, Sousa uses a rather "deceptive" chord change. Instead of using F to G7 to C as he did in measures two and three, it goes from the IV (F) to the III (E7, secondary dominant, majorizing the iii chord), to the VI (Am). The main melodic theme uses the same notes, but revolves around a different harmonic progression, resulting in greater chordal interest (less repetitive). Sousa then uses his

trademark chromatic accented chord (Ab7; note that it is a half-step below the previous chord) to create a "wall of tension" which quickly resolves into the I chord.

Another "accented" chromatic chord frequently used by march music composers is an inversion of a I chord with a lowered third and raised fifth. For example, if there was an Eb major chord (the I in the key of Eb), it would be followed by a B major chord (because a B chord is an Eb chord with a lowered third and raised fifth). Unlike the aforementioned secondary dominants, this chord really does not have logical harmonic functions to it (besides neighbor tone usage) other than to add texture and interest.

In summary:

- Most marches use seemingly simple chord progressions, for the sake of sounding melodically pleasing, however...
- March composers will often compliment their marches with interesting chords and chord changes, such as the use of chromatic harmonies, sevenths extensions, and secondary dominants.

## Difficulty

The actual difficulty of performance is considerably varied amongst marches. Because marches were some of the first music to be written for grade school bands (which were just becoming prominent throughout the country), many marches are fairly modest in difficulty. However, given the fact that many composers wrote marches for their own band (typically a professional community or circus band), some require almost virtuoso skill to perform. That being said, many conductors note that any march is difficult to play "perfectly", with all correct expressions, articulation and steady tempo. The following difficulty grading system is adapted from Norman Smith's "March Music Notes".

- **Grade 1:** Minimum difficulty. Suited for beginner bands who are first approaching music. May even be a simple etude or diddy from an instructional book.
- **Grade 2:** Also for beginner bands, but more developed, usually with different notes and rhythms. Instrumental ranges are comfortable and most require minimal endurance. Some follow the standard march form, but most are abbreviated, or in a more concert march form.
- **Grade 3:** The standard march difficulty. Usually in full march form, this difficulty requires moderate technique and endurance skills. Instrumental range is usually intermediate (trumpets going up to a high G, no ledger line), and most likely will contain chromatic notes, obligatos and counter-melodies. Many Grade 3's are used in actual parade marching. Examples of a Grade 3 march would be "*The Thunderer*", or "*The National Emblem*".
- **Grade 4:** Moderately difficult. Typical high school bands will find this grade requiring a considerable amount of practice/rehearsal. Grade 4's will contain many technically challenging parts, and some synchopation. They also tend to require a strict, complete ensemble for proper performance as they may contain intricate harmonies, and counter-melodies. Examples of a Grade 4 march would be "*The Stars and Stripes Forever*", and "*Barnum and Bailey's Favorite*".
- **Grade 5:** Considerably difficult. Usually originally written for professional, virtuoso band members, such as those in a circus band. Therefore, many Grade 5's are Screammers. They are guaranteed to contain woodwind obligatos or chromatic runs, and test the range of any player (high C's for trumpets). May have very quick tempos as well as complicated rhythms and synchopation. An example of a Grade 5 march would be "*Entry of the Gladiators*", "*The Washington Greys*", and "*Battle of Shiloh*".
- **Grade 6:** A rare difficulty. Usually a Grade 6 is found in a greater piece of work such as a symphony where it can contain mixed meters, intricate rhythms and harmonies.

## **Instrumentation**

A general instrumentation setup used originally for American marches would be very difficult to explain, as most bands were extremely varied in the late 1800's and early 1900's. As stated before, most of the standard march music was written for the composer's band. Whether that be the Sousa, Ringling Bros. or Gilmore, every band typically had marches written by their conductor in repertoire. With that said, most marches were also written in a very specific instrumentation. For example, many composers simply wrote a piano version of the march, and it was up to the publisher to arrange separate parts for concert band, orchestra, etc.

# American Music Award

The **American Music Awards** show is one of four annual major US music awards shows (the others being the *Billboard Music Awards*, the [Grammy Awards](#), and the *Rock and Roll Hall of Fame Induction Ceremony*). The **AMAs** were created by Dick Clark in 1973 to compete with the Grammys after the move of that year's show to Nashville, Tennessee led to CBS picking up the Grammy telecasts after its first two in 1971 and 1972 were broadcast on ABC. Michael Jackson and Donny Osmond co-hosted the first award show with Rodney Allen - Rippy. While the Grammys are awarded based on votes by members of the entertainment industry, the AMAs are determined by a poll of music buyers. The "big three" established awards shows (AMAs, Billboard Music Awards, and Grammys) compete for prestige and television ratings, with the Grammys nominally rewarding quality and both the AMAs and Billboard Music Awards rewarding popularity. Stories of artists being pressured to participate in one awards show over the other have been fodder for tabloid gossip and controversy.

The only other major difference between the Grammys and Billboard Music Awards is that the AMAs do not currently have an award for Best Single/Record but the Grammys and Billboard Music Awards do.

However, since the establishment of the Billboard Music Awards in 1989, there have been instances where artists (such as The Dixie Chicks and Céline Dion) have won all of the "big three" major music awards (including the AMAs). But the need for a unified music awards system (on the mold of horse racing's Triple Crown) only complicates the competition between the AMAs and the other awards shows.

For the first decade or so, the AMAs had multiple hosts, each representing a genre of music. For instance, Glen Campbell would host the country portion (Campbell, in fact, has co-hosted the AMAs more times than any other host or co-host), while other artists would co-host to represent his/her genre. In recent years, however, there has been one single host.

From its inception in 1973 until 2003, the AMAs have been held in mid- to late-January, but were moved to November beginning in 2003 so as not to further compete with other major awards shows (such as the Golden Globe Awards and the Academy Awards).

The most American Music Awards belong to Alabama who have collected twenty-two awards. The record for a solo artist belongs to Whitney Houston, who has collected twenty.

The record for the most American Music Awards won in a single year is held by both Michael Jackson (for 1983's *Thriller*), and Whitney Houston (for 1993's *The Bodyguard Soundtrack*), each with 8 awards to their credit (including the Award of Merit, which both artists were awarded during their respective year).

## American patriotic music

**American patriotic music** owes its origins to four main wars — the American Revolution, the War of 1812, the American Civil War, and the Spanish American War. During the period prior to American independence, much of America's patriotic music was aligned with the political ambitions of the British in the new land. In 1803, the British engaged Charles Dibdin, whose music was considered a potent influence in war, to write a series of songs to "keep alive the national feelings against the French.

"The Liberty Song", written by John Dickinson in 1768 to the music of William Boyce's "Heart of Oak", is perhaps the first patriotic song written in America. The song contains the line "by uniting we stand, by dividing we fall", the first recorded use of the sentiment. The American Revolution produced three popular patriotic tunes — "British Grenadiers", "God Save the King" and "Yankee Doodle". Political and cultural links between the colony and Great Britain can perhaps explain the popularity of the two former tunes, despite the war for independence. In 1814, a Washington lawyer Francis Scott Key wrote the Star Spangled Banner, later to become the country's [national anthem](#), in response to witnessing the bombardment of Fort McHenry in Baltimore during the War of 1812.

During the events leading up to the American Civil War, both the north and the south generated a number of songs to stir up patriotic sentiments such as Battle Hymn of the Republic. However, after the Civil War, the sentiments of most patriotic songs were geared to rebuilding and consolidating the United States. During the Spanish-American War in the 1890s, songwriters continued to write patriotic tunes that honored America's soldiers and their victories. Songs such as "Brave Dewey and His Men" and "The Chare of the Roosevelt Riders" lauded Commodore George Dewey and Theodore Roosevelt. Songs such as "The Black KPs", likely labelled racist and offensive by modern listeners, were intended to rally the public behind the war effort .

World War I, the "War to end all wars" produced patriotic American songs such as "It's a Long Long Way to Tipperary" by popular songwriter Arthur Fields, "K-K-K-Kathy" and "Uncle Sam". "God Bless America", written in 1918 by Irving Berlin, is sometimes referred to as the unofficial national anthem of the United States. In 1940, Woody Guthrie wrote "This Land Is Your Land" in response to his dislike of "God Bless America", calling it unrealistic and complacent. The World War II era produced a significant number of patriotic songs in the Big Band and Swing format. Popular patriotic songs of the time included "Remember Pearl Harbor" and "God Bless America". Patriotic songs in latter half of the 20th century included "Ballad of the Green Berets" during the Vietnam War and Lee Greenwood's "God Bless the USA" during the years of the first Gulf War.

## American pop

*Teen pop* is a vague and nebulous term, applied generally to whatever form of music is most popular among mainstream adolescent audiences. Adolescents are an especially important audience, both because of their relatively large amount of discretionary spending, and their fervent devotion to pop stars. Though the modern era of teen pop music is not usually said to have begun until the 1960s, there were important antecedents.

Perhaps the first genre of teen pop was the [swing](#) craze, which was an important dance style among teens across the nation in the early part of the 20th century. Later, a number of vocalists like Ella Fitzgerald and the Ink Spots became very popular, especially among the young. Though these performers are not generally considered teen pop singers, their success indicated that music that appealed to teens could be highly profitable. A number of Italian-American crooners soon found a major youth audience, including Dean Martin, Rudy Vallee, Tony Bennett, Perry Como, Frankie Laine and, most famously, the "first pop vocalist to engender hysteria among his fans" Frank Sinatra<sup>[1]</sup>.

The era of the modern teen pop star, however, began in the 1960s. [Bubblegum pop](#) groups like The Monkees were chosen entirely for their appearance and ability to sell records, with no regard to musical ability. Pop groups like these remained popular into the 1970s, producing family acts like the Partridge Family and The Osmonds. By the 1990s, there were numerous varieties of teen pop, including boy bands like \*NSYNC and the Backstreet Boys, and female diva vocalists like Christina Aguilera and Britney Spears.

## American popular music

Starting with the birth of recorded music, **American popular music** has had a profound effect on music across the world. The country has seen the rise of popular styles that have had a significant influence on global culture, including ragtime, [blues](#), [jazz](#), [rock](#), [R & B](#), [doo wop](#), [gospel](#), [soul](#), [funk](#), [heavy metal](#), [punk](#), [disco](#), [house](#), [techno](#), [salsa](#), [grunge](#) and [hip hop](#). In addition, the American music industry is quite diverse, supporting a number of regional styles like zydeco, klezmer and slack-key. The appeal of these styles lies in their supple, energetic rhythms, their appealing vocal lines, and in many cases their symbolic associations with the plight of the underprivileged.

In the early 20th century, the roots of most styles of American popular music were born. During this period, the American [music industry](#) developed a series of new forms of music, using elements of blues and other genres of [American folk music](#). These popular styles included country, R&B, jazz and rock. The 1960s and '70s saw a number of important changes in American popular music, including the development of a number of new styles, including heavy metal, punk, soul, and hip hop. Though these styles were not *popular* in the sense of *mainstream*, they were commercially recorded and are thus examples of *popular music* as opposed to [folk](#) or [classical music](#).

## Early popular song

The earliest songs that could be considered *American popular music*, as opposed to the popular music of a particular region or ethnicity, was the sheet music of the Civil War era. The songs were most often meant for use in minstrel shows, theatrical productions that featured singing, dancing and comic performances. Minstrel shows generally used [African American musical](#) instruments and dance, and featured performers with their faces stained black, a technique called blackface . Minstrel shows were generally advertised as though the music of the shows was in an [African American style](#), though this was often not true.

Blacks had been present in American popular culture prior to the Civil War era, at least dating back to the African Grove Theatre in New York in the 1820s and the publication of the first music by a black composer, Francis Johnson, in 1818. However, these important milestones still occurred entirely within the conventions of European music. The first extremely popular minstrel song was "Jump Jim Crow" by Thomas Rice, which used a dance that Rice copied from a stableboy with a tune adopted from an Irish jig. The African elements included the use of the [banjo](#), believed to derive from West African string instruments, and accented and additive rhythms . Many of the songs of the minstrel shows remain well-remembered, especially those by Daniel Emmett and Stephen Foster, the latter being, according to David Ewen, "America's first major composer, and one of the world's outstanding writers of songs" . Foster's songs were typical of the minstrel era in their unabashed sentimentality, and in their glorification of slavery. Nevertheless, Foster did more than most songwriters of the period to humanize the blacks he composed about, such as in "Nelly Was a Lady", a plaintive, melancholy song about a black man mourning the loss of his wife .

The minstrel show was the beginning of a long tradition of African American music being appropriated for popular audiences, and was the first distinctly American form of music to find international acclaim. As Donald Clarke has noted, minstrel shows were "essentially black music, while the most successful acts were white, so that songs and dances of black origin were imitated by white performers and then taken up by black performers, who thus to some extent ended up imitating themselves". Clarke attributes the use of blackface to a desire for white Americans to glorify the brutal existence of both free and slave blacks by depicting them as happy and carefree individuals, best suited to plantation life and the performance of simple, joyous songs that easily appealed to white audiences .

Blackface minstrel shows remained popular throughout the last part of the 19th century, only gradually dying out near the beginning of the 20th century. During that time, a form of lavish and elaborate theater called the extravaganza arose, beginning with Charles M. Barras' *The Black Crook* . Extravaganzas were criticized by the newspapers and churches of the day because the shows were considered sexually titillating, with women singing bawdy songs dressed in nearly transparent clothing. David Ewen described this as the beginning of the "long and active careers in sex exploitation" of American musical theater and popular song. Later, extravaganzas took elements of burlesque performances, which were satiric and parodic productions that were very popular at the end of the 19th century .

Like the extravaganza and the burlesque, the variety show was a comic and ribald production, popular from the middle to the end of the 19th century, at which time it had evolved into vaudeville. This form was innovated by producers like Tony Pastor who tried to encourage women and children to attend his shows; they were hesitant because the theater had long been the domain of a rough and disorderly crowd [9]. By the early 20th

century, vaudeville was a respected entertainment for women and children, and songwriters like Gus Edwards wrote songs that were popular across the country [10]. The most popular vaudeville shows were, like the Ziegfeld Follies, a series of songs and skits that had a profound effect on the subsequent development of Broadway musical theater and the songs of Tin Pan Alley.

## **Tin Pan Alley**

Tin Pan Alley was an area called Union Square in New York City, which became the major center for music publishing by the mid-1890s. The songwriters of this era wrote formulaic songs, many of them sentimental ballads [11]. During this era, a sense of national consciousness was developing, as the United States became a formidable world power, especially after the Spanish-American War. The increased availability and efficiency of railroads and the postal service helped disseminate ideas, including popular songs.

Some of the most notable publishers of Tin Pan Alley included Willis Woodward, the Witmark house of publishing, Charles K. Harris, and Edward B. Marks and Joseph W. Stern. Stern and Marks were among the more well-known Tin Pan Alley songwriters; they began writing together as amateurs in 1894 [12]. In addition to the popular, mainstream ballads and other clean-cut songs, some Tin Pan Alley publishers focused on rough and risqué. Coon songs were another important part of Tin Pan Alley, derived from the watered-down songs of the minstrel show with the "verve and electricity" brought by the "assimilation of the ragtime rhythm" [13]. The first popular coon song was "New Coon in Town", introduced in 1883, and followed by a wave of coon shouters like Ernest Hogan and May Irwin .

## **Broadway**

The early 20th century also saw the growth of Broadway, a group of theatres specializing in musicals. Broadway became one of the preeminent locations for musical theater in the world, and produced a body of songs that led Donald Clarke to call the era, the golden age of songwriting. The need to adapt enjoyable songs to the constraints of a theater and a plot enabled and encouraged a growth in songwriting and the rise of composers like George Gershwin, Vincent Youmans, Irving Berlin and Jerome Kern .

Foreign operas were popular among the upper-class throughout the 19th century, while other styles of musical theater included operettas, ballad operas and the opera bouffe. The English operettas of Gilbert and Sullivan were particularly popular, while American compositions had trouble finding an audience. George M. Cohan was the first notable American composer of musical theater, and the first to move away from the operetta, and is also notable for using the language of the vernacular in his work. By the beginning of the 20th century, however, black playwrights, composers and musicians were having a profound effect on musical theater, beginning with the works of Will Marion Cook, James Reese Europe and James P. Johnson; the first major hit black musical was *Shuffle Along* in 1921 .

Imported operettas and domestic productions by both whites like Cohan and blacks like Cook, Europe and Johnson all had a formative influence on Broadway. Composers like Gershwin, Porter and Kern made comedic musical theater into a national pastime, with a feel that was distinctly American and not dependent on European models. Most of these individuals were Jewish, with Cole Porter the only major exception; they were the descendants of 19th century immigrants fleeing persecution in the Russian Empire, settled most influentially in various neighborhoods in New York City [17]. Many of the early musicals were influenced by black music, showing elements of early jazz, such as In

Dahomey; the Jewish composers of these works may have seen connections between the traditional black blue notes and their own folk Jewish music.

Broadway songs were recorded around the turn of the century, but did not become widely popular outside their theatrical context until much later. Jerome Kern's "They Didn't Believe Me" was an early song that became popular nationwide. Kern's later innovations included a more believable plot than the rather shapeless stories built around songs of earlier works, beginning with *Show Boat* in 1927. George Gershwin was perhaps the most influential composer on Broadway, beginning with "Swanee" in 1919 and later works for jazz and orchestras. His most enduring composition may be the opera *Porgy and Bess*, a story about two blacks, which Gershwin intended as a sort of "folk opera", a creation of a new style of American musical theater based on American idioms .

## Ragtime

Ragtime was a style of [dance music](#) based around the piano, using syncopated rhythms and chromaticisms [19]; the genre's most well-known performer and composer was undoubtedly Scott Joplin. The ragged rhythms of ragtime are documented to at least as far back as 1886, at Congo Square in New Orleans, where African American and Caribbean dances mixed in wild celebrations. Author Gunther Schuller sees ragtime as a mixture of African elements with the 2/4 pattern of European marches [20], while others point to the importance of jigs and other dance styles among the music of large African American bands in many northern cities during the end of the 19th century. Donald Clarke considers ragtime the culmination of coon songs, used first in minstrel shows and then vaudeville, and the result of the rhythms of minstrelsy percolating into the mainstream; he also suggests that ragtime's distinctive sound may have come from an attempt to imitate the African American banjo using the keyboard .

Due to the essentially African American nature of ragtime, it is most commonly considered the first style of American popular music to be truly black music; certainly, it was also strongly influenced by European elements, but ragtime brought syncopation and a more authentic black sound to popular music. Popular ragtime songs were notated and sold as sheet music, but the general style was played more informally across the nation; these amateur performers played a more free-flowing form of ragtime that eventually became a major formative influence on [jazz](#) .

## Early recorded popular music

Thomas Edison's invention of the phonograph cylinder kicked off the birth of recorded music. The first cylinder to be released was "Semper Fidelis" by the U.S. Marine Band. At first, cylinders were released sparingly, but as their sales grew more profitable, distribution increased. These early recorded songs were a mix of vaudeville, barbershop quartets, marches, opera, novelty songs, and other popular tunes. Many popular standards, such as "The Good Old Summertime", "Shine on Harvest Moon", and "Over There" come from this time. There were also a few early hits in the field of jazz, beginning with the Original Dixieland Jazz Band's 1917 recordings, and followed by King Oliver's Creole Jazz Band, who played in a more authentic New Orleans jazz style .

[Blues](#) had been around a long time before it became a part of the first explosion of recorded popular music in American history. This came in the 1920s, when classic female blues singers like Ma Rainey, Bessie Smith and Mamie Smith grew very popular; the first hit of this field was Mamie Smith's "Crazy Blues". These urban blues singers changed the idea of popular music from being simple songs that could be easily performed by anyone to works primarily associated with an individual singer. Performers like Sophie Tucker, known for "Some of These Days", became closely associated with their hits, making their individualized interpretations just as important as the song itself .

At the same time, record companies like Paramount Records and Okeh Records launched the field of race music, which was mostly blues targeted at African American audiences. The most famous of these acts went on to inspire much of the later popular development of the blues and blues-derived genres, including Charley Patton, Lonnie Johnson and Robert Johnson.

## Popular jazz and swing

[Jazz](#) is a kind of music characterized by blue notes, syncopation, swing, call and response, polyrhythms, and improvisation. Though originally a kind of dance music, jazz has now been "long considered a kind of popular or vernacular music (and has also) become a sophisticated art form that has interacted in significant ways with the music of the concert hall" . Jazz's development occurred at around the same time as modern ragtime, blues, gospel and country music, all of which can be seen as part of a continuum with no clear demarcation between them; jazz specifically was most closely related to ragtime, with which it could be distinguished by the use of more intricate rhythmic improvisation, often placing notes far from the implied beat. The earliest jazz bands adopted much of the vocabulary of the blues, including bent and blue notes and instrumental "growls" and smears.

Though jazz had long since achieved some limited popularity, it was Louis Armstrong, who became one of the first music stars and a major force in the development of jazz. Armstrong was an improviser, capable of creating numerous variations on a single melody; he also popularized scat singing, an improvisational vocal technique in which nonsensical syllables (vocables) are sung, often as part of a call-and-response interaction with other musicians onstage. Both scat singing and musical variation remain an important part of jazz.

The first major popular form of jazz was called swing, which is characterized by a strong rhythm section, usually consisting of a double bass and drums, playing in a medium to fast tempo, and rhythmic devices like the swung note. Swing is primarily a kind

of 1930s jazz fused with elements of the blues and the pop sensibility of Tin Pan Alley [26]. Swing used bigger bands than other kinds of jazz had and was headed by bandleaders that tightly arranged the material, discouraging the improvisation that had been an integral part of jazz. David Clarke called swing the first "jazz-oriented style (to be) at the centre of popular music... as opposed to merely giving it backbone" [27]. By the end of the 1930s, vocalists became more and more prominent, eventually taking center stage following the American Federation of Musicians strike, which made recording with a large band prohibitively expensive [28]. Swing came to be accompanied by a popular dance called the swing dance, which was very popular across the United States, among both white and black audiences, especially youth.

## Blues diversification and popularization

Beginning in the 1920s and accelerating greatly in the 1940s, the blues began rapidly diversifying into a broad spectrum of new styles. These included an uptempo, energetic style called [rhythm and blues](#) (R&B), a merger of blues and Anglo-Celtic song called [country music](#) and the fusion of [hymns](#) and [spirituals](#) with blues structures called [gospel music](#). Later than these other styles, in the 1940s, a blues, R&B and country fusion eventually called [rock and roll](#) developed, eventually coming to dominate American popular by the beginning of the 1960s.

Country music is primarily a fusion of African American blues and spirituals with Appalachian folk music, adapted for pop audiences and popularized beginning in the 1920s. Of particular importance was Irish and Scottish tunes, dance music, balladry and vocal styles [29], as well as Native American, Spanish, German, French and Mexican music. The instrumentation of early country revolved around the European-derived fiddle and the African-derived banjo, with the guitar added later. Country music instrumentation used African elements like a call-and-response format, improvised music and syncopated rhythms. Later still, string instruments like the ukulele and steel guitar became commonplace due to the popularity of Hawaiian musical groups in the early 20th century [30]. The roots of modern country music are generally traced to 1927, when music talent scout Ralph Peer recorded Jimmie Rodgers and The Carter Family. Their recordings are considered the foundation for modern country music. There had been popular music prior to 1927 that could be considered country, but, as Ace Collins points out, these recordings had "only marginal and very inconsistent" effects on the national music markets, and were only superficially similar to what was then known as hillbilly music [31]. In addition to Rodgers and the Carters, a musician named Bob Wills was an influential early performer known for a style called [Western swing](#), which was very popular in the 1920s and 30s, and was responsible for bringing a prominent jazz influence to country music.

Rhythm and blues (R&B) is a style that arose in the 1930s and '40s, a rhythmic and uptempo form of blues with more complex instrumentation. Author Amiri Baraka described early R&B as "huge rhythm units smashing away behind screaming blues singers (who) had to shout to be heard above the clanging and strumming of the various electrified instruments and the churning rhythm sections . R&B was recorded during this period, but not extensively and was not widely promoted by record companies, who felt it was not suited for most audiences, especially middle-class whites, because of the suggestive lyrics and driving rhythms . Bandleaders like Louis Jordan innovated the sound of early R&B. Jordan's band featured a small horn section and prominent rhythm instrumentation and used songs with bluesy lyrical themes. By the end of the 1940s, he had produced nineteen major hits, and helped pave the way for contemporaries like Wynonie Harris, John Lee Hooker and Roy Milton.

Christian spirituals and rural blues music were the origin of what is now known as gospel music. Beginning in about the 1920s, African American churches featured early gospel in the form of worshipers proclaiming their religious devotion (*testifying*) in an

improvised, often musical manner. Modern gospel began with the work of composers, most importantly Thomas A. Dorsey, who "(composed) songs based on familiar spirituals and hymns, fused to blues and jazz rhythms" . From these early 20th-century churches, gospel music spread across the country. It remained associated almost entirely with African American churches, and usually featured a choir along with one or more virtuoso soloists.

Rock and roll is a kind of popular music, developed primarily out of country, blues and R&B. Easily the single most popular style of music worldwide, rock's exact origins and early development have been hotly debated. Music historian Robert Palmer has noted that the style's influences are quite diverse, and include the Afro-Caribbean "Bo Diddley beat", elements of "big band swing" and Latin music like the Cuban son and "Mexican rhythms" [35]. Another author, George Lipsitz claims that rock arose in America's urban areas, where there formed a "polyglot, working-class culture (where the) social meanings previously conveyed in isolation by blues, country, polka, zydeco and Latin musics found new expression as they blended in an urban environment" .

## 1950s and 60s

The middle of the 20th century saw a number of very important changes in American popular music. The field of [pop music](#) developed tremendously during this period, as the increasingly low price of recorded music stimulated demand and greater profits for the record industry. As a result, music marketing became more and more prominent, resulting in a number of mainstream pop stars whose popularity was previously unheard of. Many of the first such stars were Italian-American crooners like Dean Martin, Rudy Vallee, Tony Bennett, Perry Como, Frankie Laine and, most famously, the "first pop vocalist to engender hysteria among his fans" Frank Sinatra [37]. The era of the modern teen pop star, however, began in the 1960s. Bubblegum pop groups like The Monkees were chosen entirely for their appearance and ability to sell records, with no regard to musical ability. The same period, however, also saw the rise of new forms of pop music that achieved a more permanent presence in the field of American popular music, including rock, soul and pop-folk. By the end of the 1960s, two developments had completely changed popular music: the birth of a counterculture, which explicitly opposed mainstream music, often in tandem with political and social activism, and the shift from professional composers to performers who were both singers and songwriters.

Rock and roll first entered mainstream popular music through a style called [rockabilly](#), which fused the nascent rock sound with elements of country music. Black-performed rock and roll had previously had limited mainstream success, and some observers at the time believed that a white performer who could credibly sing in an R&B and country style would be a success. Sam Phillips, of Memphis, Tennessee's Sun Records, was the one who found such a performer, in Elvis Presley, who became one of the best-selling musicians in history, and brought rock and roll to audiences across the world [38]. Presley's success was preceded by Bill Haley, a white performer whose "Rock Around the Clock" is sometimes pointed to as the start of the rock era. However, Haley's music was "more arranged" and "more calculated" than the "looser rhythms" of rockabilly, which also, unlike Haley, did not use saxophones or chorus singing .

R&B remained extremely popular during the 1950s among black audiences, but the style was not considered appropriate for whites, or respectable middle-class blacks because of its suggestive nature. Many popular R&B songs were instead performed by white musicians like Pat Boone, in a more palatable, mainstream style, and turned into pop hits [40]. By the end of the 1950s, however, there was a wave of popular black blues-rock and country-influenced R&B performers gaining unprecedented fame among white listeners; these included Bo Diddley and Chuck Berry [41]. Over time, producers in the R&B field turned to gradually more rock-based acts like Little Richard and Fats Domino.

Doo wop is a kind of vocal harmony music performed by groups who became popular in the 1950s. Though sometimes considered a kind of rock, doo wop is more precisely a fusion of vocal R&B, gospel and jazz with the blues and pop structures , though until the 1960s, the lines separating rock from doo wop, R&B and other related styles was very blurry. Doo wop became the first style of R&B-derived music "to take shape, to define itself as something people recognized as new, different, strange, *theirs*" (emphasis in original) . As doo wop grew more popular, more innovations were added, including the use of a bass lead vocalist, a practice which began with Jimmy Ricks of The Ravens [44]. Doo wop performers were originally almost all black, but a few white and integrated groups soon became popular. These included a number of Italian-American groups like Dion & the Belmonts and Frankie Valli & the Four Seasons, while others added female vocalists and even formed all-female groups in the nearly universally male field; these included The Queens and The Chantels .

The 1950s saw a number of brief fads that went on to have a great impact on future styles of music. Performers like Pete Seeger and The Weavers popularized a form of old-time revival of Anglo-American music. This field eventually became associated with the political leftwing and Communism, leading to a decline in acceptability as artists were increasingly blacklisted and criticized. Nevertheless, this form of pop-folk exerted a profound influence in the form of 1950s folk-rock and related styles. Alongside the rather sporadic success of popularized Anglo folk music came a series of Latin dance fads, including mambo, rumba, chachachá and boogaloo. Though their success was again sporadic and brief, Latin music continued to exert a continuous influence on rock, soul and other styles, as well as eventually evolving into salsa music in the 1970s.

## Country: Nashville Sound

During World War 2, the materials used to produce records were scarce and expensive, and the record companies responded by cutting production to focus entirely on mainstream music, and thus country remained little recorded and even less promoted. After the war, however, there was increased interest in specialty styles, including what had been known as *race* and *hillbilly* music; these styles were renamed to *rhythm and blues* and *country and western*, respectively. Major labels had had some success promoting two kinds of country acts: Southern novelty performers like Tex Williams and singers like Frankie Laine, who mixed pop and country in a conventionally sentimental style [47]. This period also saw the rise of Hank Williams, a white country singer who had learned the blues from a black street musician named Tee-Tot, in northwest Alabama [48]. Before his death in 1953, Hank Williams recorded eleven singles that sold at least a million copies each and pioneered the Nashville sound.

The Nashville sound was a popular kind of country music that arose in the 1950s, a fusion of popular [big band](#) jazz and swing with the lyricism of honky-tonk country [49]. The popular success of Hank Williams' recordings had convinced record labels that country music could find mainstream audiences. Record companies then tried to strip the rough, honky-tonk elements from country music, removing the unapologetically rural sound that had made Williams famous. Nashville's industry was reacting to the rise of rockabilly performer Elvis Presley by marketing performers that crossed the divide between country and pop; [50]. Chet Atkins, head of RCA's country music division, did the most to innovate the Nashville sound by abandoning the rougher elements of country, while Owen Bradley used sophisticated production techniques and smooth instrumentation that eventually became standard in the Nashville Sound, which also grew to incorporate strings and vocal choirs [51]. By the early part of the 1960s, the Nashville sound was perceived as watered-down by many more traditionalist performers and fans, resulting in a number of local scenes like the Lubbock sound and, most influentially, the Bakersfield sound.

Throughout the 1950s, the most popular kind of country music was the Nashville Sound, which was a slick and pop-oriented style. Many musicians preferred a rougher sound, leading to the development the Lubbock Sound and Bakersfield Sound. The Bakersfield Sound was innovated in Bakersfield, California in the mid to late 1950s, by performers like Wynn Stewart, who used elements of Western swing and rock, such as the breakbeat, along with a honky tonk vocal style [52]. He was followed by a wave of performers like Buck Owens and Merle Haggard, who popularized the style.

## Soul

Soul music is a combination of R&B and gospel which began in the late 1950s in the United States. Soul music is characterized by its use of gospel techniques with a greater

emphasis on vocalists, and the use of secular themes. The 1950s recordings of Sam Cooke, Ray Charles and James Brown are commonly considered the beginnings of soul music. Solomon Burke's early recordings for Atlantic Records codified the style, and as Peter Guralnick writes, "it was only with the coming together of Burke and Atlantic Records that you could see anything resembling a movement" .

In Memphis, Stax Records produced recordings by soul pioneers Otis Redding, Wilson Pickett and Don Covay. An important center of soul music recording was Florence, Alabama, where the Fame Studios operated. Jimmy Hughes, Percy Sledge and Arthur Alexander recorded at Fame; later in the 1960s, Aretha Franklin would also record in the area. Fame Studios, often referred to as Muscle Shoals, after a town neighboring Florence, enjoyed a close relationship with Stax, and many of the musicians and producers who worked in Memphis also contributed to recordings done in Alabama.

Aretha Franklin's 1967 recordings, such as "I Never Loved a Man the Way I Love You", "Respect" and "Do Right Woman-Do Right Man," are among soul's most commercially successful productions. During this period, Stax artists such as Eddie Floyd and Johnnie Taylor also made significant contributions to soul music. By 1968, the soul music movement had begun to splinter, as James Brown and Sly and the Family Stone began to expand upon and abstract both soul and rhythm and blues into other forms. Guralnick wrote that more "than anything else... what seems to me to have brought the era of soul to a grinding, unsettling halt was the death of Martin Luther King in April of 1968" .

## 1960s rock

The first of the major new rock genres of the 1960s was surf, pioneered by Californian Dick Dale. Surf was largely instrumental and guitar-based rock with a distorted and twanging sound, and was associated with the Southern California surfing-based youth culture. Dale had worked with Leo Fender, developing the "Showman amplifier and... the reverberation unit that would give surf music its distinctively fuzzy sound" .

Inspired by the lyrical focus of surf, if not the musical basis, The Beach Boys began their career in 1961 with a string of hits like "Surfin' USA". Their sound was not instrumental, nor guitar-based, but was full of "rich, dense and unquestionably special" "floating vocals (with) Four Freshman-ish harmonies riding over a droned, propulsive burden" [56]. The Beach Boys' songwriter Brian Wilson grew gradually more eccentric, experimenting with new studio techniques as he became associated with the burgeoning counterculture.

The counterculture was a youth movement that included political activism, especially in opposition to the Vietnam War, and the promotion of various hippie ideals. The hippies were associated primarily with two kinds of music: the folk-rock and country rock of people like Bob Dylan and Gram Parsons, and the psychedelic rock of bands like Jefferson Airplane and The Doors. This movement was very closely connected to the British Invasion, a wave of bands from the United Kingdom who became popular throughout much of the 1960s. The first wave of the British Invasion included bands like The Zombies and the Moody Blues, followed by rock bands like the Rolling Stones, The Who and, most famously, The Beatles. The sound of these bands was hard-edged rock, with The Beatles' originally known for songs that were virtually identical to classic black rock songs by Little Richard, Chuck Berry, Smokey Robinson, The Shirelles and the Isley Brothers [57]. Later, as the counterculture developed, The Beatles began using more advanced techniques and unusual instruments, such as the sitar, as well as more original lyrics.

Folk-rock drew on the sporadic mainstream success of groups like the Kingston Trio and the Almanac Singers, while Woodie Guthrie and Pete Seeger helped to politically radicalize rural white folk music [58]. The popular musician Bob Dylan rose to prominence in the middle of the 1960s, fusing folk with rock and making the nascent scene closely connected to the Civil Rights Movement. He was followed by a number of country-rock

bands like The Byrds and the Flying Burrito Brothers and folk-oriented singer-songwriters like Joan Baez and the Canadian Joni Mitchell. However, by the end of the decade, there was little political or social awareness evident in the lyrics of pop-singer-songwriters like James Taylor and Carol King, whose self-penned songs were deeply personal and emotional.

Psychedelic rock was a hard, driving kind of guitar-based rock, closely associated with the city of San Francisco, California. Though Jefferson Airplane was the only psychedelic San Francisco band to have a major national hit, with 1967's "Somebody to Love" and "White Rabbit", the Grateful Dead, a folk, country and bluegrass-flavored jam band, "embodied all the elements of the San Francisco scene and came... to represent the counterculture to the rest of the country"; the Grateful Dead also became known for introducing the counterculture, and the rest of the country, to the ideas of people like Timothy Leary, especially the use of hallucinogenic drugs like LSD for spiritual and philosophical purposes .

## 1970s and 80s

Following the turbulent political, social and musical changes of the 1960s and early 1970s, rock music diversified. What was formerly known as *rock and roll*, a reasonably discrete style of music, had evolved into a catchall category called simply *rock music*, an umbrella term which would eventually include diverse styles like [heavy metal music](#), [punk rock](#) and, sometimes even [hip hop music](#). During the '70s, however, most of these styles were not part of mainstream music, and were evolving in the underground music scene.

The early 1970s saw a wave of singer-songwriters who drew on the introspective, deeply emotional and personal lyrics of 1960s folk-rock. They included James Taylor, Carole King and others, all known just as much for the lyric ability as for their performances. The same period saw the rise of bluesy Southern rock and country rock groups like the Allman Brothers Band and Lynyrd Skynyrd [60]. In the 1970s, soft rock developed, a kind of simple, unobtrusive and mellow form of pop-rock, exemplified by a number of bands like America and Bread, most of whom are little remembered today; many were one-hit wonders [61]. In addition, harder arena rock bands like Chicago and Styx also saw some major success.

The early 1970s saw the rise of a new style of country music that was as rough and hard-edged, and which quickly became the most popular form of country. This was outlaw country, a style that included such mainstream stars as Willie Nelson and Waylon Jennings. Outlaw country was very rock-oriented, and had lyrics that focused on the criminal, especially drug and alcohol-related, antics of its performers, who grew their hair long, wore denim and leather and looked like hippies in contrast to the clean-cut country singers that were pushing the Nashville sound.

By the end of the decade, [disco](#), a form of electronic dance music, was popular. Disco's time was short, however, and was soon replaced with a number of genres that evolved out of the [punk rock](#) scene, like [New Wave](#). Bruce Springsteen became a major star, first in the mid to late 70s and then throughout the '80s, with dense, inscrutable lyrics and anthemic songs that resonated with the middle and lower classes.

## 70s funk and soul

In the early 1970s, soul music was influenced by psychedelic rock and other styles. The social and political ferment of the times inspired artists like Marvin Gaye and Curtis Mayfield to release album-length statements with hard-hitting social commentary. Artists like James Brown led soul towards more dance-oriented music, which eventually evolved into funk. Funk was typified by 1970s bands like Parliament-Funkadelic, The Meters, and James Brown himself, while more versatile groups like War, The Commodores and Earth, Wind and Fire also became popular. During the '70s, some highly slick and commercial blue-eyed soul acts like Philadelphia's Hall & Oates achieved mainstream success, as well as a new generation of street-corner harmony or city-soul groups like The Delfonics and Howard University's Unifics.

By the end of the '70s, Philly soul, funk, rock and most other genres were dominated by disco-inflected tracks. During this period, funk bands like The O'Jays and The Spinners continued to turn out hits. After the death of disco in 1980, soul music survived for a short time before going through yet another metamorphosis. With the introduction of influences from [electro music](#) and funk, soul music became less raw and more slickly produced,

resulting in a genre of music that was again called *R&B*, usually distinguished from the earlier rhythm and blues by identifying it as *contemporary R&B*.

## 80s pop

By the 1960s, the term *rhythm and blues* had no longer been in wide use; instead, terms like *soul music* were used to describe popular African American music. In the 1980s, however, *rhythm and blues* came back into use, most often in the form of *R&B*, a usage that has continued to the present. Contemporary R&B arose when sultry funk singers like Prince became very popular, alongside dance-oriented pop stars like Michael Jackson and female vocalists like Tina Turner and Whitney Houston .

By the end of the 1980s, pop-rock largely consisted of the radio-friendly hair metal bands, who used images derived from the British glam movement with macho lyrics and attitudes, accompanied by [hard rock](#) music and heavy metal virtuosic soloing. Bands from this era included many British groups like Def Leppard, as well as heavy metal-influenced American bands Mötley Crüe, Guns N' Roses, Bon Jovi and Van Halen .

The mid-1980s also saw [Gospel music](#) see its popularity peak. A new form of gospel had evolved, called Contemporary Christian music (CCM). CCM had been around since the late 1960s, and consisted of a pop/rock sound with slight religious lyrics. CCM had become the most popular form of gospel by the mid-1980s, especially with artists like Amy Grant, Michael W. Smith, and Kathy Triccoli. Amy Grant was the most popular CCM, and gospel, singer of the 1980s, and after experiencing unprecedented success in CCM, crossed over into mainstream pop in the 1980s and 1990s. Michael W. Smith also had considerable success in CCM before crossing over to a successful career in pop music as well. Grant would later produce CCM's first #1 pop hit ("Baby Baby"), and CCM's best-selling album (Heart In Motion).

In the 1980s, the country music charts were dominated by pop singers with only tangential influences from country music, a trend that has continued since. The 1980s saw a revival of honky-tonk-style country with the rise of people like Dwight Yoakam and the new traditionalists Emmylou Harris and Ricky Skaggs [67], as well as the development of alternative country performers like Uncle Tupelo. Later alternative country performers, like Whiskeytown's Ryan Adams and Wilco, found some mainstream success.

## Birth of the underground

During the 1970s, a number of diverse styles emerged in stark contrast to mainstream American popular music. Though these genres were not largely popular in the sense of selling many records to mainstream audiences, they were examples of *popular music*, as opposed to [folk](#) or [classical music](#). In the early 1970s, blacks and Puerto Ricans in New York City developed hip hop culture, which produced a style of music also called hip hop. At roughly the same time, Latinos, especially Cubans and Puerto Ricans, in New York also innovated salsa music, which combined many forms of Latin music with R&B and rock. The genres of [punk rock](#) and [heavy metal](#) were most closely associated with the United Kingdom in the 70s, while various American derivatives evolved later in the decade and into the 80s. Meanwhile, Detroit slowly evolved a series of [electronic music](#) genres like [house](#) and [techno](#) that later became a major part of popular music worldwide.

### Hip hop

Hip hop is a cultural movement, of which music is a part, along with graffiti and breakdancing. The music is composed of two parts, rapping, the delivery of swift, highly rhythmic and lyrical vocals, and DJing, the production of instrumentation either through

sampling, instrumentation, turntablism or beatboxing [68]. Hip hop arose in the early 1970s in Harlem, New York City. Jamaican immigrant DJ Kool Herc is widely regarded as the progenitor of hip hop; he brought with him the practice of toasting over the rhythms of popular songs. In New York, DJs like Kool Herc played records of popular funk, disco and rock songs. Emcees originally arose to introduce the songs and keep the crowd excited and dancing; over time, the DJs began isolating the percussion breaks (the rhythmic climax of songs), thus producing a repeated beat that the emcees rapped over.

Rapping included greetings to friends and enemies, exhortations to dance and colorful, often humorous boasts. By the beginning of the 1980s, there had been popular hip hop songs like "Rappers Delight" by the Sugarhill Gang and a few major celebrities of the scene, like LL Cool J and Kurtis Blow. Other performers experimented with politicized lyrics and social awareness, while others performed fusions with jazz, heavy metal, techno, funk and soul. Hip hop began to diversify in the latter part of the 1980s. New styles appeared, like alternative hip hop and the closely related jazz rap fusion, pioneered by rappers like De La Soul and Guru. The crews Public Enemy and N.W.A. did the most during this era to bring hip hop to national attention; the former did so with incendiary and politically charged lyrics, while the latter became the first prominent example of [gangsta rap](#).

## **Salsa**

Salsa music is a diverse and predominantly Caribbean rhythm that is popular in many Latin American countries. Salsa incorporates multiple styles and variations; the term can be used to describe most any form of the popular Cuban-derived musical genres (like chachachá and mambo). Most specifically however, salsa refers to a particular style was developed by mid-1970s groups of New York City-area Cuban and Puerto Rican immigrants to the United States, and stylistic descendants like 1980s salsa romantica .

Salsa music always has a 4/4 meter. The music is phrased in groups of two bars, using recurring rhythmic patterns, and the beginning of phrases in the song text and instruments. Typically, the rhythmic patterns played on the percussion are rather complicated, often with several different patterns played simultaneously. The clave rhythm is an important element that forms the basis of salsa. Apart from percussion, a variety of melodic instruments are commonly used as accompaniment, such as a guitar, trumpets, trombones, the [piano](#), and many others, all depending on the performing artists. Bands are typically divided into horn and rhythm sections, lead by one or more singers (*soneros* or *saiseros*) .

## **Punk and alternative rock**

Punk was a kind of rebellious rock music that began in the 1970s, as a reaction against the popular music of the day, especially [disco](#), which was seen as insipid and uninspired; punk drew on American bands including the Velvet Underground, The Stooges and the New York Dolls [71]. Punk was loud, aggressive and usually very simple, requiring little musical training to play. Later in the decade, British bands like the Sex Pistols and The Clash found short-lived fame at home and, to a lesser degree, in the United States. American bands in the field included most famously The Ramones, as well as groups like the Talking Heads that played a more artsy kind of music that was closely associated with punk before eventually evolving into pop-[New Wave](#) .

[Hardcore punk](#) was the response of American youths to the worldwide [punk rock](#) explosion of the late 1970s. Hardcore stripped punk rock and New Wave of its sometimes elitist and artsy tendencies, resulting in short, fast, and intense songs that spoke to disaffected youth. Hardcore exploded in the American metropolises of Los Angeles, Washington, DC, New York and Boston and most American cities had their own local scenes by the end of the 1980s .

[Alternative rock](#) is a diverse grouping of rock bands that in America developed largely from the hardcore scene in the 1980s in stark opposition to the mainstream music scene. Alternative rock subgenres that developed during the decade include [indie rock](#), [gothic rock](#), [grunge](#), and college rock. Most alternative bands were unified by their collective debt to punk, which laid the groundwork for underground and alternative music in the 1970s. Though the genre is considered to be rock, some styles were influenced by American folk, reggae and jazz. Like punk and hardcore, alternative rock had little mainstream success in America in the 1980s, but via the grassroots establishment of an indie scene through touring, college radio, fanzines, and word-of-mouth, alternative bands laid the groundwork for the breakthrough of the genre in the American public consciousness in the next decade.

## Heavy metal

Heavy metal is a form of music characterized by aggressive, driving rhythms and highly amplified distorted guitars, generally with grandiose lyrics and virtuosic instrumentation. Heavy metal is a development of blues, blues rock, rock and prog rock. Its origins lie in the British hard rock bands who between 1967 and 1974 took blues and rock and created a hybrid with a heavy, guitar-and-drums-centered sound. Most of the pioneers in the field, like Black Sabbath, were English, though many were inspired by American performers like Blue Cheer and Jimi Hendrix.

In the early 1970s, the first major American bands began appearing, like Blue Öyster Cult and Aerosmith, and musicians like Eddie Van Halen began their career. Heavy metal remained, however, a largely underground phenomenon. During the 1980s, a pop-based form of hard rock, with a party-hearty spirit and a glam-influenced visual aesthetic (sometimes referred to as "hair metal") dominated the music charts, led by superstars like Poison, Bon Jovi, Mötley Crüe, and Ratt. The 1987 debut of Guns N' Roses, a hard rock band whose image reflected the grittier underbelly of the Sunset Strip, was at least in part a reaction against the overly polished image of hair metal, but that band's wild success was in many ways the last gasp of the hard-rock and metal scene. By the mid-1980s, as the term "heavy metal" became the subject of much contestation, the style had branched out in so many different directions that new classifications were created by fans, record companies, and fanzines, although sometimes the differences between various subgenres were unclear, even to the artists purportedly belonging to a given style. The most notable of the 1980s metal subgenres in the United States was the swift and aggressive thrash metal style, pioneered by bands like Anthrax, Megadeth, Metallica and Slayer.

## 1990s to the present

Perhaps the most important change in the 1990s in American popular music was the rise of alternative rock through the popularity of [grunge](#). This was previously an explicitly anti-mainstream grouping of genres that rose to great fame beginning in the early 1990s. Grunge is an alternative rock subgenre with a "dark, brooding guitar-based sludge" sound, drawing on heavy metal, punk, and elements of bands like Sonic Youth and their use of "unconventional tunings to bend otherwise standard pop songs completely out of shape". With the addition of a "melodic, Beatlesque element" to the sound of bands like Nirvana, grunge became wildly popular across the United States [76]. Grunge became commercially successful in the early 1990s, peaking between 1991 and 1994. Bands from cities in the U.S. Pacific Northwest especially Seattle, Washington, were responsible for creating grunge and later made it popular with mainstream audiences. The supposed Generation X, who had just reached adulthood as grunge's popularity peaked, were closely associated with grunge, the sound which helped "define the desperation of (that) generation".

[Gangsta rap](#) is a kind of hip hop, most importantly characterized by a lyrical focus on macho sexuality, physicality and a dangerous, criminal image. Though the origins of gangsta rap can be traced back to the mid-1980s raps of Philadelphia's Schoolly D and the West Coast's Ice-T, the style is usually said to have begun in the Los Angeles and Oakland area, where Too \$hort, NWA and others found their fame. This West Coast rap scene spawned the early 1990s G-funk sound, which paired gangsta rap lyrics with a thick and hazy tone, often relying on samples from 1970s P-funk; the best-known proponents of this sound were the breakthrough rappers Dr. Dre and Snoop Doggy Dogg.

By the end of the decade and into the early 2000s pop music consisted mostly of a combination of pop-hip hop and R&B-tinged pop, including a number of [boy bands](#) and female divas. The predominant sound in 90s country music was pop with only very limited elements of country. This includes many of the best-selling artists of the 1990s, like Clint Black, Shania Twain, Faith Hill and the first of these crossover stars, Garth Brooks.

## International and social impact

American popular music has become extremely popular internationally. Rock, hip hop, jazz, country and other styles have fans across the globe. BBC Radio DJ Andy Kershaw, for example, has noted that country music is popular across virtually the entire world . Indeed, out of "all the contributions made by Americans to world culture... (American popular music) has been taken (most) to heart by the entire world" . Other styles of American popular music have also had a formative effect internationally, including funk, the basis for West African Afrobeat, R&B, a major source for Jamaican [reggae](#), and rock, which has profoundly influenced most every genre of popular music worldwide. Rock, country, jazz and hip hop have become an entrenched part of many countries, leading to local varieties like Australian country music, Tanzanian Bongo Flava and Russian rock.

Rock has had a formative influence on popular music, which had the effect of transforming "the very concept of what popular music" is while Charlie Gillett has argued that rock and roll "was the first popular genre to incorporate the relentless pulse and sheer volume of urban life into the music itself" .

The social impacts of American popular music have been felt both within the United States and in foreign countries. Beginning as early as the extravaganzas of the late 19th century, American popular music has been criticized for being too sexually titillating and for encouraging violence, drug abuse and generally immoral behavior. Criticisms have been especially targeted at African American styles of music as they began attracting white, generally youthful audiences; blues, jazz, rock and hip hop all fall into this category .

A type of music that has an impact on the American society today is called "Bhangra" (music from the state of Panjab, India). Bhangra is probably one of the most energetic types of music ever played. Bhangra has been so successful that it is played in most clubs around the world. Some common Bhangra artists/Bands are: Jazzy B., Lehmbur Hussainpuri, Sukhshinder Shinda, Panjabi MC, RDB (Rhythm Dhol Bass). Bhangra was invented/discovered by the Sikhs in Panjab. Bhangra is sang in Panjabi. The Sikhs needed a type of music to celebrate weddings and other occasions like their harvest festival Vasakhi so they came up with Bhangra!

## American Primitivism

**American Primitivism**, also known as American Primitive Guitar, is the guitar music genre started by John Fahey in the late 1950's. Its hallmark was its avant-garde/neo-classical compositions played in traditional bluegrass fingerpicking style. Other famous proponents were Leo Kottke, Robbie Basho and Peter Lang; all played at one time or another on Fahey's Takoma Records label. Modern players influenced by the genre include Sir Richard Bishop, Nick Schillace and Tetsui Akiyama.

## Quotes

". . . The New Age people call it Folk; the Folk people call it New Age, but it is really neither. It's transitional. The style is derived from the country blues and string band music of the 20's and 30's, however much of the music is contemporary. Fahey referred to it as 'American Primitive' after the 'French Primitive' painters, meaning untutored."

"...Fahey suggested the idea of joining similar themes, and exploring both time and space. He also wanted me to try using dissonance and minor tunings. Maybe the biggest thing he put into me was the idea that a major part of music exists in the space between notes and chords."

# 1950s

## Covers: Early 50s

Through the late 1940s and early 1950s, rhythm and blues music had been gaining a stronger beat and a wilder style, with artists such as Fats Domino and Johnny Otis speeding up the tempos and increasing the backbeat to great popularity on the juke-joint circuit. Despite the pioneering efforts of Freed and others, black music was still taboo on many white-owned radio outlets. However, savvy artists and producers quickly recognized the popularity and potential of rock and roll and raced to cash in with white versions of this black music. Black performers saw their songs recorded by white performers, an important step in the dissemination of the music, but often at the cost of feeling and authenticity. Most famously, Pat Boone recorded sanitized versions of Little Richard songs (Little Richard retaliated by getting wilder, creating in "Long Tall Sally", a song so intense that Boone couldn't find a way to cover it). Similarly, Ricky Nelson recorded Fats Domino. Later, as those songs became popular, the original artists' recordings received radio play as well (though this seldom resulted in any remuneration to the original artists). The cover versions were not necessarily straightforward imitations. For example, Bill Haley's incompletely bowdlerized cover of "Shake, Rattle and Roll" transformed Joe Turner's humorous and racy song into an energetic teen dance number, while Georgia Gibbs replaced Etta James's sarcastic vocal in "Roll With Me, Henry" (covered as "Dance With Me, Henry") with a perkier vocal more appropriate for an audience unfamiliar with the song which James's song was an answer to (Hank Ballard's "Work With Me, Annie").

## Rockabilly: Mid-50s

*Main article:* [Rockabilly](#).

At the same time that R&B was turning into rock and roll, country & western music was undergoing a similar transformation to faster tempos and more aggressive playing. In cities like Memphis, Tennessee, country and blues record producers such as Sam Phillips combined this "hillbilly" music with the driving rhythm of rock and roll and rockabilly was born. In 1954, an unknown performer named Elvis Presley would come into Phillips' studio with a request to record a disc for his mother. Recognizing talent in the shy young man, Phillips arranged to have Elvis record some ballads with professional musicians, but that date quickly turned into a jam session as Elvis sang the R&B songs he loved. Elvis' first release for Phillips' Sun Records, "That's All Right Mama" became the first rockabilly hit and established Elvis as the first true rock and roll star.

But it was in 1955 that the rock era really began to take off with Bill Haley and the Comets' seminal recording, "Rock Around the Clock". The song was a breakthrough for both the group and for all of rock and roll music. If everything that came before laid the groundwork, "Clock" certainly set the mold for everything else that came after. With its combined rockabilly and R & B influences, "Clock" topped the U.S. charts for several weeks, and has since been featured on the soundtrack to such films as *Blackboard Jungle* and *American Graffiti*, as well as the original theme music to the TV series *Happy Days*.

## Diversification of American rock: Late 50s

With the runaway popular success of rock, the style began to influence other genres. Vocalized R&B became [doo wop](#), for example, while uptempo, secularized [gospel music](#) became [soul](#), and audiences flocked to see Appalachian-style folk bands playing rock-influenced pop version of their style. Young adults and teenagers across the country were playing in amateur rock bands, laying the roots for local scenes, [garage rock](#) and [alternative rock](#). More immediately, places like Southern California produced their own varieties of rock, such as [surf](#).

### Surf Music

*Main article:* [Surf music](#)

The rockabilly sound reached the West coast and mutated into a wild, mostly instrumental sound called surf music. This style, exemplified by Dick Dale and The Surfaris, featured faster tempos, innovative percussion, and processed electric guitar sounds which would be highly influential upon future rock guitarists. Other West coast bands, notably the Beach Boys and Jan and Dean, would capitalize on the surf craze, slowing the tempos back down and adding harmony vocals to create the "California Sound".

# 1960s

## British Invasion

American rock and roll had an impact across the globe, perhaps most intensely in Britain, where record collecting and trend-watching were in full bloom among the youth culture prior to the rock era, and where color barriers were less of an issue. Countless British youths listened to and were influenced by the R&B and rock and roll pioneers and began forming their own bands to play the new music with an intensity and drive seldom found in white American acts. This set the stage for Britain becoming a new center of rock and roll, leading to the [British Invasion](#) from 1958 to 1969.

By the early 1960s, bands from England were dominating the rock and roll scene world wide, giving rock and roll a new focus. First re-recording standard American tunes, these bands then infused their original rock and roll compositions with an industrial-class sensibility. Foremost among these was The Beatles, comprised of four youths from Liverpool who became the single most important and influential act in the history of rock and roll. The Beatles brought together a near-perfect mix of image, songwriting, and personality and, after initial success in the UK, were signed in the US and launched a large-scale stateside tour to ecstatic reaction, a phenomenon quickly dubbed Beatlemania.

Although they were not the first British band to come to America, The Beatles spearheaded the Invasion, triumphing in the U.S. on their first visit in 1964 (including historic appearances on the Ed Sullivan Show). In the wake of Beatlemania other British bands headed to the U.S., notably The Rolling Stones, who disdained the Beatles' clean-cut image and presented a darker, more aggressive image, as well as other bands like The Animals and The Yardbirds. Throughout the early and mid-'60s Americans seemed to have an insatiable appetite for British rock; one of the groups who made a greater mark in the USA than on the UK was Herman's Hermits. Other British bands, including The Who and The Kinks, would have some success during this period but saved their peak of popularity for the second wave of British invasion in the late 1960s.

## 1960s Garage rock

*Main article:* [Garage rock](#)

The British Invasion spawned a wave of imitators in the U.S. and across the globe. Many of these bands were cruder than the bands they tried to emulate. Playing mainly to local audiences and recording cheaply, very few of these bands broke through to a higher level of success. This movement, later known as [Garage Rock](#), gained a new audience when record labels started re-issuing compilations of the original singles; the best known of these is a series called Nuggets. Some of the better known band of this genre include The Sonics, ? & the Mysterians, and The Standells.

## Folk-rock

*Main article:* [Folk-rock](#)

As the British Invasion led by The Beatles picked up steam, a homegrown American trend was making itself felt, led by Bob Dylan. By 1963 the 22 year old Dylan had

assimilated a deep variety of regional American styles and was about to work some alchemy to create an entirely new genre, usually dubbed "folk-rock". From 1961 to mid 1963 Dylan had kept his distance from rock and roll even though his first musical forays back in high school owed more to early rockers like Buddy Holly and Little Richard than to any of the more obscure folk and blues artists he would later embrace. He and others on the new folk circuit tended to view The Beatles as "bubblegum", but admitted to a grudging respect for their originality and energetic style. In 1963 Dylan's release of the album *The Times They Are A-Changin'* was a watershed event, bringing "relevant" and highly poetic lyrics to the edge of rock and roll. The Beatles listened to this album incessantly and moved away from the exclusive love themes of their work to date. In 1964 and 1965 Dylan threw off all pretense to roots purity and embraced the rock beat and electric instruments, climaxed by the release of the song "Like a Rolling Stone" which, at over six minutes, changed the landscape of hit radio and ushered in a period of intense experimentation on both sides of the Atlantic. Dylan would continue to surprise fans and critics with tour-de-force albums in many different styles, but, after 1964, rarely strayed far from the rock and roll framework. His influence on all rock sub-genres is incalculable, probably equaled only by The Beatles'. Among Dylan's most important disciples was Neil Young, whose lyrical inventiveness, wedded to an often wailing electric guitar attack, would presage [grunge](#).

## **Psychedelic rock**

Psychedelic music sprang up in numerous centers - New York, London, Los Angeles, and elsewhere - but early on, and strongly, in San Francisco. For some years, the so-called San Francisco Sound shared equal esteem (and nearly equal popularity) with British super-star acts like the Rolling Stones, the Who, Cream. Performers and bands like Jimi Hendrix, an American who got his big career break in England and Europe, the Grateful Dead, the Doors, and Pink Floyd all made considerable use of live improvisation.

# 1970s

## Hard Rock

A number of groups in the early 1970s continued the trend towards heavier and heavier rock and roll begun by 1960s supergroups such as Cream and The Jeff Beck Group. The most notable of these groups was undoubtedly British supergroup Led Zeppelin, who in a very short span of time rose to the apex of the rock world. Their hard-edged, loud approach to the blues and guitar rock, the epic span of many of their compositions and their unhinged lifestyle would be a great influence on many American acts of the time. What is more, they, along with fellow British group Black Sabbath, would later be recognized as the roots of heavy metal. The early albums of American group Aerosmith would greatly reflect these influences.

## Glam Rock

While British musician David Bowie is perhaps the musician most associated with glam, American acts Alice Cooper and The New York Dolls were also significant. Their music is marked by live performance kitsch antics, provocative yet catchy lyrics, and a cutting-edge sound on albums like Alice Cooper's Bob Ezrin produced Billion Dollar Babies. Conversely, The New York Dolls sound was more stripped down and raw, influenced by 60's girl groups, and protopunk groups like The MC5 and The Stooges. The ironic mockery of rock excess presented by glam rock acts would later influence both [punk rock](#) and [glam metal](#).

## Progressive Rock

Prog Rock can largely be seen as an expansion on the supergroup idea. It was highly technical rock that attempted to move past the dominance of blues rock improvisation into a compositional framework more reminiscent of classical music. Some significant Prog Rock groups are Pink Floyd, Emerson, Lake and Palmer, King Crimson and Yes.

## Punk Rock

Fed up with what they perceived as the excess and decadence of arena rockers like The Rolling Stones and Led Zeppelin, a number of groups centered in urban New York and London began playing a stripped down sound that came to be called [punk](#). These groups felt that rock had lost sight of its rebellious, cutting-edge origins and had become obsessed with money and fame. Bands like Britain's The Clash and The Sex Pistols and America's The Ramones would lead this musical revolution. Punk rock in the US was largely an east coast phenomenon, especially centered around New York City, though the decade would later see the development of the [hardcore punk](#) movement, lead by Los Angeles' Black Flag.

## 1980s

### New Wave

In the '80s electronic fueled New Wave music[[New Wave]] groups became the forefront of the American music scene that included the influential groups Blondie and Talking Heads.

### Heavy Metal

[Heavy Metal](#) also became popular with acts such as Slayer and Metallica. Later began the rise of Hair Metal with popular acts such as Poison and Bon Jovi.

### Grunge

Early grunge bands, particularly Alice In Chains, Mudhoney and Soundgarden, took much of their sound from early heavy metal and much of their approach from punk, though they eschewed punk's ambitions towards political and social commentary to proceed in a more purely nihilistic direction. Grunge remained a mostly local phenomenon until the breakthrough of Nirvana in 1991 with their album Nevermind. A slightly more melodic, more completely produced variation on their predecessors, Nirvana was an instant sensation worldwide and immediately made much of the competing music seem stale and dated by comparison. Nirvana were a great success during the nineties but they really hit the big time with their hit *Smells Like Teen Spirit* which is their most well-known song.

Nirvana whetted the public's appetite for more direct, less polished rock music, and one place it was found was in the debut album from a hard-rocking West Coast band with ties to the grunge movement, a band named Pearl Jam. Pearl Jam took a somewhat more traditional rock approach than other grunge bands but shared their passion and rawness. Pearl Jam were a major commercial success from their debut but, beginning with their second album, refused to buy in to the traditional corporate promotion and marketing mechanisms of MTV and Ticketmaster (with whom they famously engaged in legal skirmishes over ticket service fees).

### Nu Metal

The mid to late '90s were dominated by the rap-metal blend of styles called nu-metal. Korn and Limp Bizkit are one of the more popular acts of the time.

### Pop-punk

One of the other great rock bands of the nineties was Green Day. Green Day released their first album in 1989 but it wasn't until they released Dookie in 1994 that they really achieved world wide success. Their success made way for bands like The Offspring, and Blink-182 throughout the decade.

## 2000s

So far the early 2000s hasn't yet seen a band of the influence of Nirvana or The Beatles. Post-Grunge bands continue to dominate radio in the early '00s with bands such as Nickelback and Staind.

Garage rock made a comeback with bands like The White Stripes and The Strokes gaining critical acclaim and popularity.

New Wave/Post Punk has made a comeback with the likes of Franz Ferdinand and The Killers.

Green Day currently is a popular band in the category with their release of American Idiot, the likes of which gave the current Pop-Punk movement even more strength. Bands like Fall Out Boy and My Chemical Romance have also become popular in the same genre of music.

However, so far nobody has yet to rise to the top of the 2000s pile, although young British band Coldplay is heavily favored to take the spotlight.

# Analog modeling synthesizer

**Analog Modeling Synthesizer**, also referred to as **Virtual Analog** or **VA** is a [synthesizer](#) that emulates the sounds of traditional analog synthesizers using digital techniques. There is a vague consensus that while VA's can be useful and expressive instruments in their own right, they seldom achieve the vibrant sound of true analog synthesizers. On the other hand, they exceed many analog instruments in reliability and polyphony, and offer patch storage capabilities not found on all analog instruments.

Examples of VA synthesizers include:

- Clavia Nord Lead and Modular series

- Novation

- Roland JP-8000

- Alesis Ion and Micron

- Korg MS-2000

- Access Virus line of VA synths

Categories: [Synthesizers](#)

# Anarcho-punk

**Anarcho-punk** is a part of the [punk](#) movement consisting of groups, bands and individuals promoting specifically anarchist ideas. Not all punks identify with anarchism. However, anarchism plays a significant role in punk. Also, punk has had a significant influence on the expression of contemporary anarchism.

## Beliefs and origins

A surge of popular interest in anarchism occurred during the 1970s in the UK following the birth of [punk rock](#), in particular the situationist-influenced graphics of Sex Pistols artist Jamie Reid, and that band's first single, Anarchy in the UK. However, while the early punk scene appropriated anarchist imagery mainly for its shock value, the band Crass expounded serious anarchist and pacifist ideas, and went on to become a notable influence within various late-twentieth century protest movements.

Many anarcho-punks are supporters of issues such as animal rights, feminism, the anti-war movement, the anti-globalization movement, and many other social movements. Though Crass espoused pacifism as a belief, this is not necessarily the case for all anarcho-punks. Though some anarcho-punks are pacifists and most are in favor of direct action, others consider "violent" action appropriate and sometimes necessary within context. Many favour a diversity of tactics.

While there is certainly no leadership, it is difficult to imagine anarcho-punk existing without the influence of Crass, although Crass founder Penny Rimbaud has stated that it is a label he dislikes. He feels that the anarcho-punks were actually representative of true punk, while the Sex Pistols, The Clash, The Damned etc. were nothing more than 'music business puppets'.

## The DIY punk ethic

Many anarcho-punk bands, especially at the local level of unsigned groups, have taken on what is known as a DIY ethic: that is, Do It Yourself; indeed, a popular Anarcho-punk slogan reads "DIY not EMI", a reference to a conscious rejection of the major record company of that name. Many anarcho-punk bands were showcased on the Bullshit Detector series of LPs released by Crass Records and Resistance Productions Records between 1980 and 1994. There is an argument that despite promoting an anti-capitalist ideology, these were commodities sold in the market place and thus were inherently contradictory. It is however difficult to see how such groups could otherwise make their music and ideas available, although some anarcho-punk performers were also a part of the [Cassette Culture](#) scene. In this way an attempt was made to bypass the traditional recording and distribution routes, with material often being made available in exchange for "a blank tape plus self-addressed envelope". The anarcho-punk movement also had its own network of fanzines (sometimes called punk-zines) which disseminated news, ideas and artwork from the scene. Again, these were usually very much 'DIY' affairs, tending to be produced in runs of hundreds (at most) rather than thousands (although there were exceptions, such as Toxic Graffiti), printed on photocopiers or duplicator machines, and distributed by hand at punk shows.

## **Identity politics**

Anarcho-punk has been highlighted as one of the social phenomena which took anarchism in the direction of 'identity politics' (or 'lifestylism'). Some argue that style became an essential ingredient of the movement, sometimes obscuring other factors, although others would reply that the performers who aligned themselves with anarcho-punk in fact embraced a wide diversity of approaches in both format and ideas. This would appear to be borne out by the range of artists and performers listed on the anarcho-punk bands page.

# Anarcho-rockers

**Anarcho-rockers** are a subgenre of the [rocker](#) movement consisting of groups and bands promoting specifically anarchist ideas. However, while the early rocker scene appropriated anarchist imagery mainly for its shock value, the band The Weakerthans expounded serious anarchist and pacifist ideas, and were to become a notable influence within various late-twentieth century protest movements. Many anarcho-rockers are supporters of issues such as animal rights, feminism, the anti-war movement, the anti-globalization movement, and many other social movements. Anarcho-rocker has been highlighted as one of the social phenomena which took anarchism in the direction of 'identity politics' (or 'lifestylism'). Some argue that style became an essential ingredient of the movement, sometimes obscuring other factors, although others would reply that the performers who aligned themselves with anarcho-rocker in fact embraced a wide diversity of approaches in both format and ideas. Anarcho-rockers are an anti-establishment music movement that began about 1980, exemplified by Riot Rockers, The Clash, Bakunin's Bum, Dazoque, Rhythm Activism, Vennaskond, The Weakerthans etc. Also Stray Cats were at the beginning very close to Anarcho-rockers.

## Anarcho-Rocker bands

- The Astro Zombies
- Bad Reputation
- Banane Méetalik
- Barnyard Ballers
- Carlos Up To Vegas
- Cenobites
- Chibuku
- Die Chinesischen Glückskekse
- The Ed Random Band

## Anatolian rock

The **Turkish rock** scene began in the mid- to late 1960s, when popular United States and United Kingdom bands became well-known. Soon, Turkish performers like Mogollar created a distinctively Turkish fusion of rock and Turkish folk; this was called **Anatolian rock**, a term which now generically describes most any kind of rock music written in Turkish.

From 1966 to about 1975, [psychedelic rock](#) was very popular in Turkey. After that, more [progressive](#)-styled bands gained popularity, with older performers like Cem Karaca (Safinaz, 1978) and Mogollar (Düm-tek) moving towards prog.

As other Rock genres gained popular in Turkey, Anatolian Rock also began to diversify. Today, the country boasts many excellent rock bands like Pentagram, Mor ve Ötesi, Kargo, Cilekes, Duman and maNga, with the latter having won the "Best Rock Band" award in almost all the polls set up in 2005. The specific influences of these bands fall into a wide range of musical genres from the Seattle grunge attitude to heavy or doom metal and rapcore genres. Hence, Anatolian rock refers to a fusion of a wide selection western rock subgenres with either a traditional Turkish sound or simply rock music with Turkish lyrics. Such cultural fusion has led way to some exciting rock music to develop in Turkey.

Individual pop rock performers are also very successful, like Özlem Tekin, ^ebnem Ferah, Demir Demirkan, Kargo soloist Koray Candemir, K1raç and Teoman.

# Ancient music

## Eras of European art music

|  |                   |
|--|-------------------|
| <b>Ancient music</b>                         | 1500 BCE - 476 CE |
| <a href="#">Early music</a>                  | 476 - 1600        |
| <a href="#">Common practice period</a>       | 1600 - 1900       |
| <a href="#">20th century classical music</a> | 1900 - 2000       |

**Ancient music** is [music](#) that developed in literate cultures, replacing [prehistoric music](#).

The development of writing took place in different time periods in different geographic areas. The first examples of structured linear writing have been found in the lower Danube Valley and date from around 5000 BCE. The first examples of Sumerian writing in Mesopotamia date from around 4000 BCE. So this is when the era of ancient music began. In Europe it ended in 476 CE, and was followed by the [Early music](#) era of [European classical music](#). For [Arab music](#), ancient history ended in 622 CE.

Very little remains of music from Ancient Greece or Rome. The epics of Homer and the [lyrics](#) of Sappho, for instance, were meant to be sung with instrumental accompaniment, but nothing remains of their scores. Fragments of Greek music are, however, extant, most notably scraps from tragedy (a choral song by Euripides for his Orestes and an [instrumental intermezzo](#) from Sophocles' Ajax), a few [hymns](#) by Mesomedes of Crete (2nd century CE), and the Seikilos epitaph (dated variously between the 2nd century BCE and 1st century CE). Of Roman music, there remains but one meagre scrap: a line from Terence's Hecyra set to music by his composer Flaccus.

Until recently, it was generally believed that all music of antiquity was monophonic and that polyphony was an invention of the Middle Ages, but archaeological evidence indicates that this view is no longer tenable. The "oldest known song" in cuneiform from Ur, 4,000 years old, deciphered by Prof. Anne Draffkorn Kilmer (University of California at Berkeley), was demonstrated to be composed in harmonies of thirds, like ancient English *gymel*, and was also written using a [diatonic scale](#). Neither harmony nor the diatonic scale can still be considered developments belonging only to "Western" music.

In addition, double pipes, such as used by the Greeks and Persians, and ancient bagpipes, as well as a review of ancient drawings on vases and walls, etc., and ancient writings (such as in Aristotle, *Problems*, Book XIX.12) which described musical techniques of the time, all indicate harmony existed.

One pipe in the aulos pairs (double flutes) likely served as a drone or "keynote," while the other played melodic passages.

The term "ancient music" may also refer to contemporary, but traditional or [folk](#), music which is considered to continue its "ancient" style and includes much Persian music, [Asian music](#), Jewish music, Greek music, [Roman music](#), the music of Mesopotamia, the music of Egypt, and Muslim music. See also: [authentic performance](#).

## The Harps of Ur

In 1929 Leonard Woolley discovered pieces of at least three [harps](#) while excavating in the ruins of the ancient city of Ur located in what was Ancient Mesopotamia and is contemporary Iraq. Some fragments are in Pennsylvania, some in the British Museum in London, and some in Baghdad. They have been dated to 2,750 BCE. Various reconstructions have been attempted, but none were totally satisfactory. Depending on various definitions, they could be classed as lyres rather than harps. The most famous is the bull-headed harp, held in Baghdad. It survived both Iraqi wars, and attempts are being made to play a replica of it as part of a touring [orchestra](#).

## Harps from Syria and Egypt

Assurbanipal (705 - 681 BCE) was king of Assyria. At his capital at Nineveh is a bas-relief showing the fall of the Judean city of Lachish. In the procession is the Elamite court orchestra, containing seven lyre-players and possibly a hammer-dulcimer player. The lyres appear to have seven strings. True harps are shown in murals from the time of Ramesses III of Egypt, about 1200 BCE. "The Tomb of the Harpists" contains a bas-relief with two blind musicians. James Bruce described it in 1768 and it is sometimes known as Bruce's Tomb.

## Ancient Roman music

**Ancient Roman Music** In a discussion of any ancient music, non-specialists and even many musicians have to be reminded that much of what makes our modern music familiar to us is the result of developments only within the last 1,000 years; thus, our ideas of melody, scales, harmony, and even the instruments we use would not be familiar to Romans who made and listened to music many centuries earlier.

## General Characteristics of Roman Music

As strange as it seems, we know less about the music of ancient Rome than we do about the music of ancient Greece. There are a number of at least partially extant sources on the music of the Greeks. For example, much is known about the theories of Pythagoras and Aristoxenus (some of it from Greek sources and some through the writings of later Roman authors), and there exist about 40 deciphered examples of Greek musical notation. There is very little such material on the music of the Romans. There are various reasons for this, one of which is that early fathers of the Christian church were aghast at the music of theater, festivals, and pagan religion and suppressed it once Christianity became the official religion of the Roman empire.

The Romans are not said to have been particularly creative or original when it came to music. They did not attach any spiritual *ethos* to music, as did the Greeks. Yet, if the Romans admired Greek music as much as they admired everything else about Greek culture, then it is safe to say that Roman music was mostly monophonic (that is, single melodies with no harmony) and that the melodies were based on an elaborate system of scales (called "modes"). Also, the rhythms of sung music followed the natural meter of the words.

There were also other, non-Greek influences on Roman culture--from the Etruscans, for example, and, with imperial expansion, from the Middle Eastern and African sections of the empire. Thus, there were, no doubt, elements of Roman music that were native Italian as well as non-European; the exact nature of these elements is unclear.

# Musical instruments

Roman musical instruments included:

- Wind (lip reed; i.e. like a modern brass instrument)
  - *tuba*—not the modern tuba, but a long and straight bronze trumpet with a detachable, conical mouthpiece like that of the modern French horn. Those found are about 1.3 meters long; they had a cylindrical bore from the mouthpiece to the point where the bell flares abruptly, in a fashion similar to that of the modern, straight trumpet often seen in presentations of "period music". (It goes without saying that there were no valves. One instrument was capable only of a single overtone series.) It was essential to the military, providing "bugle calls" and was apparently borrowed from the Etruscans.
  - *cornu*—a somewhat more than semi-circular (shaped like an upper-case letter 'G') bronze instrument with or without a cross-bar/handle across the diameter. It had a conical bore (like a modern French horn) and a conical mouthpiece. Also used in the military and also borrowed from the Etruscans.
- Wind (mechanical reed; i.e. like a modern clarinet)
  - the *aulos* (the Greek term—in Latin, *tibae*), usually double, consisting of two double-reed (as in a modern oboe) pipes, not joined but generally played with a mouth-band to hold both pipes steadily between the player's lips. Modern reconstructions indicate that they produced a low, clarinet-like sound. There is some confusion about the exact nature of the instrument; alternate descriptions indicate each pipe having a single-reed (like a modern clarinet) instead of a double reed.
  - the *ascaules*—a bagpipe.
- Plucked string instruments
  - the *lyre*—borrowed from the Greeks (essentially an early harp; i.e. a frame of wood or tortoise shell with various numbers of strings stretched from a cross bar to the sounding body. The lyre was held or cradled in one arm and hand and plucked with the other hand. The Romans gradually abandoned this instrument in favor of the more sophisticated *kithara*, a larger instrument with a box-type frame with strings stretched from the cross-bar at the top to the sounding box at the bottom; it was held upright and played with a plectrum. The strings were tuneable by adjusting wooden wedges along the cross-bar.
- The organ—There are some mosaic images of organs and fragmentary remains in the National Archaeological Museum of Naples. The pipes were sized so as to produce many of the modes (scales) taken over from the Greeks. From the fragments, the instruments seem to be a cross between the bagpipe and the organ. It has not been established if they were blown by the lungs or by some mechanical bellows. Of greater interest is the *hydraulis*, an organ that worked by water pressure.

The instrument goes back to the ancient Greeks and a well-preserved model in pottery was found at Carthage in 1885. Essentially, the air to the pipes that produce the sound comes from a mechanism of a wind-chest connected by a pipe to a dome; air is pumped in to compress water, and the water rises in the dome, compressing the air, and causing a steady supply to reach the pipes.

- Percussion
  - Variations of a hinged wooden or metal device (called a *scabellum*)—a "clapper"—used to beat time. Also, there were various rattles, bells, and tambourines.

## Music in Society

In spite of the purported lack of musical originality on the part of the Romans, they did enjoy music greatly and used it for many activities. Scott recounts the obvious military uses of the *tuba* for signalling, as well as music for funerals, private gatherings, public performances on the stage and large gladiatorial spectacles. Music was also used in religious ceremonies. It should be noted that the Romans cultivated music as a sign of education. Music contests were quite common and attracted a wide range of competition, including Nero, himself, who performed widely as an amateur and once traveled to Greece to compete. .

There are also numerous references (cited in Scott ) to the pervasive presence of music in ancient Rome, music even on a very large scale--hundreds of trumpeters and pipers playing together at massive games and festivals--and even of normally hand-held *kitharas* built as large as carriages.

## What the music sounded like

Although the Greeks had musical notation, there is no evidence that the Romans copied it. That is to say, of the surviving illustrations, say, in the mosaics of Pompeii, of musicians performing, none of them show the musicians to be reading music. Thus, we have not discovered, as yet, anything on the order of written music that would tell us exactly what Roman musicians were singing and playing at funerals, parties, gladiatorial games, etc. (Again, the modern reader is reminded that the musical scores of films about ancient Rome, such as *Ben Hur* or *Spartacus* are total anachronisms.) Even the well-known writings of the late Roman philosopher, Boethius, are more of a treatise on the music of the ancient Greeks rather than an explanation of what contemporary music of the Roman empire must have sounded like. It is, thus, speculative, but perhaps reasonable speculation, that the Romans might have tuned those instruments that could be tuned—those with pipes or strings—to one or more of the many Greek modes that had come down to them. Familiar, perhaps, to the modern ear would be the military calls on the trumpet-like *tuba*, since all instruments of that nature only have access to the same series of overtones bound by the laws of physics.

## Andalusi nubah

**Andalusi nubah** is a [genre](#) found in the North African Maghrib states of Morocco, Algeria, Tunisia, and Libya but, as the name indicates, of Spanish origin. The name replaced the older use of sawt and originates from the musician waiting behind a curtain to be told it was his turn or *nawbah* by the *sattar* or curtain man. (Touma 1996, p.68)

Lyrics are sung by the soloist or in unison by the chorus are chosen from the muwashshah or zajal poetic forms, being in classical and colloquial Arabic, respectively. (ibid, p.70-71)

Andalusi nubah uses one tab' (similar to maqam) per performance, and includes several instrumental pieces and predominantly vocal pieces accompanied by instrumentation. These differ as to mizan or rhythmic pattern (wazn). (ibid, p.68)

Formally the tempo increases while the awzan simply within each of five sections. The sections are introduced by short instrumental pieces and vary according to region, the name indicating the awzan used:

- in Algeria: msaddar, btayhi, darj, insiraf, khlas
- in Tunisia: btaybhi, barwal, darj, khafif, khatm
- in Morocco: basit, qayim wa-nisf, btayhi, darj, quddam

The ensemble used includes the ud, rabab or rebec, nay, box xither, tambourine, and goblet drum, the players of which also serve as [chorus](#). (ibid, p.70)

## Andalusian classical music

**Andalusian [classical music](#)** is a style of music found across North Africa, though it evolved out of the music of Andalusia between the 9th and 15th centuries. It is now most closely associated with Morocco (al-Âla), though similar traditions are found in Algeria (Gharnâfî, and San'a), Tunisia and Libya (al-Maalûf).

## Origins

Andalusian classical music probably evolved during Muslim rule in Cordoba, and the Baghdad-born musician Ziryâb (d. 857) is usually credited with its invention. Later, the poet, composer and philosopher Ibn Bâjja (d. 1139) of Saragossa is said to have combined the style of Ziryâb with Christian Spanish music to produce a wholly new style that spread across Iberia and North Africa. The classical music of Andalusia reached North Africa via centuries of cultural exchange, as well as through mass resettlements of Muslims and Sephardi\_Jews from Cordova, Seville, Valencia and Granada, fleeing the Christian Reconquista.

## Music

A suite form called the *nûba* forms the basis of *al-âla*. Though it has roots in Andalusia, the modern *nûba* probably is a North African creation. Each *nûba* is dominated by one musical mode. It is said there used to be twenty-four *nuba* linked to each hour of the day, but in Morocco only eleven *nuba* have survived, which together include 25 "Andalusian" modes. Each *nûba* is divided into five parts called *mîzân*, each with a corresponding rhythm. The rhythms occur in the following order in a complete *nuba*:

1. *basît* (6/4)
2. *qâ'im wa nuf* (8/4)
3. *btâyhî* (8/4)
4. *darj* (4/4)
5. *quddâm* (3/4 or 6/8)

An entire *nuba* can last six or seven hours, though this is never done today. Rather, in Morocco usually only one *mîzân* from any given *nûba* is performed at a time.

Each *mizan* begins with instrumental preludes called either *tûshiya*, *m'shaliya* or *bughya*, followed by as many as twenty songs (*sana'i*) in the entire *mizan*.

Andalusian classical music orchestras are spread across Morocco, including the cities of Fez, Tetouan, Chaouen, Tangier, Meknes, Rabat and Casablanca.

## Instruments

Andalusian classical music orchestras use instruments including oud ([lute](#)), rabab (rebec), darbouka (goblet drums), taarija ([tambourine](#)), qanún (zither) and kamenjah ([violin](#)). More recently, other instruments have been added to the ensemble, including [piano](#), contrabass, [cello](#), and even [banjos](#), saxophones and [clarinets](#), though these latter instruments are rare.

## Anglican chant

**Anglican chant** is a method of singing prose translations of the [Psalms](#) developed and formerly much used in the Anglican church. Each verse, pair, group of three, or group of four verses is set to a simple harmonized melody of 7, 14, 21 or 28 bars (known respectively as a single, double, triple or quadruple chant), with the majority of the syllables freely chanted on the extendable *reciting notes*, which occupy the first, fourth, eighth, eleventh (etc.) bars.

The origins of the method are obscure, but it was well established by the eighteenth century. The earliest known examples are single chants, dating from the latter part of the 16th century, written by Thomas Tallis and his contemporaries, so it seems likely that Anglican chant was devised by them to provide a suitable musical setting for Coverdale's psalter, as published in the Book of Common Prayer. The earliest double chants are from about 1700.

Canticles such as the Magnificat and Nunc dimittis may also be sung in this manner.

## How chanting works

To explain how chanting works, it is best to use an example. Above is a single chant. Below are the first four verses of the Magnificat, with the text coloured to show which words correspond to which notes in the music ("the chant").

1. My soul doth ' magnify the ' Lord : And my spirit hath re'joiced in ' God my ' Saviour.
2. For He ' hath re'garded : the ' lowliness ' of His ' handmaiden.
3. For be'hold from ' henceforth : all gene'rations shall ' call me ' blessed.
4. For He that is mighty hath ' magnified ' me : and ' holy ' is His ' Name.

Precise rules for chanting vary according to the particular **psalter** in use. The rules used in the *Parish Psalter* (one of the more popular, edited by Sydney Nicholson) are as follows:

- The chant is sung to the words of one verse.
- The barlines in the music correspond to the inverted commas (called "pointing marks") in the text.
- The double barline in the music corresponds to the colon in the text.
- Where there is one note (a semibreve) to a bar, all the words for the corresponding part of the text are sung to that one note.
- Where there are two notes (two minims) to a bar, all the words *except the last syllable* are sung to the first minim. The final syllable is sung to the second minim. Where more than the last syllable is to be sung to the second minim, a dot is used (much like a pointing mark) in the text to indicate where the note change should occur.

There are various additional rules which apply occasionally:

- Sometimes the second minim of a pair is replaced by two crotchets. In this case, the relevant syllable is slurred across the two notes.
- When the two minims are replaced with a dotted-minim and a crotchet in one or more (but not all) of the musical parts, the last syllable is sung by those parts on the note having the value of the crotchet, but in time with the other parts (and it is likely that a dot will be required in the text to move the other parts back from the last syllable so that the crotchet is musically functional). It is a common mistake to sing the crotchet as an isolated rhythmic feature.
- A change of chant may be used to signal a thematic shift in the words of the psalm.

## Double, triple and quadruple chants

The example above is a **single chant**. It is normally only for very short psalms (half a dozen verses or so) that single chants are used.

The most commonly-used chants used are **double chants**. These are twice the length of a single chant. The music of the chant is repeated for every pair of verses. This reflects the structure of the Hebrew poetry of many of the psalms: Each verse is in two halves - the second half answers the first; the verses are in pairs - the second verse answers the first.

**Triple** and **quadruple chants** appeared from the latter part of the 19th century, to cover some of the exceptions to this format. They set the verses of the psalm in groups of 3 or 4 verses respectively. Psalm 2 (for example) is well-suited to a triple chant; a quadruple chant might be used for Psalm 78.

- A double chant is divided into "quarters", each of which has the music for half a verse. Triple and quadruple chants may also be described as containing six or eight quarters.
- Where a psalm (or section of a psalm) has an odd number of verses, a numbered verse will be marked "2nd part". This means if the chant is sung to a double chant, that verse is to be sung to the 2nd half of the chant, rather than the first. After that, verses continue with the 1st half and alternate between the halves of the chant as before. Similarly, "3rd part" markings may be used for triple chants.

## Antiphonal singing

A further stylistic technique is used in cathedrals and churches which use an antiphonal style of singing. In this case, the choir is divided into two equal half-choirs, each having representation for the four musical parts, and usually facing one another. They are typically named *decani* (usually the half-choir to the south side) and *cantoris* (usually the half-choir to the north side). Then the choir may employ either of the techniques known as *quarter-chanting* and *half-chanting*. In quarter-chanting, the side that starts (usually decani) sing the first quarter of the chant (and thus the first half of the verse). The side that did not start (usually cantoris) then sing the second quarter of the chant (and thus the second half of the verse). This sequence then repeats. In half-chanting (which is more true to antiphonal singing in the [Gregorian style](#)), decani sing the first two quarters of the chant, and cantoris the next two quarters (so that each half-choir sings a whole verse at a time).

## Anglo-American music

The Thirteen Colonies of the original United States were all former English possessions, and Anglo culture became a major foundation for American folk and popular music.

Many American folk songs use the same music, but with new lyrics, often as parodies of the original material. American Anglo songs can also be distinguished from British songs by having fewer pentatonic tunes, less prominent accompaniment (but with heavier use of drones) and more melodies in major .

Anglo-American traditional music, dating back to colonial times, includes a variety of [broadsides ballads](#), humorous stories and tall tales, and disaster songs regarding mining, shipwrecks (especially in New England) and murder. Folk heroes like Joe Magarac, John Henry and Jesse James are also part of many songs. Folk dance of Anglo origin include the [square dance](#), descended from the European high society quadrille, combined with the American innovation of a caller instructing the dancers . Sea shanties are an important part of Anglo-American music

Folklorist Alan Lomax described regional differences among rural Anglo musicians as included the relaxed and open-voiced northern vocal style and the pinched and nasal southern style, with the west exhibiting a mix of the two. He attributed these differences to sexual relations, the presence of minorities and frontier life .

# Animal song

An **animal song** is a repetitive vocal utterance of higher animals such as [birds](#) and [whales](#). The term is not clearly defined in the scientific literature, though most investigators agree that an animal [song](#) must have syllabic diversity and temporal regularity akin to the repetitive and transformative patterns which define human [music](#).

Motifs and different categories of sound syllables set animal song apart from repetitive animal vocalizations.

In some cases such as birds and cetaceans, the songs are learned from adults. Other mammals besides whales, such as canines and rodents are being studied for evidence of learned animal song.

# Answer song

An **answer song** (or **answer record**) is, as the name suggests, a song (usually a [recorded track](#)) made in answer to a previous song by another artist. The concept became widespread in [blues](#) and [R&B](#) recorded music in the 1930s through 1950s. Today, this practice is most common in [hip hop music](#), especially as the continuation of a feud between performers.

While most answer records are released on underground mixtapes and do not achieve mainstream success, the tracks are sometimes performed live and achieve word-of-mouth popularity. Some answer records are released commercially, however this is rare - as detailed below.

An aspect of hip hop performance is for an MC to "diss" (show disrespect towards) other performers. This may stem from a creative dispute between the two performers, competition between them (or their record labels) or personal slights. Such disses are often not made directly, an MC might refer to his or her town as being better than another (unnamed) town but clearly imply a competitor. This practice stems from dancehall [reggae](#) music, where the disses are much more direct and personal - as well as being more commonly released commercially (see Bounty Killer's album "The Art Of War").

The answer record is therefore a signal that the battle has been joined. The dissed MC will release a track insulting the originator of the feud, which will be responded to with another recording and so on. It is not uncommon for both performers to call each other's sexuality and talent into question, which sometimes results in answer records of a particularly high lyrical quality - as each performer attempts to out-do the other.

Additionally, many answer records are recorded over the beat of a song previously released by the target. For this reason, such records are rarely released commercially, as the song is technically in violation of copyright. The reason for taking this step is generally to demonstrate to the target and the audience that the new performer is significantly better at using the same music.

Among the most famous answer records of history is Boogie Down Productions' "The Bridge Is Over." This is a response to a Marley Marl-produced track entitled "The Bridge", which claimed that Queensbridge was the most important borough in New York City. BDP, from another borough, disputed that fact in what is often described as a classic of [hip hop music](#).

Another famous case is that of U.T.F.O.'s hit "Roxanne." This track was perceived by many female rappers as being anti-feminist and resulted in a large number of answer records, many of them by MCs taking the name Roxanne (among them Roxanne Shante and The Real Roxanne). Indeed, it is not uncommon to hear about "The Roxanne Wave" in a discussion of hip hop music at this time.

The phenomenon is significantly more well-known in [hip hop music](#) than in dancehall reggae, however dancehall "wars" are increasingly common. Some of these - especially those recorded by female artists - are light-hearted in intent. Consider, for example Lady Saw and Marsha's response to Shaggy's "It Wasn't Me," entitled "Son of a Bitch". The original song dealt with Shaggy's advice to a friend to deny an extramarital affair, even in the face of incontrovertible evidence. The answer record is framed as a conversation between the women, one of whose husband or boyfriend has been unfaithful. While the lover is never named as Shaggy (or his duet partner "Rik Rok" Ducent), the use of the same backing track is designed to convey that impression.

In recent times, major record labels have released answer songs to great success, most noticeably Frankee's "F U Right Back", a response to a song by Eamon which was supposedly written about her. However, due to both being essentially variations of the same song, it would be impossible for both to be released commercially if there wasn't a

pre-arranged agreement organised by the record labels involved. Despite this lack of authenticity, both songs top charts across the globe, including in America and the UK.

# Anthem

An **anthem** is a composition to an English religious text. The term has evolved to mean a song of celebration, usually acting as a symbol for a certain group of people, as in the term "[national anthem](#)". See *below for other uses*.

## History

The word "anthem" is derived from the Greek ἀντίφωνον through the Saxon *antefn*, a word which originally had the same meaning as antiphony.

It is now, however, generally restricted to a form of church music, particularly in the service of the Church of England, in which it is appointed by the rubrics to follow the third collect at both morning and evening prayer. It is just as usual in this place to have an ordinary [hymn](#) as an anthem, which may be a more elaborate composition than the congregational hymns. Several anthems are included in the English coronation service. The words are selected from Holy Scripture or in some cases from the Liturgy, and the music is generally more elaborate and varied than that of psalm or hymn tunes. Though the anthem of the Church of England is analogous to the [motet](#) of the Roman Catholic and Lutheran Churches, both being written for a trained choir and not for the congregation, it is as a musical form essentially English in its origin and development.

The anthem developed as a replacement for the Catholic "votive antiphon" commonly sung as an appendix to the main office to the Blessed Virgin Mary or other saints. Though anthems were written in the Elizabethan period by Byrd, Tallis and others they are not mentioned in the Book of Common Prayer until 1662, when the famous rubric *In quires and places where they sing here followeth the Anthem* first appears.

Early anthems tend to be simple and homophonic in texture, in order that the words could be clearly heard. Late in the 16th century the "verse anthem," in which passages for solo voices alternated with passages for full choir, began to evolve. This became the dominant form in the Restoration period, when composers such as Henry Purcell and John Blow wrote elaborate examples for the Chapel Royal with orchestral accompaniment. In the 19th century Samuel Sebastian Wesley wrote anthems influenced by contemporary [oratorio](#) which could stretch to several [movements](#) and last twenty minutes or longer. Later in the same century Charles Villiers Stanford composed examples which used symphonic techniques to produce a more concise and unified structure. Many anthems have been produced on this model since his time, generally by [organists](#) rather than professional [composers](#) and often in a conservative style. Major composers have tended to compose anthems only in response to commissions and for special occasions; examples include Edward Elgar's *Great is the Lord* and *Give unto the Lord* (both with orchestral accompaniment), Benjamin Britten's *Rejoice in the Lamb* (a modern example of a multi-movement anthem and today heard mainly as a concert piece) and (on a much smaller scale) Ralph Vaughan Williams' *O taste and see*, written for the coronation of Elizabeth II. With the relaxation of the rule, in England at least, that anthems should be only in English, the repertoire has been greatly enhanced by the addition of many works from the Latin repertory.

# Anti-folk

**Anti-folk** (or **antifolk**) is a [genre of music](#) related to [punk rock](#) and [American folk music](#) that originated in the mid-1980s in New York City.

Anti-folk had its roots in [punk rock](#), and is still considered by some to be an active subgenre within that scene. By a loose definition, Anti-folk combines the raw, abrasive, and frequently politically charged attitudes of the punk scene with the sounds of American folk tradition.

This genre takes the earnestness of politically charged '60s hippie music and subverts it into something else: music that sounds raw and authentic, but mocks the seriousness and pretension of the established mainstream folk scene and also mocks itself. In Anti-folk, self-mockery and self-aggrandizement have somehow fused, just as political commentary fused with poppy love songs in the sixties.

The Moldy Peaches and Ani DiFranco are considered influential artists in this genre, and are primarily responsible for its popularity. On the West Coast, S.P.A.M. Records' Bobby Joe Ebola and the Children MacNuggits made their own contributions to the genre with vulgar acoustic rock. Contemporary anti-folk music is popular in many parts of United States and has also made its mark in the UK and Europe, chiefly because of Rough Trade Records, the Moldy Peaches, and Jeffrey Lewis, but also in large part due to self-sufficient music communities, venues, and many touring international acts building friendships and musical partnerships. The New York City anti-folk scene mostly revolves around the Sidewalk Cafe, a club in the East Village that hosts shows and an open mike night called the Anti-Hootenanny, hosted by songwriter and seminal Anti-folker Lach. Also notable in the community is Olive Juice Music, a collective and label centered around a recording studio run by Major Matt Mason USA, and Luv-A-Lot, a homemade label run by the prolific Dashan Coram.

Anti-folk is a parent genre of other microbrew classifications such as Urban Folk and Counterfolk. Some performers, such as Dufus, Need New Body, and Man Man, have split with the scene and moved on. But is it a "genre," a "scene," a "community," or just a bunch of songwriters that like to hang out with each other? Most people involved would say it's a frankenstein combination of all of the above.

In recent years Antifolk has spread beyond the US. The UK antifolk scene (largely centred around London and Brighton) is rapidly developing its own identity. The London scene first came to prominence in 2004 with shows promoted by the dirty lo-fi humour of Filthy Pedro and the disturbingly humorous David Cronenberg's Wife. The Brighton scene was quick to follow, with the blunt and fierce monster punches of Larry Pickleman, the creators of Tweecore the Bobby Mcgees and the Queen of AFUK Mertle. Other major players are JJ Crash with his political undercurrents, Spinmaster Plantpot with his a capella 30 second rants / bluesey wailings and Paul Hawkins' edgy and tragicomic tales of social alienation. AFUK-affiliated acts such as the Mink Troubadour Kamikaze Squadron and Emmy the Great have begun to gain national radio airplay while AFUK favourites Milk Kan seem well-placed to break through into the mainstream consciousness.

There is arguably an active Anti-Folk scene in Australia. Centred around inner-city Melbourne, a collection of artists including The Lucksmiths, Darren Hanlon, Jodi Phillis and The Mabels play biting witty songs with accessible melodies that take a lot from 60's pop. The most internationally successful is The Lucksmiths. The Australian breed of anti-folk differs from the American in that the themes are often more ironic and self-referential and tangible. In this respect, they bridge anti-folk with [post-modern music](#). Melbourne's Candle Records is the home of many of these artists.

The singer-songwriter Beck (who has reached a greater level of popularity than most anti-folk acts) has been influenced, to at least some extent, by the New York anti-folk

scene, though one would not really consider his music actual anti-folk.

Some examples of anti-folk performers:

Madeline Adams  
Against Me  
The Apricorn Quartet  
Baptist Generals  
Joe Bendik  
Bobby Joe Ebola and the Children MacNuggits  
Boys Suck  
The Breadweather Biologists  
Brer Brian  
Will Brierly  
Cake Bake Betty  
Kelly Caldwell  
Timothy Cameron  
Can Kickers  
Centromatic  
Cheese On Bread  
Chonk  
Diane Cluck  
Kimya Dawson  
Darren Deicide  
Ani DiFranco  
Peter Dizozza  
Dream Bitches  
Dufus  
Herman Düne  
Patrick Elkins  
Filthy Pedro  
Dan Fishback  
G. Lucas Crane Vs. Non-Horse  
Ghost Mice  
Adam Green  
Hamell on Trial  
Darren Hanlon  
Paul Hawkins  
Huggabroomstik  
Calvin Johnson  
Joie/Dead Blonde Girlfriend  
King Missile  
Phoebe Kreutz  
Lach  
Langhorne Slim  
Jeffrey Lewis  
Little Grizzly  
The Lucksmiths  
The Mabels  
Chris Maher  
Major Matt Mason USA  
Roger Manning  
Ish Marquez  
Bobby McGees  
Mertle  
Michelle Shocked  
Milk Kan  
Mirah

Miwa  
The Moldy Peaches  
Monica's Dress  
Nathan Moomaw  
James O'Brien  
Paleface  
Jodi Phillis  
Phranc  
Brian Pitlin  
Larry Pickleman  
The Plastic Assassins  
Prewar Yardsale  
Grey Revell  
Regina Spektor  
Sickboy  
soce, the elemental wizard  
Stipplicon  
This Bike Is A Pipe Bomb  
The Milkcrate Rustlers  
The Sidewinders  
Andrew Phillip Tipton  
Toby Goodshank  
Turner Cody  
Urban Barnyard  
Jason Voss  
The WoWz  
The Woes

# Arab music

**Arab music** is the [music](#) of Arabic-speaking people or countries, especially those centered around the Arabian Peninsula. The world of Arab music has long been dominated by Cairo, a cultural center, though musical innovation and regional styles abound from Morocco to Saudi Arabia. Beirut has, in recent years, also become a major center of Arabic music. Classical Arab music is extremely popular across the population, especially a small number of superstars known throughout the Arab world. Regional styles of [popular music](#) include Algerian raï, Moroccan gnawa, Kuwaiti sawt, Egyptian el gil and Turkish Arabesque-pop music.

"The common style that developed is usually called 'Islamic' or 'Arab', though in fact it transcends religious, ethnic, geographical, and linguistic boundaries" and it is suggested that it be called the Near East (from Morocco to India) style (van der Merwe 1989, p.9).

Habib Hassan Touma (1996, p.xix-xx) lists "five components" which "characterize the music of the Arabs:

1. The Arab tone system (a [musical tuning](#) system) with specific interval structures, invented by al-Farabi in the tenth century (p.170).
2. Rhythmic-temporal structures that produce a rich variety of [rhythmic](#) patterns, *awzan*, used to accompany the metered vocal and instrumental genres and give them form.
3. [Musical instruments](#) that are found throughout the Arabian world and that represent a standardized tone system, are played with standardized performance techniques, and exhibit similar details in construction and design.
4. Specific social contexts for the making of music, whereby musical genres can be classified as urban (music of the city inhabitants), rural (music of the country inhabitants), or Bedouin (music of the desert inhabitants)....
5. A musical mentality that is responsible for the aesthetic homogeneity of the tonal-spatial and rhythmic-temporal structures in Arabian music, whether composed or improvised, [instrumental](#) or vocal, secular or sacred. The Arab's musical mentality is defined by:
  1. The maqam phenomenon....
  2. The predominance of vocal music...
  3. The predilection for small instrumental ensembles...
  4. The mosaiclike stringing together of musical form elements, that is, the arrangement in a sequence of small and smallest melodic elements, and their repetition, combination, and permutation within the framework of the tonal-spatial model.
  5. The absence of polyphony, polyrhythm, and motivic development. Arabian music is, however, very familiar with the ostinato, as well as with a more instinctive heterophonic way of making music.
  6. The alternation between a free rhythmic-temporal and fixed tonal-spatial organization on the one hand and a fixed rhythmic-temporal and free tonal-spatial structure on the other. This alternation...results in exciting contrasts."

Much Arab music is characterized by an emphasis on [melody](#) and [rhythm](#) rather than [harmony](#). Thus much Arabic music is homophonic in nature. Some genres of Arab music are polyphonic—as the instrument Qanoun is based upon the idea of playing two-note [chords](#)—but quintessentially, Arabic music is melodic.

It would be incorrect though to call it [modal](#), for the Arabic system is more complex than that of the Greek modes. The basis of the Arabic music is the maqam (pl. maqamat),

which looks like the mode, but is not quite the same. The maqam has a "tonal" note on which the piece must end (unless modulation occurs).

The maqam consists of at least two jins, or scale segments. "Jins" in Arabic comes from the ancient Greek word "genus," meaning type. In practice, a jins (pl. ajnas) is either a trichord, a tetrachord, or a pentachord. The trichord is three notes, the tetrachord four, and the pentachord five. The maqam usually covers only one octave (two jins), but sometimes it covers more than one octave. Like the melodic minor scale and Indian ragas, some maqamat have different ajnas, and thus notes, while descending or ascending. Because of the continuous innovation of jins and because most music scholars don't agree on the existing number anyway, it's hard to give an accurate number of the jins. Nonetheless, in practice most musicians would agree on the 8 most frequently used ajnas: Rast, Bayat, Sikah, Hijaz, Saba, Kurd, Nahawand, and Ajam--and a few of the most commonly used variants of those: Nakriz, Athar Kurd, Sikah Beladi, Saba Zamzama. Mukhalif is a rare jins used exclusively in Iraq, and it does not occur in combination with other ajnas.

The main difference between the western [chromatic scale](#) and the Arabic scales is the existence of many in-between notes, which are sometimes referred to as quarter tones for the sake of practicality. However, while in some treatments of theory the quarter tone scale or all twenty four tones should exist, according to Yksuf Shawq+ (1969) in practice there are many fewer tones (Touma 1996, p.170).

In fact, the situation is much more complicated than that. In 1932, at International Convention on Arabic music held in Cairo, Egypt (attended by such Western luminaries as Bela Bartok and Henry George Farmer), experiments were done which determined conclusively that the notes in actual use differ substantially from an even-tempered 24-tone scale, and furthermore that the intonation of many of those notes differ slightly from region to region (Egypt, Turkey, Syria, Iraq). The commission's recommendation is as follows: "The tempered scale and the natural scale should be rejected. In Egypt, the Egyptian scale is to be kept with the values, which were measured with all possible precision. The Turkish, Syrian, and Iraqi scales should remain what they are..." (translated in Maalouf 2002, p. 220). Both in modern practice, and based on the evidence from recorded music over the course of the last century, there are several differently-tuned "E"s in between the E-flat and E-natural of the Western Chromatic scale, depending on the maqam or jins in use, and depending on the region.

Musicians and teachers refer to these in-between notes as "quarter-tones" ("half-flat" or "half-sharp") for ease of nomenclature, but perform and teach the exact values of intonation in each jins or maqam by ear. It should also be added, in reference to Touma's comment above, that these "quarter-tones" are not used everywhere in the maqamat: in practice, Arabic music does not modulate to 12 different tonic areas like the Well-Tempered Klavier, and so the most commonly used "quarter tones" are on E (between E-flat and E-natural), A, B, D, F (between F-natural and F-sharp) and C.

The prototypical Arab ensemble in Egypt and Syria is known as the takht, which includes, (or included at different time periods) instruments such as the 'oud, qanún, rabab, nay, [violin](#) (which was introduced in the 1840s or 50s), riq and dumbek. In Iraq, the traditional ensemble, known as the chalghi, includes only two melodic instruments--the jowza (similar to the rabab but with four strings) and santur--with riq and dumbek.

Arab classical music is known for its famed virtuoso singers, who sing long, elaborately ornamented, melismatic tunes, and who are known for driving audiences into ecstasy. Its traditions come from pre-Islam days, when female singing slaves entertained the wealthy, and inspired warriors on the battlefield with their rajaz poetry; they also performed at weddings and later, for the hajj. Male performers were limited to mukhanathin, or transvestite slaves, who were scorned by most Muslims. Early Islam largely looked down upon music, and considered it sinful and vile. Music in most of the Arab countries is entirely secular in nature.

In the 20th century, Egypt was the first in a series of Arab countries to see a sudden emergence of [nationalism](#), as it became independent after 2000 years of foreign rule.

Turkish music was replaced by national music, and Cairo became a center for musical innovation, hosting a 1932 conference of musicians from across the Arab world.

Soon, the Arab world was inundated with new instruments from the west, including the [electric guitar](#), [cello](#), double bass and [oboe](#), and adding influences from [jazz](#) and other foreign musical styles. The singers remained the stars, however, especially after the development of the recording and film industry in the 1920s in Cairo. These singing celebrities include Abd el-Halim Hafez, Farid el-Atrache, Asmahan, Sayed Darweesh, Mohammed Abd el-Wahaab, Warda Al-Jazairia, and possibly the biggest star of modern Arab classical music, Umm Kalthum.

# Genres

## Secular art music

Secular genres include maqam al-iraqi, andalusi nubah, muwashshah, Fjiri songs, qasidah, layali, mawwal, taqsim, bashraf, sama'i, tashmilah, dulab, and sawt. (Touma 1996, p.55-108)

## Sacred music

Arab religious music includes Christian and Islamic music. However, Islamic music, including sung [Qur'an reading](#), is structurally equivalent to Arabic secular music, while Christian Arab music is influenced by Catholic, Greek Orthodox, Anglican, Coptic, and Maronite church music. (ibid, p.152)

# History

## Early years

By the 11th century, Moorish Spain was a centre for the manufacture of instruments. These spread gradually through France, influencing French [troubadours](#) and reaching the rest of Europe. The English words [lute](#), rebec, [guitar](#), [organ](#) and naker are derived from Arabic oud, rabab, qitara, urghun and nagqara'. al-Ghazali (1059 - 1111) wrote a treatise on music in Persia, including the words "Ecstasy means the state that comes from listening to music". The oud was popular between the tenth and sixteenth centuries then fell into disuse, but re-emerged in the nineteenth century. The Persians invented the Ghazal (love song).

## The sixteenth century

Bartol Gyurgievits (1506 - 1566) spent 14 years as a slave in the Turkish empire. After escaping, he published "De Turvarum ritu et caermoniis" in Amsterdam in 1544. It is one of the first European books to describe music in Islamic society. In India the Islamic Mughal emperors ruled both Muslims and Hindus. The greatest of these, Akhbar (1542 - 1605) had a team of at least 50 musicians. 36 of these are known to us by name. Akhbar was not a strict Muslim, and even started a new faith called Din-i-Ilahi, a mixture of Islam, Hinduism, Christianity and Jainism. The origins of the "belly dance" are very obscure as depictions and descriptions are rare. It may have originated in Persia or Turkey, possibly developed with the harems. Essential elements of belly dancing are the zills (finger cymbals). Examples have been found from 200 BC, suggesting a possible pre-Islamic origin.

## Female slaves

Slavery was widespread in early Islam. Just as in the Roman empire, they were often brought from Africa. The Qu'ran specifically allows them to earn money. Black slaves from Zanzibar were noted in the eleventh century for the quality of their song and dance. The "Epistle on Singing Girls", written in Baghdad in the ninth century satirises the excessive money that can be made by singers. The author mentioned an Abyssinian girl who fetches 120,000 dinars at an auction - far more than an ordinary slave. A festival in the eighth century mentions fifty singing slave-girls with lutes who acted as backing musicians for a singer called Jamilia. In 1893, "Little Egypt", a belly-dancer from Syria, appeared at the Chicago world's fair and caused a sensation.

## Male instrumentalists

Male instrumentalists were condemned in a treatise in the ninth century. They were associated with vices such as chess, love poetry, wine drinking and homosexuality. Many Persian treatises on music were burned by zealots. Following the invasion of Egypt,

Napoleon commissioned reports on the state of Ottoman culture. Villoteau's account reveals that there were guilds of male instrumentalists, who played to male audiences and "learned females" who sang and played for women. The instruments included the oud, the [zither](#) and the ney (flute). By 1800 several instruments that were first encountered in Turkish military bands had been adopted into European classical orchestras: the [piccolo](#), the [cymbal](#) and the kettle drum. The Santur or hammered dulcimer was cultivated within Persian classical schools of music that can be traced back to the middle of the nineteenth century. There was no written notation for the santur until the 1970s. Everything was learned face-to-face (to chest-to-chest as the Persian language has it).

## The Twentieth century

The first Conference of Arab Music was held in Cairo in 1932. Umm Kalthum (1904 - 1975) was by far the most popular singer of the Arab world. There are many spellings of her name, including "Oom Kalsoum". More recent popular artists are Cheb Khaled, Elissa, Amr Diab, Nancy Ajram, Ehab Tawfik, Hisham Abbass, Haifa Wahbi, and Natacha Atlas. Radio Tarifa play a mixture of electric guitars and antique instruments. Their music consists of historical styles from Moorish Spain and the Maghreb countries of Northern Africa. Traditionally Arab music has no chords but over the past 40 years they have been used more frequently. Islam has an obligation called Tajwid or Tajweed - to recite every letter correctly. Records broadcast in Islamic countries often have to pass a test of clarity. Compared to the rest of the world, the diction of singers is of very high quality.

## **Arapaho music**

The Arapaho are a tribe of Native Americans from the western Great Plains, in the area of eastern Colorado and Wyoming. Traditional Arapaho music, described by Bruno Nettl (1965, p. 150), includes sacred and secular songs. Traditional music uses terraced descent type melodic motion, with songs consisting of two sections, each with a range of more than an octave and scales of four to six tones.

## Sun Dance

The Arapaho Sun Dance, performed in the summer when the Arapaho bands come together for the occasion, is a ceremony performed in order to guide warriors on a vision, receiving a guardian spirit. The vision is inspired by intense self-torture.

There are also Arapaho [folk](#) songs taught by guardian spirits, which are only supposed to be sung when the recipient is near death.

## **Secular music**

Secular Arapaho songs include a wide variety of round dances in triple meter, the snake dance, the rabbit dance (a partner dance introduced after European contact) and a turtle dance, along with lullabies, children's, war, historical, and courtship songs.

# Ghost Dance

*Main article:* [Ghost Dance](#)

The Ghost Dance was a religion, introduced from tribes further west than the Arapaho in the 1880s. In 1891, the religion was outlawed by the United States, leading to a rebellion among the adherents and culminating in the Wounded Knee Massacre. Music was an integral part of the Ghost Dance, and included folk songs that were retained long after the movement ended (ibid, 151).

## Peyote songs

*Main article:* [Peyote song](#)

Peyote is a cactus found natively in Mexico. The buttons of the cactus, when chewed, act as a hallucinogen used in the ancient Aztec religion and continued by area tribes to the present. Peyote ceremonies spread north and east, reaching the Apache tribes in the 18th century and then spreading to most every tribe in North America, along with some Apache music and Plains-Pueblo characteristics. Peyote songs accompany the peyote ceremonies, and are mostly the same throughout the area of peyote's entheogenic use. These songs are most similar to traditional songs of the Plains area, but are characterized by a rapid rhythm composed of two note values, transcribed as quarter and eighth notes. Vocables, or non-lexical syllables are used, as are cadential and closing formulas.

# Arch form

In [music](#), **arch form** is a [sectional](#) way of [structuring](#) a piece of music based on the repetition, in reverse order, of all or most musical sections such that the overall form is symmetrical, most often around a central movement. The sections need not be repeated verbatim but at least must share [thematic](#) material.

It creates interest through an interplay among "memory, variation, and progression." Though it appears static and to deny progress the pairs of movements create with the center a "unidirectional process" and the form "actually engenders specific expressive possibilities that would otherwise be unavailable for the work as a whole." (Wilson 1992, p.32)

Béla Bartók is often noted for his use of arch form such as in his Fourth and Fifth quartets, *Second Piano Concerto*, and, less so, *Second Violin Concerto*. (ibid)

# Arena

An **arena** is an enclosed area, often circular or oval-shaped, designed to showcase theater, musical performances, or sporting events. It is composed of a large open space surrounded on most or all sides by tiered seating for spectators. The key feature of an arena is that the event space is the lowest point, allowing for maximum visibility. Usually, an arena is designed to accommodate a fairly large number of spectators.

The term *arena* is sometimes used as a synonym for a very large venue such as Pasadena's Rose Bowl, but such a facility is typically called a *stadium*. The use of one term over the other has mostly to do with the type of event. Football is typically played in a stadium while basketball and hockey are typically played in an arena, although many of the larger arenas hold more spectators than do the stadiums of smaller colleges or high schools. And there are exceptions. The home of the Duke University basketball team would qualify as an arena, but the facility is called Cameron Indoor Stadium.

The term "arena" is also used loosely to refer to any event or type of event which either literally or metaphorically takes place in such a location — often with the specific intent of comparing an idea to a sporting event, such as "the arena of war" or "the arena of love" or "the political arena".

In the United States, the term *arena* generally refers specifically to indoor stadia.

The Latin word *arena* means "sand", which was useful as the primary surface when gladiators battled wild animals or each other, to absorb the blood. In Spanish, the word carries both meanings. A bullfight is held in an *arena* (or *plaza de toros*, literally "place of bulls") and its floor is also covered with *arena*.

Categories: [Music venues](#)

# Arena rock

**Arena rock** is a loosely defined style of [rock music](#), often also called **anthem rock**, and the style of music is closely associated with "[corporate rock](#)". Arena rock is usually medium hard rock, but lacks the edginess or rage often inherent in [heavy metal](#). Simple [rhythms](#), [acoustic/electric guitar](#) interplay, and [keyboards](#) define the instrumental sound, and vocally the music is far closer to [mainstream pop](#) than most hard rock or metal.

In the 1960s, the tremendous popularity of the Beatles and the Rolling Stones led to the use of larger venues to accommodate audiences. The Beatles' 1965 appearance at New York's Shea Stadium is often cited as the first "arena rock" concert. By the 1970s, the ability to perform for huge crowds in sports [arenas](#) and stadiums became a prerequisite for rock stardom.

While many groups performed in massive venues while on tour, the term "arena rock" usually refers to 1970s and 1980s hard rock groups that occupied a middle ground between the heavy metal sound and the softer adult oriented sounds of [country rock](#) and the singer-songwriters of the decade. In the 1980s, the best-known arena for concerts was Wembley Stadium, although many arena rock bands had relatively limited success in the United Kingdom. Bands such as Boston, Foreigner, Journey, Kansas, Queen, REO Speedwagon, Styx and Survivor and performers such as Meat Loaf, Eddie Money and Peter Frampton directed their appeal to a young white American audience who favored bombastic, anthemic rock. Critics never favored these groups, and the phrase "arena rock" has long had a pejorative connotation, but their records sold in the millions.

The rise of MTV and [new wave music](#) adversely affected many of these groups, but some continued to be successful in the 1980s. Hair metal bands such as Twisted Sister and Def Leppard, in retrospect, are essentially a continuation of this style and sound. Indeed, even some heavy metal acts were able to break into the fold, most notably Metallica whose drummer Lars Ulrich was recorded as saying that they desired to "...fuck with the concept of arena rock" during their extensive stadium tour in 1992. This marked a change from the band's initial desire to shun "mass market" practices, but showed that as the popularity of a group increases, so too must the venue at which it performs. However, "arena rock" retains much of its pejorative meaning, as some popular "alternative" groups of the 1990s such as Stone Temple Pilots were tagged with this label by dismissive critics. In the early 2000s, Creed was similarly labeled.

## Argentine cumbia

**Argentine cumbia** is an umbrella term that comprises several distinct trends within the same tradition: the [dance](#) and [music](#) style known as [cumbia](#) in Argentina.

Cumbia has been well-known and appreciated in Argentina for a long time, but it gained nationwide scope and attention when it became popular in the main urban centers, the large cities of the Río de la Plata basin, in the 1990s.

Among the most important cumbia bands and singers that popularized the genre are Ráfaga, Los Chakales, Amar Azul, Gilda, and other traditional cumbia bands like Los Palmeras, Cali and Trulalá.

Most bands are composed of [synthesizer keyboards](#) as main instruments, [electronic sounds](#) and [percussion](#), and a musical score very charged with vocal [harmonies](#), [bells](#), and [trumpets](#) (usually electronically synthesized).

## History

In the 1990s, cumbia first found a place among the lower classes, who attended large dancing locals called bailantas, often to listen and watch live concerts by cumbia groups. Some bands, most notably Ráfaga, chose a glamorous style with theatrically-presented messages about romantic love and sensuality, hope and despair. Others took to more explicit themes, such as sex, alcohol abuse and the cumbia subculture itself, often in a very light, irreverent style, sometimes intentionally humorous.

The rhythm and themes of cumbia then spread to the whole of society, as its romantic and humorous manifestations were adopted to lighten up parties and other social events.

Around the beginning of the 2000s, probably influenced by the Argentine economic crisis, romantic cumbia drifted slowly away from the spotlight, while the rest of the bands slowly gave way to the much more aggressive [cumbia villera](#) ("shantytown cumbia"), which was from the start mostly restricted to the urban lower classes.

Over 60 years of history, cumbia in Argentina was very influenced by other Argentinian folkloric kinds of music, like chamamé, guaracha and cuarteto. Cumbia songs tell stories about love and experiences of common people. Cumbia in Argentina also has different styles depending on the country region, like norteña, santafesina, cordobesa, sonidera, and other more recent styles like cumbia-rap and cumbia villera. In the present, cumbia bands play electric guitars, bass guitars, electronic percussion and sintethizers, all common instruments of rock bands, and there are also other instruments like bongos, trumpets, acordeones, etc... The clothing is also a very important characteristic of cumbia bands. Each bands has its own way of dressing, usually all members of the band wear the same special costume or exclusive clothes.

# Aria

An **aria** (Italian for *air*; plural: *arie* or *arias* in common usage) in [music](#) was originally any expressive [melody](#), usually, but not always, performed by a [singer](#). It is now used almost exclusively to describe a self contained piece for one voice usually with [orchestral accompaniment](#). Perhaps the most common context for arias is [opera](#); there are also many arias that form movements of [oratorios](#) and [cantatas](#). Composers also wrote "concert arias", not part of any larger work, such as "Ah Perfido" by Beethoven and a number of concert arias by Mozart.

The aria first appeared in the 14th century. In that time, it signified a manner or style of singer or plating. Aria could also mean a melodic scheme (motif) or pattern for singing a poetic pattern, such as a sonnet. It was also attached to instrumental music, though this is no longer the case. Over time, arias evolved from simple melodies into a structured form; in about 17th century, the aria was written in ternary form (ABA); these arias were known as da capo arias. The aria later "invaded" the opera repertoire with its many sub-species (Aria cantabile, Aria agitata, Aria di bravura, and so on). By the mid-19th century, many operas became a sequence of arias, reducing the space left for recitative, while other operas (for instance those by Wagner) were entirely through-composed, with no section being readily identifiable as a self-contained aria.

# Armenian chant

**Armenian chant** is the melismatic monophonic [chant](#) used in the liturgy of the Armenian Apostolic Church.

Armenian chant, like Byzantine chant, consists mainly of [hymns](#). The chants are grouped in an oktoechos. The oldest hymns were in prose, but later versified hymns became more prominent, such as those by Nerses Schnorhali. The official book of hymns, the shakaran, contains 1,166 hymns.

The earliest surviving manuscripts with music notation date from the 14th century, and use a system of neumes known as *Armenian neumes*, which seem to use a developed system but which have not been deciphered. In the 19th century, a new notation was introduced, which is still used now.

Armenian chant is now sung to a precise rhythm, including specific rhythmic patterns which are atypical of [plainsong](#). This is considered by some scholars (such as P. Aubry) to be a result of Turkish influence, although others (such as R. P. Decevre) consider it of great antiquity and use it as evidence in favor of a more rhythmic interpretation of [Gregorian chant](#).

The chants used by communities in the Armenian Diaspora are usually harmonized and differ from the original forms. The source of the most traditional music is the liturgies at Echmiadzin, the religious center of Armenia.

# Ars antiqua

**Ars antiqua** is a term which refers to the music of Europe of the late Middle Ages between approximately 1170 and 1310, covering the period of the Notre Dame school of polyphony and the subsequent years which saw the early development of the [motet](#). Usually the term is restricted to sacred music, excluding the secular song of the [troubadors](#) and *trouvères*; however sometimes the term is used more loosely to mean all European music of the thirteenth century and slightly before. The term *ars antiqua* is used in opposition to [ars nova](#), which refers to the period of musical activity between approximately 1310 and 1375.

Almost all composers of the *ars antiqua* are anonymous. Léonin (fl. late 12th century) and Pérotin (fl. c.1180 – c.1220) were the two composers known by name from the Notre Dame school; in the subsequent period, Petrus de Cruce, a composer of motets, is one of the few whose name has been preserved.

In [music theory](#), the *ars antiqua* period saw several advances over previous practice, most of them in conception and notation of rhythm. The most famous music theorist of the first half of the 13th century, Johannes de Garlandia, was the author of the *De mensurabili musica* (about 1240), the treatise which defined and most completely elucidated the rhythmic modes. A German theorist of a slightly later period, Franco of Cologne, was the first to describe a system of notation in which differently shaped notes have entirely different rhythmic values (in the *Ars Cantus Mensurabilis* of approximately 1260), an innovation which had a massive impact on the subsequent history of European music. Most of the surviving notated music of the 13th century uses the rhythmic modes as defined by Garlandia.

The *ars antiqua* is sometimes divided into two rough periods, known as the early [Gothic](#) and the high Gothic. The early Gothic includes the French music composed in the Notre Dame school up until about 1260, and the high Gothic all the music between then and about 1310 or 1320, the conventional beginning of the *ars nova*. The forms of organum and [conductus](#) reached their peak development in the early Gothic, and began to decline in the high Gothic, being replaced by the motet.

Though the style of the *ars antiqua* went out of fashion rather suddenly in the first two decades of the fourteenth century, it had a late defender in Jacques of Liège or Jacob of Liège, who wrote a violent attack on the "irreverent and corrupt" *ars nova* in his *Speculum Musicae* (c.1320), vigorously defending the old style in a manner suggestive of any number of music critics from the Middle Ages to the present day. To Jacques, the *ars antiqua* was the *musica modesta*, and the *ars nova* was a *musica lasciva*—a kind of music which he considered to be indulgent, capricious, immodest, and sensual.

# Ars nova

**Ars nova** was a stylistic period in music of the Late Middle Ages, centered in France, which encompassed the period from the publication of the *Roman de Fauvel* (1310 and 1314) until the death of Machaut (1377). Sometimes the term is used more loosely and refers to all European music of the 14th century, thereby including such figures as Landini, who was working in Italy. Occasionally the term "Italian ars nova" is used to denote the music of Landini and his compatriots (see [Music of the trecento](#) for the concurrent musical movement in Italy). The term *ars nova* means "new art" or "new technique", and was first used in a publication by Philippe de Vitry of the same name (c.1322).

*Ars nova* is generally used in conjunction with another term, [ars antiqua](#), which refers to the music of the immediately preceding age, usually extending back to take in the period of Notre Dame polyphony (therefore covering the period from about 1170 to 1320). Roughly, then, the *ars antiqua* is the music of the thirteenth century, and the *ars nova* the music of the fourteenth; many music histories use the terms in this more general sense.

It caused controversy as the in the Roman Catholic Church, starkly rejected by Pope John XXII, but embraced by Pope Clement VI. The monophonic chant, already harmonized with simple organum, was becoming altered, fragmented, and hidden beneath secular tunes. The lyrics of love poems might be sung above sacred texts, or the sacred text might be placed within a familiar secular melody. It was not merely polyphony that offended the medieval ears, but the notion of secular music merging with the sacred and making it's way into the liturgy.

Stylistically, the music of the *ars nova* differed from the preceding era in several ways. Rhythm was used much more freely, shunning the straitjacket of the rhythmic modes, which prevailed in the thirteenth century; secular music acquired much of the polyphonic sophistication previously found only in sacred music; and new techniques and forms, such as isorhythm and the isorhythmic [motet](#), became prevalent. The overall aesthetic effect of these changes was to create music of greater expressiveness and variety than had been the case in the thirteenth century. Indeed the sudden historical change which occurred, with its startling new degree of musical expressiveness, can be likened to the introduction of perspective in painting, and it is useful to consider that the changes to the musical art in the period of the *ars nova* were contemporary with the great early [Renaissance](#) revolutions in painting and literature.

The greatest practitioner of the new musical style was undoubtedly Guillaume de Machaut, who also had an equally distinguished career as a priest and poet. The *ars nova* style is nowhere more perfectly displayed than in his considerable body of motets, [lais](#), [virelais](#), rondeaux, and [ballades](#). It was in 1364, during the pontificate of Avignon Pope Urban V, that Machaut composed the first polyphonic setting of the mass called *Le Masse de Notre Dame*.

Towards the end of the fourteenth century a new stylistic school of composers and poets centered around Avignon in southern France developed; the highly mannered style of this period is often called the [ars subtilior](#), though some scholars choose to consider it a late development of the *ars nova* rather than breaking it out as a separate school. This strange but interesting repertory of music, limited in geographical distribution (southern France, Aragon and later Cyprus), and clearly intended for performance by specialists for an audience of connoisseurs, is like an endnote to the entire Middle Ages.

## Ars subtilior

**Ars subtilior** (more subtle art) is a musical style characterized by rhythmic and notational complexity, centered around Avignon in southern France, at the end of the fourteenth century (Hoppin 1978, p.472-473). Thus it was right at the dividing-line between the musical Middle Ages and Renaissance. Often the term is used in contrast with [ars nova](#), which applies to the musical style of the preceding period from about 1310 to about 1370; though some scholars prefer to consider the *ars subtilior* a subcategory of the earlier style.

## Overview and history

Musically the productions of the *ars subtilior* are highly refined, complex, difficult to sing, and probably were produced, sung and enjoyed by a small audience of specialists and connoisseurs. Hoppin suggests the superlative *ars subtilissima*, saying, "not until the twentieth century did music again reach the most subtle refinements and rhythmic complexities of the manneristic style." They are almost exclusively secular songs, and have as their subject matter love, war, chivalry, and stories from classical antiquity; there are even some [songs](#) written in praise of public figures (for example and [modernist music](#) of the [20th century](#)'s "emphasis on generating music through technical experiment" to the precedent set by the *ars subtilior* movement's "autonomous delight in extending the kingdom of sound." He cites Baude Cordier's perpetual canon *Tout par compas* (All by compass am I composed), notated on a circular staff.

Albright contrasts this motivation with "expressive urgency" and "obedience to rules of craft" and, indeed, *ars subtilior* was coined to avoid the negative connotations of the terms ***manneristic style*** and ***mannered notation***. However, many of the devices first used by the *ars subtilior* composers became standard compositional techniques in the [Renaissance](#), indicating that some of their music must have been widely known and distributed, i.e. it was not merely a dead-end artistic movement, even though subsequent music sounds nothing like it.

The center of activity of the style was Avignon at the end of the Babylonian Captivity and during the Great Schism (1378–1417), the time during which the Western Church had a pope both in Rome and in Avignon. The town on the Rhône had developed into an active cultural center, and produced the most significant surviving body of secular song of the late fourteenth century. From Avignon the style spread into northern Spain and as far as Cyprus (which was a French cultural outpost at the time); in addition, a handful of Italian composers such as Zacara da Teramo composed in a manneristic style related to the *ars subtilior*.

## Notational characteristics

One of the techniques of the *ars subtilior* involved using red notes, or "coloration"; these red notes indicated a reduction of note values by one third. For instance, a three bar passage if written entirely in red notes would only be two bars long. If a "perfect" passage would be written in red notes it would become syncopated; this syncopation was considered a hemiola (see example 1). Triplets occurred when an "imperfect" passage was transcribed into red notes (see example 2).

- Example 1: time signature of 3/4. If three dotted half notes were written as red notes, each of the notes would lose one quarter note, becoming a series of three half notes, therefore fitting into two bars. The quarter note on the third beat of the first bar would be tied to the quarter note on the first beat of bar two.
- Example 2: time signature of 2/4. If three quarter notes were written as red notes, each one would become equivalent to 0.66 of a beat. [  $0.66 \times 3$  (three quarter notes) = 2 quarter notes ]

Composers in the *ars subtilior* style often wrote their manuscripts themselves in unusual and expressive shapes. In addition to the circular canon by Baude Cordier, a piece by Jacob Senleches, *La Harpe de melodie*, is written in the shape of a harp; this and other examples of the unusual notational style of the *ars subtilior* are preserved in the Chantilly Codex, the primary source for this music, and also the Modena Codex.

## Composers in Ars Subtilior Style

Matteo da Perugia  
Jacob Senleches  
Anthonello de Caserta  
Philippus da Caserta  
Johannes Ciconia  
Baude Cordier  
Solage  
Grimace  
Jacopo da Bologna  
Lorenzo da Firenze  
Martinus Fabri  
Antonio Zacara da Teramo

# Art punk

**Art Punk** is a term given to [punk rock](#) music which may infuse avant-garde elements or which focuses on being more original and challenging as an art form. After punk's rise in and around 1977, many groups struggled with the directions of the new musical style. Some groups were formed with extremely populist ideology; many of these groups believed punk should be simple and often wrote three-chord songs, presumably with the intention that anyone should be able to play this music. Some examples of bands formed under these or similar principles include The Clash, Sham 69 and Sex Pistols. At roughly the same time, many punk groups were evolving to include more complex song structures and varied instruments, such as the synthesizer. Some of these groups include Wire, Talking Heads, and Suicide. Most of the original art punk bands are often classified as [post-punk](#), despite the fact that bands like Suicide and Television existed before even the Ramones. The influence of these bands extends beyond the boundary of punk music.

## Art Punk Bands

- Suicide
- Rocket From The Tombs
- Pere Ubu
- The Wipers
- Animal
- Teenage Jesus and The Jerks
- Modern Lovers

# Art rock

**Art rock** is a term used by some to describe [rock music](#) that is characterized by ambitious or postmodern lyrical themes and/or [melodic](#), [harmonic](#), or [rhythmic experimentation](#), often extending beyond standard pop song forms and genres, toward influences in [jazz](#), [classical](#), [world music](#) or the [experimental](#) avant-garde. The art rock designation is a vague one, since few rock and pop musicians openly aspire to the title. The concept of "art rock" has also sometimes been conflated with the genre of [progressive rock](#), though today the terms are usually used differently.

The record often cited as the first step towards such experimentation is the Beatles' Sgt. Pepper's Lonely Hearts Club Band (1967), it being an "unabashedly eclectic, musically clever (harmonies, rhythms and, above all, arrangements) melange that could only have been created in the modern recording studio." Art rock may be considered "arty" through imitation of classical "art" music or literature, or simply through eclecticism. Examples of the former include The Moody Blues, The Nice, and Emerson, Lake & Palmer and examples of the latter include Roxy Music, Genesis, Audience and Electric Light Orchestra. (Rockwell 1992, p.492-494)

Taken subjectively, art rock is a term that can encompass just about any style within the rock n' roll umbrella. To name just a few: Brian Eno's ambient music; the avant-garde experimental proto-punk of The Velvet Underground while John Cale was present in the lineup, which actually predates Sgt. Pepper's; the electronica and musique concrete of German Krautrock bands like Can and Neu!; Tool's textured [heavy metal](#); [gothic rock](#) founding fathers Bauhaus; Joni Mitchell's jazz-infused folk rock; and the sonic experimentation and/or abrasive noise common to many [post-punk](#), [indie](#), and [alternative rock](#) bands of the past 25 years. Around 2004, the phrase "art rock" has been popularly used to describe a movement of bands influenced by the 1970s/1980s work of artists like David Bowie and Brian Eno, such as The Arcade Fire, Broken Social Scene and Wolf Parade.

Critics and fans sometimes use the term "art rock" to make a cultural statement about the state of popular music. Artists whose sound is based in the rock and pop forms first established in the 1960s -- even those who clearly transcend these forms -- are still viewed by some members of the elite, particularly classical or jazz critics, as mere peddlers of product, and thus 'low art'. Identifying certain popular music as 'art rock' makes a claim both for the integrity of the specified work or artist and for the serious artistic potential of rock and pop music in general.

Art rock reached its commercial height with the popularity of the aforementioned [progressive rock](#) bands, such as King Crimson, Yes, and especially Pink Floyd, whose mix of jazz, classical and blues influences, smooth psychedelic soundscapes, and anti-establishment lyrics proved to be just as influential and commercially viable as mainstream music. After the punk revolution of the late '70s put simplicity back in style, and as openly philosophical bands like Pink Floyd drifted toward the mainstream with hit singles and more commercial productions, their "art rock" designation fell away, and a new breed of artists with influences in noisy punk and minimalist electronic music took their place on the cutting edge of "art rock."

Though technically one might think of art rock as the antithesis of punk's straightforwardness, most well respected art rock bands of the last 30 years made music influenced by the punk ethic, if not the sound, in some regard. Sonic Youth began as a wildly experimental venture, influenced by the noisiest fringes of punk and the classical avant-garde — especially the guitar works of Glenn Branca; by the late 1980s, their music was accessible enough to influence a new generation of alt rock and grunge bands, like Nirvana. In fact, the webs of connections are so twisted that original progressive rockers King Crimson and [new wave punks](#) Talking Heads actually converged on very similar

styles of music in the 1980s, even sharing the same guitarist (Adrian Belew). But both groups throughout their varied careers are considered by many to epitomize art rock, as the term refers to a perceived aesthetic or ideology of pop music, rather than a specific musical style.

The use of *art* in art rock should not be confused with its use in art music, which generally connotes classical music, not "arty" [popular music](#). However, it must be noted that late 20th-century "classical" composers such as John Cage, Karlheinz Stockhausen, Steve Reich, Terry Riley, and Philip Glass, with their interest in rhythm, repetition, and texture, have come ever closer to bridging the gap with popular music. The only remaining line between art rock and avant-garde classical is a vague one: avant-garde, like other classical music, is still usually composed and written down so that it can be played in concert by various performers, while in art rock, like any other modern pop music, the music is not written down because the primary medium is the original recording, and subsequent live performances are usually done by the songwriters/composers themselves. But even here the line is blurred, since many of these same avant-garde "classical" composer have relied on recorded sound and tape loop manipulation just as much as any art rock band. At the same time, rock artists like Frank Zappa have composed well respected works of avant-garde classical music.

# Ashtorath

**Ashtorath** is a solo Canadian [dark ambient](#) band formed in 2001 by Despairialindrid aka. Despair.

While many [dark ambient](#) acts incorporate [synthesizer](#) work and or sampling into their music, Ashtorath uses just guitar and pedal effects to create atmospheric and minimalist music. This guitar only approach to creating layered ambient music has also been used by the German atmospheric drone band Maeror Tri.

The project was halted in 2003 so that bandmember Despair could create his new band, GloomScry.

## Asian American jazz

**Asian American jazz** is a musical movement in the United States begun in the 20th century by Asian American [jazz](#) musicians.

Although Asian Americans had been performing jazz music almost since that music's inception, it was not until the late 20th century when a distinctly Asian American brand of jazz began to develop. West Coast musicians such as Glenn Horiuchi, Jon Jang, and Francis Wong, as well as New Yorkers like Fred Ho and Jason Kao Hwang, began to create a hybrid music that was reflective of their ancestral heritages and experiences as Asian Americans, but which was at the same time also rooted in jazz, a music of African American origin. Most of the first musicians associated with the movement were of Chinese or Japanese ancestry, though more recently musicians of Filipino, Vietnamese, Indian, and Iranian descent have also become active.

Often, Asian American jazz combines standard jazz instruments with Asian instruments (such as taiko, shamisen, erhu, suona, or kulintang), which are often performed by musicians from Asia. Also, they may play jazz instruments in a manner imitative of Asian instruments. Many Asian American jazz ensembles also include musicians who are not of Asian descent.

Of particular significance to the development and promotion of the movement are the record label Asian Improv, as well as the Chicago Asian American Jazz Festival begun by Chicago musician Tatsu Aoki.

One of the more prominent bands is a Japanese American [fusion jazz](#) band called Hiroshima, which has been around since 1974.

# Asian music

***Asian music*** actually is a vague, loose term that encompasses numerous different musical styles originating from just as numerous Asian cultures. For more specific information, try:

- [Buddhist music](#)

## A-side and B-side

In recorded music, the terms **A-side** and **B-side** refer to the two sides of 7 inch vinyl records on which [singles](#) were released beginning in the 1950s. The terms have come to refer to the types of [song](#) conventionally placed on each side of the record, with the A-side being the featured song (the one that the record producer hopes will receive radio airplay and become a "hit"), while the B-side, or "flipside," is secondary.

## History

In the era of the 78 rpm shellac records A-sides and B-sides existed, but for the most part radio stations would play either side of the record, and records often had more than one track per side. The "side" did not convey anything about the content of the record.

The terms came into popular use with the advent of 45 rpm vinyl records in the early 1950s. It became conventional to release "singles" containing two songs, one on each side of the record. At first, most [record labels](#) would randomly assign which song would be an A-side and which would be a B-side. Because of this, many artists had so-called "double-sided hits", where both songs on a record made one of the national sales charts (in Billboard, Cashbox or other magazines), or would be featured on jukeboxes in public places.

As time wore on, however, the convention for assigning songs to sides of the record changed. Generally, the song on the A-side was the song that the record company wanted radio stations to play. By the early 1990s double-sided hits had become rare. Album sales had increased, and B-sides had become the side of the record where non-album, non-radio-friendly, or simply inferior recordings were placed.

With the advent of cassette and compact disc singles in the late 1980s, the A side/B side differentiation became much less meaningful. At first cassette singles would often have one song on each side of the cassette, matching the arrangement of vinyl records, but eventually cassette maxi-singles, containing more than two songs, became more popular. With the decline of cassette singles in the 1990s, the A-side/B-side dichotomy became virtually extinct, as the remaining dominant medium, the compact disc, lacks an equivalent physical distinction. However, the term B-side is still frequently used to refer to the "bonus" tracks or "coupling" tracks on a CD single, and a very few vinyl singles are still released.

With the advent of legal methods of downloading music via the Internet, even the CD single has become virtually non-existent, and thus the B-side as well. Songs that were not part of an artist's collection of albums are made available through the same downloadable catalogs as tracks from their albums, and are usually referred to as "unreleased", "non-album", or "exclusive" tracks, the latter in the case of a song being available solely from a certain provider of music.

## Significance

B-side songs are released on the same record as a [single](#) to provide extra "value for money". There are several types of material commonly released in this way:

- a different (e.g., instrumental, a capella, live, acoustic, or [remixed](#)) version of the A-side
- another song from the same [album](#), which the record company does not want to release on its own
- a song not considered good enough for the album
- a song that was stylistically unsuitable for the album
- a song that had not yet been completed at the time of the album's release

Since both sides of a single received equal royalties some composers deliberately arranged for their songs to be used as the B-sides of singles by popular artists, thereby making a fortune literally off the back of the A-side. This became known as the "flipside racket".

On a few occasions, the B-side became the more popular song. This was usually because a [DJ](#) preferred the B-side to its A-side and played it instead. Then the B-side would in a sense become the A-side, by virtue of being the preferred side. Examples:

Gene Vincent - Woman Love/Be-Bop-A-Lula

Righteous Brothers - Stuck on You/Unchained Melody (that the cover of 'Unchained Melody', an already widely recorded 1950's hit, enjoyed more airplay and popularity than the A-side when it had only originally been intended as something of a throwaway B-side greatly angered producer Phil Spector)

Madonna - Angel/Into the Groove

Rod Stewart - Reason To Believe/Maggie May

Sometimes the B-side is so popular that the single is 'flipped' and the b-side officially becomes the main track in its own right. Such as:

The Stone Roses - Fools Gold

Gloria Gaynor - I Will Survive

New Order - True Faith

Even more rarely, both sides of the single would become hits. This feat was done repeatedly by some artists. Examples:

Elvis Presley - Don't Be Cruel/Hound Dog

Fats Domino - I Wanna Walk You Home/Walking To New Orleans

Queen - We Are The Champions/We Will Rock You

The Beatles - Hey Jude/Revolution

The song How Soon Is Now? by The Smiths started out as the extra track on the 12" of William It Was Really Nothing but later gained a separate release as an A-side in its own right.

The flip side of a single does not necessarily contain B-side material. A single containing two songs of normal quality is referred to as a "double A-side". In rare occasions there are even triple A-side singles, such as "What Becomes Of The Broken Hearted"/"You'll Never Walk Alone"/"Saturday Night At The Movies", the 1996 triple A-side #1 UK single by Robson and Jerome.

In reference to this convention, it has occasionally seemed a good joke to issue a "double B-side" single. Examples include *Styrafoam/Texas Chainsaw Massacre Boogie*

by The Tyla Gang (1976) and a single by Marvin the Paranoid Android in 1981. Don't Cry Wolf/One Way Love by The Damned was dubbed a "double D-side".

On some reissued singles the A- and B-sides are by completely different artists, or two songs from different albums that would not normally have been released together. These were sometimes made for jukeboxes, as one record with two popular songs on it would make more money.

## Other types of non-primary sound recording

B-sides are different from unreleased material, outtakes and demos. **Unreleased material**, for obvious reasons, usually doesn't see the light of day. On rare occasions, particularly for reissues, these songs are in fact placed on albums, often with that description after it. In an extreme case, singer Moby's DVD titled "18 B-Sides and DVD" featured 21 of them.

**Outtakes** are songs recorded for an album but, either for technical or artistic purposes, not included in the released album. They occasionally appear on reissues of albums, billed as "bonus tracks". Georgia group R.E.M.'s album titled "Dead Letter Office", for example, is largely a collection of outtakes from their previous albums.

**Demos** are early versions of songs which, like "unreleased material", seldom see the light of day. Demos of songs often have additional or alternative verses. Often more demos than full songs are recorded, as an artist goes back and retools what is already present. Singers Moby, Prince, and Billy Corgan of now-defunct group Smashing Pumpkins are rumored to have large personal collections of demos.

On occasion, artists release albums of compiled B-sides and rare tracks, making it easier for fans to listen to new and unheard material from discontinued singles. Nirvana's *Incesticide*, The Smashing Pumpkins' *Pisces Iscariot*, and Green Day's *Shenanigans* are examples, as are the "Switched-On" series of compilations by Stereolab. In 2004, Feeder released *Picture Of Perfect Youth*, a limited edition album which contained 36 b-sides across two CDs.

## B-side collections

Anthrax - Attack of the Killer B's (1991)  
Bouncing Souls - The Bad the Worse and the Out of Print (2002)  
Broken Social Scene - Bee Hives (2003)  
The Cure - Join the Dots: B-Sides and Rarities, 1978-2001 [Boxset] (2004)  
Def Leppard - Retro Active (1993)  
Deftones - B-sides & Rarities (2005)  
Do As Infinity - Do The B-Side (2004)  
Dropkick Murphys - Singles Collection Volume 1 (2000)  
Dropkick Murphys - Singles Collection Volume 2 (2005)  
Eels - B-Sides & Rarities 1996-2003 (2005) (an iTunes Music Store Collection)  
Feeder - Picture Of Perfect Youth (2004)  
Five Iron Frenzy - Cheeses...(of Nazareth) (2003)  
Fountains of Wayne - Out of State Plates (2005)  
Godsmack - The Other Side (2003)  
Gorillaz - G-Sides (2001)  
Green Day - Shenanigans (2002)  
hitomi - HTM ~TIARTROP FLES~ (2003)  
Iron Maiden - Best of the B'Sides (2002)  
James - Ultra (2001)  
Jars of Clay - The White Elephant Sessions (1999)  
Elton John - Rare Masters (1992)  
Kent - B-Sidor 95-00 (2000)  
Less Than Jake - B is for B-Sides (2004)  
Mae - Destination: B-Sides (2004)  
Manic Street Preachers - Lipstick Traces (2003)  
Matthew Good Band - Lo-Fi B-Sides (1997)  
Moby - Play: The B Sides (2001)  
Moby - 18 B-Sides (2004) (most of the b-sides from album 18)  
Morphine - B-Sides and Otherwise (1997)  
Muse - Hullabaloo (2001)  
Nirvana - Incesticide (1992)  
NOFX - 45 or 46 Songs That Weren't Good Enough to Go on Our Other Records (2002)  
No Doubt - Everything in Time (2004)  
Oasis - The Masterplan (1998)  
Ocean Colour Scene - B-sides, Seaside and Freerides (1997)  
OMD - Navigation - The B-Sides (2001)  
Pearl Jam - Lost Dogs (2003)  
Pet Shop Boys - Alternative (1995)  
Pixies - Complete B-Sides (2001)  
Scattered Few - Out of the Attic (1994)  
Shihad - B-Sides (1996)  
Skid Row - B-Side Ourselves (1992)  
Skinny Puppy - B-Sides Collect (1999)  
Smashing Pumpkins - Pisces Iscariot (1994)  
Smashing Pumpkins - Judas O (2001) (limited edition bonus CD to Rotten Apples; a collection of B-sides meant to "sequel" Pisces Iscariot)  
Something for Kate - Phantom Limbs - Selected B Sides (2004)

Suede - Sci-Fi Lullabies (1997)  
Tears for Fears - Saturnine Martial & Lunatic (1996)  
They Might Be Giants - Miscellaneous T (1991)  
XTC - Beeswax: Some B-Sides 1977-1982 (1982)  
Weezer - B-Sides And Rarities (1994) (which is actually a widespread bootleg,  
not an official album)

## Albums featuring extensive b-sides

New Order - Substance (1987)  
The Smiths - The World Won't Listen (1987)  
The Smiths - Louder Than Bombs (1987)  
The Beatles - Past Masters, Volume One (1988)  
The Beatles - Past Masters, Volume Two (1988)  
Prince - The Hits/The B-Sides (1993)  
Sarah McLachlan - Rarities, B-Sides and Other Stuff (1996)  
U2 - The Best of 1980-1990: Limited Edition (1998)  
Cowboy Junkies - Rarities, B-Sides and Slow, Sad Waltzes (1999)  
U2 - The Best of 1990-2000: Limited Edition (2002)  
Ash - Intergalactic Sonic 7s (incl Bonus CD Cosmic Debris) (2002)  
Blur - Bustin' + Dronin'" (1998)  
Mansun - Kleptomania (2004)  
Morrissey - Bona Drag (1990)  
Morrissey - World of Morrissey (1995)  
Morrissey - My Early Burglary Years (1998)  
Morrissey - You Are the Quarry: Deluxe Edition (2004)  
Nine Inch Nails - The Downward Spiral: Deluxe Edition (2004)  
Weezer - Weezer Deluxe Edition  
Korn - "See You on the Other Side (Deluxe Edition)" (2005)  
Slipknot - "Slipknot (Digipak)" (2000)  
Tom Petty and the Heartbreakers - Playback (1995)  
Steps - The Last Dance (2002)  
Billy Joel - My Lives (2005)  
Avril Lavigne - B-Sides (200?)

# Aspects of music

An **aspect of music** is any characteristic, dimension, or element taken as a part or component of [music](#). The traditional musicological or European-influenced aspects of music often listed are those elements given primacy in European-influenced classical music: [melody](#), [harmony](#), [rhythm](#), tone color, and [form](#).

- Melody is a succession of notes heard as some sort of unit.
- Harmony is the relationship between two or more simultaneous pitches or pitch simultaneities.
- Rhythm is the organization of the durational aspects of music.
- Tone color is timbre, see list below.
- Form is the structure of a particular piece, how its parts are put together to make the whole.

However, a more comprehensive list is given by stating the aspects of sound: [pitch](#), [timbre](#), [intensity](#), and [duration](#). (Owen 2000:6)

- Pitch is the perception of the frequency of the sound experienced, and is perceived as how "low" or "high" a sound is, and may be further described as definite pitch or indefinite pitch. It includes: melody, harmony, tonality, tessitura, and tuning or [temperament](#) (ibid).
- Timbre is the quality of a sound, determined by the fundamental and its spectra: overtones or harmonics and envelope, and varies between voices and types and kinds of [musical instruments](#), which are tools used to produce sound. It includes: tone color and articulation (ibid).
- Intensity, or dynamics, is how loud or quiet a sound is and includes how stressed a sound is or articulation.
- Duration is the temporal aspect of music; time. It includes: pulse, beat, rhythm, rhythmic density, [meter](#), tempo (ibid).

These aspects combine to create secondary aspects including form or structure, [texture](#), and style. Other commonly included aspects include the spatial location or the movement in space of sounds, gesture, and [dance](#). Silence is also often considered an aspect of music, if it is considered to exist.

- Structure includes: motive, subphrase, phrase, phrase group, period, [section](#), exposition, repetition, variation, [development](#), and other formal units, textural continuity (ibid).
- Texture is the interaction of temporal and pitch elements. It includes: homophony, polyphony, heterophony, and simultaneity. (ibid)
- Style is what distinguishes an individual composer or group, period, genre, region, or manner of performance (ibid).

Often a definition of music lists the aspects or elements that make up music under that definition. However, in addition to a lack of consensus, Jean Molino (1975: 43) also points out that "any element belonging to the total musical fact can be isolated, or taken as a strategic variable of musical production." Nattiez gives as examples Mauricio Kagel's *Con Voce* [with voice], where a masked trio silently mimes playing instruments. In this example sound, a common element, is excluded, while gesture, a less common element, is given

primacy. In classical music of the [common practice period](#), for instance, melody and harmony are often considered to be given more importance at the expense of rhythm and timbre. John Cage considers duration the primary aspect of music as, being the temporal aspect of music, it is the only aspect common to both "sound" and "silence".

It is often debated whether there are aspects of music which are universal. The debate often hinges on definitions, for instance the fairly common assertion that "tonality" is a universal of all music may necessarily require an expansive definition of tonality. A pulse is sometimes taken as a universal, yet there exist solo vocal and instrumental genres with free and improvisational rhythms no regular pulse (Johnson 2002), one example being the alap section of an [Indian classical music](#) performance. "We must ask whether a cross-cultural musical universal is to be found in the music itself (either its structure or function) or the way in which music is made. By 'music-making,' I intend not only actual performance but also how music is heard, understood, even learned." (Dane Harwood 1976:522)

According to Merriam (1964, p.32-33) there are three aspects always present in musical activity: concept, behaviour, and sound. Virgil Thomson (Erickson 1957, p. vii) lists the "raw materials" of music in order of their discovery: rhythm, melody, and harmony; with the construction of these materials using two major techniques: [counterpoint](#) (the simultaneity and organization of different melodies) and orchestration. Rhythm does not require melody or harmony, but it does require melody if the instrument produces a continuous sound, harmony arises from reverberation causing the overlap of different pitches, and counterpoint arises from multiple melodies.

Kenneth Gorlay recounts that, "Writing of her own Igbo music, the Nigerian musicologist Chinyere Nwachukwu maintains that the 'concept of music *nkwa* combines singing, playing musical instruments, and dancing into one act' (1981: 59). Whatever concept of 'music' is held by members of western society, it is highly improbable that, apart from forward-looking scholars and composers, it will contain all three elements. *Nkwa* in fact is not 'music' but a wider affective channel that is closer to the karimojong mode of expression than to western practice. The point of interest here is that Nwachukwu feels constrained to use the erroneous term 'music': not because she is producing a 'musical dissertation,' but because the 'one act' which the Igbos perform has no equivalent in the English language. By forcing the Igbo concept into the Procrustean bed of western conceptualization, she is in effect surrendering to the dominance of western ideas--or at least to the dominance of the English language! How different things would have been if the Igbo tongue had attained the same 'universality' as English!" (1984, p.35) He then concludes that there exists "nonuniversality of music and the universality of nonmusic."

## Other common aspects and terms

Other terms used to discuss particular pieces include [note](#), which is an abstraction which refers to either a specific pitch and/or rhythm or the written symbol; [chord](#), which is a [simultaneity](#) of notes heard as some sort of unit; and [chord progression](#) which is a succession of chords (simultaneity succession).

# Atonality

**Atonality** describes [music](#) that does not conform to the system of tonal hierarchies, which characterizes the sound of [classical](#) European music between the seventeenth and nineteenth centuries. Not only does it not conform to the common practice of this particular period, but it is noticeably divorced from the acoustical underpinnings of music going back as far as the scale systems of ancient Greece. This separation of traditional meaning to be found in melodic motifs throughout history, have left purely atonal music generally bereft of common emotional and spiritual meaning. Atonality usually describes compositions written from about 1923 to the present day, where the hierarchy of tonal centers, in some cases, may not be used as the primary way to organize a work. Tonal centers gradually replaced modal organization starting in the 1500s and culminated with the establishment of the major-minor key system in the late 1600s and early 1700s.

The most prominent school to compose in this manner was the [Second Viennese School](#) of Arnold Schönberg, Alban Berg, and Anton Webern. However, composers such as Josef Matthias Hauer, Béla Bartók, Aaron Copland, George Antheil, and others wrote music that is described as atonal, and many traditional composers “flirted with atonality,” in the words of Leonard Bernstein.

## History of atonality

While music without a tonal center had been written previously, for example Franz Liszt's *Bagatelle sans tonalité* of 1885, it is with the 20th century that the term *atonality* began to be applied to pieces, particularly those written by Arnold Schönberg and The Second Viennese School.

Their music arose from what was described as the crisis of tonality in the late 19th century and early 20th century in [classical music](#). It was described by composer Ferruccio Busoni as the "exhaustion of the major-minor key system," and by Schönberg as the "inability of one tonal chord to assert dominance over all of the others." The first phase is often described as "free atonality" or "free chromaticism" and involved the conscious attempt to avoid traditional diatonic harmony. Works of this period include the opera *Wozzeck* (1917-1922) by Alban Berg and *Pierrot Lunaire* (1912) by Schönberg. The second period, begun after World War I, was exemplified by attempts to create a systematic means of composing without tonality, most famously the method of composing with 12 tones or the [twelve-tone technique](#). This period included Berg's *Lulu* and *Lyric Suite*, Schönberg's *Piano Concerto*, his opera *Jacob's Ladder* and numerous smaller pieces, as well as his final string quartets. Schönberg was the major innovator of the system, but his student, Anton Webern, then began linking dynamics and tone color to the primary row as well, making the row not only of notes but other aspects of music as well. This, combined with the parameterization of Olivier Messiaen, would be taken as the inspiration for [serialism](#).

Atonality emerged as a pejorative term to condemn music in which [chords](#) were organized seemingly with no apparent coherence. In Nazi Germany, atonal music was attacked as "Bolshevik" and labeled as degenerate (*Entartete Musik*) along with other music produced by enemies of the Nazi regime. Many composers had their works banned by the regime, not to be played until after its collapse after World War II.

In the years that followed, atonality represented a challenge to many composers—even those who wrote more tonal music were influenced by it. The Second Viennese School, and particularly 12-tone composition, was taken by avant-garde composers in the 1950s to be the foundation of the New Music, and led to [serialism](#) and other forms of musical experimentation. Prominent post-World War II composers in this tradition are Pierre Boulez, Karlheinz Stockhausen, Luciano Berio, Krzysztof Penderecki, and Milton Babbitt. Many composers wrote atonal music after the war, even if before they had pursued other styles, including Elliott Carter and Witold Lutosławski. After Schönberg's death, Igor Stravinsky began to write music with a mixture of serial and tonal elements. During this time, the [chord progressions](#) or successions designed to avoid a tonal center were explored and named, creating a vocabulary described as [musical set theory](#) focusing on pitch classes and pitch sets.

Atonal music continues to be composed, and many atonal composers of the late 20th century are still alive and active. However, atonal composition began to fade in the 1960s—where, on one hand, [aleatoric music](#) and electronic music demanded more and more attention and, on the other hand, musicians influenced by Eastern mysticism, modality, and [Minimalism](#) began writing music based on ostinato patterns.

## Controversy over the term itself

The use of the term "atonality" has been controversial. Schönberg, whose music is generally used to define the term, was vehemently opposed to it, arguing that "atonal" meant "without tone." For some, the term continues to carry negative connotations. A popular joke among musicians posits that "The two great errors of the 20th century were atonality and Marxism."

"Atonal" developed a certain vagueness in meaning as a result of its use to describe a wide variety of compositional approaches that deviated from traditional chords and chord progressions. Attempts to solve these problems by using terms such as "pan-tonal," "non-tonal," "free-tonal," and "without tonal center" instead of "atonal" have not gained broad acceptance.

Composer Anton von Webern, musicologist Robert Fink, and others have asserted that all music is perceived as having a tonal center. Others have argued that the avoidance of a tonal center produces more sophisticated music, which requires greater ability to appreciate, for example, Schönberg in his article on 12-tone composing. Influential critic Theodor Adorno argued, however, that one could express anything from tragedy to a smirk in atonality, provided one had compositional ability.

Others remarked that atonal music could not express the wide range of human emotions in an appropriate way. One could translate Shakespeare's plays into hundreds of different languages, but one could not translate a Beethoven symphony into an atonal equivalent. The language of music was not as arbitrary as the normal languages. Atonality was even described as "not music" or "incomprehensible."

In the historical view, however, neither of the extremes of prediction have come about: atonality has neither replaced tonality, nor has it disappeared. There is, however, much agreement amongst many composers that atonal systems in the hands of less-talented composers will still sound weak expressively, and composers with a genuine tonal gift are capable of writing exquisite works using twelve-tone methods. Serialism itself has been taken up by tonal composers as a modest replacement for the common practice tendencies of certain traditional forms to conform to certain tonal expectations.

The minimalist movement in music was an obvious reaction to the stilted academicism of university composition departments, each striving to out-do the other with all manner of freakishness and pseudo-science regarding the creative future of western music. Examples of these composers would be Steve Reich, Philip Glass and John Coolidge Adams. The advent of postmodern classicism has proven a return to tonal traditions (far from exhausted), and is represented by the American traditionalist composer, John Kenneth Graham.

## Composing atonal music

Setting out to compose atonal music may seem complicated because of both the vagueness and generality of the term. Additionally George Perle (1962) explains that, "the 'free' atonality that preceded dodecaphony precludes by definition the possibility of self-consistent, generally applicable compositional procedures." (p.9) However, he provides one example as a way to compose atonal pieces, a pre-[twelve tone technique](#) piece by Anton Webern, which rigorously avoids anything that suggests tonality, to choose pitches that do not imply tonality. In other words, reverse the rules of the [common practice period](#) so that what was not allowed is required and what was required is not allowed. This is what was done by Charles Seeger in his explanation of dissonant counterpoint, which is a way to write atonal counterpoint.

Further, he agrees with Oster and Katz that, "the abandonment of the concept of a root-generator of the individual chord is a radical development that renders futile any attempt at a systematic formulation of chord structure and progression in atonal music along the lines of traditional harmonic theory." (p.31) Atonal compositional techniques and results "are not reducible to a set of foundational assumptions in terms of which the compositions that are collectively designated by the expression 'atonal music' can be said to represent 'a system' of composition." (p.1)

Perle also points out that structural coherence is most often achieved through operations on intervallic cells. A cell "may operate as a kind of microcosmic set of fixed intervallic content, stable either as a chord or as a melodic figure or as a combination of both. Its components may be fixed with regard to order, in which event it may be employed, like the twelve-tone set, in its literal transformations... Individual tones may function as pivotal elements, to permit overlapping statements of a basic cell or the linking of two or more basic cells." (pp.9-10)

Audio examples of the role of dissonance and tonality claimed as part of our own physiological make-up (the ear) may be heard in the following links (which also are examples of the interaction and effect of consonance and dissonance upon each other).

## Criticism of atonal music

Famous Swiss conductor, composer and musical philosopher Ernest Ansermet was the greatest critic of atonal music. He writes in his massive book "Les fondements de la musique dans la conscience humaine" that Beethoven was unique in presenting the eternal ideal of the hero, his struggling and victory (5. symphony) and the typical Western universal ideal of a community of all social and loving humans (9. symphony) so forcefully and clearly. The classical musical language was a precondition for that with its clear, harmonious structures. Tonality based on relatively simple interval relations is absolutely necessary in Ansermet's opinion. So by the incomprehensible modern atonal music choosing interval relations randomly, such an impact, ethos and catharsis could never be reached in the audience.

# Aubade

An **aubade** is a poem or [song](#) of or about lovers separating at dawn.

The form has some dramatic elements, since the poem is often a dialogue between the lovers, one saying that dawn is near and they must part, and the other answering no. There is often a refrain, in which the watchman, or occasionally the jealous husband, warns the lovers of the approaching dawn.

Aubades were in the repertory of [troubadors](#) in Europe in the Middle Ages. An early English example is in Book III of Chaucer's *Troilus and Criseyde*. The love poetry of the 16th century dealt mostly with unsatisfied love, so the aubade was not a major genre in Elizabethan lyric. However, there is an aubade embedded in Shakespeare's *Romeo and Juliet*, starting with the famous lines:

Wilt thou be gone? it is not yet near day:

It was the nightingale, and not the lark,

That pierc'd the fearful hollow of thine ear

The aubade gained in popularity again with the advent of the metaphysical fashion; Donne's poem "The Sunne Rising" is one of the finest examples of the aubade in English. Aubades were written from time to time in the 18th and 19th century, although none of them quite up to metaphysical standards.

There have been several notable aubades in the 20th century, as well as a major poem titled "Aubade" by Philip Larkin in which the lover is life.

Aubade is also the name of Callisto's girlfriend in Thomas Pynchon's short story "Entropy."

# Audio file format

An **audio file format** is a container format for storing audio data on a computer system. Despite its name, there are many file formats for storing audio files.

The general approach towards storing digital audio formats is to sample the audio voltage (corresponding to a certain position in the membrane of a speaker) in regular intervals (e.g. 44,100 times per second for CDDA or 48,000 or 96,000 times per second for DVD video) and store the value with a certain resolution (e.g. 16 bits per sample in CDDA). Therefore sample rate, resolution and number of channels (e.g. 2 for stereo) are key parameters in audio file formats.

## Types of formats

It is important to distinguish between a file format and a codec. Even though most audio file formats support only one audio codec, a file format may support multiple codecs, as AVI does.

There are three major groups of audio file formats:

- uncompressed formats, such as WAV, AIFF and AU.
- formats with lossless compression, such as FLAC, Monkey's Audio (filename extension APE), WavPack, Shorten, TTA, Apple Lossless and lossless Windows Media Audio (WMA).
- formats with lossy compression, such as MP3, Vorbis (filename extension OGG), lossy Windows Media Audio (WMA) and AAC.

## Lossy audio formats

Lossy file formats are based on psychoacoustic models that leave out sounds that humans cannot or can hardly hear, e.g. a low volume sound after a big volume sound. MP3 is such an example.

As of 2002, one of the most popular audio file formats was MP3, which uses the MPEG-1 audio layer 3 codec to provide acceptable lossy compression for music files. The compression is about 10:1 compared with uncompressed WAV files (in a standard compression scheme), therefore a CD with MP3 files can store about 11 hours of music, compared to 74 minutes of the standard CDDA, which uses uncompressed PCM.

There are many newer audio formats and codecs claiming to achieve improved compression and quality over MP3. Vorbis is an unpatented, free codec. Microsoft has its Windows Media Audio format and Apple the Advanced Audio Coding format. Both are closed source and proprietary.

## Lossless audio formats

Lossless audio formats (such as TTA and FLAC) provide a compression ratio of about 2:1, sometimes more. In exchange for their lower compression ratio, these codecs don't destroy any of the original data. This means that when the audio data is uncompressed for playing, the sound produced will be identical to that of the original sample. Taking the free TTA lossless audio codec as an example, one can store up to 20 audio CDs on a single DVD-R, without any loss of quality. The downside to this method is that this DVD disc will only play on a device that can both read DVDs and decode the chosen codec. This will most likely be a home computer. Although these codecs are available for free, one important aspect of choosing a lossless audio codec is hardware support. It is in the area of hardware support that FLAC is ahead of the competition. FLAC is supported by a wide variety of portable audio playback devices.

One important consideration is in the area of DRM, where FLAC is very clear about being against any copy prevention features of any kind. More importantly this means that you the owner of the computer will not be restricted in using the FLAC files.

Lossless compression of sound is not nearly as widely used outside of professional applications, as lossy compression can provide a much greater data compression ratio with nearly the same apparent quality. Usually, the difference of quality between lossless and lossy audio compression is absorbed by the quality of the hardware, such as headphones, cables connectors or sound speakers.

## **Uncompressed audio formats**

There are many uncompressed data formats. The most popular of them is WAV, probably because it is the default uncompressed format for the Microsoft Windows operating systems. WAV is a flexible file format designed to store more or less any combination of sampling rates or bitrates. This makes it an adequate file format for storing and archiving an original recording. A lossless compressed format would require more processing for the same time recorded, but would be more efficient in terms of space used. WAV, like any uncompressed format, encodes all sounds, whether they are complex sounds or absolute silence, with the same number of bits per unit of time.

Let's take an example. A file contains a minute of a symphonic orchestra playing beautifully followed by a minute of silence. If the sound were stored in an uncompressed audio format, like WAV, the same amount of data would be used for each half. If data were encoded with a lossless audio format, like TTA, the first minute would be a bit smaller than in the WAV file, and the silent half would take almost no disc space at all. But then, recording in the TTA format would require a lot more processing than the WAV.

The WAV format is based on the RIFF file format, which is similar to the IFF format.

BWF (Broadcast Wave Format) is a standard audio format created by the European Broadcasting Union as a successor to WAV. BWF allows metadata to be stored in the file. See: European Broadcasting Union: Specification of the Broadcast Wave Format - A format for audio data files in broadcasting. EBU Technical document 3285, July 1997. This format is the primary recording format used in many professional Audio Workstations used in the Television and Film industry. Stand-alone file based multi-track recorders from Sound Devices, Zaxcom, HHB USA, Fostex, and Aaton all use BWF as their preferred file format for recording multi-track audio files with SMPTE Time Code reference. This standardized Time Stamp in the Broadcast Wave File allows for easy synchronization with a separate picture element.

## Multiple channels

Since the 1990s, movie theatres have upgraded their sound systems to surround sound systems that carry more than two channels. The most popular examples are Advanced Audio Coding or AAC (used by Apple 's iTunes) and Dolby Digital, also known as AC-3. Both codecs are copyrighted and encoders/decoders cannot be offered without paying a licence fee. Less common are Vorbis and the recent MP3-Surround codec. The most popular multi-channel format is called 5.1, with 5 normal channels (front left, front middle, front right, back left, back right) and a subwoofer channel to carry low frequencies only (the human ear cannot distinguish where the low frequencies come from).

It is a common misconception that 5.1 Surround sound includes 2 rear speakers. In fact, a 5.1 setup includes what Dolby call Surround speakers, and are actually placed at the sides of the listener. "6.1" setups do however, include a single rear speaker placed at the rear centre, behind the listener - Dolby calls this setup Dolby Digital EX . A 7.1 setup has the usual front 3 (front Left, front Centre, front Right), 2 Surround sound speakers situated to the left and right of the listener, and 2 rear speakers (rear Left and rear Right); with the usual Sub-woofer for bass - Dolby call this .1 / Sub speaker by the term LFE (Low-Frequency Effects).

# Audio engineering

**Audio engineering** is a part of audio science dealing with the recording and reproduction of sound through mechanical and electronic means. The field of audio engineering draws on many disciplines, including electrical engineering, acoustics, psychoacoustics, and [music](#). Unlike acoustical engineering, audio engineering generally does not deal with noise control or acoustical design. Much of audio engineering is also used in broadcast engineering.

## Practitioners

An **audio engineer** is someone with experience and training in the production and manipulation of sound through mechanical means. As a professional title, this person is sometimes designated as a **sound engineer** instead. An informal name might be a "sound guy" and/or an "audio guy". A person with one of these titles is commonly listed in the credits of many commercial music recordings (also in other productions that include sound, such as movies).

Audio engineers are generally familiar with the design, installation, and/or operation of sound recording, sound reinforcement, or sound broadcasting equipment. In the recording studio environment, the audio engineer or **recordist** is a person recording, editing, manipulating, mixing and mastering sound by technical means in order to realize and artist's or record producer's creative vision. While usually being associated with [music](#) production, an audio engineer may be involved in dealing with sound for a wide range of applications, including post-production for video and film, live sound reinforcement, advertising, multimedia, broadcasting.

Audio engineers operate mixing consoles, microphones, signal processors, tape machines, digital audio workstations, sequencing software and speaker systems. Traditionally an audio engineer is responsible for the technical aspects of a [sound recording](#) or other audio production and works together with a record producer or a director. However, the audio engineer's role is quite often integrated with that of the producer.

In typical sound reinforcement applications, audio engineers often assume the role of producer, making artistic decisions along with technical ones.

# Audio mixing

**Audio mixing** is used for [sound recording](#), audio editing and sound systems to balance the relative volume and frequency content of a number of sound sources. Typically, these sound sources are the different [musical instruments](#) in a [band](#) or vocalists, the sections of an [orchestra](#) and so on.

Sometimes audio mixing is done live by a sound engineer or recording engineer, for example at rock concerts and other musical performances where a public address system (PA) is used. A typical concert has two mixers, one located in the audience to mix the front of house speakers heard by the audience, and the other is located at the side of the stage, mixing for the monitor speakers positioned directly in front of the performers so that they can hear one another.

Another example of live mixing is a DJ mixing two records together. Break beats are created by mixing between identical breaks. Often the end of one pre-recorded song is mixed into another so that the transition is seamless, which is done through beat-matching or beat-mixing, and possibly [pitch](#) control.

At other times, audio mixing is done in studios as part of multitrack recording in order to produce digital or analog audio recordings, or as part of an album, film or television program. See: [remix](#).

An audio mixing console, or mixing desk, or mixing board, has numerous rotating controls (potentiometers) and sliding controls (faders which are also potentiometers) that are used to manipulate the volume, the addition of effects such as reverb, and frequency content (equalization) of audio signals. On most consoles, all the controls that apply to a single channel of audio are arranged in a vertical column called a channel strip. Larger and more complex consoles such as those used in film and television production can contain hundreds of channel strips. Many consoles today, regardless of cost, have automation capabilities so the movement of their controls is performed automatically, not unlike a player piano. A recent trend is to use a "control surface" connected to a computer. This eliminates much of the electronics in a conventional console as the actual mixing work is done digitally by the computer.

Audio mixing on a personal computer is also gaining momentum. More and more independent artists are starting to use their personal computers for digital recording and mixing their work. Audio editing on the computer is also easy and generally preferred.

A recent trend is mixing to 5.1, which is "surround" audio. This requires 6 channels of audio: left, center, right, left rear, right rear, and low frequencies (sub-woofer). In commercial release, only DVD video has a standard. The demand for 5.1 in the audio and music domain was once small but has recently increased dramatically, along with the introduction of 7.1 & 9.1 surround channel audio.

# Audio programming language

An **audio programming language** is a programming language specifically targeted to sound and [music](#) production or synthesis.

ABC

ChuckK : strongly-timed, concurrent, and on-the-fly audio programming language

SuperCollider

# Audio track

The **audio track** is in some respects interchangeable with [sound track](#). The subtle differences between the two which is acknowledged by some include:

- Sound track is more often applied to film
- Audio track is more often applied to video
  
- Sound track is more often applied to physical sound output
- Audio track is more often applied to an editable medium
  
- Sound track is more often applied to an audio album for sale or download
- Audio track is more often applied to sound only accompanying visuals

# Aulos

The ancient Greek **aulos**, often mistranslated as "flute", was a double-piped reed instrument. Archeological finds indicate that it could be either single-reeded, like a [clarinet](#), but more usually double-reeded, like an [oboe](#). Unlike the [lyre](#), which could be mastered by any aristocrat with sufficient leisure to practice it, the aulos was an instrument chiefly associated with professional musicians, often slaves. Female aulos-players were a fixture of Greek drinking parties, and male and female aulos players often doubled as prostitutes.

The aulos accompanied a wide range of Greek activities: it was present at sacrifices, dramas and even wrestling matches, for the broad jump, the discus throw, sailor's dances on triremes. Plato associates it with the ecstatic cults of Dionysus and the Korybantes. In his writings, Plato banned the aulos from his Republic but reintroduced it in "Laws".

In mythology, Marsyas the satyr or "papa selenus" was supposed to have invented the aulos, or else picked it up after Athena had thrown it away because it caused her cheeks to puff out and ruined her beauty. In any case, he challenged Apollo to a musical contest, where the winner would be able to "do whatever he wanted" to the loser - Marsyas's expectation, typical of a satyr was that this would be sexual in nature. But Apollo and his lyre beat Marsyas and his aulos. And since the pure lord of Delphi's mind worked in different ways than Marsyas's, he celebrated his victory by stringing his opponent up from a tree and flaying him alive. King Midas got donkey's ears for judging Marsyas as the better player. Marsyas' blood and the tears of the Muses formed the river Marsyas in Asia Minor.

This tale was a warning against committing the sin of "hubris", or overweening pride, in that Marsyas thought he might win against a god. Strange and brutal as it is, this myth reflects a great many cultural tensions that the Greeks expressed in the opposition they often drew between the lyre and aulos: freedom vs. servility and tyranny, leisured amateurs vs. professionals, moderation (sophrosyne) vs. excess, etc. Some of this is a result of 19th century AD "classical interpretation", ie. Apollo versus Dionysus, or "Reason" (represented by the kithara) opposed to "Madness" (represented by the Aulos). In the temple to Apollo at Delphi, there was also a shrine to Dionysus, and his Maenads are shown playing the Aulos, on drinking cups, but Dionysus is sometimes shown holding a kithara or lyre. So a modern interpretation can be a little more complicated than just simple duality.

It should be noted, however, that this opposition is mostly an Athenian one. We might surmise that things were different at Thebes, which was a center of aulos-playing. And we know that at Sparta – which had no Bacchic or Korybantic cults to serve as contrast – the aulos was actually associated with *Apollo*, and accompanied the kings into battle.

# Australian country music

**Australian country music** is a vibrant part of the [music of Australia](#). There is a broad range of styles, from [bluegrass](#), to yodelling to [folk](#) to the more popular.

Australia has a long tradition of [country music](#), which has developed a style quite distinct from its U.S. counterpart. Waltzing Matilda, often regarded as Australia's unofficial [National anthem](#), is a quintessential Australian country song, influenced more by Celtic folk ballads than by American Country and Western music. This strain of Australian country music, with lyrics focusing on strictly Australian subjects, is generally known as "bush music" or "bush band music".

Another, more Americanised form of Australian country music was pioneered in the 1930s by such recording artists as Tex Morton. Strictly Australian country music and bush ballads were popularized by Slim Dusty, best remembered for his 1957 song "A Pub With No Beer". In recent years local contemporary country music, featuring much [crossover](#) with [popular music](#), has enjoyed considerable popularity in Australia.

Country music has also been a particularly popular form of musical expression among the Australian Aboriginal and Torres Strait Islander peoples.

## **Awards and festivals**

The major celebration of country music in Australia is the Tamworth Country Music Festival in January each year. Indigenous country music is in evidence at The Deadlys, a celebration of indigenous musicians and their music.

# Australian hardcore

**Australian hardcore punk** is an active [rock music](#) subgenre with a dedicated following. Many Australian [hardcore](#) bands enjoy a relatively large fanbase locally without touring outside their home state. Recorded material of these bands is often hard to find as many do not record but focus on live shows (the mainstay of the scene).

The roots of Australian hardcore can be traced all the way back to the first Australian punk band, The Saints, and more recently, to include such acts as AC/DC and Midnight Oil. UK and the U.S. influence is evident in many bands, nonetheless, Australian hardcore has, in bands such as Toe to Toe and Mindsnare, its own distinct dry humour, attitude and sound. Local and regional (scene and state) differences are also evident. Other influences are by U.S. hardcore, U.K. Punk and [Heavy Metal](#) bands.

The Do-It-Yourself (DIY) ethic is strong. The rise of CD burners and the Internet has allowed more bands to self-publish their records and sell through their websites or on consignment in local record stores. If recorded material is available distribution is often through local distributors run out of band member's garages or [small independent labels](#) which are active in most capital cities.

Interstate tours are organised occasionally by more established bands. Only a few hardcore bands ever tour overseas.

A number of Australian hardcore bands hold ideological, political and religious values and may communicate these in their music. These values include anarchist, Christian and straight edge. A common attitude to espousing values in music is found in an interview with Winston McCall of Parkway Drive (Byron Bay) with Maddi West of DB Magazine. Commenting about regional scenes - contrasting Byron Bay and Adelaide:

"I'd say Adelaide has probably got the biggest straightedge/vegan scene in Australia. In Byron there's about five straightedge kids and I think maybe two kids that are vegan and that's about it," McCall laughs. "I'm vegetarian myself and there's a couple of us that are straightedge, but we just wanna have fun and play music. We do believe in trying to make a difference in some way, but as a whole we don't really champion any beliefs. We're just a hardcore band!" Winston McCall of Parkway Drive interview, DB Magazine

## **SHORT.FAST.LOUD. on Triple J radio**

The ABC Triple J network has a weekly program, short.fast.loud., that showcases punk and hardcore music released both locally and elsewhere.

## **Australian hardcore bands**

Day of Contempt, I Killed The Prom Queen, Shotpointblank and Parkway Drive are seen by some as more mainstream Australian metalcore bands. All these bands have toured the USA.

Less mainstream bands like United Force, No Grace, All It Cost Was Everything and Jungle Fever have loyal local and overseas followings.

# Australian hip hop

**Australian hip hop music** began in the early 1980s, primarily influenced by hip hop music and culture imported via radio and television from America. Since the late 1990s, a distinctive local style has developed, and the genre is continuing to gain credibility in the alternative and underground music scenes.

The first Australian hip hop record released was "Combined Talent" by Just Us in 1988. Another release of note is Knights Of The Underground Table (1992) by Def Wish Cast, which sold well locally and in Europe. Also in 1992, Postcards From the Edge of the Undersound was released by Sound Unlimited (also known as the Sound Unlimited Posse). Released by Sony, it was for the best part of a decade the only such major label release of an Australian hip hop act.

American versus Australian accents used by local MCs has caused much heated debate within the Australian hip hop community over the years, however there is an increasing tendency for artists to use their own accent and rap about things closely related to Australian culture.

Australian hip hop is a part of the underground music scene with only a few successful commercial hits in the last decade. Albums and singles are released by mostly independent record labels, often owned and run by the artists themselves.

Although still far from mainstream, in recent years Australian hip hop has grown rapidly in popularity. In recognition of the increasing acceptance of hip hop, influential youth radio station Triple J introduced the Hip Hop Show, hosted by Maya Jupiter (herself a hip hop artist), a weekly show dedicated to hip hop and rap. This in turn has helped to further raise the profile of Australian hip hop. In 2004, the Australian Record Industry Association introduced a new category in their annual awards, Best Urban Release. The inaugural award was won by Koolism.

The most commercially successful hip hop group in Australia is the Hilltop Hoods. They have reached Gold status for their album The Calling - the first Australian hip hop act to do so. This success was mirrored by 1200 Techniques, who achieved gold status with their [debut album](#) Choose One and established a reputation as an excellent live act. The Sydney-based collective The Herd achieved considerable success with their second album An Elephant Never Forgets, featuring the controversial hit "77%" and the single Burn Down The Parliament. The Cat Empire, a group that performs a fusion of many styles of music including hip hop, has also found widespread success. Producer J Wess, former basketball player, also achieved huge sales of his debut The J Wess LP.

Obese Records is one of the biggest production labels within Australian hip hop. Their CEO is MC Pegz and they have signed such artists as the Hilltop Hoods, Drapht, Reason and the Funkoars to name just a few.

In 2005, independent film-maker Oriel Guthrie's documentary Skip Hop debuted at the Melbourne International Film Festival. The film includes live footage of Freestyle battle and prominent gigs around Australia. Also featured are interviews with the Hilltop Hoods, Def Wish Cast DJ Peril, The Herd, Danielsan from Koolism and Wicked Force Breakers.

## Australian indie rock

**Australian indie rock** is part of the overall flow of [Australian rock](#) history but has a distinct history somewhat separate from mainstream rock in Australia, largely from the end of the [punk rock](#) era onwards.

# History

## Beginnings

*Main article:* [Australian rock](#)

[Rock and roll](#) in Australia got started in the late 1950s and 1960s, influenced by the sounds coming from the USA and UK. Early on, the [surf rock](#) sound dominated, though in the mid-1960s, the beat genre from the UK had become established. Numerous garage bands formed in the cities and suburbs, and a vibrant musical culture began.

## Punk and post-punk

The [punk](#) movement began in the mid-1970s, and resulted in an explosion of musical activity. Numerous bands formed, as did many independent record labels, often run out of bedrooms. Soon the raw energy of punk evolved into [post punk](#), which combined the DIY ethos of punk with rule-breaking, genre-defying artistic experimentation. The profusion of small, defiantly uncommercial and often unhesitatingly experimental bands became known as the "little band scene". Throughout the 1980s, it flourished in most Australian major cities, evolving around venues (such as Melbourne's Seaview Ballroom) and community radio stations such as 3RRR. A few bands, like The Models, crossed over to the mainstream; others, like The Birthday Party went on to achieve critical acclaim abroad.

This era can be said to have ended in the 1990s, when in the wake of the explosion of [grunge](#), alternative music became mainstream. Major labels signed three-chord grunge/punk-style rock bands, commercial radio played them and the 'alternative' sound soon became ubiquitous, ultimately culminating in manufactured pop groups like Killing Heidi, styled to sound raucously 'alternative' and appearing on television commercials for mobile phones. In this way, this process of mainstreaming echoes what happened in the USA and UK.

## 1990s to the present

The mainstreaming of alternative music did not kill [indie rock](#) in Australia, though did signal a shift in its focus. The form of 'alternative' music that the major labels and commercial radio stations were interested in was predominantly three-chord rock informed by [punk rock](#) and Seattle-style grunge; loud, rebellious, and easily marketable to a generation of teenagers. Bands who did not fit this manifest were largely left behind by this process, and did attract smaller audiences (predominantly in their 20s and based in bohemian inner urban areas). In inner Melbourne, a considerable [post rock](#) scene flourished, with bands like Art of Fighting, Silver Ray and Gersey playing more subdued music using the traditional guitar/bass/drums structure; bands in this scene often played at inner-city venues such as the Punters Club and the Empress Hotel. Other bands explored alternative instrumentation, including accordions, strings and chromatic percussion. [Indie pop](#), too, remained largely (though not entirely) out of the spotlight, with bands like Sydney's Sneeze, Melbourne's Sleepy Township and Brisbane's Clag.

Several indie labels of note have operated in Australia around this time. Chapter Music, established by Guy Blackman in Perth but later relocated to Melbourne, released recordings on both vinyl and CD by a wide range of artists, including Panel Of Judges, Sleepy Township and Origami, as well as a compilation of Australian 1970s/1980s [post punk](#) titled *Can't Stop It*. Sydney's Half A Cow, run by Nic Dalton, released albums by bands like Dalton's own Sneeze, Spdfgh, and Sydney [shoegazers](#) Swirl. Fitzroy-based Trifekta, run by Tom Larnach-Jones (and distributed by major label Festival Mushroom Records) also released recordings by various more established Melbourne bands, including Ninetynine. Minimum Chips, Gersey and Architecture in Helsinki, as well as local releases of international bands like Life Without Buildings. More recently, Tasmanian-cum-Melbourne label Unstable Ape Records have been releasing many recordings by independent local bands such as Love Of Diagrams, Sir and the Bird Blobs.

## Australian jazz

[Jazz](#) is an [American musical genre](#) primarily created by African Americans. Despite the great distance between the two nations, jazz and jazz-influenced syncopated dance music was being performed in Australia within only a few years of the emergence of jazz as a definable musical genre in the United States. Until the 1950s, jazz-based music, modelled on the leading white British and American jazz bands, was the primary form of accompaniment at Australian public dances, and this style enjoyed wide popularity.

After World War II the Australian jazz scene began to diversify as local musicians were able to get access to recordings by leading African-American jazz musicians like Charlie Parker, Dizzy Gillespie, Miles Davis and Thelonious Monk, and [bebop](#), [cool jazz](#) and [free jazz](#) exerting a strong influence on Australian musicians in the late 1950s and beyond.

Although jazz in Australia suffered a drop in popularity during the Sixties and Seventies, as it did in most other countries, there was a marked resurgence of interest in the Eighties and Nineties as a new generation of musicians came to the fore. The best Australian jazz performers are now regarded as equal to the best in the world, although as in popular music, they still suffer from a lack of music industry support.

It is also important to acknowledge the role of New Zealand musicians in the Australian jazz scene, and as jazz historian Andrew Bissett has noted, it is impossible to properly discuss the subject of Australian jazz without reference to New Zealand. Many of the most important "Australian" jazz musicians of the last 40 years have come from New Zealand, including renowned pianist-composers Mike Nock and Dave McRae and Judy Bailey, and vocalists Ricky May and Kerrie Biddell.

## **Jazz precursors in Australia**

White American and British 'black-face' minstrels and vaudeville performers brought imitations of slave plantation music to Australia with the 1850s-60s gold rush in the 19th century. They toured across the continent, both the major capital cities and smaller, boom towns like Ballarat and Bendigo. Visits by American vaudeville troupes became much more common after the introduction of regular steamship services between America and Australia in the 1870s. Some genuine African-American troupes toured from the 1870s, including jubilee singers.

Ragtime reached Australia from the 1890s and many white and black ragtime artists of repute toured Australia, and its popularity was boosted by the visit of the American naval fleet in 1908 and a hugely successful tour by a sixty-piece group led by famed brass band leader and composer John Philip Sousa in 1910. Some of these artists taught Australians how to 'rag' (improvise in ragtime style) and the visit of the Sousa band influenced a generation of aspiring young Australians to take up brass instruments.

## Early 20th century

Thanks to this early contact, and also an increase in the flow of American music to Australia via phonograph records, modern dance arrangements, piano rolls and visiting jazz acts, Australians developed a strong interest in jazz influenced dance music and its related forms. 'Jazz'(hot dance music) was well established by the mid-1920s. Hundreds of thousands of Australians served overseas during World War I and many were exposed to jazz through contact with American servicemen. Jazz was recorded on piano-rolls in Australia before 1923 and disc recordings like, "Yes Sir That's My Baby" by Ray Tellier's San Francisco Orchestra, were also being recorded by 1925.

Local exposure to current trends in American jazz in the Twenties was moderated by Australia's relative remoteness, and by commercial and political constraints. Postwar prosperity saw dance music and public dances enter a boom period, with the opening of huge dance halls, able to hold thousands of patrons, in Sydney, Melbourne and other large cities.

The biggest musical influence in the period 1923-1928 was a string of visiting American dance bands, mainly from the West Coast. Frank Ellis and his Californians, who arrived in 1923, were probably the most influential and popular of these groups. Thousands of dance fans regularly flocked to see them at Sydney's largest dance hall, the Palais Royale (the Royal Hall of Industries at Moore Park, which still stands today). The arrival of the American bands had several significant effects, including pushing up the wages for dance-band musicians. At the height of their success, Ellis's musicians were being paid the huge sum of 30 pounds per week each -- roughly ten times the average weekly wage at that time -- and Ellis himself was paid a staggering 45 pounds per week.

At first, local bands were (predictably) of a somewhat lower standard than the better American bands, but Australian jazz musicians were eager learners and were often generously tutored by the visitors, some of whom stayed on for many years. Ellis also found that Australian dance tempos were considerably slower -- around 36 beats per minute -- than the normal tempo in the United States, and he gradually introduced audiences to faster tempos of around 56 beats per minute, a move that was quickly emulated by all the other dance bands in Sydney.

Australian jazz musicians in this period avidly picked up new repertoire, playing techniques and stylistic innovations from seeing imported bands, but restrictions on touring groups after 1928, alongside the broader effects of the Great Depression, meant that Australian jazz players generally had to learn by listening to new records.

As noted by veteran musician Graeme Bell, British recording giant EMI enjoyed a virtual monopoly over the Australian record market until after WWII, and as a result, cover versions of American recordings by white English dance bands were a dominant local influence in the inter-war period. It was not until the 1950s that Australian musicians were able to gain significant access to original recordings by American performers.

Another major filter on Australian exposure to new American jazz was that until 1942, American record companies marketed all recordings by black performers in a separate "race" catalogue, and almost none of these race recordings were imported into Australia or released locally. Australian jazz pioneer Frank Coughlan stated that he did not hear recordings by Louis Armstrong until 1928, several years after Armstrong had become a major star in the U.S.

Tours by overseas acts came under increasing union restrictions in the late 1920s, due to action by American music unions who black-banned a visiting Australian brass band, and tours by white bands became less frequent. Tours by black American bands were

very rare -- Australia's racist immigration policies were used to restrict visits by black performers, and this was exacerbated by the musicians union actions.

In 1928 Sonny & Clark's Colored Idea, one of the first and best all-black jazz bands to visit Australia, was forced to leave prematurely after some of the troupe were allegedly caught in a compromising situation with white women; however it has been suggested that the deportation was also partly a reprisal for the American black-balling of the aforementioned Australian band. From thereon until the 1950s, Australians heard very little live jazz by black artists.

From the mid 1930s onwards, the popularity of jazz, principally "swing" music, increased significantly. Notable bands of the 1920s included the American led Tellier Orchestra and Australian led Sidney Simpson & His Wentworth Cafe Orchestra and, in the 1930s, Jim Davidson & His New Palais Royal Orchestra, Frank Coughlan & His Trocadero Orchestra and Dudley Cantrell & His Grace Grenadiers, and numerous others.

Frank Coughlan was one of the most significant figures of this era and is widely regarded as "The Father of Australian Jazz". His shortlived 1936 band, formed for the opening of the famous Sydney ballroom, The Trocadero, was regarded as the best Australian swing band of its day, although it lasted less than a year.

A few big bands from America (including Artie Shaw's Orchestra) toured Australia during WWII, but local exposure was limited, because their concerts were restricted to American military personnel, although some local musicians went to extraordinary lengths to sneak into the concerts.

## Post-World War II jazz

After the end of WWII Australian jazz began to diverge into two major strands. The more popular strand was variously described as 'dixieland' or 'trad' or 'revivalist'. It exerted a significant influence on popular music over the next two decades, and also had an ongoing (if less direct) effect on the popular music of the Sixties and Seventies, through performers such as Judith Durham of The Seekers, Margret RoadKnight and members of The Loved Ones, all of whom had started their musical careers in the "trad" genre.

The Australian Jazz Convention was founded in 1946 and has continued ever since, making it the world's oldest continuous jazz festival. One of the most significant figures of postwar Australian jazz, and the figurehead of the 'trad' movement, is Graeme Bell (b. 1914), whose All Stars band was the first Australian jazz group to tour overseas and attain wide international recognition. The All Stars' groundbreaking visit to war-ravaged Czechoslovakia in 1947 to perform at the World Youth Festival in Prague in 1947 was a landmark event.

As jazz historian Bruce Johnston notes, this was a daring undertaking for the time – the band members left jobs and sold businesses and possessions to help pay for the venture. Moreover, there were none of the support systems now available to travellers or touring performers, and these problems were complicated by the chaotic conditions prevailing in Eastern Europe in the immediate postwar period. So precarious was the venture that by the time they left, the band had only been able to raise enough for one way tickets. Nevertheless, their appearance at the Prague Festival was a triumph and a planned two-week stay extended to a rapturously received nationwide tour lasting four months.

This was followed by an arduous but ultimately successful eight-month tour of the United Kingdom, becoming the first jazz band to tour the UK for some 20 years. The Bell UK tour was later recognised as being a major influence on the development of postwar British jazz, particularly in terms of the All Stars' dance-oriented style which was crucial in transforming British jazz from an intellectual, purist past-time into a popular social event centred on dance and audience participation.

Melbourne became the centre of the post-WWII revival of Australian jazz, and the bands of Graeme Bell, Frank Johnson, Len Barnard and Bob Barnard, Frank Traynor and The Red Onions had a strong influence on the direction of Australian jazz.

In the 1950s, and again principally through the importation of records, a number of jazz musicians became passionately devoted to the new modern style, variously known as "bop" or "Bebop" and exemplified by the music of Charlie Parker, Dizzy Gillespie, Thelonious Monk and Miles Davis, as well as "jump" exponents like Louis Jordan, whose music was a direct presursor of early [rock'n'roll](#).

There were two important centres of activity for this newer strand of Australian bebop. Jazz Centre 44 in St Kilda, Victoria was founded in the Fifties by entrepreneur Horst Liepolt (who later founded the Sweet Basil's club in New York). This venue fostered many leading talents including Brian Brown, Keith Stirling, Alan Turnbull, and Stewie Speer. Around the same time a group of Sydney musicians opened the El Rocco Jazz Cellar in Kings Cross, Sydney, a venue that jazz historian John Clare (aka Gail Brennan) counts as a focal point for the later direction of much of the Australian jazz scene.

## 1960s and 1970s

The onslaught of "beat" music in the 1960s decimated the popularity of jazz, with many 'trad' fans lured away first into folk and later to pop and rock. However, many of the players who emerged from the Australian bebop strand -- including Bob Bertles, John Sangster, Derek Fairbrass, Stewie Speer, Bernie McGann and Bobby Gebert -- either joined or provided backing for rock bands and many of these "modern" players also became sought-after session musicians. Many top Australian players who emerged in this period gained further valuable experience backing visiting American and British singers.

During the 1960s a broad new division formed in the 'modern' strand. Under the influence of so-called "cool" or "West Coast" style typified by Dave Brubeck and Gerry Mulligan, leading soloists such as Don Burrows and George Golla gravitated to this more accessible form, while others such as Bernie McGann, John Sangster and John Pochee remained passionately devoted to the more aggressive and progressive directions of bop, as well as absorbing the radical influences of the "free jazz" experimenters of the Sixties such as Ornette Coleman and Cecil Taylor. It is interesting to note that during the 1960s Bernie McGann was criticised for being an Ornette Coleman imitator -- even though he had never heard Coleman's work at the time the claim was made! (One of McGann's biggest early influences was Brubeck's saxophonist Paul Desmond).

New Zealand-born Mike Nock established his career during this period and he is now recognised as one of the most creative and accomplished jazz musicians from this part of the world. Nock began taking piano lessons from his father when he was 11, began performing four years later and at 18 moved to Australia, where he made his first recording Move with the Three-Out trio in 1960. After heading a trio that toured England in 1961, Nock went to the United States, where he remained for most of the next twenty-five years. He began attending the Berklee College of Music but dropped out. After a year to be the house pianist at a Boston club, where he had the opportunity to work with Coleman Hawkins, Pee Wee Russell, Phil Woods and Sam Rivers among many others. Nock gained further recognition during this period as a member of Yusef Lateef's band (1963-65). He went on to lead his own combos, gigged for a short period with Art Blakey's Jazz Messengers and eventually moved to San Francisco where he worked with John Handy. During 1968-70 Nock led the Fourth Way, a pioneering jazz-rock fusion group. He worked as a sought-after studio musician in New York between 1975 and 1985, and for several years he was musical director for singer Dionne Warwick. After returning to Australia he worked both as teacher at the Sydney Conservatorium of Music and as a musician, occasionally revisiting the U.S.

Melbourne's thriving TV industry was an important source of work for jazz musicians in the early-mid 1960s, with programs like Graham Kennedy's In Melbourne Tonight employing regular house bands that typically comprised of the cream of the Melbourne session scene. Melbourne musicians like Bruce Clarke and Frank "The Lion" Smith also worked extensively on soundtracks and advertising music, and Carke's Jingle Workshop studio in St Kilda, which produced much important music in these genres, was a significant focus, not merely for its commercial work, but also because it was the venue for regular Sunday jam sessions, many of which Clarke recorded.

Pop-rock dominated the Australian music scene during the Sixties and early Seventies and as noted above, many leading jazz performers including McGann, Sangster and Speer worked with rock groups during this period, as well as absorbing important stylistic influences from the Motown, [soul music](#) and [funk](#) genres. The influx of thousands of visiting American servicemen during the Vietnam war provided further impetus for local interest in these styles. Jazz maintained a low if consistent profile, with performers

including Burrows making regular appearances on TV. Both in Sydney and Melbourne, jazz players also worked extensively on music for live TV and advertisements.

Don Burrows (b. 1928) was one of the most prominent Australian jazz artists of this period. Among the many achievements of his sixty-year professional career, he composed and performed on the soundtrack to Tim Burstall's landmark 1969 feature film *2000 Weeks*, he was the first Australian jazz artist to win a gold record, the first Australian to perform at the prestigious Montreux and Newport jazz festivals (1972) and the first Australian jazz musician to receive an MBE, and he fronted his own TV series for six years.

Melbourne-born John Sangster (1928-1995) was another important musician-composer who came to the fore in the 1960s. Beginning as a trombonist in the 1940s, Sangster switched to cornet and then to drums, learning much of his craft as the drummer in Graeme Bell's Australian Jazz Band during their many local and overseas tours between 1950 and 1955. In the late 1950s Sangster switched from drums to vibes; by this time he was gravitating towards modern jazz, and after a stint in the "trad" oriented Ray Price Quintet, he joined the Don Burrows' band, with whom he recorded several original compositions.

Sangster was a central figure in the thriving scene at Sydney's El Rocco and later in the 60s he joined the house band of the Sydney production of the rock musical *Hair* to learn more about rock music and rock drumming. He developed into a prolific composer, with many notable credits in film and TV, including the theme music for the popular 1970s TV nature series *In The Wild* with Harry Butler. Among his best work is his ambitious multi-album recordings of original jazz compositions based on Tolkien's "*The Hobbit*" and "*The Lord of the Rings*", featuring many of the best Australian musicians of the day.

In the 1970s there was a return to the 'big band' format, most notably with the acclaimed (but shortlived) Daly Wilson Big Band, which enjoyed considerable popularity, as did Galapagos Duck, who were part owners of and regular performers at Sydney's longest-running jazz venue, The Basement, which opened in 1973. However, economic constraints and the limited size of the Australian market has meant that most big-band ventures of this kind have been shortlived.

A very significant development in 1973 was the inception of the Jazz Studies course at the Sydney Conservatorium of Music, the first jazz course to be offered by an Australian tertiary institution. Much of the credit for the establishment of the course goes to Don Burrows, who was given full support by new Director Rex Hobcroft. The first Chairman of the course, American educator and musician Howie Smith, was chosen after a recommendation by visiting American vibraphonist Gary Burton. The Jazz Studies course has had a significant effect on local jazz, not unlike the effect that the creation of NIDA has had on Australian film, TV and theatre. A generation of talented young jazz musicians have passed through the course, which has since been chaired by Bill Motzing, Roger Frampton, Don Burrows, Dick Montz and Craig Scott

[Jazz fusion](#), as typified by groups like Return to Forever, largely passed Australia by, although the group Crossfire was probably the best and best-known Australian act to work in this area.

## 1980s and later

Through the 1980s and 1990s jazz remained a small but vibrant sector of the Australian music industry. Despite its relative lack of visibility in the mass market, Australian jazz continued to develop to a high level of creativity and professionalism that, for the most part, has been inversely proportional to its low level of public and industry recognition and acceptance.

Players who were more influenced by "traditional" or [cool jazz](#) streams tended to dominate public attention and some moved successfully into academia. Multi-instrumentalist Don Burrows was for several decades a regular presence on television and radio, as well as being a prolific session musician. Although Burrows made no secret of his dislike for the bebop and [free jazz](#) strands, he became a senior teacher at the Sydney Conservatorium of Music and has exerted a strong influence on Australian jazz through his recordings, performances and teaching.

His protege, trumpeter James Morrison, who was heavily influenced by Louis Armstrong, has carved out a very successful career playing a style not unlike that of Wynton Marsalis, that blended some modern elements (e.g. the crowd-pleasing high-register technical bravura of Dizzy Gillespie) with the accessible structures and melodies of 'trad' and 'cool' jazz.

Multi-instrumental wind player [Barlow] emerged in the late 1970s as one of the most promising new talents on the Australian scene, and after stints in the Young Northside Big Band and a formative period in the David Martin Quintet (with James Morrison), he moved to New York, where he was a member of two famed groups, the Cedar Walton Quartet and Art Blakey's Jazz Messengers. Barlow has also toured and recorded with many other jazz greats including Sonny Stitt, Chet Baker, Gil Evans, Jackie McLean, Billy Cobham, Curtis Fuller, Eddie Palmieri, Dizzy Gillespie, Benny Golson, Lee Konitz, Sonny Stitt, Helen Merrill, Mulgrew Miller and Kenny Baron.

Many "second generation" bebop-influenced performers like New Zealand born pianist Mike Nock, bassist Lloyd Swanton, saxophonist Dale Barlow, pianist Chris Abrahams, saxophonist Sandy Evans and pianist Roger Frampton (who died in 2000) rose to prominence in this period, alongside their older contemporaries, led by the illustrious Bernie McGann and John Pochee, whose long-running group The Last Straw (founded in 1974) has carried the torch for this stream of jazz for many years.

New Zealand-born pianist-composer Dave McRae established himself as a performer of note in Australia in the 1960s before moving overseas, where he branched out into a diverse range of activities including a stint as the keyboard player in the British 1970s progressive rock group Matching Mole and collaborating with Bill Oddie of The Goodies on music for their TV series.

The trio of Tony Buck (drums), and the aforementioned Lloyd Swanton (bass) and Chris Abrahams (piano), known together as The Necks since forming in 1987 (see 1987 in music), was notable for its hour-long jams of [jazz](#) and [ambient music](#) textures, gaining widespread attention both in Australia and internationally. Their album *Drive-By*, which consists of a single 60-minute track, was named Jazz Album of the Year in the 2004 ARIA Awards.

During the early twenty-first century, there was also noticeable trend back towards jazz by many popular performers who had been associated with the rock genre. Most notable amongst these were Kate Ceberano, Danielle Gaha and The Whitlams who all released traditional jazz or jazz-influenced albums within a very short space of time. Whether this trend comes to dominate Australian popular music is yet to be determined.

## Australian rock

**Australian rock** and pop musicians have produced a wide variety of music. While many musicians and bands (some notable examples include the 1960s successes of the Easybeats and the folk-pop group the Seekers, through the heavy rock of AC/DC, and the slick pop of INXS and more recently Savage Garden and Jet) have had considerable international success, there remains some debate over whether Australian popular music really has a distinctive sound. Perhaps the most striking common feature of Australian music, like many other Australian art forms, is the dry, often self-deprecating humor evident in the lyrics. Australian music also tends to distinguish itself from the rock styles of other nations by a heavy focus on melody and complex, reggae- and jazz-inspired rhythms. Even hard rock and heavy metal groups, from Cold Chisel through to Baby Animals and Rose Tattoo all had a strong sense of melody and are notable for joyous tunes.

Until the late 1960s, many have argued that Australian popular music was largely indistinguishable from imported music: British to begin with, then gradually more and more American in the post-war years. The sudden arrival of the 1960s underground movement into the mainstream in the early 1970s changed Australian music permanently: Skyhooks were far from the first people to write songs in Australia, by Australians, about Australia, but they were the first ones ever to make money doing it. The two best-selling albums ever made (at that time) put Australian music on the map. Within a few years, the novelty had worn off and it became commonplace to hear distinctively Australian lyrics and sometimes sounds side-by-side with the imitators and the imports.

## 1950s to early 1960s: the "First Wave" of Australian rock

In the mid-1950s American [rockabilly](#) and [rock and roll](#) music was taken up by local musicians and it soon caught on with fans. A small independent Sydney label, Festival Records, led the charge, releasing Bill Haley's "Rock Around The Clock" in Australia in 1956 after it had been turned down by the local branch of Decca Records. It became the biggest-selling hit ever released in Australia up to that time, and its success led to Festival becoming the dominant Australian pop music label for the next fifteen years. Their commercial success was surpassed only by the multi-national British recording giant EMI, who dominated the charts thanks to the Beatles, the Hollies, the Byrds and the other leading 'Beat' groups on their catalogue.

The most famous exponent of the so-called "First Wave" of Australian rock'n'roll was Johnny O'Keefe. Inspired by Elvis Presley and Little Richard, he carved out a unique career and became a legend of Australian rock music, and hosted one of Australia's first TV pop shows, "Six O'Clock Rock". No less a figure than Iggy Pop acknowledged O'Keefe's importance when he recorded a version of O'Keefe's hit "Real Wild Child" in the 1980s. For a few years, O'Keefe and other local rockers like Lonnie Lee & The Leemen, Dig Richards & The R'Jays, Col Joye & The Joy Boys, Alan Dale & The Houserockers, Ray Hoff & The Offbeats, Digger Revell & The Denvermen and New Zealand's Johnny Devlin & The Devils whipped up excitement on a par with their American inspirations.

The success of these 'First Wave' artists was shortlived, and by the early '60s it began to fade. Between O'Keefe's last major hit in 1961 and Billy Thorpe's first hit in 1964, the local pop scene became noticeably blander and more conservative. The charts were dominated by clean-cut acts, like the members of the so-called "Bandstand family", most of whom were signed to Festival and were regular guests on Australia's leading TV pop show, 'Bandstand', which explicitly aimed to appeal to anyone "from eight to eighty".

Nevertheless, there were some exciting undercurrents. A notable alternative to the mainstream pop fare was the emergence of instrumental and 'surf' groups, notably the Atlantics and the Denvermen in Sydney and Melbourne's the Thunderbirds. Many of the players in these dance bands had come from the jazz scene, and were also strongly influenced by the R&B and "jump" music of performers like Louis Jordan. Others were inspired by figures like American surf guitar maestros Dick Dale and Duane Eddy, and particularly by the all-pervasive popularity of the Shadows and American band the Ventures. The Shadows' influence on Australasian pop and rock music of the Sixties and Seventies is still much underrated, and their lead guitarist Hank Marvin probably inspired more aspiring electric guitarists than any other figure in popular music until the advent of Eric Clapton and Jimi Hendrix.

These instrumental outfits cut their teeth playing on the booming dance circuits in Australia's major cities and regional towns. Like [Australian jazz](#) bands of the period, these rock'n'roll musicians became extremely accomplished players. Because dance patrons in those days actually danced as couples to traditional rhythms, dance bands in Australia and New Zealand tended to play a much wider variety of musical styles than their American or British jazz counterparts — it was not unusual for Australasian bands of this period to have literally hundreds of songs in their repertoire, ranging from current rock'n'roll and pop hit to the standards of the Twenties, Thirties and Forties.

Many of these instrumental groups survived into the Beatles era by adding a lead singer, and several evolved into some of the top bands of that next wave. Surf music and

local dance crazes like "The Stomp" were hugely popular at the time, even though they rarely rate a mention these days.

Although most of the Australian and New Zealand pop/rock music of this era went unheard by international audiences, a few Antipodean acts did manage to make an impression overseas. Singer Frank Ifield was one of the very first Australian postwar performers to gain widespread international recognition. He was hugely successful in the UK in the early Sixties, becoming the first performer to have three consecutive #1 hits there, and his biggest hit, "I Remember You" was #1 in the UK and was also a Top 5 hit in the U.S.A. Singer comedian and artist Rolf Harris also had several novelty hits during this period and went on to become a fixture on British television with his own popular variety show.

## The Beat boom

Facilitated by the deep cultural, linguistic and economic links between Britain and its former colonies, the Beatles and other British Invasion groups had a massive impact on the Australasian music scene. Many of these bands toured Australia and New Zealand to wild receptions in the mid-Sixties. When The Beatles' epoch-making 1964 Australian tour arrived in Adelaide, an estimated 300,000 people — about **one-third** of the city's entire population at that time — turned out to see them as their motorcade made its way from the airport to the city.

The tours and recordings by these new 'Beat' groups revitalised the pop genre and inspired scores of new and established groups, who quickly developed a vibrant and distinctive local inflection of the 60s 'beat music' craze. The Easybeats and The Bee Gees are probably the best-known acts from this era to gain success outside Australia, but by the mid-Sixties there were literally hundreds of bands working almost every night of the week in Australia and New Zealand.

## 1964–1969: "Second Wave"

The period 1964–1969 is often classified as the 'Second Wave' of Australian rock. The leading acts of this period include Billy Thorpe & the Aztecs, pioneering beat duo Bobby & Laurie (Australia's first "long-haired" performers), the Easybeats, Ray Brown & The Whispers, Tony Worsley & The Fabulous Blue Jays, the Twilights, the Loved Ones, the Masters Apprentices, MPD Ltd, Mike Furber & The Bowery Boys, Ray Columbus & The Invaders, Max Merritt, Dinah Lee, Australia's most popular male singer Normie Rowe, The Groop, the Groove, Lynne Randell (who toured America with the Monkees and Jimi Hendrix), Johnny Young, John Farnham, Doug Parkinson, Russell Morris and Ronnie Burns. Also of note were cult acts such as the Missing Links, the Purple Hearts, the Wild Cherries and the Throb, who had only limited success at the time but whose 'heavier' sound would exert a significant influence on later bands like The Saints.

It was during the '60s that New Zealand performers began to move to Australia in search of wider opportunities. Although their origins are often overlooked (in much the same way that Canadian performers like Neil Young and Joni Mitchell are routinely classified as "American") these trans-Tasman performers — people like Max Merritt, Mike Rudd, Dinah Lee, Ray Columbus, Dave Miller, Bruno Lawrence, Dragon and Split Enz — have exerted a tremendous influence on Australian popular music.

Another significant Australian from this period, and one whose importance is only now beginning to be widely recognised, was the critic and journalist Lillian Roxon (1932–1973), who grew up in Brisbane but who was based in New York from 1959 until her premature death from asthma. She was a close friend of feminist doyen Germaine Greer, photographer Linda McCartney, poet Delmore Schwartz, artist Andy Warhol and many musicians including Lou Reed. Roxon wrote the world's first Rock Encyclopedia, published in 1969, and her writings about pop music and musicians were central to the development of serious rock criticism and rock journalism in the late 1960s and 1970s.

## 1970–1975: "Third Wave"

After a period of flux in the late 60s, during which almost all of the dominant 60s acts dissolved or faded from view, Australian rock moved into the so-called "The Third Wave" (1970–1975), a fertile period in which newer performers and veterans of the 60s Beat Boom coalesced into new formations and developed a more mature, progressive and distinctively Australian rock style. Some of these acts were successful within Australia, but few managed to achieve any lasting local or overseas success, due to the combination of poor management, lack of record company support and lack of radio exposure.

### Early "Third Wave"

Until the late 1970s, many Australian performers found it hard to become established and to maintain their profile, because of the difficulty in getting airplay on radio. Until 1975, Australian pop radio was dominated by a clique of commercial broadcasters who virtually had the field to themselves and their influence over government was such that, incredibly, no new radio licences had been issued in any Australian capital city since the prevailing industry structure had been consolidated in the early 1930s. All commercial pop radio was broadcast on the AM band, in mono, and the commercial sector strenuously resisted calls to grant new licences, introduce community broadcasting and open up the FM band (then only used for TV broadcasts in Australia) even though FM rock radio was already well-established in the United States.

Many of the more progressively-oriented artists found themselves locked out of Australian commercial radio, which concentrated on high-rotation 3-minute pop single programming. This was a result of the widespread adoption of the American-inspired "More Music" format, which had been pioneered in Los Angeles with great success by the Drake-Chenault programming consultancy.

There was a great deal of innovative and exciting music produced; although few Australians got to hear more than a fraction of it at the time, this music is undergoing a major resurgence both locally and internationally, since Australia is one of the last untapped resources of 20th-century popular music.

Landmark acts of this period include Spectrum and its successor Ariel (band), Daddy Cool, Blackfeather, The Flying Circus, Tully (band), Tamam Shud, Russell Morris, Jeff St John & Copperwine, Chain, Billy Thorpe & The (new) Aztecs, Company Caine, Kahvas Jute, Country Radio, Max Merritt & The Meteors, The La De Das, Madder Lake, former Easybeats lead singer Stevie Wright, Wendy Saddington, The Captain Matchbox Whoopee Band and country-rock pioneers The Dingoes.

Rock musicals were another important development in Australia at this time. The local production of *Hair* (musical) brought future "Queen of Pop" Marcia Hines to Australia in 1970. In 1972 the hugely successful and much-praised Sydney production of *Jesus Christ Superstar* premiered, and this production alone included Marcia Hines, Jon English, theatre legend Reg Livermore, the two main members of Air Supply, Stevie Wright and John Paul Young. It was directed by Jim Sharman, who went on to lasting international success as the director of the both the original stage production and the film version of *The Rocky Horror Show*.

Alongside the more 'adult' acts was a raft of successful pop-oriented groups and solo artists, including Sherbet, Hush, Ray Burgess, the Ted Mulry Gang (TMG) and John Paul Young, who went on to become the first Australian performer to have a major hit in

multiple international markets with his perennial "Love Is In The Air" (1978) — a song which was, not coincidentally, written and produced by former Easybeats Harry Vanda and George Young, the masterminds behind many of the biggest Australian hits of the mid-to-late Seventies. The tail-end of the Second Wave gave birth to the record-breaking Skyhooks, who bridged the transition from the Third Wave into the period of the so-called [New Wave music](#) acts of the late 1970s and early 1980s. Sherbet was undoubtedly the most successful of these.

The early 1970s was also witnessed the first major rock festivals in Australia, which were closely modelled on the fabled Woodstock festival of 1969. The festival era was exemplified by the annual Sunbury music festival, held outside Melbourne, Victoria each January from 1972 to 1975. Although there were numerous other smaller festivals, most were not successful and failed to have the lasting impact of Sunbury. After the disastrous 1975 festival, which sent the promoters broke, large-scale festivals were considered too risky and were only rarely staged in Australia until the advent of the annual Big Day Out in the 1990s.

Important changes in the early-to-mid Seventies which affected the rock scene were the long-overdue introduction of colour television and FM radio in 1975. One of the most significant was the decline of the dance-discotheque circuit in the early years of the Seventies. These rock dances were a continuation of the social dance circuit that had thrived in Australia's cities and suburbs since the 1800s. They were hugely popular from the late Fifties to the early Seventies.

The main venues were discotheques (usually located in inner city areas), and suburban church and community halls, Police Boys' Clubs and beachside surf clubs, and they attracted huge numbers of young people because they were supervised, all-ages events — Australia's restrictive liquor licensing laws of the period meant that these venues and dances were almost always alcohol-free.

According to one source, there were as many as 100 dances being held every weekend in and around Melbourne in 1965. The most popular groups frequently played almost every night of the week, commonly commuting around town to perform short sets at three or more different dances every night. It was a very lucrative circuit for musicians — even moderately popular acts could easily earn considerably more than the average weekly wage at that time.

The decline of the local dance circuit, combined with the fact that the baby boom teenagers of the Sixties were now ageing into adulthood, led to the rise of a thriving new city and suburban pub music circuit in the mid-70s, which in turn spawned a new generation of bands who cut their teeth in this often tough but formative training ground.

## **1974: *Countdown***

Teen-oriented pop music still enjoyed strong popularity during the 1970s, although much of it was sourced from overseas, and the proportion of Australian acts in the charts had hit an all-time low by 1973. That trend began to change around 1975, thanks largely to the advent of a new weekly TV pop show, *Countdown*, in late 1974. It gained a huge audience and soon exerted a strong influence on radio programmers, because it was broadcast nationwide on Australia's government-owned broadcaster, the Australian Broadcasting Corporation (ABC). *Countdown* was the most popular music program in Australian TV history, and it had a marked effect on radio because of its loyal national audience — and the amount of Australian content it featured.

The most important feature of *Countdown* was that it became a critical new interface between the record industry and radio. By the late 1970s, radio programmers ignored *Countdown*'s hit picks at their peril. Host Ian Meldrum also frequently used the show to castigate local radio for its lack of support for Australian music. Unlike commercial TV or radio, *Countdown* was not answerable to advertisers or sponsors, and (in theory) it was far less susceptible to influence from record companies. Like no other ABC program

before or since, it openly and actively promoted the products of these private companies and even back in the Seventies, there's no doubt that there would have been a major controversy if the ABC had used its resources to promote the products of any other private industry so blatantly. Yet, it was able to do so because the public, the regulators and the policy-makers evidently regarded pop records and music videos as somehow standing outside the realm of everyday commerce.

Countdown was crucial to the success of acts like John Paul Young, Sherbet, Skyhooks, Dragon and Split Enz, and it dominated Australian popular music well into the 1980s, although some critics felt that in later years it tended to concentrate on pop-oriented major-label acts and that it failed to reflect much of the exciting independent scene of the time.

## **1975: the establishment of Double Jay**

In the long term, one of the most important changes to the Australian music industry in the 1970s (and beyond) turned out to be the founding of the ABC's first all-rock radio station, Double Jay (2JJ) in Sydney in January 1975. It is indicative of the conservative nature of the Australian media and its regulators that Double Jay was the first new radio licence issued in an Australian capital city in more than 40 years. It was also Australia's first non-commercial 24-hour rock station, and the first to employ women disc jockeys.

Double-Jay's wide-ranging programming policies were influenced by British '60s pirate radio, the early programming of BBC Radio One, and the American album-oriented rock (AOR) format. The new station opened up the airwaves to a vast amount of new local music, introduced listeners to important overseas innovations like reggae, punk and New Wave music that had been ignored by commercial radio, played an unheard-of level of Australian content, and featured regular live concert broadcasts, comedy, controversial documentaries and innovative radiophonic features.

Double-Jay rapidly made a significant dent in the ratings of its major commercial competitor, 2SM (then Australia's top rating and most profitable pop station) and, in concert with Countdown, Triple J was a crucial Australian outlet for the emerging [punk](#) and [New Wave](#) music styles of the late 1970s. Much of this music was considered too extreme for commercial radio and it is doubtful that much of it would have been heard otherwise, but after 1975 it soon became an established pattern for Double Jay to break new overseas acts like The Clash and The Police, or local acts like Midnight Oil and The Birthday Party, after which they were (usually) considered "safe" for commercial radio.

Despite the constant downplaying of its significance by the commercial sector, the importance and influence on Double Jay/Triple-J on the Australian music industry and Australian commercial radio cannot be underestimated.

## The late 1970s

The advent of Double Jay and *Countdown* fundamentally changed the political economy of Australian popular music, and the pub circuit gave rise to a newer generation of tough, uncompromising, adult-oriented rock bands.

One of the most popular Australian groups to emerge in this period was the classic Australian pub rock band Cold Chisel, which formed in Adelaide in 1973 and enjoyed tremendous success in Australia in the late 1970s and early 1980s, although they never managed to break into other countries.

Other popular acts from this transitional period include AC/DC, Skyhooks, Richard Clapton, Ol'55, Jon English, Jo Jo Zep & The Falcons, The Angels, Sports, The Radiators, Australian Crawl (band), Dragon, Rose Tattoo, Ross Wilson's Mondo Rock, acclaimed soul singers Marcia Hines and Renee Geyer and pioneering Australian punk/new wave acts The Saints (Mk I) and Radio Birdman. The band Sebastian Hardie became known as the first Australian symphonic rock band in the mid-70s, with the release of their debut *Four Moments*.

Three "Australian" acts that appeared towards the end of the Second Wave — AC/DC, Little River Band and Split Enz — and lasted into the late 1970s and early 1980s achieved the long sought-after international success that finally took Australasian rock onto the world stage.

The progression of the Australian independent scene from the late seventies until the early nineties is chronicled in *Stranded: The Secret History of Australian Independent Music 1977–1991* (Pan Macmillan, 1996) by author and music journalist Clinton Walker.

## AC/DC

AC/DC are perhaps the most notorious group to spring out of Australia. They have sold millions of albums, toured the world several times over, broken countless attendance records, and influenced hard rock music the world over.

From their humble beginnings, brothers Angus and Malcolm Young forged a hard-hitting, ball-breaking pub guitar sound. When Bon Scott joined the band to lend his unique vocal talent, the band began their 'long way to the top', shooting to the top of the Australian rock scene in 1974–75 and their song "It's A Long Way To The Top (If You Wanna Rock and Roll)". This song is now widely regarded as *the* Australian rock anthem. The band found a degree of international success, especially with the release of their *Highway to Hell* album. This was to be Bon Scott's last album. During the subsequent tour, Scott was discovered in the backseat of his car, having choked on his own vomit during a drunken slumber.

The band found a new singer in the Scottish-born Brian Johnson, and released their next album, *Back In Black*, in the early 80s. The U.S. took notice of the band with some of their finest songs, such as the title track and *You Shook Me All Night Long*, and the band became a huge international act that still endures to this day.

AC/DC are credited as a seminal influence by scores of leading hard rock and heavy metal music acts, and they are now rated the fifth-biggest selling group in U.S. recording history, with total sales of over 100 million records.

## Little River Band

The next important band of this period is the soft-rock-harmony group Little River Band. Resurrected from the ashes of an earlier band called Mississippi, LRB centred on a trio of seasoned veterans. Lead singer Glenn Shorrock had fronted Australian 60s pop idols The Twilights and singer-guitarists Beeb Birtles and Graehem Goble had been the core members of Mississippi; prior to that, Birtles had played bass in chart-topping Australian '60s pop group Zoot whose former lead guitarist Rick Springfield also became a solo star in the USA.

Under the guidance of manager Glen Wheatley (former bassist in The Masters Apprentices, one of the top Australian bands of the Sixties) LRB became the first Australian bands to achieve major ongoing chart and sales success in the United States. They achieved huge success in the late 70s and early 80s and their single "Reminiscing" now ranks as one of the most frequently-played singles in American radio history.

## Split Enz

The third important group of this era is the famous New Zealand group Split Enz, who moved to Australia in 1975 and gained a cult following here before moving to England in 1977. Centred on the songwriting partnership of lead singer Tim Finn and guitarist-singer Phil Judd, and supported throughout by self-taught keyboard genius Eddie Rayner, the band was adventurous, musically brilliant and dazzling in performance. Their extraordinary Expressionist-inspired stage outfits, make-up and costumes, designed by percussionist Noel Crombie, are believed to have been an (unacknowledged) influence on London punk and New Romantic fashions, but their progressively-oriented repertoire failed to hit the mark with UK radio, despite the support of people like Roxy Music guitarist Phil Manzanera.

After a difficult transitional period and an abortive attempt to break into America, they regrouped in London in 1979 with new members, the most important recruit being Tim Finn's younger brother Neil. His musical input helped to turn the group's fortunes around and after a near-miss in the UK with the punkish single "I See Red" they went on to huge success in Australia, New Zealand and other countries with their 1980 LP "True Colours" and the single "I Got You". Their 1982 single "Six Months In A Leaky Boat" looked set to become their breakthrough U.K. hit, but it was killed off by a radio ban imposed by the BBC, who suspected (wrongly) that the song alluded to the Falklands War. After Split Enz broke up in 1984 Neil Finn formed Crowded House, who finally achieved the massive international success that had eluded the Enz.

## Punk, post-punk and early electronic music

By the late 1970s [punk rock](#)'s influence had been felt throughout the world, and bands like The Saints and Radio Birdman (sometimes considered punk rock acts themselves) gained a loyal following (largely thanks to Double Jay and to a lesser extent Countdown). Following the punk movement several influential bands of this so-called post-punk era were The Birthday Party led by the Nick Cave formed in 1978 and disbanded in 1984 and a new band formed that same year by Nick Cave and Mick Harvey Nick Cave and the Bad Seeds.

Other developments of the late 1970s were the appearance of early [electronic musicians](#) most notable of which were Sydney-based Severed Heads and Melbourne's Essendon Airport who began to experiment with tape-loops and synthesisers, but did not rise to prominence until the 1980s. Although completely underground until the late 1980s, by the late 1990s Severed Heads were widely cited in Australia and in other parts world as being significant influences on the development of [electronic music](#) genres such [synth pop](#) and [industrial music](#). At the pop end of the scale, Mi-Sex scored a major hit with the

single 'Computer Games' in 1980, which was one of the first Australian pop recordings to employ sequenced synthesiser backings.

## 1980s

While many Australasian bands from the 1980s remained cult acts outside of Australia, some, including Little River Band, AC/DC, INXS, Midnight Oil and, later, Crowded House and Kylie Minogue, found wide success for years. Others, like Men at Work, became [one-hit wonders](#) throughout most of the world.

Acts like The Church, Hunters & Collectors Hoodoo Gurus and the second incarnation of The Saints developed strong followings in Europe and other regions, while other more commercial acts such as singer John Farnham were very successful for many years within Australia, but remain largely unknown outside the country.

Farnham's commercial comeback was one the biggest success stories in Australian music in that decade, the former "King of Pop" spent years out of favour with the public and the industry, often reduced to working in suburban clubs, but he bounded back onto the charts in 1986 with the album *Whispering Jack*, which became the biggest-selling album of that year and remains one of the biggest selling Australian records. Not coincidentally, his manager was Glenn Wheatley, former manager of Little River Band.

Renowned artists such as singer-songwriter Paul Kelly and his band The Coloured Girls (renamed The Messengers for America), [ambient-rock](#)-crossover act Not Drowning, Waving, the world music Dead Can Dance and Aboriginal-band Yothu Yindi drew inspiration from uniquely Australian concerns, particularly from the land, which garnered them critical appraisal within Australia, and found international listeners.

The decade also saw perhaps the most concerted examination of the routine and everyday aspects of suburban and inner-city life since perhaps The Executives 1960's classic "Summer Hill Road." This approach was explored not only by Paul Kelly and the aforementioned Coloured Girls (in songs like "From St. Kilda To Kings Cross" and "Leaps and Bounds" but also by bands such as The Little Heroes (eg "Melbourne is Not New York"), John Kennedy's Love Gone Wrong (eg "King Street") and The Mexican Spitfires (eg "Sydney Town" and "Town Hall Steps."

The 1980s was a boom period in many ways, and it produced scores of great bands and some of the best Australian pop-rock recordings. This includes widely praised, popular and influential acts such as The Models, Laughing Clowns, Sunnyboys, Hunters & Collectors, Machinations, Matt Finish, Hoodoo Gurus, Divinyls, The Dugites, The Numbers, The Swingers, Spy Vs Spy, Eurogliders, Mental As Anything, Boom Crash Opera, The Go-Betweens, I'm Talking, Do Re Mi, Real Life, The Reels, The Stems, The Triffids, Icehouse, Redgum, Goanna, 1927, Noiseworks, Gang Gajang and The Black Sorrows. These acts often topped the Australian charts but never quite gained the international success that many critics felt they deserved, although many continued with loyal followings well into the 1990s.

One especially noteworthy group in this period was the pioneering Aboriginal group Warumpi Band from the Northern Territory, whose landmark single "Jailanguru Pakarnu (Out from Jail)" was the first rock single ever recorded in an Aboriginal language. Once again Triple J were instrumental in bringing this band to public attention, as were Midnight Oil, who took the group on national tours with them. Their classic 1987 single "My Island Home" was successfully covered by Christine Anu in the 1990s.

Detroit rock bands such as the Celibate Rifles, The Lime Spiders and The Hitmen would serve as a link between the [garage rock](#) revival of the 1980s and the [grunge](#) scene to follow.

## 1990s — Indie Rock

Throughout the developed world, [indie rock](#) of various kinds became more popular during the 1990s, especially [grunge rock](#). As in other countries, independent [music festivals](#) also saw a resurgence in popularity, most notably the Big Day Out (which began in Sydney in 1992) attracted and help build the careers of many Australian acts as well as showcasing international artists to a local audience. Notable Australian independent acts of the time included the Falling Joys from Canberra; Regurgitator, Powderfinger and Custard from Brisbane; The Living End and Dirty Three from Melbourne; Jebediah from Perth, RatCat, The Clouds, The Crystal Set from Sydney; The Whitlams, and Silverchair, who began as a teenage combo in Newcastle, were discovered by Triple-J and have since become one of the most successful Australian bands of all time. The changes brought about in this period and the aforementioned bands are discussed in the book *The Sell-In* by music journalist Craig Mathieson.

Far and away the biggest commercial success of the 1990s was [electropop](#) duo Savage Garden. They shot to fame in 1996, scoring huge hits in Australia, Asia, Europe and America. They became the first Australian act since Men At Work to score two #1 U.S. hits, and their 1999 album *Affirmation* sold over 5 million copies in the United States. alone. A 2004 report in *The Sydney Morning Herald* rated their album *Savage Garden* at #4 and "Affirmation" at #15 in the list of the 25 biggest-selling albums (from any country) over the last ten years in Australia.

While overseas [hip-hop](#) became quite popular in Australia in the early 1990's, and a number of artists began performing it, virtually none of them were signed to record deals or saw mainstream airplay. The one exception was Sound Unlimited, who released one successful album in 199(4)?

The 1990s also saw a rise in popular Australian music and videos for young children, particularly The Wiggles and Hi-5.

## 2000s

Australia's predilection for pub rock never really went away, despite the enthusiasm for dance music in the late 1990s. For some reason the vagaries of international taste changed and the sound came back in flavour in the early years of the 21st century. Thus, several Australian rock bands saw international success in Europe and in some cases the US, somewhat to the bemusement of Australian rock critics unsure why these bands have succeeded where earlier (and in their view superior) groups failed. Notable examples include The Vines, who actually rose to prominence in the UK before becoming known in Australia, and Jet. Jet, clearly very heavily influenced by seminal 1960s acts such as the Beatles and the Rolling Stones, had their single "Are You Gonna Be My Girl" used in a successful Apple iPod commercial, and consequently have sold very well in the US.

Apart from those bands which achieved international success, one of the well known aussie rock bands of the 2000's was Grinspoon. They first achieved success in the music industry a few years ago with their hit "Chemical Heart" and have since recorded a new album which is proving to be popular with teenagers.

Domestically, roots music, seemingly a catch-all term for somewhat more laid-back acoustic music covering blues, country and folk influences, came to some prominence, including the socially-conscious guitar virtuoso John Butler leading the John Butler Trio, and the plaintive harmonies of The Waifs. A number of "blues and roots" festivals have sprung up and are attracting large audiences.

As well as these uniquely "Aussie Bands", 2005 in particular sparked many brand new Australian "indie rock" bands such as End Of Fashion who won ARIA awards for their debut self-titled album and hit song "Oh Yeah" (as well as performing at the Homebake festival and appearing on talk show Rove Live several times). Even more recently was indie rock band Faker whose debut hit "Hurricane (Oh la la la)" was in the Australian charts for quite some time. Plus there is also Kisschasy who appeared in concert on October 2, 2005 with Canadian rock superstars and teen favourite Simple Plan with their hit song "Do do's and woah oah's".

Even at the commercial end of popular music, more attention was finally being paid towards "real" musicians, especially female singers-songwriters. This allowed such musicians as Missy Higgins to come into prominence.

## Hip Hop

*Main article: [Australian hip hop](#)*

Somewhat belatedly, Australian hip-hop artists began to receive commercial attention through artists like Hilltop Hoods, MC Trey, Maya Jupiter, 1200 Techniques and The Herd.

## Hardcore punk

*Main article: [Australian hardcore](#)*

Australian hardcore punk is an active rock music subgenre with a dedicated following. Many bands never tour outside their home state but enjoy a relatively large local fanbase.

Recorded material of their work may be hard to acquire as live shows are the mainstay of the scene.

The Do-It-Yourself (DIY) ethic is strong with local distributors and small record labels active in most capital cities. As in the United States some bands are relatively straight edge or are influenced by particular political views or religious convictions.

## Authentic performance

The **authentic performance** movement is an effort on the part of musicians and scholars to perform works of [classical music](#) in ways similar to how they were performed when they were originally written. The movement had its beginnings in the performance of [Medieval](#), [Renaissance](#), and [Baroque](#) music, but subsequently came to incorporate the [Classical](#) and even [Romantic](#) eras as well. The two methods adopted by authentic performance artists have been to use historically appropriate instruments and to rely on written evidence from the past to gain insight into how the works were originally played.

Related terms: **performance practice** refers to individual techniques from the performances of the past; **historically-informed performance** is a style of performance which picks and chooses which performance practices to incorporate into a modern performance, taking into account modern audience tastes and performers' abilities.

## **Authentic performance compared to traditional musical practice**

Most authentic performance artists would not advocate authenticity for its own sake, but rather as a way of achieving more artistically effective performances of older music. It is felt that the gradual changes in the construction of instruments and in the training of musicians have produced instruments and styles that are optimal for (roughly) mid to late 19th-century music, but not for older work.

In the community of classical musicians, students have over the centuries learned ways of playing and interpreting music from their teachers and also from performances they hear. This results, to some degree, in stylistic accretion, as modes of performing developed by outstanding musicians are echoed through time in the performances of the younger musicians that they influenced. Thus, the way that music is performed is in part a function of the musical culture as it has evolved up to that time.

The authentic performance movement emphasizes instead historical scholarship, covering both instruments and performance practice, in order to obtain a more direct view of original performance practices. Such scholarship is the work both of the performers themselves and of non-performing specialist scholars, usually working in universities.

Adherence to principles of authentic performance is not an all-or-nothing matter. Many traditional musicians are deeply interested in what scholarship can tell us about how music was performed in the composer's time. Moreover, modern instruments can be played in ways that approximate to some degree what can be achieved on instruments of the composer's day.

## Early instruments

Many of the instruments of early music disappeared from widespread use, around the beginning of the [Classical](#) era. Others continued in use, but greatly altered their sound quality and playing characteristics in the course of the 19th century. In either case, when older instruments, or reconstructed versions of them, are used, they are called **original instruments** or **period instruments**. The discussion below (see also Organology) covers instruments that had to be revived entirely, followed by instruments whose earlier form was rediscovered.

### Harpsichord

Among keyboard instruments, the most dramatic disappearance was that of the harpsichord, which gradually went out of style during the second half of the 18th century. Many harpsichords were destroyed—notoriously, they were used for firewood in the Paris Conservatory during Napoleonic times. Composers such as William Byrd, François Couperin, and J. S. Bach wrote for the harpsichord and not the [piano](#), which was invented ca. 1700 and only widely adopted by about 1765. The music of these composers sounds very different, and requires a different interpretive approach, when played on the harpsichord instead of the piano. Notably, since every note on a harpsichord is equally loud, subtle variations of timing and articulation, as well as a judicious use of [ornamentation](#), are employed to achieve an expressive harpsichord performance.

The harpsichord was revived in the first half of the twentieth century by Wanda Landowska. Since most useful knowledge of harpsichord construction had been lost by that time, Landowska needed to use a rather peculiar harpsichord, based on the modern grand piano, which was made for her by the Pleyel company of Paris. In the view of many later listeners, the tone of this harpsichord was not very successful. Later, harpsichord builders learned to make better instruments by following the procedures of the harpsichord builders of long ago. The revival of the authentic harpsichord began in the 1950's, with the work of the builders Frank Hubbard and William Dowd. Today, harpsichords in the style of the old makers are produced in workshops around the world.

### Viol

The viol (also called the viola da gamba) is a stringed instrument that (in its bass version) roughly resembles a six-stringed, fretted cello. Its tone is more delicate than a cello's, noble and resonant in the deeper notes and somewhat nasal and astringent in the upper range. The viol was largely abandoned by the end of the eighteenth century. Previously, a great literature for it had been created by composers of the [Renaissance](#) and [Baroque](#) eras, including William Byrd, William Lawes, Henry Purcell, Marin Marais, and J. S. Bach. The Elizabethan composers wrote complex polyphonic music for viol consort, which combined viols of three sizes (all held vertically): the bass, the tenor (about the size of a [guitar](#)), and the treble (about the size of a [viola](#)). Among the foremost modern players of the viol are Wieland Kuijken, Jordi Savall and John Hsu.

## Recorder

The recorder is a wind instrument, made of wood. Its tone is similar to the flute, but it is played by blowing through the end, rather than by blowing across a soundhole. Like viols, recorders were made in multiple sizes (contra-bass, bass, tenor, alto, soprano, the tiny sopranino and the even smaller kleine sopranino or garcloin). Handel and Telemann wrote solo sonatas for the recorder, and recorders were often played in consorts of mixed size, like viols. For a number of important modern exponents of the recorder.

## Other instruments

Other instruments that ceased to be used around the same time as the harpsichord, viol, and recorder include the [lute](#), the viola d'amore, and the baryton. Instruments that lost currency rather earlier in musical history include the [cornett](#), the serpent, the shawm, the rackett, the krummhorn, the theorbo, and the hurdy-gurdy.

## Changed instruments

Even the instruments on which classical music is ordinarily performed today have undergone many important changes since the 18th century, both in how they are constructed and how they are played.

Stringed instruments (the [violin](#), [viola](#), [cello](#), and double bass) were made with progressively longer necks and higher bridges, increasing string length and tension. For the top E string of the violin, steel instead of gut is now ordinarily used. The result has been a more powerful and penetrating tone—but, perhaps, also a less sweet one. The most prized stringed instruments of today, made by Antonio Stradivari and by the Guarneri family in 17th-18th century Italy, started out their careers as "early instruments". They were modified in the 19th century to achieve the more powerful modern sound.

In modern string playing, a more or less constant vibrato is the norm, with lack of vibrato used as a special expressive effect. In the 18th century, it was just the opposite, with vibrato serving as an ornament.

The [oboe](#) likewise became more powerful in its sound, but as a result lost a certain amount of its character; it might be said that 18th century oboes sound more "oboelike" than their modern equivalents. A similar difference is found between the early and modern bassoon.

The [flute](#) of the 18th century was typically made of wood rather than metal, and likewise had a gentler but more characteristic "woody" tone.

Early brass instruments were slightly less brilliant than their modern equivalents. The tonal difference is perhaps less than is found among the woodwinds and strings. However, the playing of early [trumpets](#) and [horns](#) was very different and indeed much more difficult, since versions of these instruments incorporating keys or valves were only invented around the end of the 18th century. The players of the earlier type of instrument had to use mostly just lip control to determine pitch; the early horns also had their pitch altered by the placement of the player's hand in the bell. Anthony Halstead is widely considered to be among the finest modern exponents of the "natural horn". The earlier [trombone](#) of course offered manual pitch control, as did its similar predecessor the sackbut.

The effect of these instruments in their original form is particularly noticeable when they play together in [orchestras](#), since not only do the musical lines sound different, but their relationship to one another is altered by the difference in relative volume (wind instruments generally being louder relative to the strings). A number of authentic-

performance orchestras have achieved a broad following, notably the Academy of Ancient Music under the direction of Christopher Hogwood, Taverner Players under the direction of Andrew Parrott and the English Baroque Soloists under John Eliot Gardiner.

For the [piano](#), the difference between 18th century and modern versions is probably greater than for any other instrument; for discussion of these differences and their consequences for performance, see [piano](#). The construction of replica 18th century pianos came somewhat after the revival of the authentic harpsichord, but used many of the same skills, since early pianos resembled harpsichords in their construction. Leading modern-day performers on the early piano or *fortepiano* include Malcolm Bilson, Robert Levin, and Melvyn Tan.

## Singing

The human voice is a biological given, but can be trained in different ways. Singers in authentic performance typically aim at a more natural, less loud tone, usually with less vibrato. It is feasible for the singer not to sing so loud, since the instruments playing at the same time are softer. Listeners to early music seldom complain that the singers are "shrieking" or "barking"—though of course this does not exclude the possibility that quite different vocal problems might be present. A few of the many outstanding singers who have contributed to authentic performance are Emma Kirkby, Julianne Baird, Nigel Rogers, and David Thomas.

Authentic performances sometimes use male singers, called countertenors, to sing alto parts. Although it is often a vexed question how often this was done in early performance, a number of countertenors have won acclaim for their purity of tone, vocal agility, and interpretive skill. Modern countertenor singing was pioneered by Alfred Deller, and leading contemporary performers include David Daniels, Derek Lee Ragin, Andreas Scholl, Michael Chance, Drew Minter, Daniel Taylor, and Brian Asawa.

One vexing problem concerns compositions intended to be sung by castrati. Modern substitutions employ female sopranos or high countertenors (known as sopranistas), but neither of those seems to capture the true effect of the castrato sound. The 1994 movie *Farinelli Il Castrato*, about an 18th-century castrato, used digital effects to create the voice by mixing the sound of a countertenor with a soprano singer.

## Recovering early performance practices

Recovering the available written information about how music was performed in the past is a difficult scholarly task, requiring fluency in multiple languages, skill in navigating old archives, and thoughtful judgment in weighing sometimes contradictory evidence. Both pedagogical works and the correspondence of musicians from past centuries play an important role. Representative of the works from which valuable information has been obtained are the following:

- *Syntagma musicum* (1614-1620) by Michael Praetorius
- *Traité de l'Harmonie Universelle* (1627) by Marin Mersenne
- *Versuch einer Anweisung die Flöte traversiere zu spielen* ("A treatise of instruction in playing the transverse flute," 1752) by Johann Joachim Quantz
- *Versuch über das wahre Art das Klavier zu spielen* ("An essay on the true art of playing keyboard instruments," 1753-1762) by Carl Philipp Emanuel Bach.
- *Versuch einer grundliche Violinschule* ("An essay on the fundamental principles of violin playing," 1756) by Leopold Mozart

Among the letters of musicians, those of Mozart are notable for their liveliness and insight, and from them considerable information about performances of his work is obtained. In the case of Haydn and Beethoven we have the advantage that they became very famous—in fact, venerated—in their own lifetimes, and many people with whom they conversed attempted to remember and write down their words.

Occasionally, the written record tells us things we might prefer not to know. For instance, a letter from Haydn (Oct. 17, 1789) says:

*Now I would humbly ask you to tell the princely Kapellmeister there that these three symphonies [ 90-92 ] because of their many particular effects, should be rehearsed at least once, carefully and with special concentration, before they are performed.*

implying of course that symphonies were often performed with no rehearsal at all. Likewise, there is testimony that the task of keeping early instruments in tune was difficult and perhaps also neglected. One critic wrote in 1684:

*At the beginning of the concerts, we observe the accuracy of the chords ... some time after, the instruments make a din; the music is for our ears no longer anything but a confused noise.*

Such evidence is a reminder that authentic performance must aim at the highest ideals of past music making, rather than what was achieved on particular occasions.

## Interpreting musical notation

One area in which scholarly interpretation is quite crucial is in interpreting the musical notation of the past, which becomes progressively less explicit as one goes back in time. Some familiar difficult items are as follows:

- Early composers apparently often wrote dotted rhythms (where the first of two notes is three times the length of the second) to mean instead a time ratio of 2 + 1, in a context where triplets are present elsewhere in the musical line. The opening line of the last movement of J. S. Bach's Brandenburg Concerto #5 is a good example.
- In a French overture, it is often held that dotted notation was meant to indicate double dotting; that is, a duration ratio of 7 to 1 instead of 3 to 1. A well-known example is the overture to Handel's Messiah, often played in the double-dotted manner by authentic performance specialists.
- Particularly in French [Baroque music](#), music written in even rhythm is sometimes performed rather as if the notes were dotted or in triplets, in a practice known as notes inégales and similar to the [swing](#) feel of [jazz](#).
- What is written as a appoggiatura is often meant to be longer or shorter than the notated length. This convention is pervasive in Mozart's music.
- In [Renaissance music](#), [musica ficta](#) are employed; these are accidentals (sharps and flats) not written in the score, but rather inferred using the performer's judgment or via rules laid down by theorists.
- Lastly, the notes of earlier music cannot generally be interpreted as designating the same pitch that they do today, since concert pitch has frequently changed. For discussion, see [pitch \(music\)](#).

## Linguistic issues

An additional relevant area of scholarship is the determination of how the languages of sung music were pronounced at the time of first performance. Such information can help in establishing rhymes and in aligning the syllables to the musical notes (underlay). The disciplines of historical linguistics and philology play the primary role here. Some early music performers prefer to sing using the old pronunciations, feeling that the notes sound better when sung to their original syllables.

Issues of pronunciation even carry over to church Latin, the language in which a huge amount of early music was written. The reason is that Latin was customarily pronounced using the speech sounds and patterns of the local vernacular language

## Tuning

Twelve tone equal temperament is the predominant tuning today, but was not so in the past. For many periods tuning may have depended upon region, varied by composer, with some composers even preferring different tunings at different times in their lives. However, it is often hard to determine exactly what these tunings were.

## Issues in authentic performance

The perceived esthetic benefits of authentic performance vary with what kind of music is being played. In rough terms, they can be characterized as follows.

- Authentic performance is argued to achieve greater transparency of musical texture. The instruments have a less overpowering tone, so that the playing of one note interferes less with the hearing of simultaneous or neighboring notes.
- In orchestral performances, dynamic contrast is typically increased: the contributions of the brass instruments and timpani on accented notes stand out more, since the difference in volume level between brass and strings is somewhat greater than with modern instruments.
- Greater transparency and greater dynamic contrast lend themselves, in turn, to greater rhythmic energy. This is particularly important in the choruses of 18th century [cantatas](#) and [oratorios](#). To the ear that has become attuned to authentic performance, older "mainstream" performances of such works often sound heavy and rhythmically dull. Paradoxically, for such listeners, the monumental character of these choruses comes through more clearly when they are performed with the lighter forces of the authentic performance movement.
- Many listeners appreciate the sheer sound quality of authentic performance instruments, finding it more beautiful and filled with character than what is heard from modern instruments. The same could be said of the human voice, when it is not required to compete with modern instruments in volume.

## Variety of opinion

Opinions on the authentic performance movement vary widely, from very strong support to very strong opposition.

A generally skeptical but moderated position has been taken by Charles Rosen, a distinguished traditional classical musician and author on music. One criticism Rosen has made is that the spread of authentic performance has depended very heavily on the [recording industry](#). This results from two factors. First, the lower volume of authentic performance instruments means they tend to be ineffective in large modern concert halls, so that live performance is difficult to sustain financially. Second, the unstable intonation and lesser reliability of early instruments means that a high-quality performance is most easily obtained in the recording studio, where multiple takes can be spliced together to iron out mistakes, and it is possible to interrupt the music frequently to retune the instruments. A musical culture based predominantly on recordings is arguably an impoverished one, given that most listeners respond more intensely to a live performance than to a recording.

There are many listeners who enjoy both authentic performance and traditional performance. Such esthetically-flexible listeners might, for instance, enjoy Malcolm Bilson's vivid and stylish authentic performances of Haydn's piano sonatas on a replica 18th century piano—but also enjoy Vladimir Horowitz's interestingly idiosyncratic (and quite heavily pedaled) performances of the same works on a modern concert grand.

"Authentic" performances of Baroque music are usually in "chamber pitch" (tuned about a semitone down compared to modern concert pitch; see [historical pitch standards](#)). While listeners with relative pitch may not even notice the difference, such performances are often unpleasant (or even acutely painful) experiences for listeners with perfect pitch.

## Authenticity or contemporary taste?

An issue in authentic performance that is seldom raised concerns just why performers want to be authentic. It might be argued that what authentic-performance participants want is not always authenticity per se, but particular benefits that come from authenticity, such as clarity, tonal vividness, and rhythmic propulsion. In fact, it is likely that musical tastes among classical music enthusiasts were already evolving in these directions even before the authentic performance movement had become a major factor.

In this connection, it is worth considering two clearly documented authentic performance practices of the past that have *not* been widely adopted today.

First, it is known from Mozart's correspondence that he was enthusiastic about the idea of performing his symphonies with very large orchestral forces, along the lines of 40 violins, with analogous numbers for the other instruments. Thus, the smaller size of Mozart's usual orchestra in the 18th century relative to modern symphony orchestras may well have been the result of economy, rather than a deliberate esthetic choice. Modern authentic performance orchestras, however, are characteristically small—even though for the more successful ones, funding would probably permit them to be larger, at least on occasion, were it considered desirable.

A second example concerns a matter of authentic performance for string music of the later 19th century. Sources suggest that at this time, most string players made heavy use of **portamento**—a sliding of the finger along the string that causes pitch to glide from one note to the next. Portamento is used sparingly in the performances of contemporary musicians, and there is evidently little wish on the part of authentic performance advocates to revive it.

The common factor of these two examples is that in each, adopting truly authentic performance practices would actually set back the goals of clarity, transparency, and rhythmic liveliness (large ensembles cannot synchronize their playing as easily as small ones can, and portamento blurs the boundary between one note and the next). This supports the view that the authentic performance movement exists in large part to satisfy musical tastes that were evolving in a particular direction in any event. To say this, of course, by no means devalues the importance or esthetic contributions of the movement.

## Nomenclature

- **Authentic performance** and **period performance** refer to attempts to re-create exactly the performance details of the past in a modern performance
- **Historically-informed performance** refers to performances which choose some performance practices and omit others, sometimes for purposes of audience appeal.
- **Performance practice** refers to details of performance technique which were used in performances within historical styles periods, as well as they can be ascertained.

# Avant garde metal

**Avant garde metal**, sometimes called **experimental**, is a cross-genre reference to [metal bands](#) characterized by large amounts of experimentation and by non-standard sounds, instruments, and song structures. While [progressive metal](#), like avant garde metal, is also a genre which favours experimentation and non-standard ideas, there are rather large differences between the two forms. One of the most striking differences is that the experimentation of progressive metal lies mostly in complex rhythms and song structures, while the genre usually sticks to a more traditional instrumentation, whereas in avant garde metal the usage of unusual sounds plays usually a fundamental role. Most of the artists that play avant garde metal also have a strong focus on a generally dark atmosphere. The bands involved have often been associated with [black metal](#), and a number of avant garde bands also have a black metal background, but it is generally looked down upon by black metal purists, who consider common elements from avant garde metal, such as keyboards or female vocals, an alienating element which has nothing to do with "real" black metal.

It should be noted that there is no common agreement within the metal world on the correct usage of the term avant garde metal, though certain issues, such as the presence of experimentation, are agreed upon.

# Avant-garde jazz

**Avant-garde jazz** (also known as **avant-jazz**) is a style of music and improvisation that combines elements of avant-garde art music and composition with elements of traditional [jazz](#). Avant-jazz overlaps with [free jazz](#), but differs in that free jazz is generally performed with fewer, or no predetermined structure or composition.

## Notable avant-jazz musicians

Andrew Hill  
Sam Rivers  
Ornette Coleman  
Don Cherry  
Ed Blackwell  
Charlie Haden  
John Coltrane (later period)  
Eric Dolphy  
Dave Holland  
Medeski, Martin, & Wood  
Evan Parker  
Sun Ra  
Pharoah Sanders  
Archie Shepp  
Joe McPhee  
John Zorn  
Cecil Taylor  
Don Pullen  
George Adams  
Albert Ayler  
Don Ayler

## Avant-progressive rock

**Avant-progressive rock** is a style of [rock music](#) that explores unconventional territory, often incorporating non-standard [chord progressions](#), tempo changes within a piece, odd time signatures, avant garde passages and complex [horn](#) and [orchestral](#) arrangements. It generally relates to [experimental](#) bands and musicians influenced by 20th century avant garde, [classical](#), [jazz](#), [folk](#) and other music, and who stretch the boundaries of the [rock](#) form in both the [compositional](#) and [improvisational](#) arenas.

Often the only similarities between groups creating avant-progressive rock music is their complete lack of conformity to convention.

## History

In the late 1970s a group of European "progressive" bands joined forces under the banner of Rock in Opposition or RIO to unite against the [music industry](#) that refused to let their music be heard. While RIO was originally a collective of bands with the same political agenda, the term is now often used to identify the "collective style of music" of the original RIO bands. This "collective style of music" later became known as "avant-progressive rock".

Avant-progressive rock music has since grown beyond Rock in Opposition and now encompasses a far greater body of music than the original "collective music" of RIO.

## Avant-progressive rock bands

The original Rock in Opposition bands were:

- Aqsak Maboul
- Art Bears
- Art Zoyd
- Etron Fou Leloublan
- Henry Cow
- Samla Mammás Manna
- Stormy Six
- Univers Zero

Other bands in this category include (but are by no means limited to):

- 5uu's
- Ain Soph
- Alamaailman Vasarat
- Altered States
- Ars Nova
- Bi Kyo Ran
- Biota
- Blast
- Bondage Fruit
- Boredoms
- Birdsongs of the Mesozoic
- Boud Deun
- Daniel Patrick Quinn
- Debile Menthol
- Deus ex Machina
- Dillinger Escape Plan
- Doctor Nerve
- Fantômas
- Forever Einstein
- Frank Zappa
- French TV
- Fulano
- Gatto Marte
- Ground Zero
- Happy Family
- Höyry-Kone
- Idiot Flesh
- Kayo Dot
- Keiji Haino
- Kenso
- Magma
- Massacre
- Maudlin Of The Well
- Mike Keneally
- Miriodor
- miRthkon
- Motor Totemist Guild
- Mr. Bungle

## **Background music**

Although **background music** was by the end of the 20th Century generally identified with Muzak or Elevator music there are several stages in the development of this concept:

## Antecedents

In the [Baroque](#) and [Classical music era](#) music could be performed as a background to other activities, for instance:

- French kings of the baroque era could have music performed during their stately dinners.
- Opera or other public music performances could have a thus high "social function" character, that few people still actually listened to the music being performed.

Even through the [Romantic music](#) era music could be assigned a place in the background:

- There's a famous anecdote (maybe not authentic) of Chopin being invited by a rich lady to perform his piano music without visual audience in a room separated from another room only by a curtain. The music was intended to be a background to the lady entertaining her lover in the other room. (Chopin allegedly left when he found out about that)
- Piano music (for instance produced by a [player piano](#)) heard in bars and on social functions could have a similar *background music* aspect as recorded music has in more recent times on similar occasions.

## Furniture music

[Furniture music](#) was an invention of Erik Satie around 1920. This type of "background music" fell in oblivion when the composer died a few years later, and was not again executed till it was rediscovered several decades later. Typical for *Furniture music* are short musical passages, with an indefinite number of repeats

## Muzak

Muzak was a *patented* type of background music, based on *recordings*, and involving an electric distribution system, invented in 1922.

## **Elevator music**

Elevator music is a more general term indicating music that is played in rooms where many people come together (that is, with no intention whatsoever to listen to music). There is a specific sound associated with elevator music, usually involving themes from "soft" popular music or "light" classical music being worked over by slow strings. The type of music for instance the Mantovani Orchestra, and conductors like Franck Pourcel and James Last produced, peaking its popularity around the 1970s.

## Ambient music

The term [Ambient music](#) is generally used when more, but often less distinguishable, influences (like for instance elements of [Jazz](#) and/or sounds from nature, etc...) are mingled in the "soundscape". Note however that some producers and/or composers of "Ambient music" or "soundscapes" (or similar associated types of music) might not have (had) any intention to use the qualifier "background" for their music.

# Bagatelle

A **bagatelle** is a short piece of music, typically for the [piano](#), and usually of a light character. The name **bagatelle** literally means a **trifle**, as a reference to the innocent character of the piece.

## Earliest known bagatelle

The earliest bagatelle with that name was by François Couperin, in his tenth harpsichord *ordre*, in which a rondeau was entitled *Les bagatelles*.

## Best known bagatelles

The best known bagatelles are probably those by Ludwig van Beethoven, who wrote three sets, Opus 33, opus 119, Opus 126 and the "Bagatelle in A minor", better known as Für Elise. Other notable examples are Franz Liszt's Bagatelle sans tonalité (an early exploration into [atonality](#)), the set by Antonín Dvořák for two [violins](#), [cello](#) and [harmonium](#) (opus 47), and sets by Bedřich Smetana, Saint-Saëns, and Jean Sibelius. In the 20th century, several composers have written sets, including Béla Bartók, who wrote a set of fourteen (opus 6); Anton Webern, wrote a set of six for [string quartet](#) (opus 9); and Gerald Finzi, who wrote *Five Bagatelles* for clarinet and piano.

# Bagpipes

**Bagpipes** are a class of [musical instrument](#), [aerophones](#) using enclosed reeds. The term is equally correct in the singular or plural, although pipers most commonly talk of "pipes" and "the bagpipe".

## Overview

A bagpipe minimally consists of an air supply, a bag, and a chanter. Optionally, further chanters and/or drones can be added.

### Air supply

The most common method of supplying air to the bag is by a blowpipe, or blowstick, into which the player blows. The blowpipe can be fitted with a non-return valve, or the player can close the tip of the blowpipe with their tongue while they breathe.

A more recent innovation, dating from the 16th or 17th centuries, is the use of a bellows to supply air. This has the advantage that the supplied air has not been heated and moistened by the player's breathing. Bagpipes using bellows can therefore use more refined and/or delicate reeds.

The possibility of using an artificial air supply, such as an air compressor, is one occasionally discussed by pipers but although experiments have been made in this direction, widespread adoption seems unlikely.

### Bag

The bag is simply an airtight (or near airtight) reservoir which can hold air while the player breathes. This means that the player can play independently of the need to take breaths. It also has the advantage that the player can breathe more naturally, and so can play comfortably for long periods of time. Materials for the bag vary widely: most common are skins of local animals, for example, goat, sheep, cow, and so on. In modern times, players have experimented with modern materials such as rubber, goretex, and other airtight fabrics.

When made of skin, the bag is usually saddle-stitched with an extra strip folded over the seam to prevent air leaking. Holes are cut in the bag to accommodate the stocks, the connectors which the various pipes are attached to the bag with. With more modern materials, the seam is usually stitched and then a strip of material glued in place to achieve the same purpose. These bags are often fitted with rubber collars to insert the stocks in, which can result in a better, tighter fit with less chance of damaging the bag while attaching the stocks.

Another innovation in bag design within the past 10 years is the addition of moisture control systems. Moisture from the piper's breath condenses on the pipes drones and reeds which can cause problems. Bags with zippers can be fitted with moisture control cartridge systems attached to the drone stocks which remove moisture as air passes through bentonite clay particles. Corrugated tube traps attached to blowstick stocks also aid in moisture control via condensation. These types of systems require bags with zippers.

### Chanter

The chanter is the melody pipe, played by one or both hands. A chanter can be bored internally so that the inside walls are parallel for its full length, or it can be bored in the shape of a cone. Additionally, the reed can be a single or a double reed. Single-reeded chanters are parallel-bored; however, both conical- and parallel-bored chanters operate with double reeds, and double reeds are, by far, the more common.

The chanter is usually open-ended; thus, there is no easy way for the player to stop the pipe from sounding. This means that most bagpipes share a legato sound where there are no rests in the music. Primarily because of this inability to stop playing, embellishments (which vary between types of bagpipe) are used to break up notes and to create the illusion of dynamic effect. Because of their importance, these embellishments are often highly technical systems specific to each bagpipe which take much study to master.

A few bagpipes (the Northumbrian smallpipe, the Uilleann pipes) have closed ends or stop the end on the player's leg, so that when the player covers all the holes (known as closing the chanter) it becomes silent. This allows for staccato playing on these instruments, although even where the chanter can be silenced, complex embellishment systems often exist.

Although the majority of chanters are unkeyed, some make extensive use of keys to extend the range and/or the number of accidentals the chanter can play. It is possible to produce chanters with two bores and two holes for each note. The double chanters have a full loud sound comparable to the 'wet' sound produced by an accordion.

An unusual kind of chanter is the regulator of the Uilleann pipes. This chanter is in addition to the main melody chanter and plays a limited number of notes, operated by keys. It is fitted in the stock for the drones and is played with the wrist, allowing the player to produce a limited but effective chordal accompaniment.

A final variant of the chanter is the two-piped chanter (confusingly also usually called a double chanter). Two separate chanters are designed, to be played with different hands. Effectively, when they are played, one chanter is always providing a drone accompaniment to the other.

## **Drone**

Most bagpipes have at least one drone. A drone is most commonly a cylindrical tube with a single reed, although drones with double reeds do exist. The drone is designed in two or more parts, with a sliding joint so that the pitch of the drone can be manipulated. Some drones have a tuning bead, which effectively alters the length of the drone by opening a hole, allowing the drone to be tuned to two or more distinct pitches. The tuning bead may also shut off the drone altogether. The drone produces a sound that is one octave below the tonic note on the chanter. If the instrument contains two drones, then the second drone is two octaves lower than the tonic note

## History

There are hundreds of types of bagpipes, each with a unique design, sound, and repertoire. Each has its own history: here we present an overview. Other articles have more information on the history of different [types of bagpipes](#).

## Sources in piping history

Unfortunately, many of the secondary sources from the nineteenth and early twentieth centuries are misleading or verging on fantasy (organist Grattan Flood, and his "The Story of the Bagpipe", published in 1911, is particularly bad in this respect), but continue to be quoted and referenced to the present day. Primary source material must often also be assessed with care. For example, an oft-repeated claim is that the Great Highland Bagpipe was banned after the '45 Rising. This claim is untrue; there is no mention of the bagpipe in the Act of Proscription, and the entire myth seems to stem from the 1822 letterpress of Donald MacDonald's *A Collection of the Ancient Martial Music of Caledonia*, called *Piobaireachd*. Although Donald MacDonald produced the music for this volume, his English (as a native Gaelic speaker) was probably insufficient to render the florid prose in the introduction, purported to be his.

## Ancient origins

Although the early history of the bagpipe is still unclear, it seems likely that the instrument was first developed in pre-Christian times. It seems likely it was developed from an instrument similar to a hornpipe or shawm and coexisted with them. Indeed in several different piping traditions today the bagpipe is played alongside a shawm-like instrument, in Brittany, Catalonia, and Istria. Where or when a bag was first attached to one of these instruments is likely to remain a mystery. However, although the Aramaic word *sum·pon·yah* (שׁוּמְפוֹן־יָהּ), appearing in Daniel 3:5, 10, and 15, has been translated "dulcimer" (a stringed instrument) and "symphony", modern Bible translations generally render the expression as "bagpipe." Koehler and Baumgartner's *Lexicon in Veteris Testamenti Libros* gives the meaning "bagpipe" (Leiden 1958, p. 1103). The earliest secular reference to a bagpipe occurs around 400 BC, when Aristophanes, the Athenian poet jibed that the pipers of Thebes (an enemy of Athens) blew pipes made of dogskin with chanters made of bone. Several hundred years later, Suetonius described the Roman Emperor Nero as a player of the **tibia utricularius**. Nero is reported to have said he would play them in public as a penance for not winning a poetry contest. The Romans may well have spread the pipes through the Roman Empire, but there is little evidence for this.

## Spread and development

The Dark Ages have left us practically nothing regarding bagpipes or their position in societies. Prior to the 12th century, only a few Pictish and Irish stone carvings record the continued existence of bagpipes during this time.

When they were first introduced to the British Isles is debatable. Findings of statuettes of bagpipers in Roman era archeological digs in England could indicate a diffusion of the bag technology from that vector. Ireland has references going back at least to the Middle Ages, as well as the stone carvings previously mentioned which date back to the 8th century. An explosion of popularity seems to have occurred from around the 12th century; the tune used by Robert Burns for "Scots Wha Hae", "Hey Tutti Taiti", is traditionally said to have been the tune played as Robert the Bruce's troops marched to the Battle of Bannockburn in 1314. During the 12th century, Europe underwent a flourishing of art and culture as her horizons were being expanded with the crusades. The bagpipes were no exception, and many of Europe's unique bagpipes began to develop around this time.

Actual examples of bagpipes from before the 18th century are extremely rare; however, a substantial number of carvings, engravings, manuscript illuminations, and so on survive. They make it clear that bagpipes varied hugely from set to set. It seems likely that bagpipe makers at that time would have mostly been primarily woodworkers with an incomplete grasp of the art of pipemaking.

The role of the bagpipe would have varied naturally from place to place, but in Bulgaria it was said, 'A wedding without a bagpipe is like a funeral', and in Britain they were a common adjunct to religious festivals. In Britain, pipers became part of the travelling minstrel class, acting as carriers of news, gossip and music around the country. In the Scottish Highlands, the pipers started to displace the [harpers](#), the chief Celtic musicians since Roman times, round about the 16th century. In 1760, the first serious study of the Highland bagpipe and its music was attempted, in Joseph MacDonald's 'Compleat Theory'. Further south, we have a manuscript by a William Dixon from Northumberland. This contains music which fits a nine-note bagpipe identical to the modern Great Highland Bagpipe; however the music is quite different, consisting mostly of variation sets of common dance tunes. This MS is almost the only glimpse we have into traditional British bagpipe repertoire outside of the Highland tradition.

As Western classical music developed, both in terms of musical sophistication and instrumental technology, the bagpipe fell out of favour due to its limited range and function. This triggered a long (but slow) decline which continued in many cases into the 20th century.

## Recent history

With the growth of the British Empire, often spearheaded by Highland regiments of the British Army, the Great Highland Bagpipe was diffused world-wide. This surge in popularity, boosted by the huge numbers of pipers trained for the two World Wars in the 20th century, coincided with a decline in the popularity of many traditional forms of bagpipe throughout Europe, which began to be displaced by instruments from the classical tradition and later by gramophone and radio.

In the modern era the use of bagpipes has become a common tradition for military funerals and memorials in the anglophone world, and they are often used at the funerals of high-ranking civilian public officials as well. Weddings, dances and parties are also venues for piping, in fact any social event, that can be given a lift by the addition of this unique instrumental music.

In more recent years, often driven by revivals of native folk music and dance, many types of bagpipes have resurged in popularity, and in many cases instruments that were on the brink of extinction have become extremely popular. In Brittany, the concept of the pipe band was adopted, the Great Highland Bagpipe was brought in and the bagad was created, a showcase ensemble for Breton folk music. The pipe band idiom has also been adopted in Spain where various types of band are popular.

In English-speaking regions, a bagpipe player is known as a "bagpiper" or "piper," and the surname Piper derives from the latter term. Other European surnames, such as

Pfeiffer (German), Gaitero (Spanish), Gajdar (Czech), Dudás (Hungarian), and Tsambounieris (Greek), may also signify that an ancestor was a player of the pipes.

## Modern usage

### Types of bagpipes

*Main article:* [Types of bagpipes](#)

[Hundreds of types of bagpipes](#) today are widely spread across Europe and the Middle East, as well as through much of the former British Empire. The name bagpipe has almost become synonymous with its best-known form, the Great Highland Bagpipe related to the Great Irish Warpipes, overshadowing the great number and variety of traditional forms of bagpipe. Despite the decline of these other types of pipes over the last few centuries, in recent years many of these pipes have seen a resurgence or even revival as traditional musicians have sought them out; for example, the Irish piping tradition, which by the mid 20th century had declined to a handful of master players is today alive, well, and flourishing. A similar story can be told of Northumbrian, Breton, Bulgarian, and other bagpipes.

Any estimate of the number of pipers playing today can only be a wild guess. However, in the Great Highland Bagpipe world, there are hundreds of pipe bands registered with pipe band associations world wide, mostly averaging ten or twelve pipers. There are many more pipers who do not play with bands. Estimates for the number of GHB players worldwide usually suggest a figure between ten and fifty thousand players worldwide. Numbers for other types of bagpipe are much smaller, but many have a substantial worldwide following, and there are many types of bagpipe who have full time makers, teachers, and professional players, supported by a large base of players.

Traditionally, one of the main purposes of the bagpipe in most traditions was to provide music for dancing. In most countries this has declined with the growth of professional dance bands, recordings, and the decline of traditional dance. In turn, this has led to many types of pipes developing a performance-led tradition, and indeed much modern music based on the dance music tradition played on bagpipes is no longer suitable for use as dance music.

### The future

Bagpipes today are probably as popular as they have ever been in history; one Scottish maker produces forty sets of pipes per week for sale worldwide, and while this is high, it is indicative of the state of the market. Pipe band associations report continued growth and the number of commercial recordings of bagpipes continues to grow year on year.

# Bagpipes in non-traditional forms of music

## Classical works featuring bagpipes

- *Ur Og and Aji*, for 4 bagpipes, bass clarinet & tabla by Canadian composer Michael O'Neill.
- *An Orkney Wedding, With Sunrise* (1984) by Sir Peter Maxwell Davies
- *Sinfonia Concertante for Six Solo Instruments and Orchestra* by P.D.Q. Bach features bagpipes as one of the six instruments.

## Bagpipes in jazz

- U.S. musician Rufus Harley (b. 1936) was the first jazz performer to use the Great Highland Bagpipes as his primary instrument.
- The American jazz saxophonist Albert Ayler (1936–1970) used great highland bagpipe on two albums: *New Grass* (1968) and *Music is the Healing Force of the Universe* (1969).

## Bagpipes in rock

- The Animals, a British rock band from Newcastle upon Tyne, featured Great Highland Bagpipes on their 1968 anti-war song "Sky Pilot," released in the U.K. on *The Twain Shall Meet* album, and as a hit single 45rpm disc in the USA.
- Canadian Rock band The Mudmen has released 3 albums, consisting of 6 guys, and 2 of them, former worlds strongest men, and brothers, play the pipes.
- The hard rock band AC/DC first gained renown for the marriage of bagpipes and rock and roll with their 1975 song "It's a Long Way to the Top (If You Wanna Rock 'n' Roll)"; the bagpipes were held in the video by band member Bon Scott, who in his youth had played bagpipes and drums in the Fremantle, Western Australia Scots Pipe Band. There were two other pipers recorded for the song.
- Although not as well known, bagpipes were used a year earlier in rock by the Sensational Alex Harvey Band, a Scottish group which featured the instrument in their 1974 single "Anthem."
- UK rock band Wizzard featured the bagpipes on their 1974 single "Are you ready to rock".
- Paul McCartney's song "Mull of Kintyre" (1977) with the band Wings, made strong use of bagpipes for a characteristically Scottish sound.
- Van Morrison on his album "Beautiful Vision" (1982) Sean Folsom played Irish Uilleann Pipes on the song "Celtic Ray", the song was later re-recorded with The Chieftains.
- The Scottish-Canadian [punk rock](#) band Real McKenzies (formed 1992) has featured bagpipes on all their albums, played by various pipers. Their most recent piper, Matt

MacNasty, has been playing with the group since their 2003 album *Oot & Aboot* and also played on their 2005 album *10,000 Shots*.

- The German band Corvus Corax uses bagpipes extensively, alongside various authentic medieval instruments.
  - The [nu-metal](#) band Ko/n (formed 1993) often uses bagpipes in their songs (played by vocalist Jonathan Davis).
  - Irish-American punk rock stalwarts Dropkick Murphys (formed 1995) also incorporate bagpipes into their sound.
  - American punk rockers Flatfoot 56 use great highland pipes in many of their songs.
- 
- The German [heavy metal](#) bands In Extremo uses bagpipes.
  - The German [hard rock/metal/folk](#) bands Subway to Sally and Schandmaul use bagpipes.
  - The German [power metal](#) band Blind Guardian used bagpipes in the song The Piper's Calling, from the album "Somewhere far Beyond".
  - The German [death metal](#) band Suidakra used bagpipes on their album *Command To Charge*.
  - The German Power Metal Band Grave Digger incorporate bagpipes in many of their songs.
- 
- Ron Wilson and His Surfaris, The Drummer famous for Wipe Out recorded the song Louie-Louie with Sean Folsom on Scots GHB, also the song "Moonshine" with Sean on the Irish Uilleann Pipes. The album is called "Lost It In The Surf" Bennet House Records (1987).
  - Dave Shaw plays pipes on The Men They Couldn't Hang's CD Waiting for Bonaparte.
  - Peter Gabriel's "Come Talk to Me" features an opening passage played by bagpipes.
  - The Irish-Punk Band Flogging Molly incorporates the Irish Uilleann Pipes into some of their music.
  - Worldbeat ensemble Afro Celt Sound System have a signature sound that highlights the Uilleann pipes in its fusion of traditional Celtic and African musical textures.
  - The Scottish-Punk band Enter the Haggis frequently makes use of the Great Highland Bagpipe.
  - Irish-rock band Black 47 incorporates the uilleann pipes with a horn section consisting of alto saxophone and trombone.
  - The Australian [folk/rock](#) band Brother often pairs bagpipes with the didgeridoo in their songs.
  - The often surreal band Forest for the Trees makes liberal use of the bagpipes.
  - The Darkness used bagpipes in the song "Hazel Eyes".
  - The Spanish Folk Metal Band Mägo de Oz uses bagpipes in many songs.
  - Ryofu, a band from northeast England, use the Northumbrian smallpipes to play rock, nu-metal and heavy metal; this has caused some controversy amongst Northumbrian folk musicians
  - Though not actual bagpipes, the Scottish band Big Country would often use guitars that, by the use of electronics, were very similar sounding to bagpipes.
  - Also, not to be forgotten, Bad Haggis, featuring Eric Riggler, who is considered to be the most recorded bagpiper alive, utilising Highland and Uilleann bagpipes.
  - Don Scobie, known as the Father of the Pacific Northwest Highland Bagpipe Rock/Rap movement, a founder of The Bag'n'Pipe Hoppers, still hires himself out for lessons, plays regular gigs, and can even be found busking on his off days.
  - British folk-rock songwriter and guitarist Richard Thompson has used Northumbrian smallpipes on two of his albums: 1988's *Amnesia*, on the track Pharoah, and 1994's *Mirror Blue*, on the track Beeswing. In both cases the piper is Alistair Anderson.

Thompson's guitar playing is influenced by pipe music, and he has cited Billy Pigg as one of his influences.

- Dutch [black metalers](#) Black Nocturnal Darkness also incorporated bagpipes, specially in their early years. Also the [folk metal](#) of Magnor (a side project of Black Nocturnal Darkness) makes use of this instrument.
- The Battlefield Band, while playing mostly traditional Scottish music, has a tradition of ending their first set with one or another of Creedence Clearwater Revival's hit songs.
- The United States band Seven Nations incorporates Great Highland Bagpipes and shuttle pipes in its music.
- Steve Earle's "Copperhead Road" makes use of bagpipes in the intro.
- Australian band The Church featured bagpipes in a portion of their 1988 hit, Under the Milky Way. Their guitarist, Marty Willson-Piper, also featured bagpipes on the songs "Melody of the Rain" and "Forever" from his 1989 solo album *Rhyme*. The piper on the latter two tracks is identified as "Tusker the Busker".
- Ben Upton played bagpipe in the song "Beer In The Shower" by Toxic Narcotic, a hardcore punk band.

## Bagpipes in other forms of music

- Originally a hymn, "Amazing Grace" is often thought of as a bagpipe tune since it is particularly powerful on the pipes and is commonly heard at funerals when the pipes are present. A well known example of this is Scotty playing it on his bagpipes at Spock's funeral in Star Trek II.
- The U.S. funk band Parliament used bagpipes on the track "Silent Boatman", from their 1970 debut *Osmium*.
- The late Canadian-born Scottish musician Martyn Bennett (1971-2005) played Great Highland Bagpipe and Scottish smallpipe in combination with hip-hop and electronic dance music on all of his albums.
- Bagpipes (played by Rufus Harley) are featured on the title track of the 1995 album *Do You Want More?!?!?!?* by the U.S. hip hop group The Roots.
- Orchestra Macaroon - Breakfast In Balquhiddar -Scottish Latin-American jazz folk-rock with the apposite "*Warning: This product may contain traces of bagpipes*".
- Part of Orbital's single, "Style", includes a remix with (probably synthesized) bagpipes called "Big Pipe Style". The original was played with a Stylophone.
- In the video game Dance Dance Revolution EXTREME, the song **bag** is composed of synthesized bagpipe sounds.

## Bagpipe humour

- Even among aficionados, it is recognized that bagpipes, bagpipers, and bagpipe music can all be legitimate sources of humour. A typical gentle-jab at the field is exemplified by the following jokes:

*The music of the pipes is best appreciated when heard over a body of water.  
The width of the Atlantic Ocean is usually considered to be sufficient.*

and

*Q. Why do bagpipers walk as they play?  
A. They're trying to get away from the noise.*

and

*Q. What do you call 10 bagpipes under the ocean?  
A. A start.*

and

*Q. What's the difference between a bagpiper and an onion?  
A. No one cries when you cut up a bagpiper.*

and

*Q. Why do pipers march up and down?  
A. It is harder to hit a moving target.*

and

*Q. How do you get two pipers to play in harmony?  
A. Shoot one.*

and

*Q. What's the difference between a bagpipe and a trampoline?  
A. You take off your shoes before jumping on a trampoline.*

OR

*Found on a bumpersticker: Bagpipes irritate only those that NEED irritating.  
Another bumpersticker: Pipers do it with Amazing Grace.*

## Bakersfield sound

The **Bakersfield sound** was a [genre](#) of [country music](#) developed in the mid- to late 1950s in and around Bakersfield, California, at bars such as The Blackboard. The town, known mainly for agriculture and oil production, was the destination for many Dust Bowl migrants and others from Oklahoma, Texas, Arkansas, and other parts of the Southwest. The mass migration of "Okies" to California also meant that their music would follow and thrive, finding an audience in California's Central Valley. One of the first groups to make it big on the west coast was the Maddox Brothers and Rose, who were the first to wear outlandish costumes and make a "show" out of their performances.

Bakersfield country really hit its stride as a reaction against the slick, string-laden [Nashville sound](#), which was becoming popular in the late 1950s. Artists like Wynn Stewart used electric instrumentation and added a backbeat, as well as other stylistic elements borrowed from [rock and roll](#). In the early 1960s, Merle Haggard and Buck Owens, among others, brought the Bakersfield sound to mainstream audiences, and it soon became one of the most popular kinds of country music, also influencing later country stars such as Dwight Yoakam.

# Balearic Beat

**Balearic Beat** is a style of [electronic dance music](#) that emerged in the late 1980s and was popular into the mid-1990s. The style was named for its popularity among European [nightclub](#) and beach rave patrons on the Balearic island of Ibiza, a popular tourist destination. Some dance music compilations referred to the style as "the sound of Ibiza," even though many other, more aggressive and upbeat forms of dance music could be heard on the island. Major artists credited with popularizing Balearic Beat include Soul II Soul and Enigma.

The Balearic Beat sound was initially typified by a distinctive, relatively heavy, slow (90–110 bpm), [R&B](#)-influenced beat consisting of bass drum, snare, and hi-hats (often produced with a Roland TR-909 drum machine) programmed in certain laid-back, swing-beat patterns; plus [soul](#), Latin, African, [funk](#), and [dub](#) affectations; and production techniques borrowed from other styles of dance music that were popular at the time. Vocals were sometimes present, but much of the music was instrumental. The sounds of acoustic instruments such as guitar and piano were sometimes incorporated into Balearic Beat.

UK [disc jockeys](#) Paul Oakenfold and Danny Rampling are commonly credited with having "discovered" Balearic Beat in 1986 while on holiday in Ibiza. Reportedly, they were introduced to the music at Amnesia, an Ibizan nightclub, by DJ Alfredo from Argentina, who had a residency there.

Having been primarily associated with a particular percussion pattern that eventually fell out of vogue, the style eventually faded from prominence, and its repertoire was subsumed by the more general "chill out" and "[downtempo](#)" genres.

Ibiza is still considered by some to have its own 'sound,' however. Compilations such as *Global Lounge Sessions: The Balearic Sound of Ibiza*, released in 2002, continue to be released. These generally feature [house music](#) and certain downtempo selections, not the old style of Balearic Beat, *per se*. Some prefer to use the term more generally, however, to apply to all of these styles.

A less common synonym for Balearic Beat is **Balearic House**.

Categories: [Electronic music genres](#)

# Ballad

A **ballad** is a story in a [song](#), usually a narrative song or poem. It is a rhythmic saga of a past affair, which may be heroic, romantic or satirical, political (affected by the previous three types mentioned, refers to either glorifying the exploits or causes of a particular leader or group, and is typical of totalitarian political systems), almost inevitably catastrophic, which is related in the third person, usually with foreshortened alternating four- and three-stress lines ('ballad meter') and simple repeating rhymes, and often with a refrain. If it is based on political or religious themes, a ballad may then be a version of a [hymn](#). Ballads should not be confused with the [ballade](#), a 14th and 15th century French verse form.

## Broadsheet ballads

Broadsheet ballads (also known as [broadsheet ballads](#)) were cheaply printed and often topical, humorous, even subversive, were hawked in English streets from the 16th century; the legends of Robin Hood and the pranks of Puck were disseminated through broadsheet ballads.

New ballads were written about current events like fires, the birth of monstrous animals, and so forth, giving particulars of names and places. Satirical ballads and Royalist ballads contributed to 17th century political discourse. In a sense, these ballads were antecedents of the modern newspaper.

Thomas Percy, Robert Harley, Francis James Child, Sir Walter Scott and James Hogg were early collectors and publishers of ballads from the oral tradition, broadsheets and previous anthologies. Percy's publication of *Reliques of Ancient Poetry* and Harley's collections, such as *The Bagford Ballads*, were of great import in beginning the study of ballads. Some of the collectors also wrote new ballads. Many ballads are referenced in scholarly works by their number in Child's compilation (see the *Child Ballads*). The American poet Carl Sandburg was influenced by ballads, and published a collection he had assembled as *The American Songbag* (1927).

The form of a ballad has been imitated in modern poetry— most notably by the Canadian ballads of Robert W. Service, in Kipling's 'Road to Mandalay' or in 'Casey at the Bat.' 'The Ballad of the Bread-man', is Charles Causley's re-telling of the story of the birth of Jesus. Many modern written musical ballads are in the repertory of American [folk music](#).

## Murder ballads

A specific subgenre of the broadsheet ballad is the murder ballad. Usually told from the point of view of the killer, murder ballads typically recount the details of the crime — who the victim is, why the murderer decides to kill him or her, how he or she is lured to the murder site and the act itself — followed by the escape and/or capture of the murderer. Often the ballad ends with the murderer in jail or on their way to the gallows, occasionally with a plea for the listener to learn from the evils committed by the speaker.

## Border ballads

[Border ballads](#) are a subgenre of folk ballads collected in the area along the Anglo-Scottish border, especially those concerned with border reivers and outlaws, or with historical events in the Borders.

Notable historical ballads include "The Battle of Otterburn" and "The Hunting of Cheviot" or "The Ballad of Chevy Chase".

Outlaw ballads include "Johnnie Armstrong", "Kinmont Willie", and "Jock o' the Side".

Other types of ballads (including fairy ballads like "Thomas the Rhymer") are often included in the category of border ballads.

## Literary ballads

Literary ballads are those composed and written formally. The form, with its connotations of simple folkloric authenticity, became popular with the rise of [Romanticism](#) in the later 18th century. Literary ballads may then be set to music, as Schubert's *Der Erlkönig*, set to a literary ballad by Goethe (see also *Der Zauberlehrling*). In Romantic opera a ballad set into the musical texture may emphasize or play against the theatrical moment. Atmospheric ballads in operas were initiated in Weber's *Der Freischütz* and include Senta's ballad in Wagner's *Fliegender Holländer*, or the 'old song' 'Salce' Desdemona sings in Verdi's *Otello*. Compare the stanza-like structure and narrative atmosphere of the musical [Ballades](#) for solo piano of Chopin or Brahms. Akilattirattu Ammanai the religious text of Ayyavazhi, which contains more than 15000 lines is the longest ballad form of literary work in the world.

## **Ballad opera**

A particularly English form, the ballad opera, has as its most famous example John Gay's *The Beggar's Opera*, which inspired the 20th-century cabaret operas of Bertolt Brecht and Kurt Weill (*q.v.*). Ballad strophs usually alternate between iambic tetrameter and iambic pentameter, though this is not always the case.

## Jazz ballad

The jazz ballad is a sentimental narrative adagio akin to a [blues](#) song. The regrets of love gone wrong provide the elements of the ballad called a 'torch song.' By extension, any popular song with a slow beat is termed a 'ballad.' In modern music, a song called a ballad is one which tells a story but may not follow any of the other conventions. Many styles of music such as [rock](#), [pop](#), and [country](#), label some songs as ballads. See also [blues ballad](#).

## Power ballad

See also [Power ballad](#). Not really a ballad at all but a love song performed using rock instruments.

## Famous ballads

Ballad- A short narrative poem with stanzas of two or four lines and usually a refrain. The story of a ballad can originate from a wide range of subject matter but most frequently deals with folk-lore or popular legend Epic- a long narrative poem celebrating the adventures and achievements of a hero...epics deal with the traditions, mythical or historical, of a nation. Ode- An Ode is a poem praising and glorifying a person, place or thing. Sonnet- A Sonnet is a poem consisting of 14 lines (iambic pentameter) with a particular rhyming scheme.

# Ballade

The **ballade** is a [verse](#) form consisting of three (sometimes five) stanzas, each with the same metre, rhyme scheme and last line, with a shorter concluding stanza (an envoi) usually addressed to a prince. (The ballade should not be confused with the [ballad](#).)

The ballade is particularly associated with French poetry of the 14th and 15th centuries. One of the most notable writers of ballades was François Villon; Geoffrey Chaucer also wrote in the form. It was revived in the 19th century by English-language poets including Dante Gabriel Rossetti and Algernon Charles Swinburne.

Also in the 19th century, the title was given by Frédéric Chopin to four important, large-scale [piano](#) pieces (opus numbers 23, 38, 47 and 52), the first significant application of the term to instrumental music. A number of other composers subsequently used the title for piano pieces, including Johannes Brahms (the third of his Klavierstücke opus 118, and the set of four opus 10), Edvard Grieg (opus 24, a set of variations), Franz Liszt (who wrote two) and Gabriel Fauré (opus 19, later arranged for piano and orchestra). Ballades for instruments other than the piano have also been written.

## A 1912 ballade by G.K. Chesterton

Though all the critics' canons grow—  
Far seedier than the actors' own—  
Although the cottage-door's too low—  
Although the fairy's twenty stone—  
Although, just like the telephone,  
She comes by wire and not by wings,  
Though all the mechanism's known—  
Believe me, there are real things.

Yes, real people— even so—  
Even in a theatre, truth is known,  
Though the agnostic will not know,  
And though the gnostic will not own,  
There is a thing called skin and bone,  
And many a man that struts and sings  
Has been as stony-broke as stone...  
Believe me, there are real things

There is an hour when all men go;  
An hour when man is all alone.  
When idle minstrels in a row  
Went down with all the bugles blown—  
When brass and hymn and drum went down,  
Down in death's throat with thunderings—  
Ah, though the unreal things have grown,  
Believe me, there are real things.

Prince, though your hair is not your own  
And half your face held on by strings,  
And if you sat, you'd smash your throne—  
Believe me, there are real things.

# Ballet

**Ballet** is the name given to a specific [dance](#) form and technique. Works of dance [choreographed](#) using this technique are called **ballets**, and may include: [dance](#), mime, acting and [music](#) ([orchestral](#) and [sung](#)). Ballets can be performed alone or as part of an [opera](#). Ballet is best known for its virtuoso techniques such as pointe work, grand pas de deux and high leg extensions. Many ballet techniques bear a striking similarity to fencing positions and footwork, perhaps due to their development during the same periods of history, but more likely, because both arts had similar requirements in terms of balance and movement.

Domenico da Piacenza (1390..1470) is credited with the first use of the term *ballo* (in *De Arte Saltandi et Choreas Ducendi*) instead of *danza* (dance) for his *baletti* or *balli* which later came to be known as *Ballets*. The first Ballet *per se* is considered to be Balthasar de Beaujoyeulx's Ballet Comique de la Royne (1581) and was a ballet comique (ballet drama). 1581 also saw the publication of Fabritio Caroso's *Il Ballarino*, a technical manual on ballet dancing that helped to establish Italy as a major centre of ballet development.

## History of ballet

Ballet has its roots in [Renaissance](#) court spectacle in Italy, but was particularly shaped by the French ballet de cour, which consisted of social dances performed by the nobility in tandem with music, speech, verse, song, pageant, decor and costume. Ballet began to develop as a separate art form in France during the reign of Louis XIV, who was passionate about dance and determined to reverse a decline in dance standards that began in the 17th century. The king established the Académie Royale de Danse in 1661, the same year in which the first comédie-ballet, composed by Jean-Baptist Lully was performed. This early form consisted of a play in which the scenes were separated by dances. Lully soon branched out into opéra-ballet, and a school to train professional dancers was attached to the Académie Royale de Musique, where instruction was based on noble deportment and manners.

The 18th Century was a period of vast advancement in the technical standards of ballet and the period when ballet became a serious dramatic art form on par with the Opera. Central to this advance was the seminal work of Jean-Georges Noverre, *Lettres sur la danse et les ballets* (1760), which focused on developing the ballet d'action, in which the movements of the dancers are designed to express character and assist in the narrative. Reforms were also being made in ballet composition by composers such as Christoph Gluck. Finally, ballet was divided into three formal techniques *sérieux*, *demi-caractère* and *comique*. Ballet also came to be featured in operas as interludes called divertissements.

The 19th Century was a period of great social change, which was reflected in ballet by a shift away from the aristocratic sensibilities that had dominated earlier periods through Romantic ballet. Ballerinas such as Marie Taglioni and Fanny Elssler pioneered new techniques such as pointework that rocketed the ballerina into prominence as the ideal stage figure, professional librettists began crafting the stories in ballets, and teachers like Carlo Blasis codified ballet technique in the basic form that is still used today. Ballet began to decline after 1850 in most parts of the western world, but remained vital in Denmark and, most notably, Russia thanks to masters such as August Bournonville, Jules Perrot and Marius Petipa. Russian companies, particularly after World War II engaged in multiple tours all over the world that revitalized ballet in the west and made it a form of entertainment embraced by the general public. It is one of the most well preserved dances in the world.

## Ballet (music)

**Ballet** as [musical form](#) is a musical composition intended for [ballet performance](#).

The same music can be used for several different ballet [choreographies](#).

Until about the second half of the 19th century the role of music in ballet was secondary, with main emphasis being on dance, with music being a compilation of danceable tunes. Writing "ballet music" used to be a job for musical craftsmen, rather than for masters. For example, critics of Tchaikovsky mentioned his writing of ballet music as something demeaning.

Adolphe Adam's *Giselle*, still popular worldwide, was among the first ballet scores that featured specifics of modern ballet music, such as leitmotifs - recurring musical themes that accompany certain characters or situations throughout the whole piece.

## **Famous ballet composers**

Delibes, Léo  
Lully, Jean-Baptiste  
Stravinsky, Igor  
Tchaikovsky, Peter

# Ballroom dance

**Ballroom dance**, refers collectively to a set of [partner dances](#), which originated in the Western world and are now enjoyed both socially and competitively around the globe. Its performance and entertainment aspects are also widely enjoyed on stage, in film, and on television. While historically ballroom dance may refer to any form of formal social dancing as recreation, with the eminence of dancesport in modern times the term has become much narrower in scope, usually referring specifically to the International Standard and International Latin style dances (see dance groupings below). In the United States, two additional variations—"American Smooth" and "American Rhythm"—have also been popularized and are commonly recognized as styles of "ballroom dance".

## Definitions and history

The term "ballroom dancing" is derived from the word ball, which in turn originates from the Latin word *ballare* which means "to dance".

The definition of ballroom dance also depends on the era. Balls have featured Minuet, Quadrille, Polonaise, Pas de Gras, Mazurka, and other popular dances of the day, which are considered to be historical dances.

In times past, ballroom dancing was "[social dancing](#)" for the privileged, leaving "folk dancing" for the lower classes. These boundaries have since become blurred, and it should be noted even in times long gone, many "ballroom" dances were really elevated folk dances.

Ballroom dancing has been in continual use as a social art form since its inception with one exception in the 20th century. Dance historians usually mark the appearance of the *Twist* in the mid 1960s as the end of social partner dancing, and they credit what was then called the Latin Hustle for bringing it back in the late 1970s.

## Rogers and Astaire

In the early 20th century, the on-screen dance pairing of Fred Astaire and Ginger Rogers greatly influenced ballroom dancing in the USA. Although both actors had independent projects and careers (Astaire had many other partners and Rogers won an Academy Award for a dramatic role), their filmed dance sequences have reached iconic status. Much of their work portrayed social dance, although their performances were highly choreographed (often by Astaire or Hermes Pan), meticulously staged, and continually rehearsed. Ballroom dance historians note their portrayal of early 20th-century dancers Vernon and Irene Castle.

Their work has greatly influenced the American-style ballroom syllabus. American Smooth style was influenced greatly by the work of franchises such as Arthur Murray and Fred Astaire Dance Studios where 'Fred & Ginger' classes and workshops remain popular.

## Modern ballroom movements

Classic and vintage dance societies are dedicated to the performance and preservation of ballroom dances of the past. These companies perform at special events attired in traditional dance costume. Some instructors specialize in the dances of one place or time, or in fad dances: short-lived, time-specific dances that may be associated with the music or style of an era (such as The Twist) or a particular song (such as YMCA or La Macarena).

## Competitive dancing

In spite of its historical image as a pastime for the privileged; formal competitions, sometimes referred to as DanceSport, often allow participation by less advanced dancers at various proficiency levels.

In the United States, amateur dance proficiency levels are defined by USA Dance (formerly United States Amateur Ballroom Dance Association, USABDA) as Bronze->Silver->Gold for syllabus dancers, and Novice->Prechampionship->Championship for open competitors. These levels roughly correspond to the "E" to "S" levels in Europe and Australia. Among professionals, levels classify into Rising Star and Open Professional.

Eligibility and "leveling up" requirements will vary greatly between countries and sometimes within. For instance, in addition to USA Dance competitions, amateur dancers in the United States often participate in competitions sanctioned by NDCA or YCN (Youth Collegiate Network), each with its own distinct culture in addition to differing definitions of level and eligibility requirements.

The International Olympic Committee now recognizes competitive ballroom dance. It now appears doubtful that it will be included in the Olympic Games especially in light of efforts to reduce the number of offerings, but the application has not been permanently rejected.

Ballroom dancing competitions in the former USSR also included the Soviet Ballroom dances, or Soviet Programme. Australian New Vogue is danced both competitively and socially. In competition there are 15 recognised New Vogue dances, which are performed by the competitors in sequence. Internationally, the Blackpool Dance Festival, hosted annually at Blackpool, England, is considered the most prestigious event a dancesport competitor can attend.

## Elements of competition

In competition ballroom dancers are judged by multifarious criteria such as connection, frame, posture, speed, proper body alignment, proper usage of weight/ankles/feet, and grooming. Judging in a performance-oriented sport is inevitably subjective in nature, and controversy and complaints by competitors over judging placements are not uncommon. The scorekeepers—called scrutineers—will tally the total number recalls accumulated by each couple through each round until the finals, when the Skating system is used to place each couple by ordinals, typically 1-6, though the number of couples in the final can vary.

## Medal examinations

Medal examinations enable dancers' abilities to be recognized according to conventional standards. In medal exams, each dancer performs two or more dances in a certain genre (e.g., International Standard) in front of a judge. In North America, examination levels include Bronze, Silver, and Gold. Each level (i.e. Bronze, Silver, Gold) may be further subdivided into either two or four separate sections.

# Dances

Commonly, "ballroom dance" refers to both International Standard and International Latin, though in some cases its meaning can be restricted to only the international standard dances. In the United States, the American styles (American Smooth and American Rhythm) are also included. Less commonly, other dances are also included under the umbrella "ballroom dance". Such dances include Nightclub Dances such as [Lindy Hop](#), [West Coast Swing](#), and Hustle. Others are called street dances, including salsa and merengue. Nightclub dances are danced differently in different places, and club/street styles differ from the styles taught in ballroom studios.

In Europe, Latin Swing dances include Tango Argentino, Mambo, Lindy Hop, Swing Boogie (sometimes also known as Nostalgic Boogie), and Disco Fox. Country and Western dances are danced both competitively and socially at Country & Western bars, clubs, and ballrooms. There is also a Rock 'n' Roll dance variant accepted as a social dance. A related category is regional social dances. One example is the subcategory of Cajun dances that originated in New Orleans, with branches reaching both coasts of the United States.

Standard/Smooth dances are normally danced to Western music (often from the mid-twentieth century), and couples dance counter-clockwise around a rectangular floor generally following the line of dance. In competitions, competitors are costumed as would be appropriate for a white-tie affair, with full gowns for the ladies and bow tie and tailsuits for the men; though in American Smooth it is now conventional for the men to abandon the tailsuit in favor of shorter tuxedos, vests, and other creative outfits.

Latin/Rhythm dances are commonly danced to contemporary latin music, and with the exception of a few travelling dances (e.g. Samba and Paso Doble) couples do not follow the line of dance and perform their routines more or less in one spot. In competitions, the women are often dressed in short-skirted latin outfits while the men outfitted in tight-fitting shirts and pants; the goal being to bring emphasis to the dancers' leg action and body movements.

## International Style

### International Standard

Slow Waltz - [Tango](#) - Viennese Waltz - Slow Foxtrot - Quickstep

### International Latin

Cha cha - Samba - Rumba - Paso Doble - Jive

## American Style

### American Smooth

[Waltz](#) - [Tango](#) - Foxtrot - Viennese Waltz

### American Rhythm

Cha-cha - Rumba - [East Coast Swing](#) - Bolero - [Mambo](#)

## Other dances occasionally categorized as ballroom

### Nightclub

Nightclub Two-step - Hustle - Modern Jive / LeRoc / Ceroc - and the whole swing variety: [West Coast Swing](#) / [East Coast Swing](#) (always included in the "American Rhythm" category) / [Lindy Hop](#) / Carolina Shag / Collegiate Shag / Balboa

### Latin nightclub

also referred to as "Country and Western" or C/W:

[C/W Polka](#) - C/W Cha-cha - C/W Two-step - [C/W Waltz](#)...

### Cajun dances

Cajun One Step - Cajun Two Step - Zydeco - Cajun Waltz - Cajun Jitterbug

### Other

[Argentine tango](#)

[Polka](#)

# Baltimore Club

**Baltimore club**, also called **Baltimore breaks**, **Baltimore house**, **knucklehead**, **thump** and **Dew Doo beat**, is a genre of [house](#) and [dance music](#). A blend of [hip-hop](#) and [electronica](#), it was created in Baltimore, Maryland in the early 1990s by Scottie B., Frank Ski, Miss Tony aka Big Tony and DJ Spen and has since been performed by artists such as Rod Lee, KW Griff, Rod Braxton, Karizma, D.J. Technics, D.J. Phinisse, Diamond K, DJ Patrick, and DJ Kenny B. Female DJ K Swift is currently one of the most popular DJ's in Baltimore, with her radio shows on 92.3 WERQ.

Baltimore club is exemplified by its 8/4 beat structure and tempos at or near 130 beats per minute. It combines repetitive, looped vocal snippets similar to [ghetto house](#) with humorous vocal samples from television shows like Sanford and Son and Sponge Bob SquarePants, and also includes heavy breakbeats and call and response stanzas similar to those found in the go-go music of Washington, D.C.. More often than not, the breakbeats are pulled from two records; "Sing Sing" by Gaz, and "Think" by Lyn Collins and James Brown. Much like the rave-era sub-genre of [techno music](#) known as [breakbeat hardcore](#), Baltimore Club sounds as if the music was purposely produced in a hurried manner as the each song is made with a limited palette of sounds and is based on a similar templates.

## Development

Some say Baltimore Breaks grew out of Miami Bass, largely due to Frank Ski working with Luke Skywalker Records in the early 1990s, remixing songs such as Disco Rick's "Wiggle Wiggle" in 1992. Frank's production of the 1991 track "Doo Doo Brown" by 2 Hype Brothers and a Dog samples heavily from the 1989 "Doo Doo Brown edit" of "C'mon Babe" by the X-rated Miami bass group known as 2 Live Crew. This most likely explains the genre's nickname of "Dew Doo Beat". Despite its roots nearer to Miami bass, the sound of the music itself more closely resembles [ghetto house](#). Ski helped to pioneer the sound with his nightly radio show on now defunct V103, playing many breakbeat hardcore songs such as "Acid Party", "Too much Energy" and others, alongside his newly released Doo Doo Brown track. The influence of the UK's [breakbeat hardcore](#) was critical in the development of the genre. Soon after the release of "Doo Doo Brown", Frank Ski teamed with Miss Tony and Scottie B. on the release of "What's up What's up" and "Pull Ya Guns Out", two of the earliest examples to feature the signature Baltimore Club sound.

Baltimore club has long been popular in Baltimore, largely in African-American venues where DJs spin exclusively Baltimore Club. DJ K-Swift, initially popular for her sets at various clubs, now hosts a nightly radio show on 92Q that plays exclusively club music. Recently, club music spread beyond the city's borders to Philadelphia and New York City and inspired offshoots in New Jersey (D.J. Tamiel /Brick City club), and Alabama (D.J. Taj/Bamabounce ). This expansion is due largely to the success and influence of the DJ duo Hollertronix, who present Baltimore Club in conjunction with hip-hop, rock, and other dance music.

Spank rock is a popular American musical group influenced by Baltimore club. These natives of Charm City began their ascent to popularity in 2003 and continue the international spread of the Baltimore dance craze.

The warehouse club The Paradox, along with smaller clubs such as Club Choices, 32nd Street Plaza, Odell's and "Louie Louie" night at the rock club HammerJacks, have all been popular hotspots to hear Baltimore club the way it was meant to be heard: On a very large, very loud and bass heavy sound system. Club Paradox also hosted one of the most popular [rave](#)-themed club nights on the east coast, "Fever", and helped to spread the popularity of Baltimore club with a wider audience.

Club Mo's, located in Kingsville, Maryland, was host to the most scandalous Baltimore Club parties between 1996 and 2001. Although the genre truly inspired primal dance forms, eventually the club was shut down by the local authorities due to improprieties involving young women and club employees.

Recently the genre has gained popularity in Baltimore's rock underground thanks to Baltimore Club nights at the Talking Head Club and others. There was also a feature on Baltimore Club in *Spin Magazine* in January 2006.

What many don't know, is that in the late 90s, Baltimore club music also grew a cult following in the Northern New Jersey club scene, mostly from the spread of mix tapes and traveling Baltimore deejays.

# Bamabounce

**Bamabounce** is a form of [Baltimore club](#) made in Alabama created by D.J. Taj. It sometimes has a faster tempo (130-45) and includes heavier dirty south and crunk samples, and loads of TV/RnB samples. Even though BamaBounce Club music is greatly inspired by the sounds of [Baltimore Club](#) music, in it's beginnings the style (then known as ghetto dub), was created from scratch by D.J. Taj. After Surfin the net and running across a few samples of [Baltimore Club](#) music, the style of Ghetto Dub, Began to change and the new style was renamed Bamabounce.

# Band

In [music](#), a **band** is a company of [musicians](#), or [musical ensemble](#), usually [popular](#) or [folk](#), playing parts of or [improvising](#) a musical arrangement on different [musical instruments](#).

## Types of bands

- [all-women band](#)
- [big band](#)
- [brass band](#)
- [bluegrass band](#)
- [boy band](#)
- Church band
- [concert band](#) (also known as a wind band or symphonic band)
- [girl group](#)
- [jazz band](#)
- jug band
- [marching band](#)
- [military band](#)
- **pop group**
- [punk band](#)
- [rock band](#)
- salsa band
- school band
- [supergroup](#)
- vocal group
- worship band

Categories: [Musical groups](#)

# Banjo

The **banjo** is a [stringed instrument](#) of African American origin, early or original examples sometimes being called the "gourd banjo". Its name is commonly thought to be derived from the Kimbundu term mbanza. Some etymologists derive it from a dialectal pronunciation of "bandore", though recent research suggests that it may come from a Senegambian term for the bamboo stick used for the instrument's neck.

The modern banjo comes in a variety of different forms, including four- (**plectrum** and **tenor** banjos) and five-string versions. A six-string version, tuned and played similar to a [guitar](#) is gaining popularity. In almost all of its forms the banjo's playing is characterised by a fast strumming or arpeggiated right hand, although there are many different playing styles.

The banjo consists of a wooden or metal rim with a plastic ( PET film) or calf or goat skin drumhead stretched across it, a neck mounted on the side of the rim, a tailpiece mounted opposite the neck, four or five strings, and a bridge. The woods used in construction vary, but are often combinations of maple, walnut, and ebony for fingerboards, pegheads, and the tops of bridges. In the five-string banjo, the fifth peg is normally on the side of the neck, although some English versions (the Zither banjo) mount the fifth string tuner on the tuning head with the others, and route the string through a tube in the neck where it exits near the fifth fret.

The earliest banjos were unfretted, like the African and Asian instruments that inspired them, but most banjos today are fretted. Banjo strings are most commonly metal, although nylon and gut can be used on some banjos, especially those played in the classical style. The two most common modern day acoustic banjos are the **resonator banjo** which has a detachable chamber, or resonator, on the back of the rim and the **open back banjo** which does not have a resonator. There are also solid body electric banjos; one such banjo, the Crossfire (manufactured by Deering), has two powerful magnetic pickups under the drumhead. A metal footed bridge ensures that pickups draw sound from both the strings and the head.

## Five-string banjo

The origins of the five-string banjo are often, but probably erroneously, linked to Joel Walker Sweeney, an American minstrel performer. Sweeney wanted an instrument similar to the banjar played by African Americans in the American south, but at the same time, he wanted to implement some new ideas. He worked with a New York drum maker to replace the banjar's skin-covered gourd with the modern open-backed drum-like pot, and added another string to give the instrument more range or a drone. This new banjo came to be tuned gCGBD; somewhat higher than the eAEG#B tuning of the banjar. However, a painting done long before Sweeney's supposed invention of the fifth string, called *The Old Plantation*, shows African American slaves playing a banjo with what looks to be a short, fifth string.

The banjo can be played in several styles and is used in various forms of [music](#). In [bluegrass music](#), which uses the five-string resonator banjo extensively, it is often played in Scruggs style, named after Earl Scruggs, melodic or Keith style, or two-finger style, also called Reno style after Don Reno, legendary father of Don Wayne Reno. In these styles the emphasis is on arpeggiated figures played in a continuous eighth-note rhythm.

American Old-time music typically uses the five-string open back banjo. It is played in a number of different styles, the most common of which are called clawhammer (or "claw-hammer") and frailing, characterised by the use of a downward rather than upward motion when striking the strings with the fingers. Frailing techniques use the thumb to catch the fifth string for a drone after each strum, or to pick out additional melody notes in what is known as "drop-thumb" or "double thumbing." Pete Seeger popularised a [folk](#) style by combining clawhammer with "up picking" without the use of finger picks.

Many tunings are used for the five-string banjo. Probably the most common, certainly in bluegrass, is the open G tuning: gDGBd. In earlier times, the tuning gCGBd was commonly used instead. Other tunings common in old-time music include double C (gCGCd), sawmill or mountain minor (gDGCd) also called Modal or Mountain Modal, and open D (f#DF#Ad). These tunings are often taken up a tone, either by tuning up or using a capo.

The fifth (drone) string is the same gauge as the first, but it is five frets shorter, three quarters the length of the rest. This presents special problems for using a capo to change the [pitch](#) of the instrument. For small changes (going up or down one or two semitones, for example) it is possible to simply retune the fifth string. Otherwise various devices are available to effectively shorten the string. Many banjo players favour the use of model railroad spikes (usually installed at the seventh fret and sometimes at others), under which the string can be hooked to keep it pressed down on the fret.

## Four-string banjo

The **plectrum banjo** has four strings, lacking the shorter fifth string, and 22 frets; it is usually tuned CGBD. As the name suggests, it is usually played with a guitar-style pick (that is, a single one held between thumb and forefinger), unlike the five-string banjo, which is almost always played with a thumpick and two fingerpicks, or occasionally with bare fingers. The plectrum banjo evolved out of the five-string banjo to cater for styles of music involving strummed chords. A further development is the **tenor banjo**, which also has four strings and is typically played with a plectrum too. It has a shorter neck of 19 frets is usually tuned CGDA, like a [viola](#), or GDAE, like a [violin](#) (but an octave lower), and has become quite a standard instrument for Irish traditional music where is mainly used in its shorter 17 frets variant. Eddie Peabody (plectrum) and Harry Reser (tenor and plectrum) are regarded as two of the best four-string banjo players of all times.

## Other banjo variants

A number of hybrid instruments exist, crossing the banjo with other stringed instruments. Most of these use the body of a banjo, often with a resonator, and the neck of the other instrument. Examples include the [guitar banjo](#), 'banjitar' (a trade-name) or *guitjo*, the *banjo mandolin* and the *banjo ukulele* or *banjolele*. These were especially popular in the early decades of the twentieth century, and were probably a result of a desire either to allow players of other instruments to jump on the banjo bandwagon at the height of its popularity, or to get the natural amplification benefits of the banjo resonator in an age before electric amplification. The six-string or guitar-banjo was the instrument of the early jazz great Johnny St. Cyr, as well as of jazzmen Danny Barker, Papa Charlie Jackson and Clancy Hayes.

Instruments using the five-string banjo neck on a wooden body (for example, that of a [bouzouki](#) or resonator guitar) have also been made, though these are not so common. A 20th-Century Turkish instrument very similar to the banjo is called Cümbüs.

## Bar form

The **Bar form** is an old and important musical form in which each stanza follows the pattern *aab*. It is named after the medieval German poetic form known as *Bar* in German. Such a poem contains three stanzas (or more), and each stanza is in *aab* form, composed of two *Stollen* followed by an *Abgesang*. The musical form thus contains two repetitions of one melody (*Stollen* - 'stanzas') followed by a different melody (*Abgesang* - 'aftersong'). The *Abgesang* may sometimes incorporate portions of the *Stollen* phrase.

The minnesingers of the 12th to 14th century in Germany wrote songs in this form, and Lutheran chorales also are typically in Bar form. A good example of barform is the Star-Spangled Banner.

# Barbershop music

**Barbershop** [harmony](#), as codified during the barbershop revival era (1940s-present), is a style of unaccompanied vocal music characterized by consonant four-part chords for every melody note in a predominantly homophonic texture. Each of the four parts has its own role: the lead sings the melody, with the [tenor](#) harmonizing above the melody, the bass singing the lowest harmonizing notes, and the baritone completing the chord. The melody is not sung by the tenor or bass, except for an infrequent note or two to avoid awkward voice leading, in tags or codas, or when some appropriate embellishing effect can be created. Occasional brief passages may be sung by fewer than four voice parts.

Barbershop music features songs with understandable lyrics and easily singable melodies, whose tones clearly define a tonal center and imply major and minor chords and barbershop (dominant and secondary dominant) seventh chords that resolve primarily around the circle of fifths, while making frequent use of other resolutions. What sets barbershop apart from other musical styles is the predominant use of the dominant-type seventh chords, which are however not true dominant seventh chords, but justly tuned otonal tetrads; where for example the voices are at frequencies in the proportion 4:5:6:7. Barbershop music also features a balanced, symmetrical form and a standard meter. The basic song and its harmonization are embellished by the arranger to provide appropriate support of the song's theme and to close the song effectively.

Barbershop singers adjust pitches to achieve perfectly tuned chords in just intonation while remaining true to the established tonal center. Artistic singing in the barbershop style exhibits a fullness or expansion of sound, precise intonation, a high degree of vocal skill, and a high level of unity and consistency within the ensemble. Ideally, these elements are natural, unmanufactured, and free from apparent effort.

The presentation of barbershop music uses appropriate musical and visual methods to convey the theme of the song and provide the audience with an emotionally satisfying and entertaining experience. The musical and visual delivery is from the heart, believable, and sensitive to the song and its arrangement throughout. The most stylistic presentation artistically melds together the musical and visual aspects to create and sustain the illusions suggested by the music.

Slower barbershop songs often eschew a continuous beat, and notes are often held (or speeded up) *ad libitum*.

The voice parts in men's barbershop singing do not correspond closely to the correspondingly-named voice parts in classical music. Barbershop singing is performed both by men's and women's groups; the elements of the barbershop style and the names of the voice parts are the same for both.

## Ringling chords

The defining characteristic of the barbershop style is the *ringing* chord. This is a name for one specific and well-defined acoustical effect, also referred to as *expanded sound*, *the angel's voice*, *the fifth voice*, or *the overtone*. (The barbershopper's "overtone" is not the same as the acoustic physicist's overtone).

The physics and psychophysics of the effect are fairly well understood; it occurs when the upper harmonics in the individual voice notes, and the sum and difference frequencies resulting from nonlinear combinations within the ear, reinforce each other at a particular frequency, strengthening it so that it stands out separately above the blended sound. The effect is audible only on certain kinds of chords and only when voices are rich in harmonics and very precisely tuned. It is not heard in chords sounded on keyboard instruments, due to the slight tuning imperfection of the even-tempered scale.

Gage Averill (2003) writes that "Barbershoppers have become partisans of this acoustical phenomenon" and that "the more experienced singers of the barbershop revival (at least after the 1940s) have self-consciously tuned their dominant seventh and tonic chords in just intonation to maximize the overlap of common overtones."

What is prized is not so much the "overtone" itself, but a unique sound whose achievement is most easily recognized by the presence of the "overtone." The precise synchronization of the waveforms of the four voices *simultaneously* creates the perception of a "fifth voice" while at the same time melding the four voices into a unified sound. The ringing chord is qualitatively different in sound from an ordinary musical chord e.g. as sounded on a keyboard instrument.

Most elements of the "revivalist" style are related to the desire to produce these ringing chords. Performance is a cappella to prevent the distracting introduction of even-tempered intonation, and because listening to anything but the other three voices interferes with a performer's ability to tune with the precision required. Barbershop arrangements stress chords and chord progressions that favor "ringing," at the expense of suspended and diminished chords and other harmonic vocabulary of the ragtime and jazz ages:

The dominant seventh-type chord... is so important to barbershop harmony that it is called the "barbershop seventh..." [SPEBSQSA (now BHS)] arrangers believe that a song should contain anywhere from 35 to 60 percent dominant seventh chords to sound "barbershop."

Historically barbershoppers used the word "minor chord" in a way that is confusing to those with musical training. Averill suggests that it was "a shorthand for chord types other than major triads," and says that the use of the word for "dominant seventh-type chords and diminished chords" was common in the late nineteenth century. A 1900 song called "Play That Barber-Shop Chord" (often cited as an early example of "barbershop" in reference to music) contains the lines

Cause Mister when you start that minor part  
I feel your fingers slipping and a grasping at my heart,  
Oh Lord play that Barber shop chord!

Averill notes the hints of rapture, "quasi-religion" and erotic passion in the language used by barbershoppers to describe the emotional effect. He quotes Jim Ewin as

reporting "a tingling of the spine, the raising of the hairs on the back of the neck, the spontaneous arrival of 'goose flesh' on the forearm.... [the 'fifth note' has] almost *mysterious propensities*... It's the *consummation* devoutly wished by those of us who love Barbershop harmony. If you ask us to explain ... why we love it so, we are hard put to answer; *that's there our faith takes over*." Averill notes too the use of the language of addiction, "there's this great big chord that gets people hooked." An early manual was entitled "A Handbook for Adeline Addicts."

He notes too that "barbershoppers almost never speak of 'singing' a chord, but almost always draw on a discourse of physical work and exertion; thus, they 'hit,' 'chop,' 'ring,' 'crack,' and 'swipe....' ....vocal harmony... is interpreted as an embodied musicking. Barbershoppers never lose sight (or sound) of its physicality."

## Historical origins

As a result of scholarship by Lynn Abbott and Dr. Jim Henry it is now generally accepted that barbershop singing originated in African-American communities in the U.S. around the turn of the century, where barbershops were, and remain today, social gathering places. The four-part harmony of the form has its roots in the black church, where close harmony has a long tradition.

The first uses of the term were associated with African-Americans. Henry notes that "The Mills Brothers learned to harmonize in their father's barber shop in Piqua, Ohio. Several other well-known black gospel quartets were founded in neighborhood barber shops, among them the New Orleans Humming Four, the Southern Stars and the Golden Gate Jubilee Quartette." . Although the Mills Brothers are primarily known as jazz and pop artists and usually performed with instrumental accompaniment, the affinity of their harmonic style with that of the barbershop quartet is clearly in evidence in their music and most notably, perhaps, in their best-known gospel recording, "Jesus Met the Woman at the Well", performed a cappella. Their father founded a barbershop quartet, the Four Kings of Harmony, and the Mills Brothers produced at least three records in which they sang a cappella and performed traditional barbershop material.

- Henry, James Earl. *The Origins of Barbershop Harmony: A Study of Barbershop's Links to Other African American Musics as Evidenced through Recordings and Arrangements of Early Black and White Quartets*. Ph.D diss., Washington University, 2000

## Female Barbershop music and "Beautyshop" quartets

Traditionally, the word "barbershop" has been used to encompass both men's and women's quartets singing in the barbershop style. Harmony, Inc. calls itself "International Organization of Women Barbershop Singers" while Sweet Adelines International calls itself "a worldwide organization of women singers committed to advancing the musical art form of barbershop harmony."

Some women's quartets, particularly in U. S. schools, have used the term "beautyshop quartets" for women's quartets singing in the barbershop style.

Notable female groups include:

- The Cracker Jills with Renee Craig
- Ambiance

Barbershop groups with both male and female members are known as *mixed barbershop* groups.

# Organization

Singing a cappella music in the barbershop style is a hobby enjoyed by men and women worldwide. The hobby is practiced mostly within one of the three main barbershop associations, which have a combined membership in the neighborhood of eighty thousand.

The primary men's organization in the US and Canada is the Barbershop Harmony Society, previously known as the **Society for the Preservation and Encouragement of Barber Shop Quartet Singing in America (SPEBSQSA)**. Women have two organizations in North America, Sweet Adelines International and Harmony Incorporated.

SPEBSQSA was founded in 1938 by Tulsa, Oklahoma tax attorney O. C. Cash. The name was a lampoon on the New Deal "alphabet agencies". *Sweet Adelines, Inc* was founded in 1945 by Edna Mae Anderson, also of Tulsa. *Harmony, Incorporated* split from Sweet Adelines in 1957 over a dispute regarding admission of black members. SPEBSQSA and Sweet Adelines at that time restricted their membership to whites, but both opened membership to all races a few years later.

All three organizations comprise choruses and quartets that perform and compete regularly throughout the US and Canada, and Sweet Adelines International also has a portion of its membership outside North America. Organizations affiliated with the Barbershop Harmony Society and Harmony Incorporated exist in the United Kingdom, The Netherlands, Germany, Ireland, South Africa, Scandinavia, New Zealand, Australia, Japan, and elsewhere. Some national and regional barbershop groups include:

- Sweet Adelines International (SAI)
- Barbershop in Germany (BinG)
- British Association of Barbershop Singers (BABS)
- Ladies Association of British Barbershop Singers (LABBS)
- Dutch Association of Barbershop Singers (DABS)
- Ladies Association of Dutch Barbershop Singers (Holland Harmony)
- Society of Nordic Barbershop Singers (SNOBS)
- Southern Part of Africa Tonsorial Singers (SPATS)
- New Zealand Association of Barbershop Singers (NZABS)
- Australian Association of Men's Barbershop Singers (AAMBS)
- Irish Association of Barbershop Singers (IABS)

A worldwide association for mixed groups, the Mixed Harmony Barbershop Quartet Association, was established in 1995 to reflect the growing popularity of male-female barbershop singing.

BHS (Barbershop Harmony Society) Districts:

Cardinal District(CAR), Kentucky & Indiana

Central States District(CSD), Missouri, Iowa, Kansas, Nebraska, South Dakota

Dixie District(DIX), Tennessee, Mississippi, Alabama, Georgia, Carolinas

Evergreen District(EVG), Washington, Oregon, Alaska, Idaho, Montana, western Canada

Far Western District(FWD), California, Arizona, Nevada, Hawaii

Illinois District(ILL), the entire state of Illinois

Johnny Appleseed District(JAD), Ohio, West Virginia, western Pennsylvania

Land O'Lakes District(LOL), Wisconsin, Minnesota, North Dakota, Michigan UP,

central Canada

Mid-Atlantic District(MAD), Virginia, Maryland, Pennsylvania, Delaware, New Jersey, New York City Metro/Long Island

Northeastern District(NED), eastern New York, all of New England, eastern Canada

Ontario District(ONT), the Canadian province of Ontario (east of Thunder Bay)

Pioneer District(PIO), lower Michigan and Windsor, ON

Rocky Mountain District(RMD), Colorado, Wyoming, New Mexico, Utah

Seneca Land District(SLD), most of New York, northwestern Pennsylvania

Southwest District(SWD), Texas, Louisiana, Arkansas, Oklahoma, New Mexico

Sunshine District(SUN), Florida

## Notable artists

### Quartets

Acoustix, 1990 international quartet champions  
Bluegrass Student Union, 1978 international quartet champions  
The Buffalo Bills, 1950 international champions, appeared in stage and screen productions of The Music Man, frequently appeared on Arthur Godfrey's radio show  
The Chordettes, women's quartet, recorded a number of mainstream popular hits during the 1950s, notably Mr. Sandman  
The Dapper Dans of Disney, who regularly sing to visitors at Disneyland, and who sang as The Be Sharps in a Simpsons episode, and, more recently, as the Singing Busts in Disney's 2003 Haunted Mansion movie  
The Gas House Gang, 1993 international quartet champions from St. Louis, Missouri  
The Haydn Quartet, early 1900s quartet  
FRED, 1999 international quartet champions, comedy quartet  
Platinum, 2000 international quartet champions  
Michigan Jake, 2001 international quartet champions  
Four Voices, 2002 international quartet champions  
Power Play, 2003 international quartet champions  
Gotcha!, 2004 international quartet champions  
Realtime, 2005 international quartet champions  
The Singing Senators, a quartet of Republican U.S. Senators

### Choruses

- The Big Apple Chorus , based out of Manhattan has competed internationally, performed in Russia, and makes up the "Singing Chorus Tree" at South Street Seaport every holiday season.
- Cambridge Chord Company, twice European champion barbershop chorus and British Association of Barbershop Singers gold medallists, "Choir of the World" International Eisteddfod 2004, based in England
- The Louisville Thoroughbreds , seven-time international champions
- The Masters of Harmony , six-time international champions (1990, 1993, 1996, 1999, 2002, 2005)
- The MegaCity Chorus , based out of Toronto, On. Up and Coming Chorus formerly Directed by June Dale and now Directed by Chris Arnold.
- The New Tradition Chorus , based out of Northbrook, IL, in the Chicagoland area. They are the 2001 International Chorus Champion and current 3rd place bronze medalist. Won a record eight consecutive silver medals.
- North Metro Chorus, three-time Sweet Adelines International chorus champions from Toronto, Ontario Directed by June Dale.
- The Singing Buckeyes , based in Columbus, Ohio, are eleven-times Johnny Appleseed District (Ohio, the western part of Pennsylvania and most of West

Virginia) Chorus Champions. They have competed many times at the international level, achieving a highest finish of third place. The chapter hosts the *Buckeye Invitational* each August. Men's and Women's quartets, mixed quartets, comedy quartets, and choruses compete head-to-head for the championships of their respective category.

- Toronto Northern Lights , five-time international silver medallist chorus from Toronto, Ontario.
- The Vocal Majority , based in Dallas, TX, ten-time international champions (1975, 1979, 1982, 1985, 1988, 1991, 1994, 1997, 2000, 2003)
- The Great Northern Union , perennial international top 10 chorus, based in the Minneapolis, Minnesota area
- The Rich-Tone Chorus, three-time Sweet Adelines international chorus champions from Richardson, Texas
- Pacific Coast Harmony, two-time International competitor from La Jolla, California, in the greater San Diego area.
- Voices In Harmony, a brand new chorus developing in California's Bay Area, under the direction of Dr. Greg Lyne.

## Typical Barbershop Songs

Barbershop Harmony Society "Polecats" — songs which all Barbershop Harmony Society members are encouraged to learn as a shared repertoire — all famous, traditional examples of the genre:

"Down Our Way"  
"Down by the Old Mill Stream"  
"Honey/Li'l Lize Medley"  
"Let Me Call You Sweetheart"  
"My Wild Irish Rose"  
"Shine on Me"  
"The Story of the Rose" ("Heart of My Heart")  
"Sweet Adeline"  
"Sweet and Lovely"  
"Sweet, Sweet Roses of Morn"  
"Wait 'Til the Sun Shines, Nellie"  
"You Tell Me Your Dream (I'll Tell You Mine)"

There are also several other well-known songs in the genre. Some are considered standards, such as "From the First Hello" and "Goodbye, My Coney Island Baby", while others are well-known because notable quartets are associated with them. An example of the latter is "Come Fly with Me", which gained popularity through association with the 2005 international quartet champion, Realtime.

Examples of other songs popular in the barbershop genre are:

- "Alexander's Ragtime Band"
- "Bright Was the Night"
- "From the First Hello"
- "Goodbye, My Coney Island Baby"
- "I'll Take You Home Again, Kathleen"
- "Yes, Sir, That's My Baby"
- "Come Fly with Me"
- "When My Baby Smiles at Me"
- "Fly Me to the Moon"
- "Hello Mary Lou"
- "Goodnight Sweetheart (It's time to go)"

"Lida Rose" is a song beloved to barbershoppers from Meredith Willson's musical comedy *The Music Man*. A barbershop quartet forms an integral part of the story, and was played by the Buffalo Bills onstage and in the screen adaptation. Barbershoppers love the show's flattering portrayal of the barbershop spirit: four bickering school-board members become inseparable singing comrades once the Music Man shows them how to ring one perfect chord. Purists complain about inauthenticities in Willson's own arrangement, which is often modified slightly for barbershop quartet performances.

# Barbiton

The **barbiton**, or **barbitos** (Gr. [Greek: barbiton] or [Greek: barbitos]; Lat. *barbitus*; Pers. *barbat*, *barbud*), is an ancient [stringed instrument](#) known from Greek and Roman classics, but derived from Persia.

The Greek instrument was a bass version of the kithara, and belonged in the [zither](#) family, but in medieval times, the same name was used to refer to a different instrument that was a variety of [lute](#).

## Ancient Descriptions

Theocritus (xvi. 45), the Sicilian poet, calls the barbitos an instrument of many strings, i.e. more than seven, which was by the Hellenes considered to be a perfect number, and matched the number of strings customary in the kithara.

Anacreon (a native of Teos in Asia Minor) sings that his barbitos only gives out erotic tones.

Pollux (Onomasticon iv. chap. 8, § 59) calls the instrument barbiton or barymite (from [Greek: barous], heavy and [Greek: mitos], a string), an instrument producing deep sounds. The strings were twice as long as those of the pectis and sounded an octave lower.

Pindar (in Athen. xiv. p. 635), in the same line wherein he attributes the introduction of the instrument into Greece to Terpander, tells us one could magadize, i.e. play in two parts at an interval of an octave on the two instruments.

Although in use in Asia Minor, Italy, Sicily, and Greece, it is evident that the barbiton never won for itself a place in the affections of the Greeks of Hellas; it was regarded as a barbarian instrument affected by those only whose tastes in matters of art were unorthodox. It had fallen into disuse in the days of Aristotle, but reappeared under the Romans.

The word barbiton was frequently used for the kithara or [lyre](#).

## Modern Interpretation

In spite of the few meagre shreds of authentic information extant concerning this somewhat elusive instrument, it is possible nevertheless to identify the barbiton as it was known among the Greeks and Romans. From the Greek writers we know that it was an instrument having some feature or features in common with the [lyre](#) and kithara, which warranted classification with it. From the Persians and Arabs we learn that it was a kind of rebab or lute, or a chelys-lyre,[3] first introduced into Europe through Asia Minor by way of Greece, and centuries later into Spain by the Moors, amongst whom it was in the 14th century known as *al-barbet*.

There is a stringed instrument, as yet unidentified by name, of which there are at least four different representations in sculpture, which combines the characteristics of both lyre and rebab, having the vaulted back and gradual narrowing to form a neck which are typical of the rebab and the stringing of the lyre. In outline it resembles a large lute with a wide neck, and the seven strings of the lyre of the best period, or sometimes nine, following the decadent lyre. Most authors in reproducing these sculptures showing the barbiton represent the instrument as boat-shaped and without a neck, as, for instance, Carl Engel. This is due to the fact that the part of the instrument where neck joins body is in deep shadow, so that the correct outline can hardly be distinguished, being almost hidden by hand on one side and drapery on the other.

## Transformation into the Barbat

The barbiton, as pictured here, had probably undergone considerable modification at the hands of the Greeks and had diverged from the original type. The barbiton, however, although it underwent many changes, retained until the end the characteristics of the instruments of the Greek [lyre](#) whose strings were strummed and plucked, whereas the rebab was sounded by means of the bow at the time of its introduction into Europe.

At some period not yet determined, which we can but conjecture, the barbat approximated to the form of the large *lute* (*q.v.*). An instrument called barbiton was known in the early part of the 16th and during the 17th century. It was a kind of theorbo or bass-lute, but with one neck only, bent back at right angles to form the head. Robert Fludd gives a detailed description of it with an illustration:

*"Inter quas instrumenta non nulla barbato simillima effinxerunt cujus modi sunt illa quae vulgo appellantur theorba, quae sonos graviores reddunt chordasque nervosas habent."*

The people called it *theorbo*, but the scholar having identified it with the instrument of classic Greece and Rome called it barbiton. The barbiton had nine pairs of gut strings, each pair being in unison. Dictionaries of the 18th century support Fludd's use of the name barbiton. G. B. Doni[8] mentions the barbiton, defining it in his index as *Barbitos seu major chelys italice tiorba*, and deriving it from lyre and cithara in common with testudines, tiorbas and all tortoiseshell instruments. Claude Perrault,[9] writing in the 18th century, states that "les modernes appellent notre luth barbiton" (the moderns call our lute barbiton). Constantijn Huygens[10] declares that he learnt to play the barbiton in a few weeks, but took two years to learn the cittern.

The *barbat* was a variety of *rebab* (*q.v.*), a bass instrument, differing only in size and number of strings. This is quite in accordance with what we know of the nomenclature of musical instruments among Persians and Arabs, with whom a slight deviation in the construction of an instrument called for a new name. The word *barbud* applied to the barbiton is said to be derived from a famous musician living at the time of Chosroes II. (A.D. 590-628), who excelled in playing upon the instrument. From a later translation of part of the same authority into German[13] we obtain the following reference to Persian musical instruments: "Die Sanger stehen bei seinem Gastmahl; in ihrer Hand Barbiton(i.) und Leyer(ii.) und Laute(iii.) und Flote(iv.) und Deff (Handpauke)." Mr Ellis, of the Oriental Department of the British Museum, has kindly supplied the original Persian names translated above, i.e. (i.) barbut, (ii.) chang, (iii.) rubb, (iv.) nei. The barbut and rubab thus were different instruments as late as the 19th century in Persia. There were but slight differences if any between the archetypes of the pear-shaped rebab and of the lute before the application of the bow to the former—both had vaulted backs, body and neck in one, and gut strings plucked by the fingers. (K. S.)

# Barcarolle

A **barcarolle** (from French; also Italian **barcarola**, **barcarole**) is a folk song sung by Venetian gondoliers, or a piece of music composed in that style. In [classical music](#), the two most famous barcarolles are that by Jacques Offenbach, from his [opera](#) *The Tales of Hoffmann*, and Frédéric Chopin's barcarolle for solo piano, in F-sharp major, opus 60.

A barcarolle is characterized by a rhythm reminiscent of the gondolier's stroke, almost invariably a moderate tempo 6/8 meter. While the most famous barcarolles are from the [Romantic](#) period, the genre was well-enough known in the 18th century for Burney to mention, in *The Present State of Music in France and Italy* (1771), that it was a celebrated form cherished by "collectors of good taste." It was a popular form in opera, where the apparently artless sentimental style of the folklike song could be put to good use: in addition to the Offenbach example, Paisiello, Weber, and Rossini wrote arias which were barcarolles, and Verdi included a barcarolle in *Un Ballo in Maschera*: (Richard's atmospheric "Di' tu se fidele il flutto m'a spetta" in Act I). Schubert, while not using the name specifically, used a style reminiscent of the barcarolle in some of his most famous songs, including especially his haunting "Auf dem Wasser zu singen" ("to be sung on the water"), D.774.

Other famous barcarolles include the three Venetian gondolier's songs from *Songs without Words*, opus 19, opus 30 and opus 62 by Felix Mendelssohn; the "June" barcarolle from Tchaikovsky's *The Seasons*; Bela Bartók's "Barcarolla" from *Out of Doors*; several examples by Rubenstein, Balakirev, Glazunov, and MacDowell; and most impressively of all, the collection of thirteen by Gabriel Fauré for solo piano.

**Baritenor**

Baritone

Bass-baritone

Bass

A **baritenor** is a male voice whose tessitura lies between the baritone and the tenor. The word is frequently used to describe one of the most common male musical vocal types, a baritone with an upward extension into tenor territory (but with a baritone quality.)

In classical music, the term may be used to describe male vocal students who have not determined into which voice type they will mature. It is rarely used to describe an adult voice, as baritones can have an extension. A baritenor is closest in tessitura to the heldentenor, a special tenor having a thick-baritone lower register. The baritenor's voice is more lyrical in quality, and usually cannot pitch as high. A baritenor's range is usually B2 to A4.

The French designation for a light, flexible baritone between the baritone and the tenor range is **baryton-martin**, after the singer Jean-Blaise Martin (1768-1837). Examples of roles written for this rare voice type include Pelléas in Debussy's Pelléas et Mélisande and Ramiro in Ravel's L'Heure espagnole. Pierre Bernac, Jacques Jansen and Camille Maurane were famous barytons-martin.

Occasionally in soul music, like the mezzo-soprano, a baritenor is a person of full voice, capable of singing both baritone and tenor. This classification is not as widely used as mezzo-soprano however.

It is a common misconception that voices are classified by vocal range when it is vocal timbre or quality that is the major discriminating factor. A contrived quality or timbre, rather than the sound related to the individuals natural quality, can lead to frequent misclassification or extraordinary sub-groups. The Bayton-Martin and Baritenor are the best examples of contrived, rather than natural intonation. The manipulation of the upper register in order to achieve a wider vocal range, leads to vowel distortion that clashes with the harmonics of a voice free of the need for such physical distortion.

**Baritone**

[Bass-baritone](#)

[Bass](#)

In music, a **baritone** (from Greek βαρυτόνος 'deeply, heavily sounding') is a male voice of intermediate pitch, between [bass](#) and [tenor](#). It is typically written for in the range G one octave and a fourth below middle C to E above middle C (i.e. G<sub>2</sub>-E<sub>4</sub>), though it is often extended at the top .

# Types of baritone and baritone roles in operas

The baritone voice is may be subdivided as follows:

## Dramatic baritone

A voice with a somewhat heavier, darker quality. A typical role for dramatic baritones in opera is a villainous role. This category cooresponds roughly to the Heldenbariton in the German fach system except that here we have separated out the Verdi baritones from these lower dramatic baritones. These roles are also called bass-baritone roles. Many of these parts are in operas by Wagner. Generally these parts do not rise above a F so they are within reach of basses who want to move up. James Morris is an example of a successful bass who moved into this repetoire with even more success.

Alberich (Das Rheingold)  
Amfortas (Parsifal)  
Escamillo (Carmen)  
Hans Sachs (Die Meistersinger von Nürnberg)  
Pizarro (Fidelio)  
Prince Igor (Prince Igor)  
The Dutchman (Der fliegende Holländer)  
Wotan (Das Rheingold, Die Walküre, Siegfried)  
Nick Shadow (The Rake's Progress)

*The Tosca classification problem.* The part of Scarpia in Tosca is a rare dramatic bass-baritone part in Italian opera. It only rises to a brief F# and has often been successfully assayed by basses like Sam Ramey and Ruggerio Raimondo and heldenbaritones like James Morris and George London. Scarpia can also be sung of course by by high Verdi Baritones like Leo Nucci or Sherill Milnes because it never goes very low.

*The Don Giovanni classification problem.* From the nineteen thirties through the nineteen eighties the title role of Don Giovanni was dominated at the Met by the star basses Ezio Pinza and then Cesari Siepi. At the 1788 premiere in Vienna the Don was sung by the lightest male voice among the low male parts. He is referred to as a baritone in most modern scores and in the New Grove Dictionary of Opera. In the German fach system the part of Don Giovanni is referred to as a Kavalierbariton.

The Vienna premier cast had the same singer (Bussani) sing Masetto and the Commendatore. He was a bass who also sang Bartolo in Le Nozze di Figaro and Alfonso in Così fan tutte. The part of Leporello was sung by the same singer (Benucci) who created the role of Guglielmo in Così and Figaro in Le Nozze di Figaro - one of which is today cast with a baritone and the other with a bass.

In fact all the non-tenor male parts in Don Giovanni have exactly the same vocal range and can be sung by either a baritone or a bass. The part of the Commendatore today is almost always sung by a bass but the part of Masetto is usually split off and sung by another singer - often a baritone. The title role requires a good deal of stage presence and charisma and is therefore usually sung by the sexiest low male voiced singer available whatever his nominal vocal classification.

## Lyric baritone

A voice that is lighter and perhaps mellower than the dramatic baritone. It is probably the most common of the baritone voice types. A typical role for a lyric baritone in opera is a comical role.

Enrico Ashton (Lucia di Lammermoor)  
Eugene Onegin (Eugene Onegin)  
Figaro (Il barbiere di Siviglia)  
Fritz (Die tote Stadt)  
Gianni Schicchi (Gianni Schicchi)  
Hamlet (Hamlet)  
Lescaut (Manon)  
Papageno (Die Zauberflöte)  
Peter (Hänsel und Gretel)  
Rodrigo (Don Carlos)  
Wolfram von Eschenbach (Tannhäuser)  
Zurga (Les Pêcheurs de Perles)

- *Verdi baritone* is a more specialized voice category, referring to a voice capable of singing consistently and with ease in the highest part of the baritone range, perhaps even up to the A above middle C. A typical role in opera for Verdi baritones is similar to the dramatic baritone: a cold-blooded villain.

Ezio (Attila)  
Don Carlo (Ernani)  
Germont (La traviata)  
Gusmano (Alzira)  
Il Conte di Luna (Il trovatore)  
Macbeth (Macbeth)  
Miller (Luisa Miller)  
Nabucco (Nabucco)  
Rigoletto (Rigoletto)  
Iago (Otello)  
Tonio (Pagliacci)  
Gerard (Andrea Chenier)

## The Verdi baritone

A very specific career. These parts are sung by specialists who can carry a great deal of voice above the staff. Almost all these parts have an aria which climaxes with a high G. The ideal Verdi baritone must have ring and bite. These baritones have dark qualities to their voices and must be able to project over a large orchestra (Much larger than orchestra's prior to Verdi's day). Verdi baritones must be ample actors and have the ability to portray both father's and villains. The voice needs to be able to sing from a high Ab and even a A, in some cases, down to a low A with hardly any change in color or dynamic. Verdi requires the baritone to sing both high and loud but also requires the voice to sing high sustained pianissimo's. These voices must be able to sustain a true and long legato and must have ample breath control. Before Verdi there were nearly no roles like this. Mozart has very high soprano parts and very low bass parts but only tenors sang as high as a G in his operas. Rossini, wrote his male parts for tenors and basses almost exclusively. Figaro in the comic opera Barber of Seville is the one notable exception. In the more typical comic opera Cenerentola there is one tenor and three basses. In his serious operas Rossini (Elizabetha, Ricciardo e Zoraide, Otello, Armida, etc.) the villain is sung by a tenor with good low notes. Most Bellini operas (Norma, Somnambula) have no high baritone parts. Bellini's last opera I Puritani has a real

baritone part as does Ashton in Donizetti's Lucia. But in general there were no high baritone parts before Verdi.

### **The *baryton-noble***

French for 'noble baritone'. Describes a part that requires a noble bearing, smooth vocalisation and forceful declamation, all in perfect balance. This category originated in the Paris Opéra, but it greatly influenced Verdi (Don Carlo in Ernani and La forza del destino; Count Luna in Il trovatore; Simone Boccanegra) and Wagner, too. (Wotan; Amfortas)

Huascar Les Indes galantes (Rameau)  
Oreste Iphigénie en Tauride  
Créon in Medée  
Guillaume in Guillaume Tell  
Alphonse de Castille in La favorite  
Comte de Saint-Bris in Les huguenots  
Hamlet in Hamlet  
Scindia in Le roi de Lahore  
Hérode in Hérodiade  
Jules-César in Cléopâtre  
Golaud in Pelléas et Mélisande

### **The Martin baritone**

A lighter, almost tenor-like voice developed at the Opéra Comique. Quite common also in operette and in French chamber music. Typical examples: Jean Perier; Hugues Cuénod; Camille Mauranne.

- Pelléas Pelléas et Mélisande

## Baritone Roles in Operettas and Musicals

Graf von Krolock (Tanz der Vampire)  
Raoul (Phantom of the Opera), but tenors have played the role  
Rueben (Joseph and the Amazing Technicolor Dreamcoat)  
Pharaoh (Joseph and the Amazing Technicolor Dreamcoat)  
Marius (Les Miserables), although it was written primarily for a tenor  
Javert (Les Miserables)  
Thénardier (Les Miserables)  
Grantaire (Les Miserables)  
Billy Bigelow (Carousel)  
Tom Collins (Rent)  
Chauvelin (The Scarlet Pimpernel) (requires extended range on top)  
Monsieur Andre and Monsieur Firmin (Phantom of the Opera)  
Pontius Pilate (Jesus Christ Superstar), though his climax may require falsetto  
King Herod (Jesus Christ Superstar)  
Rum Tum Tugger (Cats)  
Harold Hill (The Music Man)  
The Cat in the Hat (Seussical)  
Horton the Elephant (Seussical)  
Professor Henry Higgins (My Fair Lady)  
Don Quixote/Cervantes (Man of La Mancha)  
Fagin (Oliver!)  
Jud Fry (Oklahoma!)  
Curly (Oklahoma!)  
Pseudolus (A Funny Thing Happened on the Way to the Forum)  
Max Bialystock (The Producers)  
Franz Liebkind (The Producers)  
Coalhouse Walker Jr. (Ragtime)  
Benjamin Barker (Sweeney Todd)  
Father (Ragtime)  
Ko-Ko (The Mikado)  
Sir Joseph Porter (HMS Pinafore)  
Major-General Stanley (The Pirates of Penzance)  
Baron Bomburst (Chitty Chitty Bang Bang) (stage version)  
John Adams (1776)  
Thomas Jefferson (1776)  
John Dickinson (1776)  
Edward Rutledge (1776)  
Billy Flyn (Chicago)  
Dr. Frank-N-Furter (The Rocky Horror Show)  
Princeton/Rod (Avenue Q)  
Tevye (Fiddler on the Roof)  
Hero (A Funny thing Happened on the way to the forum)  
Kio (Pirates: a Romeo and Juliet Story)

## Barbershop baritone

In barbershop music, the baritone part sings in a similar but somewhat lower range to the lead (singing the melody), but has a specific and specialised role in the formation of the four-part harmony that characterises the style. Because barbershop singers can also be female, there is consequently such a singer (at least in barbershop singing) as a female baritone. The baritone singer is often the one required to support or 'fill' the bass sound (typically by singing the fifth above the bass root). On the other hand, the baritone will occasionally find himself harmonising above the melody, which calls for a tenor-like quality. Because of the nature of barbershop arrangements the baritone part is invariably the most challenging to learn and the hardest to improvise.

# Baroque metal

**Baroque metal** is a style of soft and stylistic metal [music](#) largely practiced in Italy and Scandinavia. The first baroque metal song is the 1986 song "Born Under the Sign of Highness" by the band Juste.

Baroque metal was developed in the mid-1990s primarily by the Italian band Rhapsody, who were influenced by composers such as Johann Sebastian Bach and Arcangelo Corelli, and by sounds from Hollywood fantasy [soundtracks](#) and folklore music from all over the world. [Power metal](#) totally differs from 1970s metal styles, since it adds important elements of depth, [classical](#) arrangements, complex scores and intricated [melodies](#). Whereas most genres of metal focus largely on personal experience, historical incidents, social commentary, or other aspects of "real life", baroque metal always treats fantasy, aristocratic, castles, battles and kings [themes](#).

Baroque metal [vocals](#) are always clean (as opposed to the antithetic vocals that characterize many of the other metal styles) and delivered by a trained vocalist; singing baroque metal involves more than a few high notes. Often baroque metal vocals have multi-layer vocals similar to Queen.

Typical baroque metal bands consist of a vocalist, one to three keyboardists, a guitarist, a bassist, and a drummer. Many bands also play and record with more [symphonic](#) elements, such as [violins](#), [flutes](#) and [harps](#).

## [Contemporary classical music](#)

**Baroque music** describes an era and a set of styles of [European classical music](#) which were in widespread use between approximately 1600 to 1750 (see [Dates of classical music eras](#) for a discussion of the problems inherent in defining the beginning and end points). This era is said to begin in music after the [Renaissance](#) and to be followed by the [Classical music era](#). The original meaning of "baroque" is "irregularly shaped pearl", a strikingly fitting characterization of the architecture and design of this period; later, the name came to be applied also to its music. Baroque music forms a major portion of the classical music canon. It is widely performed, studied and listened to. It is associated with composers such as J.S. Bach, George Friedrich Händel, Antonio Vivaldi, and Claudio Monteverdi. During the period, music theory, diatonic tonality, and imitative counterpoint developed. More elaborate musical ornamentation, as well as changes in musical notation and advances in the way instruments were played also appeared. Baroque music would see an expansion in the size, range and complexity of performance, as well as the establishment of [opera](#) as a type of musical performance. Many musical terms and concepts from this era are still currently in use.

# Overview

## Style and trends

Music conventionally described as Baroque encompasses a wide range of styles from a wide geographic region, mostly in Europe, composed during a period of approximately 150 years. The term "Baroque", as applied to this period in music is a relatively recent development, first being used by Curt Sachs in 1919, and only acquiring currency in English in the 1940s. Indeed, as late as 1960 there was still considerable dispute in academic circles whether it was meaningful to lump together music as diverse as that of Jacopo Peri, Domenico Scarlatti and J.S. Bach with a single term; yet the term has become widely used and accepted for this broad range of music. It may be helpful to distinguish it from both the [preceding \(Renaissance\)](#) and [following \(Classical\)](#) periods of musical history. A small number of musicologists argue that it should be split in to Baroque and Mannerist periods to conform to the divisions that are sometimes applied in the visual arts.

### Baroque versus Renaissance style

Baroque music shares with Renaissance music a heavy use of polyphony and [counterpoint](#). However, its use of these techniques differs from Renaissance music. In the Renaissance, harmony is more the result of consonances incidental to the smooth flow of polyphony, while in the early Baroque era the order of these consonances becomes important, for they begin to be felt as chords in a hierarchical, functional tonal scheme. Around 1600 there is considerable blurring of this definition: for example one can see essentially tonal progressions around cadential points in madrigals, while in early monody the feeling of tonality is still rather tenuous. Another distinction between Renaissance and Baroque practice in harmony is the frequency of chord root motion by [third](#) in the earlier period, while motion of [fourths](#) or [fifths](#) predominates later (which partially defines functional tonality). In addition, Baroque music uses longer lines and stronger rhythms: the initial line is extended, either alone or [accompanied](#) only by the basso continuo, until the theme reappears in another voice. In this later approach to counterpoint, the harmony was more often defined either by the basso continuo, or tacitly by the notes of the theme itself.

These stylistic differences mark the transition from the *ricercars*, *fantasias*, and [canzonas](#) of the Renaissance to the fugue, a defining Baroque form. Monteverdi called this newer, looser style the *seconda pratica*, contrasting it with the *prima pratica* that characterized the [motets](#) and other sacred [choral](#) pieces of high Renaissance masters like Giovanni Pierluigi da Palestrina. Monteverdi himself used both styles; he wrote his [Mass](#) *In illo tempore* in the older, Palestrinan style, and his 1610 Vespers in the new style.

There are other, more general differences between Baroque and Renaissance style. Baroque music often strives for a greater level of emotional intensity than Renaissance music, and a Baroque piece often uniformly depicts a single particular emotion (exultation, grief, piety, and so forth; see doctrine of the affections). Baroque music was more often written for virtuoso singers and instrumentalists, and is characteristically harder to perform than Renaissance music, although idiomatic instrumental writing was one of the most important innovations of the period. Baroque music employs a great deal of ornamentation, which was often improvised by the performer. Expressive

performance methods such as [notes inégales](#) were common, and were expected to be applied by performers, often with considerable latitude. Instruments came to play a greater part in Baroque music, and a cappella vocal music receded in importance.

### Baroque versus Classical style

In [the Classical era](#), which followed the Baroque, the role of counterpoint was diminished (albeit repeatedly rediscovered and reintroduced; see fugue), and replaced by a homophonic texture. The role of ornamentation lessened. Works tended towards a more articulated internal structure, especially those written in [sonata form](#). Modulation (changing of keys) became a structural and dramatic element, so that a work could be heard as a kind of dramatic journey through a sequence of musical keys, outward and back from the tonic. Baroque music also modulates frequently, but the modulation has less structural importance. Works in the classical style often depict widely varying emotions within a single movement, whereas Baroque works tend toward a single, vividly portrayed feeling. Lastly, Classical works usually reach a kind of dramatic climax and then resolve it; Baroque works retain a fairly constant level of dramatic energy to the very last note. Many forms of the Baroque would serve as the point of departure for the creation of the [sonata form](#), by creating a "floor plan" for the placement of important cadences.

### Other features

- *basso continuo* - a kind of continuous accompaniment notated with a new music notation system, figured bass, usually for a sustaining bass instrument and a keyboard instrument
- monody - music for one melodic voice with [accompaniment](#), characteristic of the early 17th century, especially in Italy
- homophony - music with one melodic voice and rhythmically similar accompaniment (this and monody are contrasted with the typical Renaissance [texture](#), polyphony)
- text over music - intelligible text with instrumental accompaniment not overpowering the voice
- vocal soloists ('bel canto')
- dramatic musical expression
- dramatic musical forms like [opera](#), *drama per musica*
- combined instrumental-vocal forms, such as the [oratorio](#) and [cantata](#)
- new instrumental techniques, like tremolo and pizzicato
- clear and linear [melody](#).
- [notes inégales](#), a technique of applying dotted rhythms to evenly written notes
- the [aria](#)
- the *ritornello* aria (repeated short instrumental interruptions of vocal passages)
- the [concertato](#) style (contrast in sound between orchestra and solo-instruments or small groups of instruments)
- precise instrumental scoring (in the Renaissance, exact instrumentation for ensemble playing was rarely indicated)
- idiomatic instrumental writing: better use of the unique properties of each type of [musical instrument](#)
- virtuosic instrumental and vocal writing, with appreciation for virtuosity as such
- [ornamentation](#)
- development to modern Western tonality (major and minor scales)

### Genres

Baroque composers wrote in many different musical genres. [Opera](#), invented in the late Renaissance, became an important musical form during the Baroque, with the operas of Alessandro Scarlatti (1660–1725), Handel, and others. The [oratorio](#) achieved its peak in the work of Bach and Handel; opera and oratorio often used very similar music forms, such as a widespread use of the da capo aria.

In other religious music, the [mass](#) and [motet](#) receded slightly in importance, but the [cantata](#) flourished in the work of Bach and other Protestant composers. Virtuoso organ music also flourished, with toccatas, fugues, and other works.

Instrumental [sonatas](#) and [dance suites](#) were written for individual instruments, for chamber groups, and for (small) orchestra. The [concerto](#) emerged, both in its form for a single soloist plus orchestra and as the [concerto grosso](#), in which a small group of soloists is contrasted with the full ensemble. The French overture, with its contrasting slow and fast sections, added grandeur to the many courts at which it was performed.

Keyboard works were sometimes written largely for the pleasure and instruction of the performer. These included a series of works by the mature Bach that are widely considered to be the intellectual culmination of the Baroque era: the Well-Tempered Clavier, the Goldberg Variations, and The Art of Fugue.

# Brief history of Baroque music

## Early Baroque music (1600–1654)

The conventional dividing line for the Baroque from the Renaissance begins in Italy, with the composer Claudio Monteverdi (1567–1643), with his creation of a recitative style, and the rise of a form of musical drama called [opera](#). This was part of a self-conscious change in style that was across the arts, most particularly architecture and painting.

Musically the adoption of the figured bass represents a larger change in musical thinking—namely that [harmony](#), that is "taking all of the parts together" was as important as the linear part of polyphony. Increasingly polyphony and harmony would be seen as two sides of the same idea, with harmonic progressions entering the notion of composing, as well as the use of the tritone as a dissonance. Harmonic thinking had existed among particular composers in the previous era, notably Gesualdo, however the Renaissance is felt to give way to the Baroque at the point where it becomes the common vocabulary. Some historians of music point to the introduction of the seventh chord without preparation as being the key break with the past. This created the idea that chords, rather than notes, created the sense of closure, which is one of the fundamental ideas of what would much later be called tonality.

Italy formed one of the cornerstones of the new style, as the papacy, besieged by Reformation but with coffers fattened by the immense revenues flowing in from Hapsburg conquest, searched for artistic means to promote faith in the Roman Catholic Church. One of the most important musical centers was Venice, which had both secular and sacred patronage available.

One of the important transitional figures would come out of the drive to revive Catholicism against the growing doctrinal, artistic and social challenge mounted by Protestantism: Giovanni Gabrieli. His work is largely considered to be in the "High Renaissance" style. However, his innovations became to be considered foundational to the new style. Among these are instrumentation (labeling instruments specifically for specific tasks) and the use of dynamics.

The demands of religion were also to make the text of sacred works clearer, and hence there was pressure to move away from the densely layered polyphony of the Renaissance, to lines which put the words front and center, or had a more limited range of imitation. This would create the demand for a more intricate weaving of the vocal line against backdrop, or homophony.

Monteverdi became the most visible of a generation of composers who felt that there was a secular means to this "modern" approach to harmony and text, and in 1607 his opera Orfeo would be the landmark which demonstrated the welter of effects and techniques that were associated with this new school, called *seconda pratica*, to distinguish it from the older style or [prima pratica](#). Monteverdi was a master of both, producing precisely styled motets that extended the forms of Marenzio and Giaces de Wert. But it is his new style pieces which were to be the most visible changes to the Baroque. These included features which are recognizable even to the end of the baroque period, including use of idiomatic writing, virtuoso flourishes and what Stanley Sadie calls "a thorough going" use of new techniques.

This musical language would prove to be international, as Heinrich Schütz (1585–1672) a German composer who studied in Venice, would adopt it to the liturgical needs of the Elector of Saxony, and serve as the choir master in Dresden.

Girolamo Frescobaldi (1583–1643).

## Middle Baroque music (1654–1707)

The most influential middle Baroque composers include Jean-Baptiste Lully (1632–1687), Arcangelo Corelli (1653–1713), Dieterich Buxtehude (1637–1707) and Henry Purcell (1659–1695).

## Late Baroque music (1707–1760)

Leading figures of the late Baroque include J.S. Bach (1685–1750), George Frideric Handel (1685–1759), Georg Philipp Telemann (1681–1767), Domenico Scarlatti (1685–1757), Antonio Vivaldi (1678–1741) and Jean-Philippe Rameau (1683–1764).

## The Baroque's influence on later music

### Transition to the Classical era (1740–1780)

The phase between the late Baroque and the early Classical era, with its broad mixture of competing ideas and attempts to unify the different demands of taste, economics and "worldview", goes by many names. It is sometimes called "[Galant](#)", "Rococo", or "pre-Classical", or at other times, "early Classical". It is a period where composers still working in the Baroque style are still successful, if sometimes thought of as being more of the past than the present—Bach, Handel and Telemann all compose well beyond the point at which the homophonic style is clearly in the ascendant. Musical culture was caught at a crossroads: the masters of the older style had the technique, but the public hungered for the new. This is one of the reasons C.P.E. Bach was held in such high regard: he understood the older forms quite well, and knew how to present them in new garb, with an enhanced variety of form; he went far in overhauling the older forms from the Baroque.

The practice of the Baroque era was the norm against which new composition was measured, and there came to be a division between sacred works, which held more closely to the Baroque style from, secular, or "profane" works, which were in the new style.

Especially in the Catholic countries of central Europe, the Baroque style continued to be represented in sacred music through the end of the eighteenth century, in much the way that the *stile antico* of the Renaissance continued to live in the sacred music of the early 17th century. The masses and oratorios of Haydn and Mozart, while Classical in their orchestration and ornamentation, have many Baroque features in their underlying contrapuntal and harmonic structure. The decline of the baroque saw various attempts to mix old a new techniques, and many composers who continued to hew to the older forms well into the 1780's. Many cities in Germany continued to maintain performance practices from the Baroque into the 1790's, including Leipzig.

In England, the enduring popularity of Handel ensured the success of Avison, Boyce, and Arne—among other accomplished imitators—well into the 1780s. By this time it was thought of as an older style, and was required for graduation from the burgeoning number of [conservatories](#) of music, and for compositions written for the sacred context.

### Influence of Baroque composition and practice after 1760

Because Baroque music was the basis for pedagogy, it retained a stylistic influence even after it has ceased to be the dominant style of composing or of music making. Even as baroque practice, for example the thoroughbass, fell out of use, it continued to be part of musical notation. In the early 19th century, scores by Baroque masters were printed in complete edition, and this led to a renewed interest in the "strict style" of counterpoint, as it was then called. With Felix Mendelssohn's revival of Bach's choral music, the Baroque style became an influence through the 19th century as a paragon of academic and formal purity. Throughout the 19th century, the fugue in the style of Bach held enormous influence for composers as a standard to aspire to, and a form to include in serious instrumental works.

The 20th century would name the Baroque as a period, and begin to study its music. Baroque form and practice would influence composers as diverse as Arnold Schoenberg, Max Reger, Igor Stravinsky and Béla Bartók. The early 20th century would also see a revival of the middle Baroque composers such as Purcell and Vivaldi.

There are several instances of contemporary pieces being published as "rediscovered" Baroque masterworks. Some examples of this include a viola concerto written by Henri Casadesus but attributed to Handel, as well as several pieces attributed by Fritz Kreisler to lesser-known figures of the Baroque such as Pugnani and Padre Martini. Today, there is a very active core of composers writing works exclusively in the Baroque style, an example being Giorgio Pacchioni.

Various works have been labeled "neo-Baroque" for a focus on imitative polyphony, including the works of Giacinto Scelsi, Paul Hindemith, Paul Creston and Martinu, even though they are not in the Baroque style proper. Musicologists attempted to complete various works from the Baroque, most notably Bach's *The Art of Fugue*. Because the Baroque style is a recognized point of reference, implying not only music, but a particular period and social manner, Baroque styled pieces are sometimes created for media, such as film and television. Composer Peter Schickele parodies classical and Baroque styles under the pen name PDQ Bach.

Baroque performance practice had a renewed influence with the rise of "Authentic" or Historically Informed Performance in the late 20th century. Texts by Quantz and Leopold Mozart among others, formed the basis for performances which attempted to recover some of the aspects of baroque sound world, including one on a part performance of works by Bach, use of gut strings rather than metal, reconstructed harpsichords, use of older playing techniques and styles. Several popular ensembles would adopt some or all of these techniques, including the Anonymous 4, the Academy of Ancient Music, Boston's Handel and Haydn Society, the Academy of St. Martin in the Fields, William Christie's Les Arts Florissants and others. This movement would then attempt to apply some of the same methods to classical and even early romantic era performance.

# Baroque orchestra

The **Baroque Orchestra** is the earliest example of a true [orchestra](#) which came into existence in the mid-late 1600s. Its origins were in France where Jean-Baptiste Lully added the newly re-designed hautboy and transverse [flutes](#) to his vingt-quatre violons du Roy. As well as violins and woodwind, the baroque orchestra would have still contained continuo instruments such as the theorbo and harpsichord. The new-fangled instrumentation and orchestration soon spread to the rest of Europe and soon became the standard solo instrumental grouping.

The term 'baroque orchestra' can also be (wrongly) used in relation to historically accurate performances of baroque, or even classical or romantic music. Many groups can be found that perform old music in the style that it is believed it would have been performed at the time, using the same instruments and the same performance practices.

Some of the baroque orchestras that play on period instruments are:

The Academy of Ancient Music

Tafelmusik

New Trinity Baroque

The English Concert

Taverner Consort and Players

Newport Baroque Orchestra

Categories: [Baroque music](#) | [Orchestras](#)

## Baroque pop

**Baroque pop** as a style originated in the mid 1960s as the flipside of sunshine pop. It used similar orchestrations but was infused with a melodramatic edge which differed. Much of The Beach Boys' Pet Sounds would fall into this category, as would a lot of the later work of Phil Spector. Scott Walker is another important figure in the genre.

Modern baroque pop is characterized by an infusion of orchestral arrangements or classical type composition within an [indie](#) or [indie pop](#) setting.

Popular baroque pop artists today include:

Rufus Wainwright

Emitt Rhodes

Arcade Fire

Broken Social Scene

The Divine Comedy

Badly Drawn Boy

Sondre Lerche

Antony and the Johnsons

Kings of Convenience

Elliott Smith

Iron & Wine

Fiona Apple

**Bass**

A **bass** (or **basso** in Italian) is a male singer who sings in the lowest vocal range of the human voice. A typical bass has a range extending from around the E below the bottom of the bass clef to the E above middle C (i.e. E2-E4). *Bass* is also used to refer to a low speaking voice.

# Types

In [classical music](#), and particularly in [opera](#), the following distinctions are often made among different kinds of bass voices:

- *Basso profondo* (frequently misspelled *basso profundo*, also French *basse noble*) is a particularly deep and resonant voice. It may reach the D, C or even B flat below the bass clef, but is most distinguished by its dark and cavernous timbre. This kind of bass typically plays an older man.
- *Basso cantante* (French *basse chantante*) is a lighter, more lyrical voice, perhaps with a slightly higher range. A typical role in opera is Escamillo from Bizet's *Carmen*.
- *Basso buffo* literally means "comic bass." It is used to describe operatic roles that do not call for lyrical, elaborate singing but do require a strong comic acting ability. A typical role in opera is Don Bartolo from Rossini's opera *Il barbiere di Siviglia*.
- [Bass-baritone](#) is a voice with the resonant low notes of the typical bass but with the ability to sing in a baritoneal tessitura. Sometimes it also refers to a voice with a range and tone somewhere between a bass and a [baritone](#). A typical role in opera is Wotan from Wagner's *Der Ring des Nibelungen*.

## Bass roles in opera

Sarastro The Magic Flute by (Wolfgang Amadeus Mozart) Dramatic Bass  
Figaro The Marriage of Figaro by (Wolfgang Amadeus Mozart) Bass-Baritone  
King Phillip Don Carlos by (Giuseppe Verdi) Dramatic Bass  
Baculus, Der Wildschütz by (Albert Lortzing) Schwerer Spielbass  
Osmin, Die Entführung aus dem Serail by (Wolfgang Amadeus Mozart) Bass  
Buffo  
Don Pasquale, Don Pasquale by (Gaetano Donizetti) Bass Buffo  
Don Alfonso, Così fan tutte by (Wolfgang Amadeus Mozart) Bass-Baritone  
Zaccaria, Nabucco by (Giuseppe Verdi) Lyric Bass  
Mephistopheles, Faust by (Charles Gounod) Lyric Bass  
König Marke, Tristan und Isolde by (Richard Wagner) Dramatic bass  
Banquo Macbeth by (Giuseppe Verdi) Dramatic bass

## **Bass roles in operettas**

The Mikado of Japan (The Mikado)  
Sergeant of Police (The Pirates of Penzance)  
Old Adam Goodheart (Ruddigore)  
Private Willis (Iolanthe)

## **Bass roles in musicals**

Barney (Pirates: a Romeo and Juliet Story)  
Caiaphas (Jesus Christ Superstar)  
Leon Czolgosz (Assassins)  
Judge Turpin (Sweeney Todd)  
Joe (Showboat)

# Bass guitar

The electric **bass guitar** (also called an **electric bass**, or simply a **bass**) an electrically-amplified [string instrument](#) similar in appearance to an [electric guitar](#), but with a larger body, a longer-[scale](#) neck and four strings tuned an octave lower in [pitch](#) than a guitar. Electric basses may be fretted or fretless, although fretted basses are far more common in most popular music settings. Fretless basses are more common in [jazz-fusion](#) music. As well, there are also hollow-bodied acoustic bass guitars.

Since the 1950s the electric bass has largely replaced the double bass in [popular music](#) as the instrument that provides the low-pitched bassline(s) and [bass runs](#). The electric bass is used as a soloing instrument in jazz, fusion, latin, and funk styles, and bass solos are sometimes performed in other genres.

# History

## 1920s Prototypes

The push to develop an amplified bass instrument can be traced back to the 1920s jazz scene. When jazz groups began to use an individual double bass in small [jazz](#) combos, it was hard for double bass players' unamplified instruments to be heard. An additional factor that may have spurred a search for an alternative instrument may have been the fact that double basses are large and awkward to transport.

In the 1920s and early 1930s, several early prototypes of electric double basses were developed. Even though these instruments had electric pickups, they were still variants of the double bass, because they were unfretted and played vertically. The Audiovox Manufacturing Company in Seattle, Washington had an upright solidbody electric bass on the market by February 1935, designed by Paul Tutmarc, a musician, instrument maker, and amplifier designer.

## 1930s: Fretted basses

Subsequently, Paul Tutmarc developed a guitar-style electric bass instrument that was fretted and designed to be held and played horizontally. Audiovox's sales catalogue of 1935-6 listed what is probably the world's first fretted, solid body electric bass that is designed to be played horizontally - the Model #736 Electric Bass Fiddle. The change to a "guitar" form made the instrument easier to hold and transport; the addition of guitar-style frets enabled bassists to play in tune more easily (which also made the new electric bass easier to learn).

## 1950s and 1960s: Fender Bass

This manufacturer's basses are often referred to as "P" or "J" position pickups, in reference to Precision and Jazz basses. During the 1960s, Fender also produced a six-string bass, the Fender VI, although it was tuned higher than a modern six-string bass.)

Following Fender's lead, other companies such as Gibson, Danelectro, and many others started to produce their own version of the electric bass. Some, like the Rickenbacker 4000 series, became identified with a particular style of music. Rickenbackers were pioneered by Paul McCartney, John Entwistle, Chris Squire, Geddy Lee, and other [progressive rock](#) bassists.

## 1970s: Boutique Bases

In 1971 Alembic established the template for what would subsequently be known as "boutique" or "high end" electric bass. Key design elements included active electronics, premium woods, and multi-laminate neck-through-body construction. Other innovations by Alembic included the world's first graphite-neck bass and one of the early production 5-string bass with a low "B" string, both in 1976. Another manufacturer Ken Smith, a professional Bassist in NY also began producing Bases in the mid 1970s and 5 and 6 string electric basses with a low "B" string in the early 1980s. Ken Smith developed and marketed the first wide spacing six-string electric bass.

## Etymology

While "bass guitar" (pronounced "base") is, generally speaking, a more common term among non-musicians, others prefer "electric bass guitar," "electric bass," or simply "bass." Many are happy to use the terms interchangeably but some express a strong preference for one or other of them.

Fender's early dominance in the market for mass produced bass guitars led to the widespread use of the term "Fender bass" to describe the instrument. After the prominent bassist Carol Kaye published her popular bass instructional book in 1969, entitled *How To Play The Electric Bass*, musician's unions in the United States followed suit, changing the name from Fender Bass to "Electric Bass" in their directories. Additionally, with the plethora of alternative manufacturers producing similar instruments, the term "Fender bass" has largely fallen out of use.

## Design considerations

Musicians have embraced a wide variety of different electric bass designs, which include a huge variety of options for the body, neck, pickups, and other features. Musicians have become open minded towards the new technologies and approaches to musical instrument design that have developed for the electric bass. As well, instruments handmade by highly-skilled masters of the craft of lutherie (guitar-making) are becoming an increasingly popular choice for professional and highly-skilled amateur bassists. These developments have given the modern bass player a wide range of choices when choosing an instrument. Design options include:

### Body

Bodies are typically made of wood although other materials such as graphite (for example, some of the Steinberger designs) have also been used. A wide variety of woods are suitable - the most common include alder, mahogany and ash, and bubinga. The choice of body material and shape can have a significant impact on the [timbre](#) of the completed instrument as well as aesthetic considerations. Other design considerations include:

- A wide range of colored or clear lacquer, wax and oil finishes exploiting the amazing variety of natural wood forms
- Various flat and carved industrial designs for different types of both traditional and exotic woods, large percentage of luthier-produced unique instruments (affecting weight, balance and aesthetics)
- Headed and headless (with tuning carried out using a special bridge, mainly manufactured by Steinberger and Hohner) designs
- Several artificial materials developed especially for instrument building, most notable being luthite
- Unique production techniques for artificial materials, including die-casting for cost-effective complex body shapes

One further variable is the solidity of the body. Most basses have solid bodies but variations include chambers for increased resonance or to reduce weight. Basses are also built with entirely hollow bodies, which changes the tone and resonance of the instrument and allows performers to practice without an amplifier.

Since the size of the resonant chamber for acoustic bass guitars is much smaller than the resonant chambers of other acoustic bass instruments such as the double bass or the guitarron, acoustic bass guitars cannot produce much unamplified volume; as such acoustic bass guitars are typically equipped with piezoelectric or magnetic pickups and amplified. Hollow-bodied bass guitars are discussed in more detail in the article on acoustic bass guitars.

### Number of strings (and tuning)

The standard design electric bass has four strings, tuned E, A, D, G (with the fundamental frequency of the E string set at 41.3 Hz, the same as the lowest string on the double bass). This tuning is the same as the standard tuning on the lower four strings on a 6 string guitar, only a lower octave. The materials used in the strings gives bass players a range of tonal options. String types include all-metal strings (roundwound), metal strings with different coverings, such as tapewound and plastic-coatings, and non-metal strings made of nylon.

As performers sought to expand the range of their instruments, a range of other tuning options and bass types has been used, including:

- Four strings with alternate tuning: B, E, A, D. In this tuning, the instrument has the familiar 4-string "feel," but with the extended lower range. In some styles of music, the basslines tend to focus on the lower range of the instrument, and as such, the loss of the high "G" string may not be a problem. This option is sometimes used by players who do not like the "feel" of the typically thicker, heavier 5-string neck.
- Five strings (normally B, E, A, D, G but sometimes E, A, D, G, C). The 5-string bass (with a low "B") provides added lower range, as compared with the 4-string bass. As well, it gives a player easier access to low notes when playing in the higher positions. The resultant tone of the instrument is usually "thicker," as the fatter strings give fewer harmonics. This is particularly the case for notes on the low "B" string.
- Six strings (B, E, A, D, G, C or B, E, A, D, G, B—although E, A, D, G, B, E has also been used). Six string basses are not very popular, but some noted bass players do use them, such as New Order's Peter Hook and Dream Theater's John Myung. Basses with seven, eight, nine, ten, eleven and even twelve (untripled) strings are also available (see also extended-range bass).
- Double and triple courses of strings (e.g., an 8-string bass would be strung Ee, Aa, Dd, Gg, while a 12-string bass might be tuned Eee Aaa Ddd Ggg, with standard pitch strings augmented by two strings an octave higher), which are found in 8-, 10-, and 12-string varieties (doubled versions of 4, 5, and 6 string basses)
- Guitar bass: Some players - especially players who have shifted over to bass from guitar - like to use the tuning D, G, B, E, two octaves below the first four strings of a guitar.
- Tenor bass: A, D, G, C
- Piccolo bass: e, a, d, g (an octave higher than standard bass tuning—the same as the bottom four strings of a guitar)
- Sub-contra bass: C#, F#, B, E ("C#" being at 18 Hz and the "E"- string being the same as the "E"-string found on standard basses). To amplify the low pitches of this instrument, a subwoofer capable of extended low-range reproduction is needed.
- Detuners, one of which is sold under the name Hipshot, are mechanical devices operated by the left-hand thumb that allow one or more strings to be detuned to a lower pitch. Hipshots are typically used to drop the "E"-string down to "D" on a four string bass). More rarely, some bassists such as Michael Manring will add detuners to more than one string, to enable them to detune strings during a performance and have access to a wider range of chime-like harmonics. This type of tuning peg may be descended from the Scruggs peg, used on [banjos](#).
- Many students cannot afford a new bass or install a detuner on their bass, and tuned every string one note lower; thus giving the same feel as an original 4-string bass, and having the possibility to go lower down to low D (tuned D,G,C,F).

There have also been extended range 11-string basses which go from a low "C#" (below the range of human hearing) up to a high Eb (one semitone below a [guitar's](#) high E), although these are uncommon and are typically custom built instruments. Bill "the Buddha" Dickens is a virtuoso bass player from the US who generally uses a 7-string

bass, but also plays on an 11-string. The additional strings provide Dickens with very low-pitched notes and enable him to play in a chordal style.

## Pickups

The vibrations of the instrument's metal strings within the magnetic field of the permanent magnets in the pickups, produce small variations in the magnetic flux threading the coils of the pickups. This in turn produces small electrical voltages in the coils. These low-level signals are then amplified and played through a speaker. Less commonly, non-magnetic pickups are used, such as piezoelectric pickups which sense the mechanical vibrations of the strings. Since the 1990s, basses are often available with battery-powered "active" electronics that boost the signal and/or provide equalization controls to boost or cut bass and treble frequencies.

Pickup types:

- "P-" pickups (the "P" refers to the original Fender Precision bass) are actually two distinct single-coil halves, wired in opposite direction to reduce hum, each offset a small amount along the length of the body so that each half is underneath two strings.
- "J-" pickups (the "J" refers to the original Fender Jazz bass) are wider single-coil pickups which lie underneath all four strings.
- Soapbar pickups, found, for example, in MusicMan basses, are the same height as a J pickup, but about twice as wide (much like an electric guitar's humbucker). The name comes from the rectangular shape being similar to a bar of soap.

Pickup configuration:

- Many inexpensive basses (as well as older/vintage basses) have just one pickup, typically a "P" or "J" pickup. However, multiple pickups are also quite common, the two most common configurations being a "P" near the neck and a "J" near the bridge (e.g. Fender Precision Deluxe), or two "J" pickups (e.g. Fender Jazz).
- For single pickup systems, the placement of the pickup greatly affects the sound, with a pickup near the neck joint thought to sound "fatter" or "warmer" while a pickup near the bridge is thought to sound "tighter" or "sharper." Some basses use more unusual pickup configurations, such as a Humbucker and "P" pickup (found on some Fenders), Stu Hamm's "Urge" basses, which have a "P" pickup sandwiched between two "J" pickups, and some of Bootsy Collins' custom basses, which had as many as 5 J pickups.

Non-magnetic pickups:

- Piezoelectric pickups are non-magnetic pickups that allow bassists to use non-metallic strings such as nylon strings. Piezoelectric pickups sense the vibrations of the string, as transmitted to the pickup through the basses' wooden body. Since piezoelectric pickups are based on the vibration of the strings and body, they can be prone to feedback "howls" when used with an amplifier, especially when higher levels of amplification are used.
- Optical pickups such as Lightwave Systems pickups are another type of non-magnetic pickup. Optical pickups are expensive and rarely used, apart from a small number of professional bass players who require the advantages offered by optical pickups: no noise (e.g., hum) or feedback problems, even at high levels of amplification.

## Frets

The majority of basses use frets to divide the fingerboard into semitone divisions, although fretless basses are also widely available. The original Fender basses had 20 frets but some modern basses have 24 or more frets covering a range of two or more octaves per string. Some fretted basses feature a "zero fret" on the fingerboard just in front of the nut, which is alleged to offer tonal and setup advantages. Some fretted basses have scalloped fret boards for easier string bending.

In addition to frets, many basses have markers inlaid into the neck as a guide to position. Typically, there are single dots below the 3rd, 5th, 7th and 9th frets and double dots at the 12th fret, all repeated at the equivalent positions an octave higher. However, there are many variations, including decorative shapes, large blocks inlaid into the fingerboard, and small dots on the side of the neck.

## Fretless basses

Fretless basses have a distinctive sound that is created because the absence of frets means that the string is pressed down directly onto the wood of the fingerboard and buzzes against it as with the double bass. The fretless bass allows players to use the expressive devices of glissando and microtonal intonation (quarter tones). Fretless basses are mostly used in jazz and jazz fusion music. Nonetheless, bassists from other genres use fretless basses, such as thrash metal/death metal bassist Steve DiGiorgio. Some bassists use both fretted and fretless basses in performances, according to the type of material they are performing.

Fusion virtuoso Jaco Pastorius, who brought the fretless bass into the spotlight, used a fretless bass that he created by removing the frets from a fretted bass and filling in the grooves, a method that is still used by some bass players. Some fretless basses have 'fret lines' inlaid in the fingerboard as a guide, while others only use guide marks on the side of the neck. Strings wound with tape or coated in epoxy are sometimes used with the fretless bass so that the metal string windings will not wear down the wooden fingerboard.

# Playing styles

## Sitting or standing

Most bass players stand while playing, although sitting is also accepted, particularly in large ensemble settings (e.g., jazz big band) or acoustic genres such as folk music. It is a matter of the player's preference as to which position gives the greatest ease of playing, and what a bandleader expects. When sitting, the instrument can be balanced on the right thigh, or like classical guitar players, the left. Balancing the bass on the left thigh positions it in such a way that it mimics the standing position, allowing for less difference between the standing and sitting positions.

## Plectra vs. fingers or thumb

The electric bass, in contrast to the upright bass (or double bass), is played in a similar position to the guitar, held horizontally across the body. Notes are usually produced by plucking with the fingers or with a plectrum (often called pick). Most bassists prefer to pluck the instrument's strings with the fingers but some also use plectra (picks).

Picks also come in many shapes, sizes and thickness. This often varies according to the [musical genre](#)—very few [funk](#) bassists use plectrums, while they are widely found in [punk rock](#) and metal styles. Using a plectrum typically gives the bass a brighter, punchier sound, while playing with fingers makes the sound softer and round. Some bassists use their fingernails flamenco-style to provide some compromise between playing fingerstyle and using a pick.

Bassists trying to emulate the sound of a double bass will often pluck the strings with their thumb, and use their fingers to anchor their hand and partially mute the strings (partially muting the strings creates a short, "thumpy" tone for the notes which mimics the sound of an upright bass).

James Jamerson, one of the most influential bassists during the Motown era, was well-known for his work in many popular Motown songs. Jamerson played the bass with only his index finger (which gained him the nickname "The Hook") but created intricate bass lines that have proven challenging even for modern bassists using the more commonly used two-fingered (typically index and middle) technique.

## Right hand support and position

Variations in style also occur in where a bassist rests his right-hand thumb. A player may rest his thumb on the top edge of one of the pickups. One may also rest his thumb on the side of the fretboard, which is especially common among bassists who have an upright bass influence. Also, bassists may simply anchor their thumbs on the lowest string (and move it off to play on the low string). This technique is known as the "floating thumb", and was previously popular mainly with bassists who played 5 or more string basses, but is now common for all bassists. By resting their thumb to anchor their hand while they use their index and middle fingers, bassists create a fuller and louder sound.

Early Fender models also came with a "thumbrest" attached to the pickguard, below the strings. Contrary to its name, this was not used to rest the thumb, but to rest the fingers while using the thumb to pluck the strings. The thumbrest was moved above the strings in 70's models, and eliminated entirely in the 80's.

## Downward stroke

This is a technique that consists in hitting the strings with continuous downward strokes with a plectrum at a very fast pace. This provides the continuous and repetitive sound of finger picking but with a punchy sound, which makes it sound like bombed. This technique was used by Dee Dee Ramone of the early [punk rock](#) band The Ramones.

## Striking or plucking position

Bassists also have different preferences as to where on the string they pluck the notes. While the influential bassist Jaco Pastorius and many with him preferred to pluck them very close to the bridge for a bright and sharp sound, many prefer the rounder sound they get by plucking closer to the neck, mostly near the neck pickup. Geezer Butler, among others, plucks the strings over the higher frets.

## Piano hammer style

The "piano hammer-style" is a high-speed technique used of striking the bass string with the index finger. In this technique, the index hand is whipped towards the bass string then retracted quickly by pivoting of the wrist. The index finger snaps down and taps the string like a piano hammer. The result is a smooth dark tone which can be contrasted by "back-pedaling" the string with the tip of the finger in an upward pluck. Usually two fingers are required with this technique.

## "Slap and pop" and related techniques

The famous slap and pop method, in which notes and percussive sounds are created by slapping the string with the thumb and releasing strings with a snap, was pioneered by Larry Graham of Sly and the Family Stone in the 1960s and early 1970s. In the 1970s Stanley Clarke developed Graham's technique further, adding the popping and speed that are a hallmark of contemporary playing. Louis Johnson, the bass player for the Brothers Johnson also made a large contribution to the world of slap with driving melodic rhythms that contributed to their many hits during the late 70's and early 80's, notably the bassline from Michael Jackson's Billie Jean and the Brothers Johnson's own hit from 1980, *Stomp*.

Another notable player of this style emerged in the 1980s in the form of Mark King of British group Level 42. Today, Flea of Red Hot Chili Peppers exemplifies slap and pop with a foundation in [funk](#), Fieldy of Korn shows slap and pop style in [Nu Metal](#), and Les Claypool of Primus is known for playing extremely complex slap and pop basslines. In the late 1980s, fusion bass virtuoso Victor Wooten of Béla Fleck and the Flecktones developed the so-called "double thumb," in which the string is slapped twice (an upstroke and a downstroke) rather than once. This technique allows for incredible speed and can be heard on tracks such as Wooten's famous "Classical Thump".

An even more recent development is the two-handed tapping style, where both hands play notes by tapping the string to the fret. This makes it possible to play [contrapuntally](#),

or to play complicated chords and arpeggios. Since this gives the bass a wide audio spectral range and a brighter sound, it is mostly used by bass players who act as the lead in their music, such as Geddy Lee of Rush (band). Notable examples are Stuart Hamm, whose music is [metal](#)-oriented, Billy Sheehan of Talas and Mr. Big fame, as well as Victor Wooten and Michael Manring, who have a more [jazzy/new age](#) style. A more extreme version of this technique is used to play the Chapman Stick and Warr guitar, many-stringed instruments sometimes used in place of basses which are made to be played through tapping.

Tony Levin, the longtime bassist for King Crimson and Peter Gabriel, pioneered the use of two wooden dowels (called "funk fingers"), which are affixed with velcro to the tips of the index and middle fingers of the right hand and used to strike the strings of the bass, producing a percussive attack and [timbre](#) similar to the "slap and pop".

Examples of the slap and pop technique can be seen at [HowToSlapBass.com](http://HowToSlapBass.com)

## Amplification and effects

Different equipment is used to amplify the electric bass, depending on the musical setting. For rehearsals, recording sessions, or small clubs, electric bass players will typically use a "combo" amplifier, so-named because it combines an amplifier and a speaker in a single cabinet. Combo amplifiers usually have a modestly-powered amplifier (50 to 200 watts) and a single speaker. For larger venues, electric bass players will often use a more powerful amplifier (300 to 1000 watts) and separate speaker cabinets in various combinations.

Various electronic components such as preamplifiers and signal processors, and the configuration of the amplifier and speaker, can be used to alter the basic sound of the instrument. In the 1990s and early 2000s, signal processors such as equalizers, distortion devices, and compressors or [limiter]s became increasingly popular additions to many [electric bass](#) players' gear, because these processors give players additional tonal options.

The choice of amplification will have a significant impact on the bassist's overall sound.

Bass amplifiers may be categorized as either:

- combo units - the amplifier and speaker combined in a single unit; or
- head and speaker (or "cabinet") - amplifier and speaker are separate.

Head units may, in turn, be either:

- integrated units, in which the preamplifier and power amplifier are combined in a single unit; or
- separate pre/power setups, in which one or more preamplifiers are used to drive one or more power amplifiers.

Amplifiers may be based on solid state (transistor) or thermionic ("tube" or "valve") technology. Tube amps are generally regarded as giving a warmer, more natural sound while solid state amps are lighter and lower maintenance, but this is an area of much debate. A common setup is the use of a tube preamplifier with a solid state power amplifier. There are also an increasing range of products that use digital modeling technology to simulate many different combinations of amp and cabinet choices.

## Loudspeakers

The requirement to reproduce low frequencies at high sound pressure levels means that most loudspeakers used for bass guitar amplification are designed around large diameter, heavy-duty drivers, with 10", 12" and 15" being most common. As a general rule of thumb, performers desiring a "heavier" or "thicker" bass tone (e.g., punk, metal, or hard rock bassists) prefer the larger speakers, while performers wanting a more articulate tone (e.g. jazz or fusion bassists) tend to prefer the quicker-responding, smaller speakers.

The speakers are built into speaker cabinets, which contain one or more drivers. The sound of these cabinets is influenced not only by the choice of driver but also their

construction. Bass speaker cabinets are either sealed or ported with tuned ports, openings designed to elicit a specific frequency response.

Speaker cabinets are largely designed around a single type of driver (common examples are 1X10" ,1x12", 1x15" and 2x10" or 4x10"). Bass players also stack two or more cabinets containing different-sized drivers to obtain a particular sound. Players with five- or six-string basses who perform in louder, heavier styles of music sometimes add a 1X18" cabinet to reproduce the lowest notes.

It is also increasingly common for high frequency "tweeters" or horns to be included in speaker cabinets. These extended range designs were initially developed in the late 1970s in response to the better quality pickups and electronics being built by Alembic and other high-end manufacturers and to better reproduce the more percussive bass playing styles that were becoming popular at the time.

One problem with adding a horn to a speaker cabinet is that the horn may be damaged by the bass tone from an overdriven amplifier. Horns and speakers in the same cabinet are sometimes wired separately, so that they can be driven by separate amplifiers. Bi-amplified systems and separately-wired cabinets produced by manufacturers such as Gallien-Krueger allow bassists to send an overdriven sound to the speaker, and a crisp high sound to the horn, which prevents this problem.

Surveying the sites of the manufacturers mentioned below will give a good indication of the range of speaker cabinets currently available.

## Amplification manufacturers

The 18 watt 1 x 12" Michael-Bell Bassamp, a closed-back amp designed specifically for upright bass, kicked off the modern era of bass amplification in the late 1940's. The upright basses were fitted with an Ampeg (short for "amplified peg") described in the 1946 patent application as a "sound amplifying means for stringed musical instruments of the violin family." In 1949, after the Michael-Hull company break-up, the Ampeg Bassamp Company was founded by Everett Hull in New York.

Other well known manufacturers of bass amplifiers or loudspeakers include: Accugroove loudspeakers, Acme loudspeakers, Acoustic, Aguilar, Alembic (preamps and filters), Ampeg, Ashdown Engineering, Basson, Behringer, Crate, Eden Electronics, Fender, Gallien-Krueger, Hartke, Peavey, SWR, Markbass, Marshall, Mesa/Boogie, Orange, and Trace Elliot.

## Effects

Due to the role the electric bass plays laying down the low-register foundation for the band, the so-called "modulation" effects, such as chorus, flanger, and phaser, are used much less frequently with the electric bass than with the electric guitar, where the use of effects is the norm. Although there has been a much smaller variety of bass-specific effects available throughout much of the history of the instrument, since the late 1990's, many bass-specific effects have become available. Of these, preamplifiers, "compression", limiting, and equalization are the most widely-used effects for bass.

Nonetheless, a range of other effects are used in various genres. "Wah-wah" and "synth" bass effects are associated with [funk](#) music. As well, since the 1960's and 1970's, bands have experimented with "fuzz bass" where the bass is distorted either by overdriving the amp or by using a distortion unit. Since the 1990's a heavier type of distortion with a "grinding" tone is used by some [metal](#) and punk bass players.

Although many of these effects sound similar to guitar effects, players often use specialized bass effects units, which are adapted to work with the lower frequency range of the bass. For example, typical electric guitar distortion units tend to remove the lower

bass frequencies when they are used with an electric bass; bassists get much better results with a bass-specific distortion unit. For alternative and experimental bands, effects are used to create unique timbres and tones that in some cases are a radical departure from the typical electric bass tone.

## Musical role

The electric bass is the standard bass instrument in many [musical genres](#), including modern [country](#), post-1970s-style [jazz](#), many variants of [rock and roll](#), metal, punk, reggae, [soul](#), and [funk](#). Even though the double bass is still the standard bass instrument in orchestral settings, some late-20th-century composers have used the electric bass in an orchestral setting. Modern bass playing draws on guitar and double bass for inspiration as well as an increasing vernacular of its own.

The bass may have differing roles within different types of music and the bassist may prefer different degrees of prominence in the music. Early uses of the electric bass saw bassists doubling the double bass part or replacing the upright bass entirely with their new, more portable and easily amplified instrument. By the 1960s, the electric bass had replaced the upright bass in most forms of popular music-although country music and jazz were an exception to this trend. The switch to electric bass moved bassists more into the foreground of a band, in two senses.

From an aural perspective, electric bass tone can often "cut through" a live mix better. As well, electric basses can be amplified to very high levels without the problem of feedback "howls" that can plague upright bass players trying to amplify their instruments. From a visual point of view, the switch to the electric bass allowed bassists much more freedom of movement on stage. The double bass sits on an endpin, and stands vertically, and players typically play in a single location for the duration of a song. However, the electric bass is smaller, and is held up with a strap, which allows the electric bassist to move about on the stage while playing, and get closer to other musicians or the audience.

## Bass run

A **bass run** is an instrumental break in which the main [vocal](#) or [melody](#) line rests (pauses, takes a "break") and the [bass instruments](#) and line are given the forefront. The technique seems to have originated in the marches of the "Sousa school", though its resemblance to call and response techniques familiar to [African American musicians](#) indicates an earlier origin. (van der Merwe 1989, p.283)

### Bass-baritone

[Bass](#)

A **bass-baritone** is a singing voice that shares certain qualities of both the [baritone](#) and the [bass](#). The term arose in the late 19th century to describe the particular type of voice required to sing Wagnerian bass roles like Wotan (in the Ring Cycle) and Hans Sachs (in Die Meistersinger von Nürnberg). Wagner wrote those roles for what he called *Hoher Bass* ("high bass").

The bass-baritone voice is distinguished by two attributes. First, it must have an effective upper range to at least F# above middle C and be capable of singing comfortably in a baritoneal tessitura. It must also, however, have the resonant lower range typically associated with the bass. For example, the role of Wotan in Die Walküre covers the range from the F# above middle C to the F below the bass clef but only infrequently descends beyond the C below middle C.

The term is also used to refer to a singer who possesses such a singing voice.

# Bassoon

The **bassoon** is a [woodwind instrument](#) in the double reed family that plays in the [tenor](#) range and below. Also called *fagott*, in German, and *fagotto*, in Italian. Appearing in its modern form in the 1800s after the model of its precursors, particularly the dulcian, the bassoon is a part of orchestral, concert band, and chamber music literature. It is known for its distinctive tone color, wide range, variety of character, and agility. A bassoon player is called a "bassoonist".

# Development

## Early history

The bassoon was developed from its precursor, most often referred to as the dulcian, a wooden instrument all in one piece. Used and developed greatly in the 16th century to add a stronger bass to the wind band then consisting largely of shawms and recorders, the dulcian's origins are unknown. Scattered evidence exists for its creation at various places and times, and few early examples survive. There were eventually eight members of the dulcian family of varying size, from soprano down to bass ranges. The early dulcian had many similarities to the modern bassoon: though generally constructed of only a single piece of wood rather than sections, it too consisted of a conical bore that doubled back on itself at the bottom, with a curved metal crook leading from the instrument body to the reed. It was, like the modern instrument, frequently constructed of maple, with thick walls to allow finger-holes to be drilled obliquely, with its bell flared slightly at the end. However, there were only eight finger-holes and two keys. The dulcian later evolved into the curtal, which featured separate joints like a modern bassoon, and gained an extra key.

Some twentieth century musicologists believed that this instrument, resembling a bundle of sticks, was given the name meaning such, "fagotto", in 16th century Italy. However, this etymology is incorrect: The term "fagotto" was in use for the bassoon before the word was used for "bundle of sticks"; also, when the term first appeared, the resemblance did not exist, as the instrument at that time was carved out of one continuous block of wood (Jansen 1978). The origin of this name is therefore a mystery. (A dance also named "fagot" dates to a century earlier.) The instrument was constructed folded back on itself, as it is to this day (giving it the name in some regions "curtal", as it was shortened significantly). The English name of "bassoon" comes from a more general term referring to the bass register of any instrument, but after Henry Purcell's call for a "bassoon" in *Dioclesian* (1690) referring to the wooden double reed, the word began to be used to refer to this instrument in particular.

The evolution of the early dulcian into the modern bassoon is also without precise record; the dulcian continued to be used into the 18th century (and in Spain, into the early 20th). A German painting, "Der Fagottspieler", in the Suermondt Museum, which scholars date to the end of the 17th century, depicts the bassoon much as it appears in its current form, and a three-keyed bassoon has been dated to 1699. It was the Dutch maker Coenraad Rijkel whose addition of the G key for the little finger of the right hand, just after the turn of the 18th century, fixed the hand position to the current standard; previously, the instrument could be played with either hand on top. The early bassoon flourished in the Netherlands in the late 17th and early 18th century, with over half a dozen prominent woodwind makers developing the instrument. Today, only thirty-three bassoons from that era survive.

## Modern history

Increasing demands on the capabilities of instruments and players in the 1800s—particularly concert halls requiring louder tones and the rise of virtuoso composer-performers—spurred on the further refinement of the bassoon. Increased sophistication

both in manufacturing techniques and acoustical knowledge made possible great improvements in the playability of the instrument.

The modern bassoon exists in two distinct primary forms, the Buffet system and the Heckel system. The Buffet system is played primarily in France but also in Belgium, while the Heckel system is played in the majority of the world.

### **Heckel system**

The design of the modern bassoon owes a great deal to the performer, teacher, and composer Carl Almenröder, who, assisted by the German acoustic researcher Gottfried Weber developed the 17-key bassoon whose range spanned four octaves. Almenröder's improvements to the bassoon began with an 1823 treatise in which he described ways of improving intonation, response, and technical ease of playing by means of augmenting and rearranging the keywork; subsequent articles further developed his ideas. Working at the Schott factory gave him the means to construct and test instruments according to these new designs, the results of which were published in *Caecilia*, Schott's house journal; Almenröder continued publishing and building instruments until his death in 1843, and Ludwig van Beethoven himself requested one of the newly-made instruments after hearing of the papers. Almenröder left Schott to start his own factory along with partner J.A. Heckel in 1831.

Heckel and two generations of descendants continued to refine the bassoon, and it is their instrument that has become the standard for other instrument makers to follow. Because of their superior singing tone quality (an improvement upon one of the main drawbacks of the Almenröder instruments), the Heckel instruments competed for prominence with the reformed Wiener system, a Boehm-style bassoon, and a completely-keyed instrument devised by C. J. Sax, father of Adolphe Sax. One latecomer attempt, from 1893, at a logical reformed fingering system was implemented by F.W. Kruspe, but failed to catch on. Other attempts at improving the instrument included a 24-keyed model by name in date and a single-reeded mouthpiece, but both were found to have adverse effects on the bassoon's distinctive tone and were abandoned.

Coming into the 20th century the Heckel-style German model of bassoon dominated the landscape; Heckel himself had made over 4000 instruments by the turn of the century, and the English makers' instruments were no longer desirable for the changing pitch requirements of the symphony orchestra, remaining primarily in [military band](#) use.

Today the Heckel factory remains and the Heckel bassoons are by many considered the best. Although a range of different manufacturers exist, all with different modifications to their bassoons. Companies that manufacture bassoons are (among others): Heckel, Yamaha, Fox Products, Schreiber, Püchner, Signet, Kohlert, B.H. Bell and Guntram Wolf. There are also several smaller bassoon manufacturers that make special instruments to fit special needs.

### **Buffet system**

The Buffet system bassoon, which stabilized somewhat earlier than the Heckel, developed in a more conservative manner. While the development of Heckel bassoon can be characterized as a complete overhaul of the instrument from both an acoustic and keywork perspective, the Buffet system focused primarily on incremental improvements to the keywork. This less radical approach deprives the Buffet system bassoon of the improved consistency, and thus ease of operation, and increased power found in the Heckel lineage bassoons, but the Buffet is considered by some to have a more vocal and expressive quality. (Conductor John Foulds in 1934 lamented the dominance of the Heckel-style bassoon, considering them to be too homogeneous in sound with the [horn](#).)

Compared to the Heckel bassoon, Buffet system bassoons have a narrower bore and differing keywork; the Buffet instruments are known for a reedier sound and greater

facility in the upper registers, reaching e<sup>'''</sup> and f<sup>'''</sup> with far greater ease and less air pressure. While specifically desirable in some music (French woodwind players traditionally produce a lighter and more reedy tone than is usual elsewhere) the more reedy sound has sometimes drawn criticism for being too distinctive. As with all bassoons the tone varies substantially from instrument to instrument and performer to performer. The Heckel system can sound rather fixed and woody, but good players strive and usually succeed in producing a warm singing tone. The Buffet can sound reedy, but many good players strive and usually succeed in producing a warm, expressive sound which is not in the least reedy.

Though the French system was once widely favored in England, Buffet instruments are no longer made there, and the last prominent English player of the French system retired in the 1980s. However, with its continued use in some regions and its distinctive tone, the Buffet continues to have a place in modern bassoon playing, particularly in France. Buffet-model bassoons are currently made in Paris by Buffet-Crampon and Selmer, with various other makers producing replica instruments.

## Construction and characteristics

The modern bassoon is generally made of maple, with medium-hardness types such as sycamore maple and sugar maple being preferred. Less-expensive models are also made out of materials such as polypropylene and ebonite, primarily for student and outdoor use; metal bassoons were made in the past but have not been in production by any major manufacturer since 1889. The bore of the instrument is conical, like that of the oboe and the saxophone, and the bottom of the instrument connects the bore in the middle with a u-shaped metal connector. Both bore and holes are precision-machined, and each instrument is finished by hand for proper tuning. The walls of the instrument are sufficiently thick that the finger holes are drilled obliquely to aid in fingering, and wooden instruments are lined with a hard rubber lining along the interior of the wing and boot joints to prevent damage from moisture with extensive playing; wooden instruments are also stained and varnished. The top of the bell is frequently completed with a ring, often of plastic or ivory. The separate joints, where they connect, are wrapped in either cork or string, to aid sealing against air leaks. The bocal, which is inserted into the top of the wing joint and has one end wrapped in cork for sealing, may come in many different lengths, depending on the desired tuning.

Folded upon itself, the bassoon stands 134 cm (4.4 feet) tall, but the total length is 254 cm (roughly 8.3 feet). Playing is facilitated by doubling the tube back on itself and by closing the distance between the widely-spaced holes with a complex system of keywork, which extends throughout nearly the entire length of the instrument. There are also short-reach bassoons made for the benefit of young or petite players.

Bassoon players must learn three different clefs: Bass (first and foremost), Tenor, and Treble. The range of the bassoon begins at B-flat<sub>1</sub> (the first one below the bass staff) and extends upward over three octaves (roughly to the E on the treble staff). Higher notes are possible but difficult to produce and rarely called for; orchestral parts rarely go higher than the C or D, with even Stravinsky's famously difficult opening solo in *The Rite of Spring* only ascending to the D. Low A at the bottom of the range is possible with a special extension to the instrument; as its use makes the bottom B-flat impossible to play and affects the intonation of the lower notes, it is rarely called for. The *Quintet for Winds* by Carl Nielsen concludes with a featured use of the low A. Frequently, a paper tube or English horn bell placed correctly in the bassoon's bell is used instead of a specially made extension.

# Usage in ensembles

## Modern ensembles

The modern symphony orchestra typically calls for two bassoons, often with a third playing the contrabassoon. (The first work written with an independent contrabassoon part was Beethoven's Fifth Symphony, although an earlier work by Mozart called for a "large bassoon" and was written below the range of the modern bassoon.) Some works call for four or more players. The first player is frequently called upon to perform solo passages. Its distinctive tone suits it for both plaintive, lyrical solos such as Ravel's Bolero and more comical ones, such as the grandfather's theme in Peter and the Wolf. Its agility suits it for passages such as the famous running line (doubled in the cello) in The Marriage of Figaro. In addition to its solo role, the bassoon is an effective bass to a woodwind choir, a bass line along with the cellos and double basses, and harmonic support along with the French horns.

A wind ensemble will usually also include two bassoons and sometimes contra, each with independent parts; other types of concert wind ensembles will have larger sections, with many players on each of first or second parts; in simpler arrangements there will be only one bassoon part and no contra. The bassoon's role in the wind band is similar to its role in the orchestra, though when scoring is thick it often cannot be heard about the brass instruments also in its range. La Fiesta Mexicana, by H. Owen Reed, features the instrument prominently, as does the transcription of Malcolm Arnold's *Four Scottish Dances* which has become a staple of the band repertoire.

The bassoon is also part of the standard wind quintet instrumentation, along with the flute, oboe, clarinet, and horn; it is also frequently combined in various ways with other woodwinds. Richard Strauss's Duet-Concertino pairs it with the clarinet as *concertante* instruments, with chamber strings as support.

The bassoon quartet is also gaining favor in recent times, with the Bubonic Bassoon Quartet being one of the more notable groups. The bassoon's wide range and variety of tone colors make it ideally suited to grouping in like-instrument ensembles. Peter Schickele's "Last Tango in Bayreuth" (after themes from Tristan and Iseult) is a popular work; Schickele's fictional alter ego P. D. Q. Bach exploits the more humorous aspects with his quartet "Lip My Reeds", which at one point calls for players to perform on the reed alone.

## Earlier ensembles

The bassoon's use in the early symphony orchestra was solely as a continuo instrument. Baroque composer Jean-Baptiste Lully and his Les Petits Violons included oboes and bassoons along with the strings in the 16-piece (later 21-piece) ensemble, as one of the first orchestras to include winds. Antonio Cesti included a bassoon in his 1668 opera Pomo d'oro. However, the use of the bassoon in the concert orchestra was sporadic until the late 17th century when winds began to make their way into the standard instrumentation, largely due to improvements in the design of wind instruments that corrected tuning problems and gave them greater ability to play chromatically (as the fretless strings were easily able to do). The bassoon was introduced as a regular member of the symphony orchestra as part of the basso continuo along with the cellos

and bass viols; they also filled out the choirs of wind instruments in opera orchestras, first in France and then in Italy. Johann Stamitz and his symphonies gave the winds slightly more independence by scoring them for orchestral color rather than strict doubling, but still the bassoon was not used as an independent melodic instrument.

Antonio Vivaldi brought the bassoon to prominence by featuring it in his 37 concerti for the instrument. The early classical orchestra included the bassoon, it was again only filling out the continuo and often unmentioned in the score; symphonic writing for bassoons as fully-independent parts rather than mere doubles would not come until later in the Classical era. Mozart's Jupiter symphony is a prime example, with its famous bassoon solo. The bassoons were generally paired, as in current practice, though the famed Mannheim Orchestra boasted four.

# Concerti and other orchestral literature

## Baroque

- Antonio Vivaldi wrote 37 concerti for bassoon

## Classical

Johann Christian Bach, Bassoon Concerto in B flat, Bassoon Concerto in E-flat major

Johann Nepomuk Hummel, Bassoon Concerto in F, W75

Wolfgang Amadeus Mozart, Bassoon Concerto in B flat, K191

## Romantic

- Carl Maria von Weber, Andante e rondo ungherese in C minor, op. 35
- Carl Maria von Weber, Bassoon Concerto in F, op. 75

## Contemporary

- Hindemith, Sonata for Bassoon and Piano(1938)
- John Williams, The Five Sacred Trees : Concerto for Bassoon and Orchestra(1997)
- Richard Strauss, Duet Concertino for Clarinet and Bassoon with strings and harp (1948)

## Famous orchestral passages

Paul Dukas, The Sorcerer's Apprentice, widely recognized as used in the movie Fantasia

Edvard Grieg, In the Hall of the Mountain King

Sergei Prokofiev, Peter and the Wolf (possibly the most-recognized bassoon theme, the part of the grandfather)

Igor Stravinsky, The Rite of Spring (opens with a famously unorthodox bassoon solo)

Igor Stravinsky, lullaby from The Firebird

Igor Stravinsky, Symphonies of Wind Instruments (less known but just as high and difficult as The Rite of Spring)

Maurice Ravel, Rhapsodie Espagnole (features a fast, lengthy dual cadenza at the end of the first movement)

Maurice Ravel, Bolero (the bassoon has a high descending solo passage near the beginning)

Maurice Ravel, Piano Concerto in G Major

Hector Berlioz, Symphonie Fantastique (In the fourth movement, there are several solo and tutti bassoon-featuring passages. This piece calls for four bassoons.)

Pyotr Ilyich Tchaikovsky, Symphony 6 in B minor

Carl Orff, Carmina Burana

## Technique

The bassoon is held diagonally in front of the player and cannot easily be supported by the player's hands alone. The most common means of support are either a neck-strap or shoulder-harness attached to the top of the butt joint, or a strap attached to the base of the butt joint which harnesses to the chair or is supported by the player's weight. More unusually, a spike similar to those used for the cello or double bass is attached to the bottom of the butt joint.

The Heckel-system bassoon is played with both hands in a stationary position, with six main finger holes on the front of the instrument (some of which are open, and some of which are aided by keywork). Also on the front of the instrument are several additional keys to be controlled by the pinky fingers of each hand. The back of the instrument has over a dozen keys to be controlled by the thumb (the exact number varies depending on model).

While instruments are constructed to have accurate pitch throughout the scale, the player has a great degree of flexibility of pitch control through the use of breath support and embouchure. Players are also able to use alternate fingerings to adjust the pitch of most playable notes.

## Extended techniques

Many extended techniques can be performed on the bassoon, such as multiphonics, flutter tonguing, circular breathing, and harmonics.

# Reeds and reed construction

## The modern reed

Bassoon reeds, made of *Arundo donax* cane, are generally made by the players themselves. Reeds begin with a piece of cane that has been left to dry. The cane is then cut and *gouged* into smooth strips, leaving the bark attached. After soaking, the strip of cane is cut into the desired thickness, or *profiled*. This can be done by hand; it is more frequently done with a machine or tool designed for the purpose. It is then cut to the correct outline, or *shaped*. Making sure the cane is thoroughly soaked, to avoid cracking, the profiled and shaped strip of cane is folded over in the middle. The outer edges, where the bark remains after profiling, are secured by three coils of wire at 2 mm and 8 mm from the beginning of the blade, and 6 mm from the bottom. The flat piece of cane is placed on a long, thin mandrel and pressed firmly around it to form into the proper shape, until the bottom of the reed is rounded enough to fit securely on the end of the bocal.

After the reed has dried, the wires are tightened around the reed, which has shrunk after drying. The lower part is sealed (generally with rubber cement or epoxy) and then wrapped with string to ensure both that no air leaks out through the bottom of the reed and that the reed maintains its shape.

To finish the reed, first, the tip (previously the center of the strip of cane) is cut, so that the blades above the bark are roughly 27 mm long. The reed is then scraped with a knife until it has the proper profile, which has a thin tip leading to a thicker back section, and the "spine" going lengthwise down the center also thick. Specific measurements differ from player to player and instrument to instrument. The very tip of a reed blade is frequently only 0.1 mm thick.

As the style of reed desired varies a great deal from player to player, most advanced players will make their own reeds in order to customize them to their own individual playing style, and almost all will be familiar with the process of making one. However, several companies offer premade reeds, and several individuals also produce reeds for sale, some specializing in this over playing.

## The early reed

Little is known about the early construction of the bassoon reed, as few examples survive, and much of what is known is only what can be gathered from artistic representations. The earliest known written instructions date from the middle of the 17th century, describing the reed as being held together by wire or resined thread; the earliest actual reeds that survive are more than a century younger, a collection of 21 reeds from the late 18th century Spanish *bajon*.

## The bassoon in jazz

The bassoon is infrequently used as a jazz instrument and rarely seen in a jazz ensemble. It first began appearing at all in the 1920s, including specific calls for its use in Paul Whiteman's group and a few other session appearances. The next few decades saw the instrument used only sporadically, as symphonic jazz fell out of favor, but the 1960s saw artists such as Yusef Lateef and Chick Corea incorporate bassoon into their recordings; Lateef's diverse and eclectic instrumentation saw the bassoon as a natural addition, while Corea employed the bassoon in combination with flautist Hubert Laws. More recently, Illinois Jacquet and Frank Tiberi have both doubled on bassoon in addition to their usual saxophone performances. Bassoonist Karen Borca, a performer of free jazz, is one of the few jazz musicians to play only bassoon; Michael Rabinowitz is another, as is the Spanish bassoonist Javier Abad. Lindsay Cooper, Paul Hanson, and Daniel Smith are also currently using the bassoon in jazz.

## **The bassoon in art and literature**

Much of the early history of the bassoon is known through its representation in painting; the only source of description for the early bassoon reed, for example, is in paintings from late 16th century Spain.

## Notable bassoonists

Étienne Ozi (1754–1813): bassoonist, composer, pedagogue  
Carl Almenröder (1786–1843): bassoonist, instrument designer, composer  
Louis Marie Eugène Jancourt (1815–1900): bassoonist, composer, pedagogue, instrument designer  
Julius Weissenborn (1837-1888): bassoonist, composer, pedagogue  
Archie Camden (1888–1979): bassoonist, pedagogue  
Simon Kovar (1890–1970): bassoonist, arranger, pedagogue  
Sol Schoenbach (1915–1999): bassoonist, pedagogue, Philadelphia Orchestra principal preceding Bernard Garfield  
Leonard Sharrow (1915–2004): bassoonist, pedagogue  
Maurice Allard (1923–): bassoonist, arranger  
Sherman Walt (1923-1989): bassoonist, pedagogue, Boston Symphony Orchestra principal 1953–1989.  
Mordechai Rechtman (1925–): bassoonist, pedagogue, arranger, conductor, Israel Philharmonic principal for 45 years  
Bernard Garfield (1928–): bassoonist, pedagogue, Philadelphia Orchestra principal 1957–2000.  
William Waterhouse (1931–): bassoonist, pedagogue, Royal Northern College of Music  
Walter Ritchie (1936–): bassoonist, pedagogue, Los Angeles Philharmonic Orchestra  
Judith LeClair (1958-): bassoonist, pedagogue, New York Philharmonic principal

## Bassoon sonata

A **bassoon sonata** is a [sonata](#) for bassoon, usually with [piano](#) accompaniment. Some bassoon sonatas in the standard repertoire are

- Giovanni Antonio Bertoli, nine sonatas (1645)
- Joseph Bodin de Boismortier, various sonatas (1730s)
- Romeo Cascarino, sonata (1950)
- François Devienne, six sonatas (1788?)
- Henri Dutilleux, Sarabande et Cortège (1942)
- Alvin Etler, sonata (1951)
- Johann Friedrich Fasch, sonata in C (authorship uncertain)
- Johann Ernst Galliard, six sonatas (1733)
- Paul Hindemith, sonate (1938)
- William Hurlstone, sonata in F major
- Wolfgang Amadeus Mozart, Sonata K. 292
- Gabriel Pierné, Prélude de Concert (1933)
- Camille Saint-Saëns, sonata in G major (1921)
- Alexandre Tansman, sonatine (1952)
- Georg Philipp Telemann, sonata in F minor

# Bass-Pop

**Bass-Pop** is a musical sub-genre sometimes referred to as **Avant-Pop**.

Term used to describe an offshoot of the [indie pop](#) scene that harbors artists with bass driven backbeats and sometimes Twee vocal riffs; Bass-pop refers to music that employs conventional pop idioms -- engaging melodies and harmonies, a straightforward verse-bridge-chorus structure, accessible hooks -- and changes things up by putting an exotic, rythm and bass spin on things.

This can be accomplished through the addition of unexpected and unconventional instrumentation, tape effects and electronics, studio trickery, stylistic curveballs, or any other wacky innovation an artist can dream up. When done right, this approach creates a pleasing and exciting tension between the catchy and the dissonant, between the familiar and the strange.

Some of the first real instances of this can be found on various Grebo releases from the 1990's in the U.K., (most notably Ned's Atomic Dustbin, Stone Roses could be considered as well). More recent examples include the modern artists for which the term was first ostensibly used in print to describe: the atmospheric and spry tunes of Ocean Alexander, the catchy left-field gems of Enon, the layered experimental pop melodies of Eels and the many bands of the Elephant Six Collective.

Category: [Music genres](#)

## Bastard pop

**Bastard pop** is a [musical genre](#) which, in its purest form, consists of the combination (usually by digital means) of the music from one song with the a cappella from another. Typically, the music and vocals belong to completely different genres. At their best, bastard pop songs strive for musical epiphanies that add up to considerably more than the sum of their parts.

## Synonyms

Bastard pop is known by a number of different names, including:

- Bootlegs (AKA Boots or Booties)
- Mashups (or Mash-ups)
- Blends
- Cutups (or Cut-ups)

In addition, more traditional terms such as "edits" or (unauthorized) "remixes" are favored by many "bootleggers" (also known as 'leggers).

# History

Though the term "bastard pop" first became popular in 2001, the practice of assembling new songs from purloined elements of other tracks stretches back at least to the '50s, and, if one extends the definition beyond the realm of pop, precursors can be found in [Musique concrète](#), as well as the classical practice of (re-)arranging traditional folk material and the jazz tradition of reinterpreting [standards](#). In addition, many elements of bastard pop culture have antecedents in [hip hop](#) and the DIY ethic of [punk](#).

## Precursors

### Classical

It is difficult to anatomize the practice of musical larceny without undertaking to write the entire history of both classical and popular music, but the appropriation of traditional songs, in particular folk music, has long been a popular pastime among classical composers. Well-known examples include Canteloube's orchestral arrangement of folk songs from the Auvergne region of France, Chants d'Auvergne, and Benjamin Britten's weaving of the ancient round "Sumer Is Icumen In" into Spring Symphony. "Variation" (as in "Variations on a theme by ... ") is one of the many names given to this classical form of "remixing", and a popular 20th century example of this is Andrew Lloyd Webber's reinterpretation of a theme by Paganini, Variations. Other modern classical analogues include Gavin Bryars' orchestral embellishment of a "found" impromptu hymn sung by a tramp, Jesus' Blood Never Failed Me Yet, and Apocalyptica's chamber reinterpretations of the songs of Metallica. While these examples are not always strictly legitimate, they capture the sense of genre collision (A v B) characteristic of bastard pop.

### "The Flying Saucer"

In 1956, Bill Buchanan and Dickie Goodman caused a musical sensation by releasing the first mainstream bastard pop single (though they referred to it as a "break-in" song, i.e. material from one song would "break-in" to another), "The Flying Saucer". The track, a reinterpretation of Orson Welles' celebrated War of the Worlds mock-emergency broadcast interspliced with musical snippets comically dramatizing the portentous patter of the announcer, spawned a raft of imitations and quickly became a craze, only to pass into oblivion within the space of a year.

### Novelty records

There have been a number of novelty records and one-off hits that have included uncleared samples. The song "Your Woman" by White Town features an uncredited sample from a 1932 song of the same name taken from the soundtrack of the Dennis Potter series Pennies From Heaven. [1] Other notable one-off bootlegs include DNA's dance remix of Suzanne Vega's "Tom's Diner" (1990) and "You Got The Love" by The Source featuring Candi Staton (1991).

In the '80s, Dutch producer Jaap Eggermont produced a series of records which almost constitute the dictionary definition of "novelty" in the form of the Stars on 45 series. These records attempted to cram as many hits as possible into the space of a three and a half minute pop song, and are perhaps more accurately described as

medleys. Though these singles have never received critical plaudits, the medley idea would later resurface in a more respectable form (for instance Coldcut's "Beats and Pieces"), and, moreover, the deliberately humorous tone of the "Stars on 45" singles has not entirely disappeared. Many bastard pop songs have been produced in jest, with the emphasis very firmly on satire, "irresistible" puns, or unadulterated throwaway fun.

### **Frank Zappa**

In the 1970s, Frank Zappa developed a technique he called "xenochrony" in which a guitar solo was extracted from its original context and placed into a completely different song -- essentially bastard pop for guitar rather than vocals. His recording engineer referred to this as "the Ampex guitar". The solo in the title song of his rock opera *Joe's Garage* (1979) is one of the more obvious examples of Zappa's xenochrony.

### **John Oswald**

John Oswald has been devising illegitimate compositions since the late '60s. His 1975 track "Power" married frenetic Led Zeppelin guitars to the impassioned exhortations of a Southern US evangelist at least 10 years before [hip hop](#) discovered the potency of the same (and related) ingredients. Similarly, his 1990 track "Vane", which pitted two different versions of the song "You're So Vain" (the Carly Simon original and a cover by Faster Pussycat) against each other, was a blueprint for the contemporary bastard pop subgenre, glitch pop. Oswald coined the term "plunderphonics" to describe his illegitimate craft. In 1993, he released *Plexure*. Arguably his most ambitious composition to date, it attempted to microsample the history of CD music up to that point (1982 - 1992) in a 20 minute collage of bewildering complexity. The ambition of this piece would later be recalled by the British bootlegger Osymyso, whose "Intro-Inspection" captured the pop-junkie feel of *Plexure*. Osymyso, who at the time was unaware of Oswald's work, used the same structure of an accelerando (arranging his source material in order from the slowest tempo to the fastest), to link a few bars each of 100 songs, creating a simpler sound than the thousands of overlapping and morphing pop "electroquotations" in *Plexure*.

### **Negativland**

Though Negativland are seldom acknowledged as musical antecedents of bastard pop, lacking perhaps the "smile factor" (i.e. sense of fun) many contemporary practitioners seek in their craft, their struggle against various forms of "censorship" (in their terms) and legal coercion (for instance, their single "U2" was one of the first pieces of music to be deemed "illegal" for its use of unauthorised samples) has made them poster children for some bastard pop commentators who approach the issue from a more critical perspective, and with an eye to the complicated cultural issues raised by both accidental and deliberate plundering within music and culture generally.

### **The JAMs and The KLF**

In the wake of these somewhat academic explorations, two British pranksters, Bill Drummond and Jimmy Cauty, entered the arena in 1987 with an album of plunderphony which, while still serving as a critical reflection on the nature of pop music and the power and potential of the sampler, upped the ante by being (almost) music one could dance to as well as think about. Their debut album, released under the name The JAMs, 1987 (*What The Fuck Is Going On?*), was banned (thanks to its raft of uncleared samples, most notably the bulk of ABBA's "Dancing Queen"), and a number of the songs have the same "laptop punk" "anyone can do it" attitude that characterizes bastard pop today. The JAMs morphed into The KLF in 1988 and continued to pursue the same art-prankster agenda, most notably with their number 1 hit (under the name The Timelords), "Doctorin' The Tardis".

## **Double Dee and Steinski**

Though the JAMs grazed the charts and The KLF, for a while at least, practically dominated them, illegitimate pop had remained largely an underground affair since the original "break-in" craze swept the US in 1956.

Working under the name Steinski, New York copywriter, DJ and self-confessed record junkie Steve Stein began (in conjunction with engineer and fellow studio boffin Doug "Double Dee" DiFranco) the next chapter in the evolution of illicit pop by producing a trio of underground 12" singles (entitled "Lesson 1" (1983), "Lesson 2" (1984) and "Lesson 3" (1985)) which exerted a powerful influence on an entire generation of "samplists" and continues to be cited to this day as a landmark in the history of "sampledelica". Indeed one can trace a line from Double Dee and Steinski through Coldcut's "Say Kids What Time Is It?" (which begat Bomb The Bass' "Beat Dis", which, in turn, begat LA Mix's "Check This Out") to DJ Shadow (who paid his dues on a track entitled "Lesson 4") and The Avalanches - and (through M/A/R/R/S' "Pump Up The Volume") to Black Box, whose "Ride on Time" spread the gospel of uncleared sample wizardry far and wide, from the depths of the underground to the top of the charts.

## **DJ subscription services**

In the 1970s, Disconet established the first DJ-only remix service. By the '80s, this had blossomed into a thriving underground scene, and a number of remixers, working for DJ-only subscription services such as X-MiX, Hottracks, Razormaid, Wicked Mix, Mixx-It, Ultimixx, and the DMC (Disco Mix Club), produced a string of white label remixes that layered samples of other songs - and even whole acapellas - over contemporary hits.

## **Emergency Broadcast Network**

In 1995, Emergency Broadcast Network released "3:7:8", the first exclusively video sample based song.

The three Rhode Island School of Design graduates - Joshua Pearson, Gardner Post and Ron O'Donnell - released their self-titled video on TVT Records. It combined video and audio samples of politicians and celebrities in such an artful way that U2, despite their earlier skirmish with Negativland, invited them to accompany them on their Zoo TV Tour as video artists.

## **Evolution Control Committee**

In 1996, the experimental band Evolution Control Committee produced what are widely credited as being the first modern bastard pop tracks. Their "Whipped Cream Mixes" combined a pair of Public Enemy acapellas with instrumentals by Herb Alpert and the Tijuana Brass.

The 1999 Eminem album The Slim Shady LP served as an early inspiration for the burgeoning bastard pop movement, as the acapella vocals from the track "My Name Is" were combined with the music of many other artists, including "Back in Black" by AC/DC and "Ice Ice Baby" by Vanilla Ice.

## **Renaissance**

### **2 many dj's and "A Stroke of Genie-us"**

*The name Pop Will Eat Itself was shamelessly stolen from an NME feature on the band Jamie Wednesday, written by David Quantick, which proposed the theory that because popular music simply recycles good ideas continuously, the perfect pop*

*song could be written by [ combining ] the best of those ideas into one track. Hence, Pop Will Eat Itself.*

The movement gained momentum again in 2001 with the release of two seminal landmarks: the *2 many dj's* album, by Soulwax's Dewaele brothers, which combined 45 different tracks in a frenzied vindication of the "pop will eat itself" prophecy, and a remix by Freelance Hellraiser of Christina Aguilera's "Genie in a Bottle" which coupled the (then) demure pop princess with the raucous guitars of New York's The Strokes in an infectious concoction entitled "A Stroke of Genie-us". This track became one of the most talked about underground hits of 2001, and was featured in many "best of" lists at the end of the year.

2manydjs is the "nom-de-turntable" of two Belgian brothers, David and Stephen Dewaele, who spent two years clearing the samples for their album, so their landmark was not entirely illegitimate, though they continued to work in the shadowy interzone between legitimacy and copyright "felony".

The Freelance Hellraiser track, in contrast, was never officially released, and indeed most bastard pop songs are only made available (for free) online (i.e. not commercially) in a not-always-successful attempt to avoid "cease and desist" notices from the copyright holders.

Occasionally, however, a song gains so much underground momentum that a commercial release becomes inevitable. The earliest example of this was Richard X (working under the name Girls On Top), whose 2002 track "We Don't Give a Damn About Our Friends" grafted an old Adina Howard acapella onto the music of Tubeway Army's "Are 'Friends' Electric?". The song became so popular that it was released with re-recorded vocals by Sugababes (under the title "Freak Like Me"), though their version was, by design, almost indistinguishable from the "original". The single went straight to number one in the UK charts, making it the first bastard pop crossover hit.

More recently, Go Home Productions has released "Ray of Gob", which splices together Madonna's "Ray of Light" and the Sex Pistols' "Pretty Vacant" and "God Save The Queen". The single, which was voted "Bootleg of the Year" in 2003, was cleared by the representatives of both parties and the track even earned the approbation of the Pistols' guitarist Steve Jones.

2001 also saw the release of DJ Z-Trip's mashup project *Uneasy Listening Volume 1*, an eclectic mix of [rock](#), [hip hop](#), electro, and [pop](#) from the '60s to the '90s that melded Metallica to Midnight Oil, Naked Eye to Public Enemy, and AC/DC to DJ Red Alert. DJ Z-Trip had made earlier excursions into the genre with live performances such as 1998's *Live at the Future Primitive Soundsession: Vol 2* and *Future Primitive 45 Night*.

In the same year, Kylie Minogue lent her support to the burgeoning genre by performing Erol Alkan's mashup of New Order's "Blue Monday" and her own hit "Can't Get You Out Of My Head" entitled "Can't Get Blue Monday Out of My Head" at the Brit Awards.

### **Napster and Audiogalaxy**

In the wake of these developments, hundreds of bedroom DJs and songwriters were inspired to make their own "bastard pop" confections. The demise of Napster and Audiogalaxy, while initially making it harder for amateurs to acquire the precious raw materials (i.e. acapellas and instrumentals) cheaply (i.e. for free), quickly led to the birth and meteoric rise of alternative P2P networks such as Kazaa, Limewire, and, more recently, BitTorrent (although the latter is more commonly used to distribute entire albums, rather than individual tracks). Where once music aficionados could trade only MP3s, it now became possible to acquire not only music, but the technology to manipulate that music freely and easily.

### **Software tools**

As a result of this, industry standard tools such as the digital audio workstation Cubase and the sound editors Wavelab, Soundforge and Cool Edit Pro quickly became ubiquitous. Moreover, new tools such as Ableton Live and, most popular of all, Sonic Foundry's (now Sony's) ACID Pro were tweaked to accommodate the needs of this new "scene". Most notably, such features as beat-mapping (a technique which simplifies the synchronization of samples of different tempos) and online previewing (allowing the composer to audition a sample, playing at the right pitch and tempo, alongside their existing composition) made it easy for many people with musical ability but little professional studio experience to knock together new combinations in a fraction of the time it would take with traditional tools, such as the magnetic tape John Oswald (and even Coldcut) slaved over in their early days.

### **Boomselection and Get Your Bootleg On**

Every new scene must have its "water cooler" and its journal, and in the case of bastard pop, Get Your Bootleg On established itself as the former while Boomselection took on the role of "blog of record". Not merely reflecting the scene, Boomselection publicised various challenges which resulted in hundreds, if not thousands, of new bootlegs being uploaded to sites around the world (while the scene was and still remains a primarily British phenomenon, there are notable bootleggers to be found in practically every corner of the globe - wherever an Internet connection and a record collection is to be found - including Australia, the USA, Belgium, France, Germany and Switzerland).

The name "Get Your Bootleg On" comes from the Missy Elliott track "Get Ur Freak On", which alongside Eminem's "Without Me" remains perhaps the most bootlegged, manipulated, remixed and reinterpreted song of the genre. Other popular artists include Britney Spears, Christina Aguilera, Madonna, and Beyoncé.

The Get Your Bootleg On site (affectionately abbreviated to GYBO) is the main launchpad for new bastard pop tunes, and is the home of a lively community of bootleggers who offer critiques of new songs, tips for newbies, pointers on where to find acapellas, legal advice, publicity for bastard pop events and general discussion of issues surrounding the bastard pop phenomenon.

In early 2005, Boomselection retired itself after a long period of inactivity. The year also marked a series of cease and desist orders brought against a number of bootleg sites, and in early 2006 GYBO received its first such notice. To survive, the site prohibited the posting of direct links to copyrighted material within the forums, but allowed users to post links to their own sites containing such material, the defense being that now GYBO was no more in violation of copyright law than Google. For the most part, the community has rallied around the site, and continues to support it in its new form.

In addition, the scene has a number of other sites which provide downloads, links, podcasts, forums and news.

## Subgenres

### A vs B

Pitting an acapella against a completely different backing track in order to make a "third song" is the original "mission" of bastard pop, and it is no surprise that, in the wake of "A Stroke of Genie-us", the genre has continued to focus on this basic premise.

Notable "versus" songs include:

Soulwax: "Dreadlock Child" (10CC's "Dreadlock Holiday" v Destiny's Child's "Independent Woman")

McSleazy: "Don't Call Me Song 2" (Blur's "Song 2" v Madison Avenue's "Don't Call Me Baby")

Loo and Placido: "My Favourite Name" (The Cardigans' "My Favourite Game" v Destiny's Child's "Say My Name")

Richard X vs Liberty X: "Being Nobody" (Chaka Khan's "Ain't Nobody" v Human League's "Being Boiled")

Hotei vs Rip Slyme: "Battle Funkastic" (Tomoyasu Hotei's "Battle Without Honor Or Humanity" v Rip Slyme's "Funkastic")

In addition, Lionel Vinyl, Soundhog, Go Home Productions, and Party Ben, amongst many others, have produced a number of critically acclaimed songs in this vein, and in some instances have secured record deals on the back of these exercises, which arguably serve as "demo MP3s" of their songwriting and production skills.

### Glitch pop

Glitch pop is a subgenre of the bastard pop scene which marries the Digital Signal Processing (DSP) wizardry associated with Kid 606 and Tigerbeat6 records to the ostensibly familiar contours of pop. Sometimes this is done in a spirit of *homage*; sometimes it serves merely as a form of ridicule and even vilification; often it is both at the same time.

An example of the "double science" at play in glitch pop is Skkatter's "Dirty Pop", which takes a song that is already an epic of carefully constructed digital micro-malfunctions (BT's deconstruction of \*NSYNC's "Pop") and pushes it even further out to the margins of musical mayhem. Similarly, Australian bootlegger and glitch pop co-conspirator Dsico has reworked a number of R'n'B tunes by such artists as The Neptunes and (again) \*NSYNC in a spirit that is at once both satirical and steeped in fanboydom. In most cases these remixes render ostensibly mainstream songs avant garde and fresh, sometimes by working against the spirit of the original, but often by leveraging the sugar rush at the heart of much of the best contemporary pop, and adding sonic CGI to its emotional armoury.

In the UK, the most notable exponent of the genre is Poj Masta, a teenage schoolboy whose work has been keenly supported by DJs such as Eddy Temple-Morris and James Hyman of London's Xfm radio station. Their weekly show, *The Remix*, has played a major role in nurturing new bootleggers and bringing them to the attention of a wide audience.

Notable glitch pop tunes include:

- Skkatter: "Madonna Is A Filthy Slut"
- Dsico: "Flash In Herre", "Fuckin Girlfriend"
- DJ Lance Lockarm: "Bladderwaul"
- Poj Masta: "Crazy In Love"

## Remixes

Technically, all bastard pop songs are [remixes](#). But while most are made up entirely of plundered material, some bootleggers have fused old acapellas with completely new compositions of their own devising.

The most popular example of this phenomenon is the Björk Remix Web, which contained hundreds of remixes of Björk tunes (for which the acapellas are rarely, if ever, available - the vocals are typically extracted by the application of clever EQing or "phase inversion"). However, the site is currently undergoing "reconstruction" and has been unavailable for several years. (A partial archive is available at the Björk Remix Web Archive.)

Another popular example with fans of Japanese pop is Evil Morning, an album which combines vocal tracks from Morning Musume and their associated artists with new instrumental tracks that rearrange or replay the original music in the style of [hard rock](#) or [heavy metal](#).

## Bootleg albums

DJ Danger Mouse's critically acclaimed remix project The Grey Album effectively launched a new bastard pop subgenre: the bootleg album. While The Beatles had made appearances on bootleg tracks prior to this album (for instance PPM's "A Life In The Day" and JPL's "Let It Be Missy Elliott (Beatlesmix)"), The Grey Album distinguished itself by being made up entirely of samples from The Beatles' White Album and vocals from Jay-Z's smash hit The Black Album. Reminiscent of Georges Perec's constrained writing exercises (a novel written without the letter 'e'; a 5000 word palindrome), this project has aroused considerable publicity as a result of the apparently heavy-handed way in which it has been suppressed. Many who have listened to it have lobbied for an official release, but EMI has resisted this tide of opinion, insisting on maintaining the sanctity of copyright in a way which some aficionados see as contrary to the spirit of The Beatles, Jay-Z (who presumably sanctioned, if not actively encouraged, the release of the acapellas) and musical expression in general.

Notable bootleg albums include:

- The Kleptones: A Night At The Hip-Hopera (Queen)
- Various Artists: Always Outsiders, Never Outdone (Prodigy)
- Various Artists: Flip The Switch (The Chemical Brothers)
- Dean Gray: American Edit (Green Day)
- DJ Z-Trip: Uneasy Listening
- The Legion of Doom: Incorporated

## Cut-ups

While there is some overlap between the terms "cut up" and "mash up", the former has increasingly come to refer to pieces that rely on the humour (or pathos) of reconstructed spoken word and video material.

The best known cutups remix political speeches and rallies to satirical effect. Johan Söderberg's "Endless Love", in which George W. Bush and Tony Blair appear to

serenade each other like lovebirds, and Chris Morris' "Bushwhacked", a détournement of Bush's 2003 State of the Union Address, are two popular examples.

Notable cut up artists include Cassetteboy, Osymyso, Cartel Communique and Evolution Control Committee.

## **Video Art**

Visual artists involved with installation art and performance art closely related to music production have recently taken up the concept of bastard pop in their work.

A noted example is Belgian artist Danny Devos, who mashed up Gordon Matta-Clark's "Descending Steps for Batan" and Dan Flavin's "Icon IV" in his own piece "Diggin' for Gordon".

## **Bay Area thrash metal**

**Bay Area thrash metal**, or "**Bay Area Thrash**", referred to a steady following of heavy metal bands in the 1980s who formed and gained international status in the San Francisco Bay Area, California. Many have attributed the scene as the starting point of thrash metal, speed metal, and even early-stage death metal.

## Summary

Although Metallica had initially formed in Los Angeles, it wasn't until their relocation to the East Bay area that Cliff Burton and Kirk Hammett joined as bassist and lead guitarist, sealing the band's first, formulative line-up.

Burton's friendship with other local acts, notably Oakland's Exodus (Kirk Hammett was previously in the band) and Testament, and San Francisco's Death Angel - among others - strongly vitalized the scene, leading to intensive touring and tape-trading that would cross borders and seas, and eventually graduate to record signings.

El Sobrante's *Possessed* would bring a turning point to the genre with 1985's *Seven Churches*, regarded as the first album to cross over from thrash metal to death metal for the largely "growling vocals" and subject matter dealing with horror and the occult. In addition to the inspiration of black metal, it would predate other albums, such as Slayer's *Reign in Blood* and Death's *Scream Bloody Gore*, which had also been regarded as influential to the two genres.

## Conclusion

By the early 1990s, the scene had mostly died down, with many groups disbanding, going on hiatus, or venturing to musical styles deemed more commercial or accessible at the time. Oakland thrash metal band Vio-lence, for instance, would dissolve, leading guitarist Robb Flynn to form and front Machine Head, which would popularize the groove metal genre (sometimes referred to as "half thrash", or "post thrash") along with Pantera.

In August of 2001, a small "reunion" of Bay Area thrash metal bands organized Thrash of the Titans, promoted to help Testament vocalist Chuck Billy, who had been diagnosed with cancer. The original Vio-lence line-up (minus Machine Head's Robb Flynn), a reunited Death Angel (minus original guitarist Gus Pepa), Heathen, Anthrax, Sadius, Stormtroopers of Death and Exodus were among the performers. In an unfortunate twist of fate, Exodus' singer Paul Baloff died from a stroke the following year.

On July 9th, 2005, a "sequel" concert, Thrash Against Cancer took place, which featured Testament, Lääz Rockit (a very early Thrash band from the area) as well as Hirax, with Death Angel guitarist Ted Aguilar.

## Beach music

**Beach music**, also known as **Carolina beach music**, is a regional genre which developed from various musical styles of the forties, fifties and sixties. These styles ranged from [big band swing](#) instrumentals to the more raucous sounds of [blues/jump blues](#), doo-wop, boogie, [rhythm and blues](#), [rockabilly](#) and old-time [rock and roll](#). Beach music is closely associated with the style of [swing dance](#) known as the shag, or the Carolina shag. Recordings with a 4/4 "blues shuffle" rhythmic structure and moderate-to-fast tempo are the most popular music for the shag, and the vast majority of the music in this genre fits that description.

## Early history

A majority of the recordings that constituted and/or influenced beach music early on were originally termed "race music". As popular R&B tastes changed to encompass [funk](#), [disco](#), [hip hop](#) and [gangsta rap](#), the predominantly white beach music enthusiasts have remained more loyal to the "old school" stylings. This has been due primarily to the beat and tempo of the music.

Historical accounts of beach music as it relates to the development of this dance are often conflicting, but most agree that the Ocean Drive section of North Myrtle Beach, South Carolina is where the beach/shag phenomenon had its greatest impact among vacationing teenagers and college students.

## Socio-political Context

Prior to the Civil Rights Act of 1964, white youth in the Jim Crow South could not always hear the compelling music of primarily black R&B artists in their home towns. In some communities, this remained in effect even after racial integration was implemented in the region. However, these young people flocked to the bars and pavilions of the Carolina beaches where the shag was gaining popularity and R&B ruled the jukeboxes, and to the "beach clubs" where R&B artists performed live.

A major contributing influence upon this cross-racial musical affinity was the powerful radio station WLAC in Nashville TN, which blanketed the Southeast with the gritty, driving sound of jump blues and other forms of R&B. Stations with similar playlists began to emerge in the Carolinas and surrounding states throughout the late fifties and the sixties, increasing the popularity of the music across racial lines and contributing to the increasing popularity of the emerging new [gospel](#)-infused R&B sound, [soul music](#).

## "Classic Beach"

Artists and groups that were important to the formative years of this genre include: Artie Shaw, Wynonie Harris, Jimmy Cavallo and The House Rockers, Ruth Brown, Little Willie John, Earl Bostic, The Drifters, Wilbert Harrison, Clyde McPhatter, Billy Ward and The Dominoes, Hank Ballard, Maurice Williams and The Zodiacs, The Tams, The 5 Royales, The Coasters, Fats Domino, Jimmy McCracklin, Solomon Burke, Sam Cooke, The Platters, The Four Tops, Louis Prima, Arthur Alexander, Stick McGee, Jackie Brenston, Wilbert Harrison, Big Joe Turner, Bruce Channel, Wilson Pickett, Clarence Carter, Dinah Washington, Billy Stewart, The Temptations, Smokey Robinson and the Miracles, Marvin Gaye, The O'Jays, The Spinners, Otis Redding, Jackie Wilson, Etta James, The Checkers, The Clovers, Barbara Lewis, Don Covay, Jimmy Ricks and The Ravens, Mary Wells, Garnett Mimms and The Enchanters, Ben E. King, Major Lance, Willie Tee and Ernie K-Doe.

While some of the "beach hits" by these artists appeared on the R&B and rock and roll charts nationally, a great many of them were "[b-sides](#)" -- or even more obscure recordings that never charted at all. With this penchant for obscure R&B, especially from the sixties, beach music has much in common with the northern soul phenomenon in the UK.

# Transition and Renewal

## The "Beach Bands"

Another wave of artists, known today as the "beach bands" came into prominence in the mid sixties to early seventies, heavily influenced by the sound of Motown and the other prominent R&B labels of the day such as Atlantic Records, Stax, etc.. These included The In-Men, Ltd., The Attractions, The Embers, The Monzas, The Sardams, The Catalinas and the nationally-charting groups The Swinging Medallions, The Okaysions, and Bill Deal and the Rhondells. Many of these bands got their start backing the famous R&B/soul artists who played at The Beach Club in Myrtle Beach, The Coachman and Four in Bennettsville SC, The Cellar in Charlotte NC, The Embers Club in Raleigh, NC, Rogues Gallery in Virginia Beach, VA and other such venues.

This wave of primarily white R&B artists was part of a strong but nationally short-lived musical trend known as "blue-eyed soul" which also produced The Rascals, The Box Tops, John Fred, Rare Earth, Leon Russell, Johnny Rivers, Bonnie Bramlett, Mitch Ryder and The Detroit Wheels, and The Righteous Brothers.

## The Revival Years

In the 80's, after decades of waning popularity, Beach music enjoyed a major revival in the Carolinas, thanks largely to the formation of a loose-knit organization known as The Society of Stranders (SOS). Originally intended as a relatively small social gathering of shag enthusiasts, "beach diggers" and former lifeguards meeting yearly in the Ocean Drive section of North Myrtle Beach, S.O.S. quickly grew to become a major Spring event.

At around the same time, a fanzine called "It Will Stand" (from the rock'n'roll/R&B anthem of that name by The Showmen) began to delve deeper into the history of beach music than any publication before or since. Concurrent with the new enthusiasm for the shag, and an increased emphasis on the roots of the music came a period of revival for many of the beach bands that had come to prominence in the sixties. In addition to these groups, younger artists began to emerge, either as members of established groups, or with groups of their own. Dedicated beach music charts began to appear, tracking the musical tastes of shaggers and other aficionados of the genre. The number of regional radio stations playing beach music began to increase substantially.

In 1981, Virginiaia entrepreneur John Aragona sponsored the first Beach Music Awards show at the Convention Center in Myrtle Beach. He would sponsor two more shows of this type over the next several years, setting the stage for the CAMMY Awards show, first held at Salisbury, NC in 1995. The shows soon moved to Charlotte and then to Myrtle Beach, where they are still an eagerly-anticipated and well-attended annual event under their new name, The Carolina Beach Music Awards (CBMA).

# The Current Regional "Beach & Shag" Scene

## Artists Of Note

The best of beach music from the early decades, from both national and regional artists, is known today as "classic beach". However, there is more to beach music than just the "oldies". New recordings in this style are being produced regularly as part of the regional music industry in the Southeastern US.

Current regional artists and groups who appear on the Beach and Shag music charts include Bill Pinkney and The Original Drifters, The Poor Souls, General Johnson and The Chairmen of the Board, The Coastline Band, The Embers, Billy Scott, The Carousels with Tony Baker, Donny and Susan Trexler, Lia and The Wave, J.D. Cash, The Band of Oz, The Fantastic Shakers, The Memphis All-Stars, Heart and Soul, The Rickey Godfrey Band, and Sea Cruz. While the terms "beach music" and "Carolina beach music" are still used, the increasing popularity of the shag has led to it sometimes being identified as "shag music". Many web sites have lately begun to refer to this music as "beach & shag".

This is the music being played by shag deejays in dance clubs, as well as on the "Beach and Oldies" radio stations that exist primarily in the Carolinas. Also charting regionally are such well-known national and international artists as Van Morrison, Ray Charles, Huey Lewis, Simply Red, Wilson Pickett, Hall and Oates, Al Green and Delbert McCClinton. In recent years, national artists of note -- such as O.C. Smith, Alabama, Jimmy Buffett, Eugene "Hideaway" Bridges, D.K. Davis, and the Carolina's own Nappy Brown and Roy Roberts -- have recorded music specifically aimed at this market.

## Impact On Popular Culture

Though primarily confined to a small regional fan base, in its early days what is now known as Carolina beach music was instrumental in bringing about wider acceptance of R&B music among the white population nationwide. Thus it was a contributory factor in both the birth of rock and roll and the later development of soul music as a sub-genre of R&B.

In the years since its beginning, while the older styles of R&B have faded from popularity nationally, the Carolina shag has gained wide popularity in swing dance circles around the US. This has not generally led to increased appreciation for the music of the beach bands, however. Many of these new shag dance aficionados prefer the "R&B oldies" and/or shagging to currently popular tunes that happen to have the required beat. As more networking is being done on the Internet among shag deejays and beach music fans nationwide, however, there is a growing acceptance of the regional bands by the "new shaggers".

In a related trend, since the year 2000 there has been a steady increase in the popularity of Southern Soul, led by such R&B labels as Ecko and Malako. These labels feature both original and new artists of "the old school", and sometimes turn out recordings aimed specifically at the beach/shag market. An example of this is "In A Beach Music Mood" by Rick Lawson. In addition, at least one dedicated Beach act, General Johnson and the Chairmen of The Board, has begun to chart both nationally and internationally with their brand of Southern Soul -- sometimes with songs that are not aimed more at the beach and shag market, such as "Three Women".

Jimmy Buffet cites beach music as a major influence. His CD "Beach House On The Moon" was intended as an homage to the genre. Though it featured The Tams, and for a while he toured with them as backup doo-wop vocalists, the CD did not yield any tunes that were big hits with beach music fans. However, since that release, there have been others by artists associated with Buffet that have had that "perfect shag beat" and a beach music feel to them. Some have become hits with shaggers, including "Drift Away" and "Follow Me" by Uncle Kracker, "Some Beach" by Blake Shelton and "When The Sun Goes Down" by Kenny Chesney. Just as was the case with "Dancing, Shagging On The Boulevard" by Alabama in the nineties, these country-flavored songs went over well on the dance floor regionally but did not please the more R&B oriented beach music fans. They did, however, impact the growing national shag dance scene to some degree.

In addition to these country and pop connections for the music, the pure R&B aspects of it have led to a kind of cultural cross-fertilization of beach and shag music with the northern soul scene in the UK and elsewhere. This has been due in large part to communication between deejays of the respective genres on the Internet. 'Fessa John Hook's Endless Summer Network -- broadcast on radio in the Carolinas and streamed on the Internet -- has a weekly program featuring noted northern soul deejay Kev Roberts, and there are plans for its programming to also be carried on satellite radio in Europe.

Carolina beach music was featured on the sound track of *Shag*, a 1989 film starring Bridget Fonda and Phoebe Cates, filmed in part at the Myrtle Beach Pavilion and other Grand Strand locations. Though not a wholly accurate portrayal, it is an agreeable and entertaining "coming of age" movie, with a good soundtrack and some excellent shagging. Not widely popular in its initial release, *Shag* has gone on to become something of a cult film. There is no doubt that it has helped to foster and maintain some interest beyond the Carolinas for beach and shag music.

In what is undoubtedly the most internationally famous example of its influence, *Beach Music* by South Carolina writer Pat Conroy takes its title from this regional genre of music. The novel's protagonist, Jack McCall, seeks to get his daughter more in touch with her Southern roots. He does this by introducing her to the shag and to classic beach music. He describes The Drifters' immortal song, "Save the Last Dance For Me" in this way:

``This is your Mama's and my favorite song. We fell in love dancing to it."''

Then, "Carolina beach music," her uncle Dupree tells her, is 'the holiest sound on earth.'"

Category: [Music genres](#)

# Beat juggling

**Beat juggling** is the act of manipulating two or more identical samples (e.g. drum beats, or vocal phrases), in order to create a unique composition, using multiple turntables and one or more mixers. This can involve pauses, scratching, backspins and delays. It could be seen as fingertip sampling, and the turntable and mixer combination could be seen as an instrument from which sounds are made, from the sounds of other instruments (samples).

# History

Beat Juggling has its roots in cutting, in which a small section of a beat is looped using two copies of the same record. This was first done by Kool DJ Herc, and later refined by DJs such as Grandmaster Flash in the early 80s.

DJ Steve Dee from Harlem, NYC, is the inventor of what we now call Beat Juggling. Referring to it simply as "The Funk", he took cutting to a whole new level - effectively making his own beats from reconstructed parts of other songs. The technique was refined by the DJ group The X-Men, whom DJ Steve Dee founded, they later were to become The X-Ecutiioners.

# Beatboxing

**Beatboxing** (a.k.a human orchestration) is the vocal percussion of hip hop culture and music. Considered by many to be a fifth element of hip hop, it is primarily concerned with the art of creating beats, rhythms, and melodies using the mouth. It can also involve singing, vocal scratching (the imitation of turntable scratching), the simulation of horns, strings, and other musical instruments, and the replication of a vast array of sound effects.

What comes to mind for most people when beatboxing is mentioned is the following ubiquitous imitation of a back beat drum pattern (in common drum set notation):

This imitates the bass (boom) and snare (chick) drums.

## Beatboxing defined

The words **beatboxing**, **vocal percussion**, and **multivocalism** are sometimes used interchangeably, but originally referred to different schools with different influences, techniques, and rhythmic repertoires. Some still use the older terms when describing the art.

Vocal percussion is more commonly associated with a cappella groups, whereas beatboxing and human beatbox are terms usually associated with hip hop or other urban music genres. Multivocalism is a relatively new term, coined by the UK's Killa Kela, to describe the collective use of beatboxing, singing, and sound imitation (fundamentally anything vocal) used in a musical sense. The boundary between the first two has been blurred as their practitioners have informed each other.

On the streets, beatboxers serve as human beat-machines, often providing the rhythmic backbones on which MCs lay their flows. On stage, many beatboxers have, and still do, serve as human jukeboxes organizing their routines as medleys of well-known songs. As the art form has evolved, it has extended its reach to include physical theater routines, and has integrated itself into hip hop (and other forms) of theater. Beatboxers with backgrounds in vocal percussion stand in for drummers, and percussionists in theater ensembles, live bands, and other line-ups. Some beatbox into instruments, such as harmonicas (Yuri Lane) and pan flutes (Radioactive), and one (Tim Barsky) has mastered doing so through a classical flute, achieving several simultaneous streams of rhythm and melody. Kid Beyond has mastered live-looping, using computers and triggers to create songs in real-time, replete with rhythm tracks, instrumentation, and full choirs of singing.

## History of beatboxing

Born in New York City, the fifth element is currently experiencing a second wind, thanks in part to the likes of Justin Timberlake, that has carried the artform across the world. In 2002, the documentary *Breath Control: The History of the Human Beatbox* premiered. It is a history of the art form that includes interviews with Doug E. Fresh, Emanon, Biz Markie, Marie Daulne of Zap Mama, and others. The same year even saw the emergence of a beatbox clothing label, mic(ism), *sported and supported by beatboxers worldwide*.

Beatboxing's early pioneers include Doug E. Fresh, Biz Markie, and Buffy from the Fat Boys. Doug E. Fresh is credited with being the first "human beatbox", and Barry B for coining the term. The term "beatboxing" is derived from the mimicry of the first generation of drum machines, then known as beatboxes.

### Vocal percussionists

Viv Fisher, a frustrated amateur British musician and sound engineer released a 7" vinyl single of multivocal work in 1978, entitled *Blaze Away*, performing as Me, Myself and Me Again, on which he performed all parts of a brass band, additionally using multitracking techniques to satisfy his desire for an accurate portrayal of the many instruments and depth of sound in a real brass band.

Mbube is a style of close harmony choral singing, originating in Africa. One of its components is the vocal representation of percussion and bass sounds by one or more members of a choir. Ladysmith Black Mambazo are a well known group performing in this style and have been releasing music in this genre since 1972.

### The early eighties

The art form enjoyed a strong presence in the 1980s. Many people's introduction to the art form, and perhaps its first recording, came when Doug E. Fresh and Slick Rick released "La Di Da Di". When the Fat Boys recorded "Stick Em", the rap community and beyond celebrated Buffy's heavy-breathing style. Even today, when people make fun of beatboxing, they imitate the deceased Buffy by huffing and puffing into their hands. The Fat Boys' movies (such as *Disorderlies*) introduced the art form to a wider audience as well.

### The mid eighties

Other important beatboxers in the mid-'80s who followed the greats like Doug E. Fresh included Greg Nice, Ready Rock C from Will Smith's crew, and The Jock Box from the comically named Skinny Boys crew.

In 1984, Viv Fisher recorded the first known multivocal TV theme tune, vocalising parts of a Brass Band for the title sequence of a BBC gameshow series entitled Bob's

Full House. In 1985, he performed the same role for BBC drama series, *Blott on the Landscape*, this time vocally recreating all instruments and percussion.

## The nineties

In many ways, beatboxing fell off the radar along with breakdancing in the late '80s; it almost slipped even deeper than the underground. Though many people kept the art form alive on the streets, in ciphers, within B-boy circles, and in showers, it didn't re-emerge until Rahzel "the Godfather of Noyze" released "Make the Music 2000", which is the first album focused primarily on beatboxing. The title is a reference to "Make the Music With Your Mouth", one of the first recorded beatboxing tracks by the hip hop sensation Biz Markie. (Markie also achieved moderate success with his single "Just A Friend".)

In the mid-'90s, Rahzel proved a versatile entertainer. He was formerly the vocal DJ for The Roots, a group that contributed to the popularity of live instrumentation in hip hop. Not only did he help put beatboxing back onto the stage, he introduced its modern form, an impressive if not awe-inspiring combination of polyrhythms, vocal scratching, and simultaneous lines of melody, rhythm, and singing. Rahzel himself acknowledges that he combined his influences of pioneer Doug E. Fresh, jazz vocalist Bobby McFerrin, and sound effect master Michael Winslow (of *Police Academy* fame) to give rise to his modern format.

On "If Your Mother Only Knew", a beatboxing sample of Rahzel, he wows an audience by singing and beatboxing simultaneously—a feat considered difficult by the beatboxing community. On several tracks, he introduced the idea of simulating turntable scratches with his throat, something even underground beatboxers upholding the art form through the lean years hadn't even heard until the album's release.

Using his commercial appeal, Rahzel paved the way for beatboxing's migration to the center of the stage, both literally and metaphorically. In its beginning, beatboxing was relegated to a supporting role or gimmick, like a side show. With beatboxing's increased popularity, Rahzel began touring the country doing solo shows.

Of course, many beatboxers express frustration with Rahzel receiving most of the attention and being known as the best beatboxer in the world. Though many well-practiced amateur and professional beatboxers possess different levels of skill, each one brings something different to the form. As Carlo Aguirre (a.k.a. Infinite), a beatboxer and MC from San Francisco's famed Felonious says, "Each person has a different instrument."

Other well-known, seminal beatboxers whose work is well known throughout the international beatboxing community include the Bronx's Kenny Muhammad (a.k.a. Kenny X, The Human Orchestra); Philadelphia's Scratch, beatboxer for the Roots; Killa Kela, one of Europe's finest, Click Tha Supah Latin, an MC and beatboxer located in Los Angeles, Shlomo, who has collaborated with Björk, MC Squared, an internationally renowned 5-time winner of Showtime at the Apollo, RoxorLoops from Beatotoxic Crew, Each who is a key organizer with the Vowel Movement located in California and Canada's own scratch pioneer Poizunus.

## The Four Elements

The last track on Rahzel's CD 'Make The Music 2000' is a track with his famous 'If Your Mother Only Knew' routine. But it contains a hidden bonus track, which is a 'Man vs. Machine' battle with beatboxers Rahzel and Kenny Muhammad vs. turntablists DJ Skribble and DJ Slinky. The song is by most beatboxers referred to as The Four

Elements, because it contains an impression of the four elements in beatbox style at the end.

- The first element is **Earth** (performed by Rahzel), using basic beatboxing techniques with a dry 'taste', in a fairly simple beat pattern.
- The second element is **Wind** (performed by Kenny Muhammad), a complex and fast beat with words in it said in a very low voice. It has a stormy character. Wind is probably the current most favourite beatbox routine. It is a cover of the song 'Nummern' (Numbers) by a German group called Kraftwerk.
- The third element is **Fire** (performed by Rahzel). It is the only element containing sounds that were not produced by the human mouth. Fire is a cover of 'Rock The Bells' by LL Cool J.
- The fourth and last element is **Water** (performed by Kenny Muhammad), maybe the least popular. The sounds are punchy and fast. Water is a cover of a tune called 'Funky Drummer' by James Brown.

Nowadays, The Four Elements are very popular amongst the beatboxing community.

## Internet presence

The largest beatboxing community on the Internet is Humanbeatbox.com, created in 2002 by UK beatboxer Alex Tew (a.k.a. A-Plus) and developed by Gavin Tyte (a.k.a. TyTe, the world's only beatboxing reverend). This site has greatly fuelled the recent resurgence in beatboxing. Beatboxers in different areas have used this site, and the Internet in general, as a means to meet in person, forming important clusters that populate Europe and the U.S. as well as organising the first Human Beatbox Convention, which took place in April 2003. TyTe developed the first Internet-based beatboxing tutorials as well as the first video tutorials and this has helped tens of thousands of people get started in beatboxing. The central feature of HumanBeatbox.com is the community forums where beatboxers and non-beatboxers alike converge to share and discuss their interest in this art form.

This important resource has been a nexus for the art form's evolution. The emergence of values such as inclusivity, sharing, and cooperation, are present, contrasting with the prevalent fierce B-boy stance that hip hop as a whole has assumed.

In 2004, beatbox-centric company mic(ism) completed development of the non-profit International Beatbox Association. The IBA, as it became known, was created to aid beatboxers in getting paid work, and thereby to help beatboxing attain the public level of credibility as a musical art form deserved of remuneration, as already enjoyed by more mainstream instrumentation. Through the IBA, it is now possible for professional beatboxers to be contacted directly by individuals wishing to book them, without artists having to make their personal contact details publicly available. In this way, beatboxers can now be safely contacted by promoters, agents, talent scouts and record labels worldwide.

## Major centers

### New York City

New York City is the birthplace of the art and still home to many of the world's most original and impressive beatboxers. These include Buffy of The Fat Boys (R.I.P.), Doug E. Fresh, Kenny Muhammad, MC Squared, Taylor McFerrin, Kid Lucky, Masai Electro, Baba, and many others. In 2002 Kid Lucky created Beatboxer Entertainment, an organization to unite NYC's beatboxers, which has since grown to include beatboxers nationally and internationally.

### United Kingdom

In the UK, Beatboxing has exploded since early 2004, thanks in part to the world's largest online beatbox community, [humanbeatbox.com](http://humanbeatbox.com), which is based in the UK. Artists are coming from all over the country. Although the majority are from London, there are a lot from other places such as Huddersfield, Leeds, Bristol and Brighton. Killa Kela is still known as the most famous UK beatboxer, however others such as Lianhart, Faith SFX and Shlomo are starting to break into the lime light. UK Beatboxers differ from other Beatboxers as they seem to come from different genres of music, i.e. Faith SFX coming from the [Grime](#) scene, Killa Kela initially coming from the Drum and Bass scene and Lianhart who has his own original flavour and is now appearing 3 or 4 times every hour on the MTVBase indents. Whereas beatboxers from other counties mainly come through the Hip Hop scene.

The King of the Jam Tournament, made by Mark Splinter, was the first initial Beatbox jam gathering that the UK had, starting out with 4 beatboxers gathering together at St. James' Park in London, has exploded with 80 beatboxers gathering at the 2004a Jam. This event made Beatboxers be able to come together and be able to jam and make real music. Although Mr Splinter has moved to Vilnius, Lithuania, he still arranges the gatherings at the same park twice a year.

The Main events of the UK are:

Make Some Noise, Bristol, May

King of the Jam, London, August and September

UK Beatbox Championships, Various Cities, February, June and July

On the 4th may 2006 a UK beat boxer appeared on the tv show level up.

### San Francisco Bay area

The Vowel Movement, created by Bryan Neuberg (a.k.a. Process), Kid Beyond, and Tim Barsky, is a collaborative San Francisco Bay area community that supports the art of beatboxing. It features regular showcases that emphasize sharing and inclusivity amongst its practitioners, bringing the art form to a diverse audience, and pushing the boundaries beyond the classification of hip hop.

## Australia

Australian beatboxer Joel Turner first came to fame after appearing on the Australian Idol competition, and then went on to become the world's first World Beatbox Champion by winning the Hip Hop World Challenge in Germany, 2005.

## Toronto, Canada

Toronto is the home of Canadian beatboxer Poizunus.

# Beatlesque

**Beatlesque** (pronounced /ˈbi:tYl[ɪ]sk/) is a term used to describe [rock](#) and [pop bands](#) and [musicians](#) who make music similar to that of The Beatles, an English rock-pop music band from the 1960s.

As the Beatles broke several music sales records and charted numerous times during their careers, the term is typically used by record reviewers, rock and pop music fans, and members of the media as a form of praise; it is only occasionally used to mean that an act is *too* derivative of the Beatles or similar acts of the 1960s. Typical hallmarks of Beatlesque bands include:

- A strong, well-crafted [melody](#), rarely driven by a riff
- A focus on vocal performance, featuring distinctive singing styles and vocal [harmony](#).
- Subtle tension in the chord progressions, as heard on Cry Baby Cry, Blackbird, Sexy Sadie, and many others. This would continue much into Lennon's solo career with songs such as Jealous Guy.
- A "fresh", eclectic, and innovative approach to composition and performance, often featuring arrangements or instruments unusual to the format of the conventional pop song
- Elements of [psychedelic music](#), especially reminiscent of the Beatles' work during the period of 1966–1968
- Strong songwriting, with intelligent, profound, and accessible lyrics
- High standards of production, resulting in a very "clean" sound

Not all of the Beatles' songs fit into this formula; for example, "I Want to Hold Your Hand" has very simple, straightforward lyrics, and "Day Tripper" is a purely riff-driven song. Adherence to a few of the criteria, plus some passing resemblance in tone or voice, is often enough, however, to be labeled into this varied genre.

Some bands and artists considered to be "Beatlesque" are listed below. The list is supplemented by an informal publication of the Usenet newsgroup [rec.music.beatles](#) on Beatlesque bands. It should be noted that some bands (see Oasis), consciously attempted to mimic the Beatles' sound. For the most part, however, the resemblance to The Beatles is not as intentional.

## Examples of "Beatlesque" bands and artists

Richard Cummins Independent artist from Vancouver, Richard's songs are always being compared to the Beatles, largely due to his extreme emphasis on melody, memorable hooks and harmony.

Tori Amos: Certain of her compositions have been cited, particularly more recent songs such as "Wednesday" from her album *Scarlet's Walk* and "Ireland" off of her most studio release *The Beekeeper*. She has also covered a fair number of Beatles songs.

Apples in Stereo: An independent American pop band that heavily draws from The Beach Boys in addition to The Beatles. The album *Her Wallpaper Reverie* is probably the most heavily Beatles influenced album of The Apples. Some Apples songs even have titles similar to Beatles songs such as "Strawberryfire" ("Strawberry Fields Forever") and "Submarine Dream" ("Yellow Submarine").

Badfinger: Recorded the Paul McCartney composition "Come and Get It" for an early hit, in much the same way that the song was demoed to them. George Harrison, too, worked with Badfinger, not only producing much of their music but also contributing the slide guitar solo on their song "Day After Day." George Martin, Geoff Emerick, Chris Thomas, and Mal Evans, all of whom worked heavily with The Beatles, also worked with Badfinger (all but Martin produced them). Badfinger was sometimes accused of being too derivative. They were on the Beatles' Apple Records label.

Charlatans UK: Contemporary British band from Manchester, near the Beatles' home of Liverpool.

Cheap Trick

Chris Cornell: Has claimed in a Rolling Stone interview that the Beatles are his favorite band. His *Euphoria Morning* album shows much Beatles influence in the melodies and chord progressions; Kim Thayil has mentioned that Soundgarden somewhat imitated the Beatles on their *Superunknown* album.

The Church: Strong Beatles influence on many songs from this Australian band.

Coldplay: Known for their Beatlesque melodies.

Peter Cook and Dudley Moore: Cook and Moore recorded a Beatle parody titled "L.S. Bumble Bee" released in early 1967, with Moore sounding like Lennon, which spoofed the psychedelic sound. It appeared on many Beatle bootleg albums.

Marshall Crenshaw: Crenshaw started his career portraying John Lennon in a touring production of *Beatlemania*.

Crowded House: Beatles-like sounds fill this band's catalog, from their debut album to their demise. See also Neil Finn, Split Enz

Don Dixon: Chiefly a record producer, but has recorded his own material.

Electric Light Orchestra: Band members have remarked that they were heavily influenced by the Beatles. Frontman Jeff Lynne later produced George Harrison's *Cloud Nine* album, worked with him on the *Traveling Wilburys* albums, and completed Harrison's final work *Brainwashed*; Lynne also produced the new songs for the Beatles' own *Anthology*. John Lennon reportedly stated that if the Beatles stayed together, they would have sounded like ELO.

Galactic Cowboys: Defunct band that deftly blended power pop and heavy metal.

Gasman James: Authentic, original compositions that sound very Beatle-like. Visit <http://gasmanjames.50webs.com/>

Gin Blossoms: Occasionally experiment with their pop sound, mixing in country and zydeco.

Robyn Hitchcock: Has remarked that he was heavily influenced by The Beatles. Jacob's Trouble: Christian rock band which set out to sound as Beatlesque as possible

Jellyfish: Short-lived San Francisco band whose two lead songwriters had a relationship similar to Lennon and McCartney; they also wrote several songs for Ringo Starr's "Time Takes Time" LP.

Billy Joel: Though only a few of his songs would be considered Beatlesque, Joel has admitted that the Beatles were his chief inspiration for becoming a musician. A clear Beatles influence is evident on his Glass Houses album.

Phil Keaggy: Noticeable similarity, particularly on his 1988 album Phil Keaggy and Sunday's Child

King's X: A band from Houston, Texas that mixes Beatles songcraft, progressive metal, and funk into a unique concoction.

Klaatu: Canadian band of the early 1970s whose sound was so reminiscent of the Beatles that rumors were started that the band was actually the Beatles reformed under a different name.

Lenny Kravitz: Specifically on the songs "Stand by My Woman" and "Let Love Rule", mainly because Sean Lennon produced some songs on Kravitz's "Mama Said" album.

The La's: Another foursome from Liverpool; their biggest hit was "There She Goes".

Julian Lennon: The son of John Lennon; critics have noted the similarity in their voices.

Love & Rockets

Aimee Mann: Former lead singer of 'Til Tuesday and wife of Michael Penn. Her style has become more eclectic since leaving 'Til Tuesday.

The Monkees: Specifically created by US television to replicate the style and music of The Beatles, at the height of Beatlemania, following the success of "A Hard Day's Night" and "Help!". In television episodes the band had adventures much in the vein of the aforementioned films. Each episode had a song, rendered in the style of The Beatles. Top songwriters of the day were commissioned to write the songs, and it was only when individual band members started writing their own material did the songs depart from The Beatles template. Ultimately, The Monkees developed their own style and can be considered as a successful group in their own right.

Nirvana: Singer/guitarist Kurt Cobain idolized John Lennon, and admitted that "About a Girl" was essentially his attempt at writing a Beatles song.

Oasis: Main songwriter Noel Gallagher has often cited The Beatles as a strong influence. The drummer Zak Starkey is son of Ringo Starr.

Gilbert O'Sullivan: Best known for his 1972 hit "Alone Again (Naturally)".

Michael Penn: Particularly on his 1989 hit "No Myth".

Pink Floyd: One of the earliest acts to adapt Beatles-style harmonies and arrangements; Syd Barrett had noted the Beatles as a big influence on their early sound.

The Pixies: Singer Frank Black is a Beatles fan, and their guitarist Joey Santiago has mentioned George Harrison's guitar licks as his inspiration to learn guitar.

The Posies: One of their songs was covered by Ringo Starr.

Sam Phillips: Her albums The Indescribable Wow, and Martinis and Bikinis have been noted for their Beatlesque sound. Bikinis even included a cover of Lennon's "Gimme Some Truth."

The Pillows: Even though their songs are in the Japanese language, several of

their songs, including "Patricia" and "Scent of Sweet", have sounded remarkably Beatlesque.

Radiohead: While many of their songs are Beatles-influenced, Karma Police in particular has a piano arrangement almost exactly like that of Sexy Sadie.

The Ramones

The Raspberries: Considered one of the founders of the power pop style, drawing inspiration from the Beatles and other British Invasion bands.

The Redwalls: A former Beatle cover band that began writing its own compositions.

The Rembrandts: Most famous for performing "I'll Be There for You", the theme to the American TV show Friends.

The Romantics: 1980s power pop band from Detroit, Michigan evoked the sound of the early period Beatles and other British Invasion groups in their energetic, electric guitar- and drums-based New Wave rock, and evoked the look of the early, Beatlemania era Beatles with their matching band suits and bushy hairstyles.

Todd Rundgren: Similar to Don Dixon (above), Rundgren is primarily a producer, and has produced albums by XTC and Badfinger. His band, Utopia, is listed separately.

The Rutles: Not a proper band in their own right, the Rutles were a Beatles parody project created by Neil Innes and Eric Idle.

Elliott Smith: Has repeatedly stated the huge influence that the Beatles have had on his music.

The Smithereens: The drummer of this New Jersey-based quartet, Dennis Diken, mentioned the Beatles' influence on their music in liner notes.

The Smiths: Similar to Michael Penn (above) in that the Smiths' lyrics are generally more depressing and "downbeat" than the Beatles'.

The Spongetones: Another former Beatle cover band that began writing its own compositions.

Stars on 45: Dutch group of session players who in the 1980s recorded authentic covers of Beatles songs for a "medley" played against a disco beat. More derivative than Beatlesque.

Superdrag: Released the album Head Trip in Every Key which was fully orchestrated.

System of a Down: The Heavy Metal band's guitarist, Daron Malakian has stated in interviews that the Beatles and other 60's rock bands have a heavy influence on them, particularly in the Serj Tankian-Daron Malakian harmonies.

Terry Scott Taylor: Taylor's first two solo albums, Knowledge and Innocence and A Briefing for the Ascent, were frequently compared to the Beatles music by reviewers, and Taylor himself was often said to sound like John Lennon.

Taylor's band Daniel Amos also often received comparisons from reviewers, especially their 1978 album Horrendous Disc.

Tears For Fears: Their song "Sowing The Seeds Of Love" is heavily influenced by the 1967 Beatles. Also, their song "Shout" was owing to John Lennon's sound on his first solo album Plastic Ono Band. Their newest album as of 2005, Everybody Loves a Happy Ending, is self-consciously Beatlesque throughout.

Utopia: Notable for releasing an album directly parodying the Beatles, Deface the Music.

Ween

Weezer

Wilco

The Wackers Canadian band from Montreal. Particularly Beatlesque is the Hot Wacks LP (Elektra 1972) which yielded a single cover version of John Lennon's Oh My Love, and many shades of Abbey Road and The White Album.

The Wonders: Fictional one-hit wonder band from Tom Hanks' 1996 film That Thing You Do!. The group's songs and sound were intentionally modeled after

the Beatles of 1964.

World Party

XTC: Their albums Skylarking (produced by Todd Rundgren, above) and Oranges and Lemons, are particularly cited for the adjective. Even more so are their recordings as The Dukes of Stratosphere, which are deliberately reminiscent of the psychedelia of the 1960s.

# Beatmatching

**Beatmatching** is a technique employed by [DJs](#) to transition between two songs while performing either live at a club or event, for radio broadcast or for distribution on prerecorded mix tapes/cds, achieved by changing the tempo of a new track to match that of the currently playing track, then mixing between the two so there is no pause between songs. This is used to keep the flow of the music constant for the pleasure of the listener, both through appreciation of the quality of the mix between records and the lack of time between tracks played back to backs providing more [melody](#) and [rhythm](#) to dance to.

This technique became status quo on the [turntable](#), and many DJs continue to use vinyl records for their analog sound, manipulability, as well as their history and allure. Other DJs have switched to CD mixing technology that allows digital controls to mimic common techniques for physically manipulating records, due to their higher sound quality and the greater ease of finding and transporting a CD collection. More recently, technology has been developed that allows DJs to use actual vinyl records to manipulate mp3s and other digital tracks stored on their computer hard drives to produce the same effects.

# History

Beatmatching was originally employed by DJ Francis Grasso in the late 60's/early 70's. Originally, the technique involved counting the tempo with a metronome and finding a record with the same tempo. Today, it involves changing the speed at which a recording is played back so that its tempo matches that of the song currently playing. In this way, the DJ can either simultaneously play two songs of different original tempos without their beats clashing (or "galloping") or can more smoothly transition between songs. The tempo of the recording can be changed through the use of specialized playback mechanisms. In the case of vinyl records, for example, the turntable would have a separate control for determining the relative speed (typically listed in percent increments) faster or slower the record can be played back. Similar specialized playback devices exist for most recorded media. Changing the speed of the record that is playing is called pitching or pitch shifting.

The following equipment is necessary for beat matching:

- Two turntables (T1 and T2) with pitch controls and slipmats
- At least two records (R1 and R2)
- One mixer or crossfader, capable of:
  - Variably blending the outputs of T1 and T2
  - Cueing the music playing on either turntable without outputting the sound to the audience
- Headphones
- A Public Address System (PA) or other form of amplification and speakers

The following skills are necessary for beat matching:

## Selecting appropriate songs

Although experienced DJs often show off by beat matching songs that do not follow these rules, while learning it is best to select songs that with similar BPMs. You also generally want to choose a record on T1 with an instrumental outro or a record on T2 with an instrumental intro, to avoid a sound that is too cluttered during the time in which both records are playing. These instrumental parts do not need to be at the beginning or end of the song, and many DJs like to make smooth transitions at unexpected places.

## Counting

In order to recognize the tempo of music, you must be able to count beats. Most music designed for dancing has a strong, apparent beat, and is in the 4/4 time signature, which makes beat matching easier. To properly beat match you need to be able to recognize the first beat of the measure or bar, or the 1 in a count of 1 2 3 4 1 2 3 4 . . . If you were to continue this count past 4, one minute later you will have arrived at the BPM. A quicker way to calculate the BPM is to use the same method as counting to one minute, but count to 15 seconds instead then multiply by 4.

When counting, it is also useful to think in broad terms about the sections of the song, which will usually have a length equal to some multiple of 4 bars. Most commonly, if you count the bars in a section of a song, they will be 4, 8, 16, 32, or 64 bars in length. This information helps the DJ decide at which point during T1 he must start T2 in order for the sounds of one track to fade as the other builds, or whatever effect is desired.

## **Slip-cueing**

While one record is played over the main speakers, you must be able to find the appropriate place to come in on the other over your headphones. This is done by physically moving the record back and forth with your hand. The beat that you select should generally be a "hit" on the bass drum near the beginning of the song. This also should be the first beat of the measure. DJs will often use a sticker in center of their record to mark where the first main beat of the record takes place, to make it easier to find. Once found, you need to physically hold the record still and prevent it from spinning, thus pausing the sound. To start it again, simply release the record. You will need to physically rewind the record and start it several times, until you are confident that you have found the first beat and can start it at the exact moment that you desire.

## **Matching tempos**

When two records are playing simultaneously, you listen to both and note which beat is running ahead or lagging behind, and adjust the pitch control accordingly. At least initially, it is best to make all adjustments on T2, so that the tempo of the music playing to the crowd is not erratic. Another technique, if you already know the BPMs for both records (because you have measured them yourself or looked them up in a reference guide or the internet), is to "cheat" and figure out how you need to adjust the pitch control mathematically. Many DJs use a combination of both, using measured BPMs to approximately match tempos and then fine tuning their adjustment by ear.

# Step by step process of beatmatching

Assuming that you are already playing a record on T1,

1. Select desired song to mix in on R2.
2. Cue R2 on T2 to first main beat and pause it, using the headphones so that this process is not audible to the audience.
3. Count beats on the R1, and find the first beat of the measure.
4. Start R2 to correspond with the first beat of R1. At this point you will need to listen to both records, which can be accomplished two ways. Some mixers allow you to fade between both inputs in your headphones, but if you do not have this ability you can simply adjust your headphones to only cover one ear and listen to R1 over the main speakers.
5. Match tempos using the pitch adjust on T2. You will usually need to repeat Steps 4 and 5 a number of times before the tempos are actually locked together. You will know that you have succeeded when even after listening to R2 for a (relatively) long time, it will stay perfectly synched with R1.
6. Note the total percentage of the variation in speed needed and divide it by two. If you were to leave T1 at neutral and adjust T2 all the way to +6%, it would make pitch increase drastically on T2, so that your Barry White records would sound more like the Bee Gees). Instead, gradually slow down T1 to -3% (slowly enough that the crowd does not notice) and bring T2 to a more reasonable +3%. Then check you tempos one more time and repeat Steps 4 and 5 if necessary.
7. Pause R2, as in Step 2.
8. Set the mixer to play both records over the main speakers (usually done by setting the cross-fader in the middle position). So long as R2 is paused, the crowd will still hear only R1. Any movement on R2, however, will be audible to the crowd. This movement can be done intentionally as scratching.
9. Count beats on R1 and until you have reached an appropriate place to merge the two records. Often this will be the first beat not only of a measure but of a 4, 8, or 16 beat section.
10. Allow R2 to start in synch with R1.
11. Listen closely and make small adjustments to tempo and volume until the desired effect is achieved.
12. Remember to fade out R1 entirely when ready.

Once mastered, this skill allows you to layer one record over another and create smooth transitions between different songs. After you have matched beats, you can also fade in and out smoothly between songs, and cue back either song to the beginning, thus extending both songs indefinitely. The same technique can also be used to isolate [breaks](#), using two copies of the same record to extend a short "break-down" section as long as is desired.

# Bebop

**Bebop** or **bop** is a form of [jazz](#) characterized by fast tempos and [improvisation](#) based on harmonic structure rather than melody. It was developed in the early and mid-1940s. [Hard bop](#) later developed from bebop combined with [blues](#) and [gospel music](#).

## Style

Many bebop tunes were based on the [chord progressions](#) (also called chord changes) from popular songs. (The technical term for such tunes is contrafacts or contrafactions.) A (slightly shortened) version of the chord changes to the song "I Got Rhythm" by George Gershwin was so often used that they are often referred to simply as "Rhythm changes." Contrafaction was already a well-established practice in earlier jazz, but came to be central to the bebop style. In part this was because the extremely fast tempos favored by boppers often did not suit the original melody, and because they often further altered the original chords or even combined chords from two different tunes. In part the use of contrafacts had a practical purpose: small record labels like Savoy, which documented the early bebop movement, often wished to avoid paying copyright fees for pop tunes.

Bebop composers and improvisers, particularly Charlie Parker, stylistically employed frequent use of upper chord tones, i.e., ninths, elevenths, and thirteenth, creating a more colorful and rich harmonic sound than past jazz styles. As the bebop language developed, these "altered chords" were used less for coloration than as fundamental building blocks of new harmonic spaces. The soloist's implied switch from an original to a reconstructed space created a narrative of liberation.

With the emergence of [hard bop](#) and [modal jazz](#) in the late 1950s and early 1960s, each altered chord was seen to imply a scale or mode (Gioia 299). The capacity to improvise over a complex sequence of altered chords using only the implied scales requires a mental agility of a mathematical, problem-solving kind that is another hallmark of bebop. These techniques have moved from the avant-garde to become part of the mainstream language of jazz, a language jazz musicians master as a rite of passage.

Bebop was also heavily characterized by the flattened fifth. The flattened fifth, one of the two strong dissonances on the diatonic scale, was a relatively new addition to popular music at the time. Although it had occasionally been used for passing chords or special harmonic effects in the 20s or 30s, and is an intrinsic member of the "blues" scale derived from African music (Gioia 9), the feature had never played an integral role in the foundation of a style to the extent it does in bebop. After roughly a decade, the flattened fifth would become a blue note just as common as the undetermined thirds and sevenths in traditional [blues](#) (Brendt 15).

This is related to the harmonic technique of tritone substitution. Here, the familiar series of perfect cadences is replaced by chromatic motion of the root. Thus, the standard "IIm7 - V7 - I" sequence, a building block of the 20th century popular song, is reconstructed as "IIm7 - mII7 - I". A bebop musician like Thelonious Monk, confronted with a chord marked as G7 (G dominant seventh) resolving to C, would often replace it with Dm7 (Dm dominant seventh).

Bebop differed drastically from the highly organized compositions and "solid, yet springing 4/4 propulsion" of the swing era, and was instead characterized by fast tempos, complex harmonies, intricate melodies, and rhythm sections that laid down a steady beat only on the bass and the drummer's ride cymbal (Rosenthal 12). The music itself was jarringly different to the ears of the public, who were used to the bouncy, organized, danceable tunes of those like Benny Goodman and Glenn Miller during the swing era. Instead, bebop appeared to sound racing, nervous, and often fragmented. Everything was condensed, and no notes except the absolutely necessary were added. As one bebop musician said, "everything that is obvious is excluded" (Gitler 16), which often amounted in the music going above the heads of listeners. The style was also highly dependent on improvisations, which even include non-traditional solo instruments

such as the drums. In the playing, a theme would be presented in unison at the beginning and the end of each piece, with improvisational solos making up the body of the work.

The classic bebop combo consisted of saxophone, trumpet, bass, drums, and piano. This was a format used (and popularized) by both Charlie Parker (alto sax) and Dizzy Gillespie (trumpet) in their 1940s groups and recordings, sometimes augmented by an extra saxophonist or guitar.

Later codifications of bebop harmony emerged, notably in the teachings of pianist/educator Barry Harris, who encouraged players to learn "bebop scales" for improvising such as the Bebop Minor (I-II-mIII-III-IV-V-VI-mVII), the Bebop Dominant (I-II-III-IV-V-VI-mVII-VII), and the Bebop Half-Diminished (I-mII-mIII-IV-mV-mVI-mVII). A feature of these scales is that when they are played in 8ths, up or down, players automatically play a tone featured in the corresponding chord on every 4/4 beat.

## Etymology

The name *bebop* (also called **rebop**) is an onomatopoeic imitation of a characteristic quick two-note phrase that was played together by the lead instruments to introduce a solo or end a song. It is also the name of one of the first jazz pieces tending from Swing toward Bebop by Dizzy Gillespie.

## Bebop musicians

Notable musicians identified with bebop:

Julian Adderley, alto sax  
Clifford Brown, trumpet  
Ray Brown, bass  
Don Byas, tenor sax  
Charlie Christian, guitar  
Kenny Clarke, drums  
Tadd Dameron, piano  
Miles Davis, trumpet  
Kenny Dorham, trumpet  
Dizzy Gillespie, trumpet  
Dexter Gordon, tenor sax  
Wardell Gray, saxophone  
Al Haig, piano  
Barry Harris, piano  
J.J. Johnson, trombone  
Duke Jordan, piano  
Stan Levey, drums  
John Lewis, piano  
Charles Mingus, bass  
Thelonious Monk, piano  
Fats Navarro, trumpet  
Charlie Parker, alto sax  
Sonny Rollins, tenor sax  
Sonny Stitt, tenor and alto sax  
Oscar Pettiford, bass  
Tommy Potter, bass  
Bud Powell, piano  
Max Roach, drums  
Red Rodney, trumpet  
Lucky Thompson, tenor sax  
George Wallington, piano

# Bel canto

**Bel canto** (**Belcanto**, **bel canto**) (Italian, *beautiful singing*) is an Italian musical term. It refers to the art and science of vocal technique which originated in Italy during the late sixteenth century and reached its pinnacle in the early part of the nineteenth century during the Bel Canto [opera](#) era. Rossini, Bellini, and Donizetti are the best-known exponents of this style, which flourished from approximately 1810 to 1830. Some would credit the 17th century composer Pietro Cavalli with introducing bel canto, but his smooth and flowing melodic lines form a different style that belongs to a different era.

Bel canto singing is characterized by a focus on perfect evenness throughout the voice, skillful legato, a light upper register, tremendous agility and flexibility, and a certain lyric, "sweet" timbre. Operas of the style featured extensive and florid ornamentation, requiring much in the way of fast scales and cadenzas. Emphasizing technique over volume, bel canto style has famously been linked to an exercise said to demonstrate its epitome, where a singer holds a lit candle to her mouth and sings without causing the flame to flicker.

While the bel canto period is typically dated to the early 19th century, the term itself did not come to be commonly used in its current sense until the middle of the 19th century. It was at this time that composers such as Wagner began to call for larger, more dramatic voices; opponents of this trend complained, with Rossini, "Alas for us, we have lost our bel canto."

The sopranos Maria Callas and Joan Sutherland were probably the best-known bel canto singers of the postwar period. (Virginia Zeani and Leyla Gencer were both bel canto soprani of equal abilities, but they made fewer recordings and, thus, were less famous in America.) For many years, the bel canto [tenor](#) was a rarity; however, since the appearance of Chris Merritt and Rockwell Blake they have been making a comeback. Skilled bel canto tenors of today include Juan Diego Florez and William Matteuzzi.

# Bell

A **bell** is a simple sound-making device. The bell is a [percussion instrument](#) and an [idiophone](#). Its form is usually an open-ended hollow drum which resonates upon being struck. The striking implement can be a tongue suspended within the bell, known as a *clapper*, a small, free sphere enclosed within the body of the bell, or a separate mallet.

Bells are usually made of metal, but small bells can also be made from ceramic or glass. Bells can be of all sizes: from tiny dress accessories to church bells literally weighing tons.

## **Church and temple bells**

In the Western world, its most classical form is a church bell or town bell, which is hung within a tower and sounded by having the entire bell swung by ropes, whereupon an internal hinged tongue strikes the body of the bell (called a free-swinging bell). A set of bells, hung in a circle for change ringing, is known as a ring of bells.

In the Eastern world, the traditional forms of bells are temple and palace bells, small ones being rung by a sharp rap with a stick, and very large ones rung by a blow from the outside by a large swinging beam. This last technique is employed world-wide for some of the largest tower-borne bells, because swinging the bell itself could damage the tower.

In the Roman Catholic Church and among some High Anglicans, small hand-held bells, called Sanctus or sacring bells, are often rung by a server at Mass when the priest holds high up first the host, and then the chalice immediately after he has said the words of consecration over them (the moment known as the Elevation). This serves to indicate to the congregation that the bread and wine have just been transformed into the body and blood of Christ (see transubstantiation), or, in the less rigorous Anglican teaching, that Christ is now really present in the elements, and that what the priest is holding up for them to look at is Christ himself.

## **Buddhist bells**

Japanese Buddhist bells are used in religious ceremonies. Suzu bells, meaning "cool and refreshing," are the smallest bells and contain metal pellets. The next largest bell is the Kane bell. The largest bell is the furin, or wind bell, which is a form of wind chime.

## Bells as musical instruments

Some bells are used as [musical instruments](#), such as clock chimes, carillons, or ensembles of bell-players, called bell choirs, using hand-held bells of varying tones. A "ring of bells" is a set of 4 to twelve bells or more used in change ringing, a particular method of ringing bells in patterns. A "peal" in changing ringing may have bells playing for several hours, playing 5,000 or more patterns without a break or repetition.

### Ancient Chinese bells

The ancient Chinese had bronze bells called zhong (钟) which were used as musical instruments. Some of these bells were dated from 2000 to 3600 years old. These bells can each produce two tones. These bells usually have inscriptions on them from which scholars used as references for studying ancient Chinese writings (a.k.a. Bronzeware script). Another related ancient Chinese musical instrument is called qing (磬 pinyin qing4) but it was made of stone instead of metal.

## Bellmaking

The playing of bells is known as bellringing, and such a bell produces a very loud, clear tone. If the bell is mounted as cast, it is called a "maiden bell" while "tuned bells" are worked after casting to produce a precise note. The traditional metal for these bells is a bronze of about 20% tin. Known as bell metal, this alloy is also the traditional alloy for the finest Turkish and Chinese [cymbals](#). Other materials sometimes used for large bells include brass and iron. The process of casting bells is called bellmaking.

## Belltowers

Bells are also associated with clocks, indicating the hour by ringing. Indeed, the word clock comes from the Latin word *cloca*, meaning bell. Clock towers or bell towers can be heard over long distances which was especially important in the time when clocks were too expensive for widespread use.

In the case of clock towers and grandfather clocks, a particular sequence of tones may be played to represent the hour. One common pattern is called the "Westminster Quarters," a sixteen-note pattern named after the Palace of Westminster which popularized it as the measure used by Big Ben.

## Famous bells

Big Ben is the hour bell of the Great Clock in St. Stephen's Tower at the Palace of Westminster, the home of the Houses of Parliament in the United Kingdom.

The Great Bell of Dhammazedi may have been the largest bell ever made. It was lost in a river in Myanmar after being removed from a temple by the Portuguese in 1608. It is reported to have been about 300 tonnes in weight. The largest bell still in existence may be the Great Mingun Bell, located in Mingun, Myanmar. It weighs 90 tonnes (200,000 lb).

Great Tom is the bell that hangs in "Tom Tower" (designed by Christopher Wren) of Christ Church, Oxford. It was cast in 1680, and weighs over six tons. Great Tom is still rung 101 times at 21:05 every night to signify the 101 original scholars of the college.

The Liberty Bell is an American bell of great historic significance, located in Philadelphia, Pennsylvania. It previously hung in Independence Hall and was rung on July 4, 1776 to mark American independence.

Sigismund is a bell in the Wawel Cathedral in Kraków, Poland, cast in 1520. It is rung only on very significant national occasions, the most recent of which was the death of Pope John Paul II.

The Tsar-Kolokol III bell by the Motorin Bellfounders would have been larger than even the Great Mingun Bell at more than 200 tons, but it was never rung and broke in 1737. It is on display in Moscow, Russia inside the Kremlin.

The largest swinging bell is the World Peace Bell in Newport, Kentucky, cast by Paccard of France. The bell itself weighs 66,000 lb while with clapper and supports the total weight which swings when the bell is tolled is 89,390 lb.

Pummerin in Vienna's Stephansdom is the most famous bell in Austria and the fifth largest in the world.

The St. Petersglocke, in the local dialect of Cologne also called "Decke Pitter" (fat Peter), is a Bell in the Cologne Cathedral. It weighs 24 tons and was cast in 1922. At this time, it was the largest free-swinging bell in the world. It swings around the top, while the World Peace Bell swings around the Center of Gravity, which is more like turning than like swinging. So, depending on the point of view, the St. Petersglocke may be up to now the largest free-swinging bell in the world. And, because of the Doppler Effect, a bell which swings around the top has a better sound than a bell which swings around the gravity point.

## Chimes

A variant on the bell is the [tubular bell](#) or *chimes*, composed of several metal tubes which are struck manually with hammers. In the case of wind or aeolian chimes, the tubes are blown against one another by the wind.

## Benefit concert

A **benefit concert** is a [concert](#) featuring musicians, comedians, or other performers that is held for a charitable purpose, often directed at a specific and immediate humanitarian crisis. Such events raise both funds and public awareness to address the cause at issue.

Benefit concerts typically feature popular performers working for little or no pay. The largest such effort in recent memory was the multi-venue Live 8 concert organized by Bob Geldof, who has arranged a number of similar events. Benefit concerts were also arranged following the 2004 Indian Ocean earthquake and Hurricane Katrina. America: A Tribute to Heroes was a benefit concert organized in the aftermath of the September 11, 2001 attacks on the World Trade Center and The Pentagon by the four major United States television networks.

Albums or video recordings of performances at benefit concerts can provide additional revenue for the charitable cause to which the event is directed. Furthermore, the importance of the cause can lead musicians to put aside long-held grudges. Examples of this include the brief reunion of Roger Waters with Pink Floyd for their Live 8 performance; and the first post-break-up reunion of Simon and Garfunkel at a 1972 concert in support of presidential candidate George McGovern.

## Notable benefit concerts

Other notable benefit concerts have included the following:

December 28, 1791 - a benefit concert is held in Prague for the family of Wolfgang Amadeus Mozart.

December 22, 1808 - Ludwig van Beethoven held a benefit concert which was over four hours long and included the premiers of the Fifth and Sixth Symphonies, along with Piano Concerto No. 4 and pieces of the Mass in C. 8 February 1847, Johann Strauss II premiers his 'Explosions-Polka' written for the 'Lust-Explosionsfest' (Joyful Explosions Festival), a benefit concert held in the Sträußl-Säle of the Josefstädter Theater.

January 16, 1853 - Johann Strauss II recovers from an illness in order to premier his new waltz, Phönix-Schwingen at a benefit concert.

In 1955, Dorothy Buffum Chandler organizes a concert featuring Dinah Shore, Danny Kaye and Jack Benny that raised \$400,000 towards building a performing arts center for Los Angeles.

On August 1, 1971, partially at the behest of Ravi Shankar, George Harrison hold the Concert for Bangladesh in Madison Square Garden, featuring Bob Dylan, Eric Clapton, Ringo Starr, Billy Preston, Leon Russell, Klaus Voormann, and Badfinger.

On January 18, 1973 - The Rolling Stones raise over \$350,000 for victims of an earthquake that had destroyed Managua, the capital of Nicaragua, on December 22, 1972.

January 9, 1979 - The Music for UNICEF Concert is held at the United Nations General Assembly and broadcast worldwide to raise money for UNICEF and mark the International Year of the Child.

December 26-December 29, 1979 - Concerts for the People of Kampuchea is held at the Hammersmith Odeon, benefitting the citizens of Cambodia who were victims of the tyrannical reign of dictator Pol Pot

January 13, 1980 - The Beach Boys, Grateful Dead, and Jefferson Starship headline a concert at Oakland Coliseum for the benefit of the people of Kampuchea (now Cambodia).

July 13, 1985 - The Live Aid benefit concert takes place in multiple venues, including London, Philadelphia, Sydney and Moscow.

September 22, 1985 - the first Farm Aid concert, organized by Willie Nelson and John Mellencamp to raise money for family farmers in the United States is held in Champaign, Illinois.

On July 30, 2003, 450,000 spectators see The Rolling Stones, AC/DC, The Guess Who, and others at the largest concert in Canadian history, the Molson Canadian Rocks for Toronto concert in Toronto, Ontario, Canada, held to prove that the city is safe from SARS.

## **Parodies and other references**

Like other notable cultural phenomena, benefit concerts have been the subject of parody. For example, a South Park episode, Chef Aid, features a concert held for the benefit of Chef, featuring performances by Elton John, Ozzy Osbourne, and Meat Loaf.

## Beneventan chant

**Beneventan chant** is a liturgical [plainchant](#) repertory of the Roman Catholic Church, used primarily in the orbit of the southern Italian ecclesiastical centers of Benevento and Montecassino, distinct from [Gregorian chant](#) and closely related to [Ambrosian chant](#). It was officially supplanted by the Gregorian chant of the Roman rite in the 11th century, although traces remain.

# Bhangra

**Bhangra** (Punjabi: ਭਾਂਗਰਾ, *bhaEgʌ*) is both a lively dance which is from the region of Punjab, now divided between North India and Pakistan, and the musical accompaniment to the dance. A variety of popular music, also called Bhangra, has developed from these traditions and has a keen youth following around the world.

**Festivals** Sangeet Natak Akademi – Thyagaraja Aradhana – Cleveland  
Thyagaraja Aradhana

**Media** *Sruti, The Music Magazine*

**[National anthem](#)** "Jana Gana Mana", also national song "Vande Mataram"

Bhangra is a fusion of music, [singing](#) and the beat of the dhol drum, a single stringed instrument called the iktar (ektara), the tumbi and an instrument reminiscent of an enlarged pair of tongs called chimta. The accompanying songs are small couplets written in the Punjabi language called *bolis*. They relate to harvest celebration, love, patriotism or current social issues.

Today the word *Bhangra* is more associated with the style of [dance pop music](#) derived from the above mentioned musical accompaniment. The dhol's smaller cousin, the dholaki, is sometimes used instead of or in addition to the dhol. Additional [percussion](#), including tabla, is frequently used in bhangra.

Bhangra has always been popular amongst Punjabi people all over the world, but it has enjoyed a resurgence over the last ten years or so. Its raw traditional sound is often supplemented with contemporary musical styles. In its more recent history, bhangra has been fused with [disco](#), [reggae](#), [techno](#), [house](#), [rap](#), [ragga](#) and now jungle. In fact, these new styles have been so successful that modern bhangra is now being re-exported back to India. Most of this tends to come from the UK Desi scene, a subculture found amongst the South Asian diaspora.

Both collegiate and non-collegiate Bhangra competitions are held throughout the world, especially in the Punjab (India), United States, Canada, and the UK. Some competitions in the United States include:

Bhangra Blowout in Washington, D.C.

Bruin Bhangra in Long Beach, California

Bhangra Fusion in Ann Arbor, Michigan

Dhol Di Awaz in the San Francisco Bay Area

South Beach Bhangra in Miami

# Bhangragga

**Bhangragga** is a slang term for the style of [music](#) incorporating elements of [Bhangra](#) and dancehall reggae (or [Ragga](#), short for the word Raggamuffin). The sound is very [percussion](#)-heavy - a distinct holdover from Bhangra - with a propulsive beat clearly designed for dancing. The Dancehall influence can be felt through the use of pre-programmed music, similar to Dancehall "riddims". Lyrically, the style features a combination of Sub-Continental-accented (usually Indian) vocals delivered in the clipped style associated with Dancehall - and sometimes including the Patois of the latter style. This style is almost exclusively a British phenomenon, as the two cultures involved in its genesis mix reasonably freely there. The most successful exponent, however, is Apache Indian, who had a world-wide hit with *Boom-Shak-A-Lak*, which was included on the [soundtrack](#) to the film *Dumb and Dumber*, among others.

The style is also known as **Bhangramuffin** and may also be known as **Bhangra-wine**.

# Bicinium

In [music](#) of the [Renaissance](#) and early [Baroque](#) eras, a **bicinium** (pl. **bicinia**) was a composition for only two parts, especially one with a pedagogical purpose.

The term has had two usages in music history:

1. Recently, the term has come to mean any composition at all from the Renaissance or early Baroque period for two vocal or instrumental parts.
2. Historically, a bicinium referred specifically to a two-part composition used as a teaching tool, most often in Protestant, German-speaking areas.

The term was first used in Poland, by Jan z Lublina in a treatise of 1540. Volumes of bicinia were published in the next several decades in Germany, the Low Countries, and even in Italy, as the usefulness of bicinia as teaching aids became apparent. In addition, Martin Luther had strongly expressed that children should learn both music, and the [psalms](#): bicinia with German texts from the Psalms fulfilled his purpose.

Students could be expected to master singing a single part in a [duet](#) more easily than a part in a larger ensemble. Usually a bicinium was designed to be sung or played by students of the same age and ability, rather than for a single student and a teacher.

This model of moving from two-part study, writing, and singing to three parts and then more was adopted by Heinrich Glarean in his *Dodecachordon* (1547), one of the most influential [music theory](#) and pedagogy treatises of the Renaissance.

In a similar manner, present-day music students typically learn [counterpoint](#) first by writing in two parts, and then later in three, only moving to four or more parts after mastering the earlier stages.

A similar pedagogical composition for three voices is known as a **tricinium** (pl. **tricina**).

Categories: [Renaissance music](#) | [Baroque music](#) | [Musical forms](#)

# Big band

A **big band** is a large [musical ensemble](#) that plays [jazz](#) music. The term is synonymous with the bands of the [Swing](#) Era, which were popular through the 1930s and 1940s, but is generally applied to any large jazz ensemble. The term **jazz orchestra** is also used.

Music for big band is highly 'arranged', leaving only specified gaps for jazz soloists, in contrast to the [improvisational](#) nature of most jazz combos.

## Structure

The [band](#) is divided up into a number of sections, by instrument. While composers and arrangers have written for many combinations of instrument, conventional bands since the 1930s have had a [rhythm](#) section (composed of [drums](#), [bass](#), [piano](#), and possibly [guitar](#)), a trumpet section, a trombone section, and a saxophone section. In the second half of the twentieth century, a standard 17-piece instrumentation evolved, for which many commercial arrangements are available. This instrumentation consists of five saxophones, four trumpets, four trombones and a four-piece rhythm section.

### Saxophone section

The [saxophone](#) section (known as *the reeds*, *the sax section*, or just *the saxes* in jazz parlance) usually comprises five players: two altos, two tenors and one baritone. The 'leader' of the section, who sets overall style, volume, and phrasing, is always the first alto player. If the arrangement requires it, the players double on other [wind instruments](#), such as [flute](#), [clarinet](#), and soprano saxophone.

The sax section represents the 'backbone' of the wind instruments in that they frequently carry the tune or provide backing harmonies underneath a soloist or section solis. As the saxophone is physically less demanding than brass instruments, they are usually written to play a great deal of the time in typical bigband arrangements. Saxes when playing along with brass in an [ensemble](#) are said to 'soften' the sound of the brass but give it support.

Because of the shape and the fact that the sound emanates from the open keys as well as the bell, a saxophone cannot be muted for effects or volume reduction. It can only be played louder or more softly. Effects in the sax section are provided by using the alternative instruments such as flutes, clarinets, sopranos etc.

### Brass section

The [brass](#) section is a collective term for the trombone and trumpet sections. Quite often these sections play the same phrases and rhythms, for a powerful, brassy sound. These instruments can also make use of sound-changing mutes, which are widely used in jazz.

#### Trumpet section

The [trumpet](#) section usually comprises four (sometimes five) players, each playing a separate part. The section leader is usually the first (or *lead*) trumpet, who plays the highest and most strenuous part. When the whole band is playing *tutti* (in unison, or all the same), the lead trumpet player is still considered the lead player of the band and is followed in phrasing, articulation, etc., by the rest of the band. The second trumpet player is usually the [jazz](#) soloist. The other players are generally assigned progressively lower pitch parts.

#### Trombone section

This is similar in formation to the trumpet section, except that there are three tenor trombones and one bass trombone. The trombone section provides a deeper sound than that of the trumpets.

Unusually, a French horn can be grouped into the trombone section in place of a tenor or bass trombone.

## Rhythm section

The rhythm section strictly speaking comprises [drums](#), double bass (or [bass guitar](#)) and [guitar](#). Although the [piano](#) is grouped as a rhythm section member, his/her part in providing rhythm is minimal. The function of the piano player, apart from solos, is to punctuate various accents, provide replies, counter melodies etc. and provide fills in the music. The piano player can also contribute to the harmonic richness of the rhythm section by playing upper extensions of the chords played by the guitar. In some arrangements, there is no written piano part, or only chords.

The guitar in a big band is mostly used as a pure rhythm instrument in that it plays straight time. That is, in a 4/4 tune, the guitarist will play four beats in every bar. The guitarist sometimes takes solos, but usually not as many as the piano. Many people agree that one of the greatest exponents of the art of big band guitar playing was Freddie Green of the Count Basie orchestra.

The double bass player, or bass guitarist, is sometimes said to be the most important member of the rhythm section because this instrument not only provides the beat, but gives a foundation (the roots) to the harmony. It can be heard and sometimes felt by all the band below all the other instrumentalists. The bass player usually plays four beats in every bar of a 4/4 tune and is usually playing continuously without rests throughout the tune. To achieve a good swing feeling the bass player will try to play extreme legato making all the notes run into one another giving a continuous but pulsating sound. Staccato bass playing is usually avoided except in non swing tunes.

The drummer is also a most important member of the rhythm section who together with the bass and guitar (if present) form the core of a solid 'timekeeping' machine. The drum kit usually comprises, bass drum, tom-tom(s), snare drum, ride cymbal, hi-hat or 'sock' cymbal, crash cymbal and sometimes other cymbals. In big band music the drummer usually only plays the bass drum lightly (to keep himself in time) to avoid interfering with the bass player. The main pieces of kit used are the snare drum, hi-hat and ride cymbal. In drum solos the drummer will almost always use most or all of his kit to achieve variety.

Although not intended to be heard *above* the wind instruments, the rhythm section is essential both to the band and to the audience in providing the important pulse in the music that is so important for dancing and listening to. The rhythm section is sometimes referred to as the 'powerhouse' or engine room of the band as one of its main purposes is to drive the band forward at a steady rate. The rhythm section is sometimes said to provide a large part of the 'swing' to a band. A rhythm section not playing together will not [swing](#) and will sound stiff and awkward. When playing together properly, the rhythm section achieves what is known in electronics terms as 'phase-lock' and are totally together in tempo and phase. Under these conditions, the rhythm section is said to be 'swinging'.

## Big band arrangements

Musical arrangements for big bands often make use of several common compositional techniques.

Trumpet parts can be arranged in close harmony (called a thickened line) to give a broader impression of the melody. On other occasions, trumpets play in unison, giving a powerful, penetrating sound that cannot be achieved by a single trumpet. Groups of two or three trumpets are sometimes used in simple harmony.

The baritone saxophone may be written to play the lead alto part an octave lower to reinforce the melody and provide an effective '5 part' harmony in close harmony saxophone *solis*. The baritone saxophone is sometimes written with the trombones, (especially in bands without a bass trombone) to give extra richness at the bottom of the trombone section. On occasions, the baritone sax can double with the bass player and bass trombone to create very heavy bass lines or riffs.

## History

[Swing](#) bands were very popular from the late 1920s to the early 1950s.

Later bandleaders played different styles of jazz with their bands. For example, the Gil Evans Orchestra pioneered the '[cool](#)' style, and the Jaco Pastorius Big Band played [fusion](#).

Modern big bands can be found playing all styles of jazz.

Category: [Musical groups](#)

# Binary form

**Binary form** is a way of structuring a piece of [music](#) into two related sections, both of which are usually repeated.

Binary form was popular in the [Baroque period](#), often used to structure movements from [sonatas](#) for [keyboard instruments](#). It was also used for short one movement works. However, around the middle of the 18th century, the form largely fell from use as [sonata form](#) and organic development gained prominence. When it is found in later works, it usually takes the form of the theme in a set of variations. Many larger forms incorporate binary structures, and many more complicated forms (such as sonata forms) share certain characteristics with binary form.

## Structure

Most strictly, a piece in binary form is characterized by two complementary, related sections of roughly equal duration. The first section will start in a certain [key](#), and will usually modulate to a related key:

- compositions in major keys will typically modulate to the dominant, the fifth scale degree above the tonic
- compositions in minor keys will typically modulate to the relative major, the major key centered on the third scale degree above the tonic.

The second section of the piece begins in the newly established key, where it remains for an indefinite period of time. After some harmonic activity, the piece will eventually modulate back to its original key before ending. In 18th Century compositions, it was common for both A and B sections to be separated by double bars with repeat signs, meaning both sections were to be repeated.

Binary form is usually characterised as having the form *AB*, though since both sections repeat, a more accurate description would be *AABB*. Others, however, prefer to use the label *AA'*. This second designation points to the fact that there is no great change in character between the two sections. The [rhythms](#) and [melodic](#) melodic material used will generally be closely related in each section, and if the piece is written for a [musical ensemble](#), the [instrumentation](#) will generally be the same. This is in contrast to the use of [verse-chorus](#) form in [popular music](#) - the contrast between the two sections is primarily one of the keys used.

## Further Distinctions

A piece in binary form can be further classified according to a number of characteristics:

### Simple vs. Rounded

Occasionally, the *B* section will end with a "return" of the opening material from the *A* section. This is referred to as **rounded binary**, and is labeled as *ABA'*. In rounded binary, the beginning of the *B* section is sometimes referred to as the "bridge", and will usually conclude with a half cadence in the original key. Rounded binary is not to be confused with ternary form, also labelled *ABA* - the difference being the *B* section in ternary form is completely contrasting with the *A* material, as in, for example, a minuet and trio.

If the *B* section lacks such a return of the opening *AA* material, the piece is said to be in **simple binary**.

### Sectional vs. Continuous

If the *A* section ends with an Authentic (or Perfect) cadence in the tonic key, the design is referred to as a **sectional binary**. This refers to the fact that the piece is in different tonal sections, each beginning at ending in their own respective keys.

If the *A* section ends with any other kind of cadence, the design is referred to as a **continuous binary**. This refers to the fact that the *B* section will "continue on" with the new key established by the cadence at the end of *A*.

### Symmetrical vs. Asymmetrical

If the *A* and *B* sections are roughly equal in length, the design is referred to as **symmetrical**.

If the *A* and *B* sections are of unequal length, the design is referred to as **asymmetrical**. In such cases, the *B* sections is usually substantially longer than the *A* section.

## Bird song

**Bird songs** are certain vocal sounds that birds make—in non-technical use, those sounds that are melodious to the human ear. In ornithology, bird 'songs' are often distinguished from shorter sounds, which may be termed 'calls'.

## Definition

The distinction between songs and calls is somewhat arbitrary. Ehrlich et al. say that songs are longer and more complex, and that calls tend to serve such functions as alarms or keeping members of a flock in contact, while songs claim territory and advertise for mates. Other authorities such as Howell (1994) make the distinction based on function, so that even short vocalisations such as those of pigeons are considered songs—and even non-vocal sounds such as the drumming of woodpeckers and the "winnowing" that snipes' wings make in display flight. Still other investigators say that song must have syllabic diversity and temporal regularity akin to the repetitive and transformative patterns which define [music](#).

Bird song is best developed in the order Passeriformes. Most song is emitted by male rather than female birds.

## **Anatomy**

The avian vocal organ is called the syrinx; it is a bony structure at the bottom of the trachea (unlike the larynx at the top of the mammalian trachea). The syrinx and sometimes a surrounding air sac resonate to vibrations that are made by membranes past which the bird forces air. It controls the pitch by changing the tension on the membranes and controls both pitch and volume by changing the force of exhalation. The bird can control the two sides of the trachea independently, which is how some species can produce two notes at once.

## Learning

It has been known since time immemorial that the songs of different species vary, and are more or less characteristic of the species. In modern-day biology, bird song is typically analysed using acoustic spectroscopy. Species vary greatly in the complexity of their songs and in the number of distinct kinds of song they sing (up to 3000 in the Brown Thrasher); in some species, individuals vary in the same way. In a few species such as starlings and mockingbirds, songs imbed arbitrary elements learned in the individual's lifetime, a form of mimicry (though maybe better called "appropriation" [Ehrlich et al.], as the bird doesn't pass for another species). In many species it appears that although the basic song is the same for all members of the species, young birds learn the details of their songs from their fathers, and this allows variations to build up over generations, a form of dialect.

Birds learn songs early in life with subvocalizations that develop into renditions of adult songs. Zebra Finches, the most popular specimen used in birdsong research, develop a version of a familiar adult's song after 20 or more days from hatch. By around 35 days, the chick will have learned the adult song. By around 60 days rehearsal has perfected the song which after another 30 days, at sexual maturity, becomes invariant.

Research indicates bird song is a form of motor learning that involves regions of the basal ganglia. Models of bird song motor learning are sometimes used as a model for how humans learn speech, and indeed they share many similarities, such as requiring teachers, practice, error-correction, and eventually becoming more difficult to learn after the bird or human reaches sexual maturity.

Researchers suggest birds learn songs, rather than inherit their sounds genetically. Research has hypothesized learned songs allow the development of more complex songs through cultural interaction, it allows intraspecies dialects that help birds stay with their own kind within a species, and it allows birds to adapt their songs to different acoustic environments. (Slater, 1989)

## Neurology of song production and learning

Birdsong learning occurs along neural pathways that connect the hyperstriatum ventralis, which is a region unique to the avian pallium, to the robust nucleus of the archistriatum. The pathway traverses the paraolfactory lobe, the dorso-lateral division of the medial thalamus, and the lateral magnocellular nucleus of the anterior neostriatum. (The neostriatum is similar to the putamen in the basal ganglia of mammals.) Cells in along the learning pathway accumulate testosterone, suggesting androgens might be involved in birdsong learning.

Birdsong production is generally thought to start at the nucleus uvaeformis of the thalamus with signals emanating along a pathway that terminates at the syrinx. The pathway from the thalamus leads to the interfacial nucleus of the neostriatum, high vocal center, which is the hyperstriatum ventralis, then to the robust nucleus of the archistriatum, the dorso-lateral division of the medial thalamus and to the tracheosyringeal nerve.

Disruptions along the learning pathway between 20 and 60 days of a finch's life permanently damages the bird's song, but has no effect if the same pathways were disrupted later in life. Disruptions along the production pathways can always damage a birds ability to sing.

Recent research in birdsong learning has focused on the area ventralis of Tsai, which produces dopamine to the paraolfactory lobe, the lateral magnocellular nucleus of the anterior neostriatum and the ventrolateral medulla. Other researchers have explored the possibility that the high vocal center is responsible for syllable production, while the robust nucleus of the archistriatum, the primary song output nucleus, may be responsible for syllable sequencing and production of notes within a syllable.

# Language

The [language of the birds](#) has long been a topic for anecdote and speculation. Certain meanings, such as those of different types of calls by hens, have been taken as a matter of course. Modern science has just begun to investigate this type of animal language. Researchers have described up to twenty-two different types of crow calls made under varying circumstances. In a 2005 study by Chris Templeton et al. published in the journal *Science*, it was shown that the number of "dees" in a chick-a-dee call corresponds to the degree of danger that a predator poses (See *Why Files* overview).

Interestingly, the gene FOXP2, defects of which affect both speech and comprehension of language in humans, becomes more active in the striatal region of songbirds during the time of song learning.

## Human culture

Bird song is often imitated in [music](#), especially [song](#) or whistling. Several [classical](#) composers have incorporated it into their music. Ludwig van Beethoven, for example, included imitations of the Nightingale, Common Quail and Common Cuckoo in his Symphony No. 6 (the Pastoral). The French composer Olivier Messiaen had a particular interest in bird song, carefully notating many birds' cries and incorporating them into his music (his Catalogue d'oiseaux for solo piano is especially notable in this regard).

François-Bernard Mâche's *Musique, mythe, nature, ou les Dauphins d'Arion* (1983), includes a study of "ornitho-musicology" using a technique of Nicolas Ruwet's *Language, musique, poésie* (1972) paradigmatic segmentation analysis, shows that bird songs are organized according to a repetition-transformation principle used to analyze human music.

Recorded bird songs have also been used, as Ottorino Respighi was the first to do, in *The Pines of Rome*. In the [psychedelic](#) 60's and 70's era, many bands included sound effects in their songs. Bird songs were among the most-used effects. Especially the band Pink Floyd liked them. They can be heard in many songs from Pink Floyd's 1969 albums *More* and *Ummagumma* (for example in the song *Cirrus Minor*).

Bird song is also a popular subject in poetry. Famous poems inspired by bird song include Shelley's *To a Skylark* ("Hail to thee, blithe Spirit!/Bird thou never wert") and Gerard Manley Hopkins' *Sea and Skylark*.

## Transcriptions of bird songs

Many people have used words or nonsense syllables to represent bird vocalizations. Naturally these vary greatly; a well-known example is the White-throated Sparrow's song, given in Canada as O sweet Canada Canada Canada and in New England as Old Sam Peabody Peabody Peabody (also Where are you Frederick Frederick Frederick?). In addition to nonsense words, grammatically correct phrases have been constructed as likenesses of the vocalizations of birds. For example, the Barred Owl produces a motif which writers of bird guides interpret as "Who cooks for you? Who cooks for you all?" (Sibley 2000) with the emphasis placed on "you."

Nevertheless, some order may be found by referring to the scale of vowels. Low-frequency (back) vowels such as "oo" and "oh" usually represent low pitches, while high-frequency (front) vowels such as "ee" represent high pitches. The "w" sound is a glide from "oo" to a higher frequency, so a transcription such as tweet usually represents a rising pitch. Likewise the "y" sound is a glide from "ee" to a lower frequency, so yoo or tew usually represents a falling pitch. Transcriptions such as eer and ir also usually represent falling pitch, as does ow. Among consonants, s often represents an extremely high pitch and l a low pitch.

For example, we could expect the call of the Whip-poor-will to be an upward glide that ends abruptly, followed by a low note, followed by one that glides upward and then back down. This is precisely what careful listening (as to the Real Audio file) or sonic analysis shows.

This method generally works only for whistles. Lower-pitched coos and squawks give the impression of vowels from their overtones, so the vowel gives little or no information about the fundamental frequency. Also, people's perceptions still vary greatly, even more

if they speak different native languages, so one can't understand transcriptions with perfect reliability.

# Bitpop

**Bitpop** is a type of [electronic music](#), where at least part of the music is made using old 8-bit computers or game consoles. Popular choices are the Commodore 64 and Game Boy. Two major publishers of bitpop are Relax Beat & Bleepstreet Records. Examples of bands in the genre are 1987, Bodenständig 2000, Covox, firestARTer, David Sugar, GOTO80, The Hardliner, Huoratron, Teamtendo, Khonnor, Machinae Supremacy, Monster & Maskiner, Mr. Pacman, Pluxus, Pontonius, Puss, Slagsmålsklubben, Nintendude (Check MSN's free music downloads) and Welle:Erdball

The name has incorrectly been considered as a pun on [britpop](#) and bit.

Related to bitpop are groups that write chip music such as She, YM Rockerz, AY Riders and dropdabomb.

Some related genres are Gamewave, Picopop, and [electropop](#).

# Black metal

**Stylistic origins:** [Classical music](#),  
[Thrash metal](#)

**Cultural origins:** Late 1980s Europe, especially Norway

**Typical instruments:** [Guitar](#) – [Bass guitar](#) – [Drums](#) – [Keyboards](#)

**Mainstream popularity:** Black metal is an underground form of music.

[National Socialist Black Metal](#) – [Viking metal](#) – Melodic black metal

[Blackened death metal](#) – [Folk metal](#) – Symphonic black metal

Scandinavia – United States – Eastern Europe

**Black metal** is a [musical genre](#) which emerged in the early 1980s predating the great expansion of [heavy metal](#) 'extreme' genres. Black metal evolved from [thrash metal](#), as did its sister genre [death metal](#).

There are two views on the genre. One views black metal as a very specific form of music that must adhere to a particular 'style' in order for it to be a part of the genre; while the second considers the lyrical and philosophical/political ideology of the music to take more precedence in defining the genre itself, rather than 'style'.

The main originators of black metal are considered to be the bands Mercyful Fate, Bathory, Hellhammer/Celtic Frost, Bulldozer and Mayhem. Albums that first sounded like what is generally considered to be black metal today are considered to be the recordings of Bathory in the mid 1980s, most notably Under the Sign of the Black Mark.

Black metal congealed in its current form (known as the second wave of black metal, which is rooted much more heavily in classical musical theory) through the influence of Norwegian bands such as Darkthrone, Enslaved, Burzum, Satyricon, Mayhem, Immortal, and Emperor, who began with the earlier style and introduced elements from mainstream heavy metal, [classical music](#) and popularised the style to a growing underground audience. Their influence is most apparent in the Satanic or pagan imagery, anti-Christian lyrics and occult themes.

## Characteristics

Black metal may, but is not obliged to, have the following characteristics:

- Fast guitars with tremolo picking
- Lyrics that take the form of pessimistic, Satanic, Pagan, or occult themes which blaspheme Christianity. Bands such as Slayer, Deicide, and Immolation overlap lyrically with black metal somewhat but are musically defined as [death metal](#) (Immolation, Deicide) or [thrash metal](#) (Slayer)
- Relatively thin guitar sound or relatively thick guitar sound, usually not in the middle.
- Limited production used intentionally as a statement against mainstream music and/or to reflect the mood of the music, to create atmosphere. This 'underproduced' effect is often achieved by cutting out low and high frequencies, leaving just the mid frequency range. Very few of the black metal pioneers still do this, since their original limited production only was due to a minimal budget. This production style is often considered an essential element of "true" Black Metal.
- Fast, repetitive, aggressive [drums](#), often with blast beats. At other times, the drums can take a slower role usually accompanied by a very dry and empty tone — especially for the effect of the atmosphere of the music.
- Occasional electronic keyboard use. The harpsichord, violin, organ, and choir settings are most common, which gives the music an orchestral feel or a cathedral-like setting. Some bands tend to use keyboards very frequently, whether it be as an instrument or even as the basis of their entire sound. They are generally placed under the symphonic black metal label.
- High-[pitched](#)/distorted screeching vocals. Contrary to popular belief, these are not essential as there have been many black metal bands old and new employing different vocal styles.
- Swift [percussion](#).
- Cold, dark, sad, melancholy, or gloomy atmosphere.
- Less focus on dynamic rhythm than [death metal](#). Very few black metal bands exhibit the rhythmic complexity inherent in [death metal](#), and even if they do, they usually exhibit at least a few of the above-listed criteria if they are still generally classified as black metal.

An abraded, very low fidelity recording style is common in most black metal. Modern evolution of many of the older 'genre leading' bands have had a vast change in sound, and by many - and most of the times, even the band - are no longer considered black metal. Such examples include Mayhem's career that began mostly in the death/black roots, moved to almost pure black, then towards death again in their later career. Also, Satyricon who started off as black metal but now play a very industrial heavy hybrid of the music. Modern offshoots of this original black metal sound have incorporated atmospheric elements using ambient guitar and keyboard passages such as organ sounds or other miscellaneous instruments.

A distinct (but not intrinsic) feature of the black metal is the use of corpse paint, a special kind of black and white make-up which was used to make the wearer look like a decomposing corpse or plague victim. It should be noted that Immortal referred to their make-up as "war paint", not carrying the same connotation as corpse paint. Another distinct feature of black metal is the use of dark, Nordic or Satanic monikers pioneered by Venom (the original line up being Cronos, Mantas & Abbadon). Examples of this

include Quorthon (Bathory), Euronymous (Mayhem) and Samoth (Emperor), to name a few.

Earlier bands tended to dwell on themes of fantasy, mythology, and folklore in their songs, as well as Satanism, darkness, evil, and so on as many of their direct musical and cultural roots included these topics.

## History

In the late 1980's and early 1990's, one of the most prominent figures of the Norwegian scene was Øystein Aarseth, better known as Euronymous, the guitarist in Mayhem.

The scene was deeply anti-Christian: it had a stated goal of removing the influence of Christianity and other non-Scandinavian religions from Norwegian culture and effecting a return to the nation's Norse roots. One minority current, associated with NSBM, included an element of unashamed anti-Semitism. The movement was largely directed by an 'Inner Circle', made up of Aarseth and a few close friends, from the basement of Aarseth's record store, Helvete (Hell). That location also housed a recording studio, where records were made by Mayhem and a number of other bands that were signed to Aarseth's independent label, Deathlike Silence Productions. Deathlike Silence's stated goal was to release records by bands "that incarnated evil in its most pure state."

Also around this time, there was a rash of arsons directed at Christian churches in Norway—many of the buildings were hundreds of years old, and widely regarded as important historical landmarks—that Aarseth's circle claimed responsibility for inspiring, if not necessarily perpetrating. The most notable church was Norway's Fantoft stave church, which was burned by a member of Euronymous's inner circle; the man behind the one-man band Burzum, Varg Vikernes, aka "Count Grishnackh", who also played bass guitar for Mayhem. Black metal enthusiasts also started to terrorize other notable "death metal" bands that were touring their country or in neighboring countries, on the basis of their lack of apparent "evilness". Many recall a strong Swedish death metal and Norwegian black metal rivalry.

The black metal scene gained some unsought mass media attention in 1991 when Mayhem's frontman Dead committed suicide by a shotgun blast to his head. His note simply read "Excuse all the blood". The ammunition was supplied by Varg Vikernes.

His body was discovered by Aarseth who, instead of calling the police, ran to a nearby convenience store and bought a disposable camera which he used to photograph the corpse for a future Mayhem album cover (Dawn of the Black Hearts). Apocryphal reports also claim that he then took some pieces of Dead's splattered brains and made a stew out of them and/or members of the band took bone fragments from their friend's skull and made necklaces out of them.

The 'Inner Circle' received even more exposure in 1993, when Vikernes killed Aarseth in Aarseth's home, stabbing him 23 times, although Vikernes claims that Aarseth fell on broken glass while running from him and that he really stabbed him only 4 or 5 times. The circumstances surrounding the reason for the murder are not entirely clear, but have mainly been attributed to ideological differences and a power struggle between Vikernes and Aarseth. Vikernes claimed that Aarseth had plotted to kill him and that the killing was committed in partial self-defence. Vikernes also claimed that there was a financial dispute over the profits from Burzum's first two full-length records (Burzum and Det Som Engang Var) as well as the first Burzum EP (Aske) that were released through Aarseth's record label, Deathlike Silence Records. Some sources say that Aarseth intentionally delayed the release of Burzum's records, because Burzum was getting more attention than Mayhem. Vikernes was sentenced to 21 years in prison and has since distanced himself from the black metal movement, becoming involved in the Neo-Nazi movement and writing extensively on the subject. Many credit Vikernes' professed beliefs as contributing to the rise of [National Socialist black metal](#), a variant that employs the genre's typically Nordic, Pagan, and anti-Christian themes as an expression of White Power ideology. While in prison, Vikernes has released two albums of a much more

ambient and electronic kind of music, *Dauði Baldrs* in 1997 and *Hliðskjálf* in 1999, although he implied in a recent interview that he would write material similar to his older works upon his release from prison.

By the last few years of the 1990s, the black metal scene had lost much of the violence that seemed to be attached to it in the early days of the scene. Also, bands begun to make records with higher production-quality.

However, since the mid-90s, an Eastern European black metal scene has been developing. Bands from these former Iron Curtain lands are recording albums more in keeping with the primitive nature of the early Norwegian artists. Many of these bands' lyrics glorify the pagan roots of their home countries, occasionally injecting elements of indigenous folk music into their arrangements. The Latvian band Skyforger is a prime example of this new aesthetic. The black metal scene in Russia and Ukraine has produced many bands more in keeping with the carefully arranged sounds coming from Scandinavia, but with more appreciation for the low fidelity aesthetic of early black metal. The Czech band Trollech are a perfect example of the "old-school" Pagan black metal band. The Ukrainian neo-Nazi Nokturnal Mortum has achieved very large recognition in the west; their earlier albums relied heavily on synthesizers, but their current work has a grimmer, more abrasive feel flavored with Slavic folk instruments. Poland's neo-Nazi band Graveland has, in recent albums, striven for a 'medieval' feel, much like a much more developed version of later 'viking' Bathory albums, but in the past made much rawer music which still held a certain intangible folk flavor. From Romania, Negur Bunget is a prime example of traditional black metal, injecting their own indigenous mix of Dacian and Latin elements, along with a Scandinavian sound. Also, notable are Serbian elite bands - The Stone and May Result.

There is also a growing number of American bands playing black metal (sometimes called USBM bands). This movement has not taken a particularly clear form, but better-known groups are Black Funeral, Judas Iscariot, Absu, Krieg, Grand Belial's Key, Goatwhore, Kult ov Azazel, Choronzon (Music project), Xasthur, Leviathan, Wolves In The Throne Room, Blackheart Destruction, and the death metal-influenced Acheron and Averse Sefira.

Bands such as Dark Funeral and magazines such as Terrorizer believe we are currently in a third wave of influential black metal bands, this time from France and Sweden. These include Deathspell Omega, Blut Aus Nord, Funeral Mist and Watain. These bands all claim to be far deeper into Satanism and/or occultism than previous artists and generally play a very raw extreme style. However, just as with the earlier second wave Norwegian bands they have started to experiment, Deathspell Omega are influenced by [gregorian chant](#) and Blut Aus Nord now incorporate elements of ambient techno.

## Subforms

### National Socialist black metal

Black metal movement that deals with Neo-Nazi ideologies, often mixed in with topics pertaining to European pagan religions. NSBM is more interpreted as an ideology than a sub-genre as there is not any developed "style" to play black metal in a National Socialist way. However, the term has stuck around not only because there are traceable movements and labels that sell NSBM exclusively, but also because it is such a hotly debated topic; giving rise to questions like whether it does or does not coincide with traditional black metal characteristics, or whether it should even be a subform as most black metal bands do not adhere to the ideology.

### War metal

It is generally accepted that Blasphemy were the first "War Metal" band. Their style was more of an extreme form of Black/Thrash. Though Blasphemy are commonly referred to as the first War Metal band, the style was portrayed in the mid to later 1980's by bands such as Sarcophago and the first albums by Sepultura and Holocausto. Blasphemy's 1990 debut album *Fallen Angel of Doom* is considered the starting point of this sub-genre and has been expanded on and changed quite dramatically by bands such as The Meads of Asphodel, Bestial Warlust, Conqueror and Axis of Advance/Sacramentary Abolishment.

Lyricaly, war metal bands almost always leans towards Satanic or anti-Christian ideals, and usually refer to war; with topics including genocide, nuclear warfare, holocaust (though not necessarily pro), death, ending humanity and/or life, tanks, and related topics. The visual aesthetics are similar.

Some prefer not to use the genre name because they consider it superfluous; some war metal bands can be considered [blackened death metal](#). Moreover, it is contended that it is a very minimalistic and non-expansive style, and given the small amount of bands that play it, it therefore ought not have its own distinct genre-name. However, more and more bands are playing and developing this style.

War metal is often associated with Canada because of native bands Blasphemy and Conqueror as well as many newer bands that have experimented with the genre and taken it away from its musical origins such as Axis of Advance, Rites of thy Degringolade and Lust.

# Block chord

**Block chords** are musically notated [chords](#) or voicing built on the staff below the [melody](#) to create a four-part [harmonized](#) melody line.

Block chords and doubled melody are easily used in a melody line that has a swing feel and strengthen the melody so as to separate that melody from the rhythmic background. Block chording was used to a large extent by jazz bands and orchestras such as those led by Count Basie and Duke Ellington. The pianist George Shearing was an early master of this technique, and lent his name to the **Shearing voicing**. There are a variety of methods:

- **Generic block chord** describes those that simply follow the above rule.
- **Double melody** (Commonly called the "Shearing voicing") with an additional fifth part that doubles the melody an octave lower.
- **Drop 2** (technically not a block chord) with the second voice from the top transposed one octave lower.

If the melody note is part of the chord, the harmony notes are also taken from the chord.

This is a good technique if the melody note is diatonic (and not chromatic) and uses diminished chords for the notes that are not part of the chord. If the melody note is considered a passing tone, the harmony is created either by a diminished chord or a chromatically shifted chord. Before creating the harmonies, the chords could be converted to 6th chords, but this is not a rule.

## Examples

The following is an example of harmonization of a C major scale with block chords. This example uses three diminished chords on the D, F, and B notes and includes an additional diminished chord on G#. This creates a balance in the harmonization of this scale by using all four existing diminished chords.

This example demonstrates the ways in which a melody line (in F major) could be block chorded using each method.

# Bluegrass music

**Stylistic origins:** [Country music](#), Scots-Irish Appalachian folk music, [Blues](#), [Jazz](#)

**Cultural origins:** Mid to late 1940s US

**Typical instruments:** [Fiddle](#), [banjo](#), acoustic [guitar](#), [mandolin](#), dobro, and upright bass

**Mainstream popularity:** originally Southeast United States, but now pockets of popularity throughout U.S., and in locales as diverse as the Czech Republic and Japan

[Progressive bluegrass](#) - [Traditional bluegrass](#)

Jam band

Czech Republic

**Bluegrass music** is considered a form of American roots music with its own roots in the English, Irish and Scottish traditional music of immigrants from the British Isles (particularly the Scots-Irish immigrants of Appalachia), as well as the music of rural African-Americans, [jazz](#), and [blues](#). Like jazz, bluegrass is played with each melody instrument switching off, playing improvised solos in turn while the others revert to backing; this is in contrast to old-time music, in which all instruments play the melody together or one instrument carried the lead throughout while the others provide [accompaniment](#).

# Characteristics

## Instrumentation

Unlike mainstream [country music](#), bluegrass relies mostly on acoustic stringed instruments: The [fiddle](#), [banjo](#), [acoustic guitar](#), [mandolin](#), and upright bass are sometimes joined by the resonator guitar (popularly known by the Dobro brand name), and an electric bass or electric upright bass is occasionally substituted for the upright bass. This instrumentation originated in rural black dance bands and was being abandoned by those groups (in favor of blues and jazz ensembles) when picked up by white musicians (van der Merwe 1989, p.62).

Debate rages among bluegrass musicians, fans, and scholars over what instrumentation constitutes a bluegrass band. Several general criteria have been put forward. Since the term bluegrass came from Bill Monroe's band, The Bluegrass Boys, the instruments used in his band are considered the traditional bluegrass instruments. These were the mandolin (played by Monroe), the fiddle, guitar, banjo and upright bass. The guitar and banjo were played by Flatt and Scruggs, respectively. While, in his earliest years, Bill Monroe had an accordion player, the Bluegrass Boys had no accordion player during the height of their career, and the accordion is not considered a traditional bluegrass instrument.

One suggested definition is that a bluegrass band includes at least four musicians who play instruments including an upright bass, an [acoustic guitar](#), and a [banjo](#), though those instruments need not always be played. (Example: During gospel songs many banjo players switch to lead guitar, a tradition dating to Earl Scruggs.) At other times the musicians may play no instruments and sing four part harmony. Other common instruments include the fiddle, the [mandolin](#), and the resonator guitar. Bluegrass bands have included instruments as diverse as [drums](#), [electric guitar](#) and electric versions of all other common bluegrass instruments, [accordion](#), [harmonica](#), mouth harp, and [piano](#), though these are not widely accepted within the bluegrass community. Instrumental solos are improvised, and can frequently be technically demanding.

## Vocals

Besides instrumentation, the distinguishing characteristics of bluegrass include vocal harmonies featuring two, three, or four parts, often featuring a dissonant or [modal](#) sound in the highest voice (see [modal frame](#)); an emphasis on traditional songs, often with sentimental or religious themes. This vocal style has been characterized as the "high lonesome sound." The "High Lonesome" sound can be credited to Shape-Note music where a high-pitched harmony, that can generally be characterized as having a nasal timbre, is sung over the main melody.

# History

## Creation

Bluegrass as a style developed during the mid 1940s. Because of war rationing, recording was limited during this time, and the best we can say is that bluegrass was not played before World War II, and it was being played after. As with any musical genre, no one person can claim to have "invented" it. Rather, bluegrass is an amalgam of old-time music, [blues](#), [ragtime](#) and [jazz](#). Nevertheless, bluegrass's beginnings can be traced to one band. Today Bill Monroe is referred to as the "founding father" of bluegrass music; the bluegrass style was named for his band, the Blue Grass Boys, formed in 1939. The 1945 addition of [banjo](#) player Earl Scruggs, who played with a three-finger roll now known as "Scruggs style," is pointed to as the key moment in the development of this genre. Monroe's 1945-48 band, which featured [banjo](#) player Earl Scruggs, singer/guitarist Lester Flatt, fiddler Chubby Wise and bassist Howard Watts, aka "Cedric Rainwater," created the definitive sound and instrumental configuration that remains a model to this day.

By some arguments, as long as the Blue Grass Boys were the only band playing this music, it was just their unique style; it could not be considered a musical genre until other bands began performing the same style. In 1947 the Stanley Brothers recorded the traditional song "Molly and Tenbrooks" in the Blue Grass Boys' style, and this could also be pointed to as the beginning of bluegrass as a genre.

It is important to note that bluegrass is not and never was a [folk music](#) under a strict definition, however the topical and narrative themes of many bluegrass songs are highly reminiscent of "folk music". In fact many songs that are widely considered to be "bluegrass" are older works legitimately classified as "folk" or "old-time" performed in a "bluegrass" style. From its earliest days to today, bluegrass has been recorded and performed by professional musicians. Although amateur bluegrass musicians and trends such as "parking lot picking" are too important to be ignored, it is professional musicians who have set the direction of the genre. While bluegrass is not a folk music in the strictest sense, the interplay between bluegrass music and other folk forms has been studied. Folklorist Dr. Neil Rosenberg, for example, shows that most devoted bluegrass fans and musicians are familiar with traditional folk songs and old-time music and that these songs are often played at shows and festivals.

## First generation

First generation bluegrass musicians dominated the genre from its beginnings in the mid-1940s through the mid-1960s. This group generally consists of those who were playing during the "Golden Age" in the 1950s, including Bill Monroe and his Blue Grass Boys, the Stanley Brothers, Lester Flatt & Earl Scruggs with the Foggy Mountain Boys, Reno and Smiley, Mac Martin and the Dixie Travelers, the Lonesome Pine Fiddlers, Jim and Jesse, and Jimmy Martin.

## Second generation

Bluegrass's second generation came to prominence in the mid- to late-1960s, although many of the second generation musicians were playing (often at young ages) in first generation bands prior to this. Among the most prominent second generation musicians are J. D. Crowe, Doyle Lawson, Sam Bush, and Tony Rice. With the second generation came a growth in [progressive bluegrass](#), as exemplified by second generation bands such as the Country Gentlemen, New Grass Revival, Seldom Scene, and Del McCoury and the Dixie Pals. In that vein, first-generation bluegrass fiddler Vassar Clements, mandolin virtuoso David Grisman, Grateful Dead frontman Jerry Garcia (on banjo) and Peter Rowan as lead vocalist collaborated on the album *Old and in the Way*; the Garcia connection helped to expose progressive bluegrass to a [rock music](#) audience.

## Third generation

The third generation in bluegrass reached primacy in the mid-1980s. Third generation bluegrass saw a number of notable changes from the music played in previous years. In several regards, this generation saw a redefinition of "mainstream bluegrass." Increased availability of high-quality sound equipment led to each band member being miked independently, and a "wall of sound" style developed (exemplified by Illrd Tyme Out and Lonesome River Band). Following the example set by Tony Rice, lead guitar playing became more common (and more elaborate). An electric bass became a generally, but not universally, accepted alternative to the traditional acoustic bass, though electrification of other instruments continued to meet resistance outside progressive circles. Nontraditional chord progressions also became more widely accepted. On the other hand, this generation saw a renaissance of more traditional songs, played in the newer style.

## Fourth generation

It could be argued that a fourth generation of bluegrass musicians is beginning to appear, marked by a high level of technical skill. Although it is too soon to see definite trends, the most notable fourth generation musician to emerge so far is probably Chris Thile, who released solo bluegrass albums at age 13 and 16 (*Leading Off* and *Stealing Second*, respectively). Recently, however, Thile's claim to the throne of bluegrass "prince" has been challenged by Josh Pinkham, a Florida teenager who performed at "MerleFest" only 18 months after picking up a mandolin. Another notable recent bluegrass band is Colorado's Open Road, a traditional-sounding band with strong original material.

## Recent developments

Since the late 1990s, several mainstream [country musicians](#) have recorded bluegrass albums. Ricky Skaggs, who began as a bluegrass musician and crossed over to mainstream country in the 1980s, returned to bluegrass in 1996, and since then has recorded several bluegrass albums and tours with his bluegrass band Kentucky Thunder. Around the same time, country music superstars Dolly Parton and Patty Loveless released several bluegrass albums. Along with the Coen Brothers' movie, *O Brother, Where Art Thou?* and the subsequent "Down From the Mountain" music tour, this has brought bluegrass music to a much wider audience. Meanwhile, bands such as the Yonder Mountain String Band and Druhá Tráva have attracted large audiences while pushing at the edges of [progressive bluegrass](#).

No discussion of recent developments in bluegrass music would be complete without mention of Alison Krauss. A vocalist/fiddler whose first album was released when she was just 16, Krauss and her band, Union Station, were major contributors to the soundtrack of 'O Brother, Where Art Thou?'. As a solo artist, collaborator, producer and with Union Station, Krauss has won, as of 2006, 20 Grammy Awards, the most of any female artist in history. She is now tied for 7th place on the all-time winners list.

## Subgenres

In addition to what might be considered "mainstream" bluegrass, which has gradually changed over the last 60 years, two major subgenres have existed almost since the music's beginning.

### Traditional bluegrass

[Traditional bluegrass](#), as the name implies, emphasizes the traditional elements. Traditional bluegrass musicians are likely to play folk songs, songs with simple traditional chord progressions, and use only acoustic instruments. In the early years, traditional bluegrass sometimes included instruments no longer accepted in mainstream bluegrass, such as washboards, mouth harps, and [harmonicas](#). Traditional bands may use bluegrass instruments in slightly different ways (claw-hammer style of banjo playing, or multiple guitars or fiddles within a band). In this sub-genre, the guitar rarely takes the lead (the notable exception being gospel songs), remaining a rhythm instrument. Melodies and lyrics tend to be simple, and a I-iv-V chord pattern is very common.

### Progressive bluegrass

*Main article: [Progressive bluegrass](#).*

The other major subgenre is [progressive bluegrass](#), synonymous with "newgrass" (the latter term is attributed to New Grass Revival member Ebo Walker). Progressive bluegrass came to widespread attention in the late 1960s and 1970s, as some groups began using electric instruments and importing songs from other genres (particularly rock & roll). However, progressive bluegrass can be traced back to one of the earliest bluegrass bands. A brief listen to the banjo and bass duets Earl Scruggs played even in the earliest days of the Foggy Mountain Boys give a hint of wild chord progressions to come. The four key distinguishing elements (not always all present) of progressive bluegrass are instrumentation (frequently including electric instruments, drums, piano, and more), songs imported (or styles imitated) from other genres, chord progressions, and lengthy "jam band"-style improvisation.

# Blues

**Stylistic origins:** African American [spirituals](#) and work songs

**Cultural origins:** West African music, brought by slaves to southern United States, especially the Mississippi Delta

**Typical instruments:** [Guitar](#) - [Piano](#) - [Harmonica](#) - [Bass](#) - [Drums](#) - [Saxophone](#) - Vocals

**Mainstream popularity:** The blues chord progressions and blue notes are widely used in most music styles of the 20th century; a highly influential music genre

**Derivative forms:** [jazz](#), [R&B](#), [rock](#)

Classic female blues - [Country blues](#) - [Delta blues](#) - [Jazz blues](#) - [Jump blues](#) - Piano blues - Boogie-woogie

[Blues-rock](#) - [Soul blues](#) - [Jazz blues](#)

[British blues](#) - [Chicago blues](#) - [Detroit blues](#) - [Louisiana blues](#) - [Memphis blues](#) - [St. Louis blues](#) - [Swamp blues](#) - [Texas blues](#) - [West Coast blues](#)

[Genres](#) - [Origins](#)

The **blues** is a vocal and instrumental form of [music](#) based on a pentatonic scale and a characteristic twelve-bar [chord progression](#). The form evolved in the United States in the communities of former African slaves from [spirituals](#), praise songs, field hollers, shouts, and [chants](#). The use of blue notes and the prominence of call-and-response patterns in the music and lyrics are indicative of the blues' West African pedigree. The blues has been a major influence on later American and Western [popular music](#), finding expression in [ragtime](#), [jazz](#), [bluegrass](#), [rhythm and blues](#), [rock and roll](#), [hip-hop](#), and [country music](#), as well as conventional pop songs.

The phrase *the blues* is a synonym for having a fit of *the blue devils*, meaning low spirits, depression and sadness. An early reference to this can be found in George Colman's farce *Blue devils*, a farce in one act (1798). Later during the 19th century, the phrase was used as a euphemism for delirium tremens and the police. Though usage of the phrase in [African American music](#) may be older, it has been attested to since 1912 in Memphis, Tennessee with W. C. Handy's "[Memphis Blues](#)". In lyrics the phrase is often used to describe a depressed mood.

# Characteristics

## Origins

There are few characteristics common to all blues, because the genre takes its shape from the peculiarities of individual performances. However, some characteristics have been present since before the creation of the modern blues and are common to most styles of [African American music](#). The earliest blues-like music was a "functional expression, rendered in a call-and-response style without accompaniment or harmony and unbounded by the formality of any particular musical structure." This pre-blues music was adapted from slave field shouts and hollers, expanded into "simple solo songs laden with emotional content". The blues, as it is now known, can be seen as a musical style based on both European [harmonic structure](#) and the West African call-and-response tradition, transformed into an interplay of voice and guitar.

Many blues elements, such as the call-and-response format and the use of blue notes, can be traced back to the [music of Africa](#). Sylviane Diouf has pointed to several specific traits—such as the use of melisma and a wavy, nasal intonation—that suggest a connection between the music of West and Central Africa and blues. [Ethnomusicologist](#) Gerhard Kubik may have been the first to contend that certain elements of the blues have roots in the Islamic music of West and Central Africa.

Stringed instruments (which were favored by slaves from Muslim regions of Africa...), were generally allowed because slave owners considered them akin to European instruments like the violin. So slaves who managed to cobble together a banjo or other instrument...could play more widely in public. This solo-oriented slave music featured elements of an Arabic-Islamic song style that had been imprinted by centuries of Islam's presence in West Africa, says Gerhard Kubik, an ethnomusicology professor at the University of Mainz in Germany who has written the most comprehensive book on Africa's connection to blues music (*Africa and the Blues*).

Kubik also pointed out that the Mississippi technique of playing the guitar using a knife blade, recorded by W.C. Handy in his autobiography, is common to West and Central Africa cultures where the kora, a guitar-like instrument, is often the stringed instrument of choice. This technique consists of pressing a knife against the strings of the guitar, and is a possible antecedent of the slide guitar technique.

Blues music later adopted elements from the "Ethiopian airs"—"Ethiopian" is used here to mean "black"—of minstrel shows and Negro spirituals, including instrumental and harmonic accompaniment. The style also was closely related to [ragtime](#), which developed at about the same time, though the blues better preserved "the original melodic patterns of African music". Songs from this early period had many different structures. Examples can be found in Leadbelly's or Henry Thomas's recordings. However, the twelve-, eight-, or sixteen-bar structure based on tonic, subdominant and dominant chords became the most common. What is now recognizable as the standard 12-bar blues form is documented from oral history and [sheet music](#) appearing in African American communities throughout the region along the lower Mississippi River during the first decade of the 1900s (and performed by white bands in New Orleans at least since 1908). One of these early sites of blues evolution was along Beale Street in Memphis, Tennessee.

## Lyrics

Early blues frequently took the form of a loose narrative, often with the singer voicing his or her "personal woes in a world of harsh reality: a lost love, the cruelty of police officers, oppression at the hands of white folk, hard times". Many of the oldest blues records contain gritty, realistic lyrics, in contrast to much of the music being recorded at the time. One of the more extreme examples, "Down in the Alley" by Memphis Minnie, is about a prostitute having sex with men in an alley. Music such as this was called "gut-bucket" blues. The term refers to a type of homemade bass instrument made from a metal bucket used to clean pig intestines for chitterlings, a soul food dish associated with slavery and deprivation. "Gut-bucket" described blues that was "low-down" and earthy, that dealt with often rocky or steamy man-woman relationships, hard luck and hard times. Gut-bucket blues and the rowdy juke-joint venues where it often was played, earned blues music an unsavory reputation. Upstanding church-going people shunned it, and some preachers railed against it as sinful. And because it often treated the hardships and injustices of life, the blues gained an association in some quarters with misery and oppression. But the blues was about more than hard times; it could be humorous and raunchy as well:

Rebecca, Rebecca, get your big legs off of me,  
Rebecca, Rebecca, get your big legs off of me,  
It may be sending you baby, but it's worrying the hell out of me.

Author Ed Morales has claimed that Yoruba mythology played a part in early blues, citing Robert Johnson's "Cross Road Blues" as a "thinly veiled reference to Eleggua, the orisha in charge of the crossroads".<sup>[13]</sup> However, many seminal blues artists such as Joshua White, Son House, Skip James, or Reverend Gary Davis were influenced by Christianity.

The original lyrical form of the blues was probably a single line, repeated three times. It was only later that the current, most common structure—a line, repeated once and then followed by a single line conclusion—became standard.

## Musical style

Though during the first decades of the twentieth century blues music was not clearly defined in terms of chords progression, the twelve-bar blues became standard in the '30s. However, in addition to the conventional twelve-bar blues, there are many blues in 8-bar form, such as "How Long Blues", "Trouble in Mind", and Big Bill Broonzy's "Key to the Highway". There are also 16 bar blues, as in Ray Charles's instrumental "Sweet 16 Bars". More idiosyncratic numbers of bars are also encountered occasionally, as with the 9 bar progression in Howling Wolf's "Sitting on top of the World". The basic twelve-bar lyric framework of a blues composition is reflected by a standard harmonic progression of twelve bars, in 4/4 or 2/4 time. The blues [chords](#) associated to a twelve-bar blues are typically a set of three different chords played over a twelve-bar scheme: where the Roman numbers refer to the degrees of the progression. That would mean, if played in the tonality of F, the chords would be as follows:

In this example, F is the tonic chord, Bb the subdominant. Note that much of the time, every chord is played in the dominant seventh (7th) form. Frequently, the last chord is the dominant (V or in this case C) turnaround making the transition to the beginning of the next progression.

The lyrics generally end on the last beat of the tenth bar or the first beat of the eleventh bar, and the final two bars are given to the instrumentalist as a break; the harmony of this two-bar break, the turnaround, can be extremely complex, sometimes

consisting of single notes that defy analysis in terms of chords. The final beat, however, is almost always strongly grounded in the dominant seventh (V7), to provide tension for the next verse. Musicians sometimes refer to twelve-bar blues as "B-flat" blues because it is the traditional pitch of the tenor sax, trumpet/cornet, clarinet and trombone.

Melodically, blues music is marked by the use of the flatted third, fifth and seventh (the so-called blue or bent notes) of the associated major scale.[15] While the twelve-bar harmonic progression had been intermittently used for centuries, the revolutionary aspect of blues was the frequent use of the flatted fourth, flatted seventh, and even flatted fifth in the melody, together with crushing—playing directly adjacent notes at the same time, i.e., diminished second—and sliding—similar to using grace notes.[16] Where a classical musician will generally play a grace note distinctly, a blues singer or harmonica player will glissando; a pianist or guitarist might crush the two notes and then release the grace note. Blues harmonies also use the subdominant major chord with an added minor seventh (IV 7) and the tonic major triad with an added minor seventh (I 7) in place of the tonic. Blues is occasionally played in a minor key. The scale differs little from the traditional minor, except for the occasional use of a flatted fifth in the tonic, often crushed by the singer or lead instrument with the perfect fifth in the harmony. Janis Joplin's rendition of "Ball and Chain", accompanied by Big Brother and the Holding Company, provides an example of this technique. Also, minor-key blues is most often structured in sixteen bars rather than twelve—e.g., "St. James Infirmary Blues" and Trixie Smith's "My Man Rocks Me"—and was often influenced by evangelical religious music.

Blues shuffles are also typical of the style. Their use reinforces the rhythm and call-and-response trance, the groove. Their simplest version commonly used in many postwar electric blues, rock-and-rolls, or early bebops is a basic three-note riff on the bass strings of the guitar. Played in time with the bass and the drums, this technique, similar to the walking bass, produces the groove feel characteristic of the blues. The last bar of the chord progression is usually accompanied by a turnaround making the transition to the beginning next progression. Shuffle rhythm is often vocalized as "dow, da dow, da dow, da" or "dump, da dump, da dump, da"[17] as it consists of uneven eight notes. On a guitar this may be done as a simple steady bass or may add to that stepwise quarter note motion from the fifth to the seventh of the chord and back. An example is provided by the following tablature for the first four bars of a blues progression in E:

```

E7 A7 E7 E7 E |-----|-----|-----|-----
-----| B |-----|-----|-----|-----

```

# History

## Origins

*Main article: [Origins of the blues](#)*

Blues has evolved from the spare music of poor black laborers into a wide variety of complex styles and subgenres, spawning regional variations across the United States and, later, Europe, Africa and elsewhere. What is now considered "blues" as well as modern "[country music](#)" arose at approximately the same time and place during the nineteenth century in the southern United States. Recorded blues and country can be found from as far back as the 1920s, when the popular record industry developed and created marketing categories called "race music" and "hillbilly music" to sell music by and for blacks and whites, respectively. At the time, there was no clear musical division between "blues" and "country," except for the race of the performer, and even that sometimes was documented incorrectly by record companies.[20] While blues emerged from the culture of African-Americans, blues musicians have since emerged world-wide. Studies have situated the origin of "black" spiritual music inside slaves' exposure to their masters' Hebridean-originated gospels. African-American economist and historian Thomas Sowell also notes that the southern, black, ex-slave population was acculturated to a considerable degree by and among their Scots-Irish "redneck" neighbors. However, the findings of Kubik and others also clearly attest to the essential Africanness of many essential aspects of blues expression.

Much has been speculated about the social and economic reasons for the appearance of the blues. The first appearance of the blues is not well defined and is often dated between 1870 and 1900. This period coincides with the emancipation of the slaves and the transition from slavery to sharecropping and small-scale agricultural production in the southern United States. Several scholars characterize the development, which appeared at the turn of the century, as a move from group performances to a more individualized style. They argue that the development of the blues is strongly related to the newly acquired freedom of the slaves. According to Lawrence Levine,[22] "there was a direct relationship between the national ideological emphasis upon the individual, the popularity of Booker T. Washington's teachings, and the rise of the blues. Psychologically, socially, and economically, Negroes were being acculturated in a way that would have been impossible during slavery, and it is hardly surprising that their secular music reflected this as much as their religious music did."

## Prewar blues

Flush with the success of appropriating the [ragtime](#) craze for commercial gain, the American [sheet music](#) publishing industry wasted no time in pursuing similar commercial success with the blues. In 1912, three popular blues-like compositions were published, precipitating the Tin Pan Alley adoption of blues elements: "Baby Seals' Blues" by Arthur Seals, "Dallas Blues" by Hart Wand and "Memphis Blues" by W. C. Handy [23]. Handy, a formally trained musician, composer and arranger was a key popularizer of blues. Handy was one of the first to transcribe and then orchestrate blues in an almost symphonic style, with bands and singers. He went on to become a very popular composer, and

billed himself as the "Father of the Blues", though it can be debated whether his compositions are blues at all;[24] they can be described as a fusion of blues with ragtime and jazz, a merger facilitated using the Latin habanera rhythm that had long been a part of ragtime.[25] Extremely prolific over his long life, Handy's signature work was the St. Louis Blues.

In the 1920s, the blues became a major element of African American and American popular music in general, reaching "white" audience via Handy's work and the classic female blues performers. It evolved from informal performances to entertainment in theaters, for instance within the Theater Owners Bookers Association, in nightclubs, such as the Cotton Club, and juke joints, for example along Beale Street in Memphis. This evolution led to a notable diversification of the styles and to a clearer cut between blues and jazz. Several record companies, such as the American Record Corporation, Okeh Records, and Paramount Records, began to record African American music. As the recording industry grew, so did, in the African American community, the popularity of country blues performers like Charlie Patton, Leadbelly, Blind Lemon Jefferson, Lonnie Johnson, Son House and Blind Blake. Jefferson was one of the few country blues performers to record widely, and may have been the first to record the slide guitar style, in which a guitar is fretted with a knife blade, the sawed-off neck of a liquor bottle, or other implement. The slide guitar went on to become an important part of the [Delta blues](#). When blues recordings were first made, in the 1920s, there were two major divisions: a traditional, rural [country blues](#), and a diverse set of more polished city or urban blues.

Country blues performers were often unaccompanied, or performed with only a banjo or guitar, and were often improvised. There were many regional styles of country blues in the early 20th century, a few especially important. The (Mississippi) Delta blues was a rootsy style, often accompanied by slide guitar and [harmonica](#), and characterized by a spare style and passionate vocals. The most influential performer of this style is usually said to be Robert Johnson,[27] who was little recorded but combined elements of both urban and rural blues in a unique manner. Along with Robert Johnson, major artists of this style were his predecessors Charley Patton and Son House. The southeastern "delicate and lyrical" Piedmont blues tradition, based on an elaborated fingerpicking guitar technique, was represented by singers like Blind Willie McTell and Blind Boy Fuller.[28] The lively Memphis blues style, which developed in the '20s and '30s around Memphis, Tennessee, was mostly influenced by jug bands, such as the Memphis Jug Band or the Gus Cannon's Jug Stompers. They used a large variety of unusual instruments such as washboard, fiddle, kazoo or [mandolin](#). Representative artists in this style include Frank Stokes, Sleepy John Estes, Robert Wilkins, Joe McCoy and Memphis Minnie. Memphis Minnie was a major female blues artist of this time. She was famous for her virtuoso guitar style. The pianist Memphis Slim also began his career in Memphis, but his quite distinct style was smoother and contained some swing elements. Many blues musicians based in Memphis moved to Chicago in the late thirties or early forties and participated in the urban blues movement, straddling the border between the country and electric blues.

City blues was much more codified and elaborate. Classic female urban or vaudeville blues singers were extremely popular in the 1920s, among them Mamie Smith, Gertrude "Ma" Rainey, Bessie Smith, and Victoria Spivey. Though more a vaudeville performer than a blues artist, Mamie Smith was the first African- American to record a blues in 1920. Her success was such that 75,000 copies of "Crazy Blues" sold in its first month. Ma Rainey, was called the "Mother of Blues." According to Clarke,[30] both Rainey and Bessie Smith used a "method of singing each song around centre tones, perhaps in order to project her voice more easily to the back of a room" and Smith "would also choose to sing a song in an unusual key, and her artistry in bending and stretching notes with her beautiful, powerful contralto to accommodate her own interpretation was unsurpassed". Urban male performers included some of the most popular black musicians of the era, such Tampa Red, Big Bill Broonzy and Leroy Carr. Before WWII,

Tampa Red was sometimes referred to as "the king of the slide guitar." Carr made the unusual choice to accompany himself on the piano.

Another important style of 1930s and early '40s urban blues was boogie-woogie. Though most often piano based, it was not strictly a solo piano style, and was also used to accompany singers and, as a solo part, in bands and small combos. Boogie-Woogie was a style characterized by a regular bass figure, an ostinato or riff. It was featured by the most familiar example of shifts of level, in the left hand which elaborates on each chord, and trills and decorations from the right hand. Boogie-woogie was pioneered by the Chicago-based Jimmy Yancey and the Boogie-Woogie Trio (Albert Ammons, Pete Johnson and Meade Lux Lewis). Chicago also produced other musicians in the style, like Clarence "Pine Top" Smith and Earl Hines, who "linked the propulsive left-hand rhythms of the ragtime pianists with melodic figures similar to those of Armstrong's trumpet in the right hand".

One kind of early 1940s urban blues was the [jump blues](#), a style heavily influenced by [big band](#) music and characterized by the use of the guitar in the rhythm section, a jazzy, up-tempo sound, declamatory vocals and the use of the [saxophone](#) or other [brass instruments](#). The jump blues of people like Louis Jordan and Big Joe Turner, based in Kansas City, Missouri, later became the primary basis for [rock and roll](#) and [rhythm and blues](#). Also straddling the border between classic rhythm and blues and blues is the very smooth Louisiana style, whose main representatives are Professor Longhair and, more recently, Doctor John.

## Early postwar blues

After World War II and in the 1950s, increased urbanization and the use of amplification led to new styles of electric blues music, popular in cities such as Chicago, Detroit and Kansas City.

Chicago became a blues center in the early fifties. The Chicago blues is influenced to a large extent by the Mississippi blues style, because most artists of this period were migrants from the Mississippi region: Howlin' Wolf, Muddy Waters, Willie Dixon, and Jimmy Reed were all born in Mississippi. Their style is characterized by the use of electric guitar, sometimes slide guitar, harmonica, traditional bass and drums. Nevertheless, some musicians of the same artistic movement, such as Elmore James or J. B. Lenoir, also used saxophones but more as a rhythm support than as solo instruments. Though Little Walter and Sonny Boy Williamson (Rice Miller) are the best known harp musicians of the early Chicago blues scene, others such as Big Walter Horton and Sonny Boy Williamson, who had already begun their careers before the war, also had tremendous influence. Muddy Waters and Elmore James were known for their innovative use of slide electric guitar. However, B. B. King and Freddy King did not use slide guitars and were perhaps the most influential guitarists of the Chicago blues style. Howlin' Wolf and Muddy Waters were famous for their deep voices. Howlin' Wolf is particularly acknowledged for distorting his voice with a special use of the microphone. Willie Dixon played a major role on the Chicago scene. He was a bassist, but his fame came from his composing and writing of most standard blues numbers of the period. He wrote "Hoochie Coochie Man" and "I Just Want to Make Love to You" for Muddy Waters, "Wang Dang Doodle" for Koko Taylor, and "Back Door Man" for Howlin' Wolf, and many others. Most artists of this style recorded for the Chicago-based Chess Records label.

The influence of blues on mainstream American popular music was huge in the fifties. In the mid-1950s, musicians like Bo Diddley and Chuck Berry emerged. Directly influenced by the Chicago blues, their enthusiastic playing departed from the melancholy aspects of blues and is often acknowledged as the transition from the blues to rock 'n' roll. Elvis Presley and Bill Haley, mostly influenced by the jump blues and boogie-woogie, popularized rock and roll within the white segment of the population. The influence of the Chicago blues was also very important in Louisiana's zydeco music. Clifton Chenier and

others introduced many blues accents in this style, such as the use of electric solo guitars and cajun arrangements of blues standards. However, other artists popular at this time, such as T-Bone Walker and John Lee Hooker, showed up different influences which are not directly related to the Chicago style. Dallas-born T-Bone Walker is often associated with the [California blues](#) style. This blues style is smoother than Chicago blues and is a transition between the Chicago blues, the jump blues and [swing](#) with some [jazz-guitar](#) influence. On the other hand, John Lee Hooker's blues is very personal. It is based on Hooker's deep rough voice accompanied by a single electric guitar. Though not directly influenced by boogie woogie, his very groovy style is sometimes called "guitar boogie". His first hit "Boogie Chillen" reached #1 on the R&B charts in 1949.

## Blues in the 1960s and 1970s

By the beginning of the 1960s, [African American music](#) like [rock and roll](#) and [soul](#) were parts of mainstream popular music. White performers had brought black music to new audiences, both within the United States and abroad. Though many listeners simply enjoyed the catchy pop tunes of the day, others were inspired to learn more about the roots of rock, soul, R&B and gospel. Especially in the United Kingdom, many young men and women formed bands to emulate blues legends. By the end of the decade, white-performed blues in a number of styles, mostly fusions of blues and rock, had come to dominate popular music across much of the world.

Blues masters such as John Lee Hooker and Muddy Waters continued to perform to enthusiastic audiences, inspiring new artists steeped in traditional blues, such as New York-born Taj Mahal. John Lee Hooker was particularly successful in the late sixties in blending his own style with some rock elements, playing together with younger white musicians. The 1971 album *Endless Boogie* is a major example of this style. B.B. King had emerged as a major artist in the fifties and reached his height in the late sixties. His virtuoso guitar technique earned him the eponymous title "king of the blues". In contrast to the Chicago style, King's band used strong brass support (saxophone, trumpet, trombone) instead of slide guitar or harp. Tennessee-born Bobby "Blue" Bland is another artist of the time who, like B.B. King, successfully straddled blues and R&B genres.

The music of the Civil Rights and Free Speech movements in the U.S. prompted a resurgence of interest in American roots music in general and in early African American music, specifically. Important music festivals such as the Newport Folk Festival brought traditional blues to a new audience. Prewar acoustic blues was rediscovered along with many forgotten blues heroes including Son House, Mississippi John Hurt, Skip James, and Reverend Gary Davis. Many compilations of classic prewar blues were republished, in particular by the Yazoo Records company. J. B. Lenoir, an important artist of the Chicago blues movement in the fifties, recorded several outstanding LPs using acoustic guitar, sometimes accompanied by Willie Dixon on the acoustic bass or drums. His work at this time had an unusually direct political content relative to racism or Vietnam War issues. As an example, this quotation from *Alabama blues* record:

I never will go back to Alabama, that is not the place for me (2x)

You know they killed my sister and my brother,  
and the whole world let them peoples go down there free

In the late sixties, the so-called West Side blues emerged in Chicago with Magic Sam, Magic Slim and Otis Rush. In contrast with the early Chicago style, this style is characterized by a strong rhythm support (a rhythm and a bass electric guitar, and drums). Talented, new musicians like Albert King, Freddy King, Buddy Guy, or Luther Allison appeared.

However, what made blues really come across to the young white audiences in the early 1960s was the Chicago-based Paul Butterfield Blues Band and the [British blues](#) movement. The style of [British blues](#) developed in England, when dozens of bands such

as Fleetwood Mac, John Mayall & the Bluesbreakers, The Rolling Stones, The Yardbirds, and Cream took to covering the classic blues numbers from either the [Delta](#) or [Chicago blues](#) traditions. The British blues musicians of the early 1960s would ultimately inspire a number of American [blues-rock](#) fusion performers, including Canned Heat, Janis Joplin, Johnny Winter, The J. Geils Band, Ry Cooder, and others, who at first discovered the form by listening to British performers, but in turn went on to explore the blues tradition on their own. Many of Led Zeppelin's earlier hits were renditions of traditional blues songs. One blues-rock performer, Jimi Hendrix, was a rarity in his field at the time: a black man who played [psychedelic](#) blues-rock. Hendrix was a virtuoso guitarist, and a pioneer in the innovative use of distortion and feedback in his music. Through these artists and others, both earlier and later, blues music has been strongly influential in the development of [rock music](#).

## Blues from the 1980s to the present

Since 1980, blues has continued to thrive in both traditional and new forms through the continuing work of Taj Mahal, Ry Cooder and the music of Robert Cray, Albert Collins, Keb' Mo' and others such as Jessie Mae Hemphill or Kim Wilson. The Texas rock-blues style emerged based on an original use of guitars for both solo and rhythms. In contrast with the West Side blues, the Texas style is strongly influenced by the British rock-blues movement. Major artists of this style are Stevie Ray Vaughan, The Fabulous Thunderbirds and ZZ Top. The '80s also saw a revival of John Lee Hooker's popularity. He collaborated with a diverse array of musicians such as Carlos Santana, Miles Davis, Robert Cray and Bonnie Raitt. Eric Clapton, who was known for his virtuoso electric guitar within the Blues Breakers and Cream, made a notable comeback in the '90s with his MTV Unplugged album, in which he played some standard blues numbers on acoustic guitar.

Around this time blues publications such as *Living Blues* and *Blues Revue* began appearing at newsstands, major cities began forming blues societies and outdoor blues festivals became more common. More [nightclubs](#) and venues emerged. The local nightclub scene in America and abroad has carried the torch for blues music and likely accounts for as much of the resilience of the blues as recorded music. These local joints thrive despite the increase in ultra lounges and dance clubs, cranking out live music every night of the week across the country. In the 1990s and today blues performers are found touching elements from almost every musical genre, as can be seen, for example, from the broad array of nominees of the yearly Blues Music Awards, previously named W. C. Handy Awards[38] Contemporary blues music is nurtured by several well-known blues labels such as Alligator Records, Blind Pig Records, Chess Records (MCA), Delmark Records, and Vanguard Records (Artemis Records).

Some labels are famous for their rediscovering and remastering of blues rarities such as Delta Groove Music, Arhoolie Records, Smithsonian Folkways Recordings (heir of Folkways Records), and Yazoo Records (Shanachie Records).

## Musical impact

As the origin of the blues scale, the blues has exerted a profound influence on many styles of music. Many jazz, folk or rock performers, such as Louis Armstrong, Duke Ellington, Miles Davis, Bob Dylan and The Red Hot Chili Peppers, have performed significant blues recordings. The blues scale frequently is found in non-blues musical forms, such as popular songs like Harold Arlen's "Blues in the Night", [blues ballads](#) like "Since I Fell for You" and "Please Send Me Someone to Love", and even orchestral works like George Gershwin's "Rhapsody in Blue" and "Concerto in F". Indeed, the blues scale is ubiquitous in modern popular music and informs many [modal frames](#), especially the ladder of thirds as in "A Hard Day's Night". Blues forms turn up in some surprising places. The theme to the televised *Batman* had a blues structure, as did teen idol Fabian's first hit, "Turn Me Loose". The first great [country music](#) star Jimmie Rodgers was a blues performer. Guitarist/vocalist Tracy Chapman's hit "Give Me One Reason" was a 12-bar blues and has, as a result, become a contemporary blues club standard in Chicago. Blues is sometimes danced as an informal type of [swing dance](#), with no fixed patterns and a heavy focus on connection, sensuality and [improvisation](#), often with body contact. However, most [blues dance](#) moves are inspired by traditional blues dancing. Although usually done to blues music, it can be done to any slow tempo 4/4 music, including "club" music.

[R&B](#) music can be traced back to [spirituals](#) and blues. Spirituals are often cited as the origin of the blues. Musically, spirituals were a descendent of New England choral traditions, and in particular of Isaac Watts's [hymns](#), mixed with African rhythms and call-and-response forms. Spirituals or religious chants in the Afro-American community are much better documented than the "low-down" blues. They developed mostly because the communities could gather more easily during mass or worship gatherings, the so-called camp meetings. Their popularity was also due to their—at first glance—politically correct contents. Most early country bluesmen such as Skip James or Charley Patton were able to play as well both genres, which usually basically only differ in the lyrics. Georgia Tom Dorsey is the perfect example of blues musician and composer straddling the border between country and urban blues, and spirituals. He is often cited as the father of [Gospel music](#). However, the beginning of Gospel music can be better dated to 1930 and the first successes of the Golden Gate Quartet. In the fifties, [soul music](#), best represented by Sam Cooke, Ray Charles and James Brown, overtook many elements of both Gospel and blues music. In the sixties and seventies these genres merged in what is called [soul blues](#) music. Direct heir of soul, [funk](#) music of the seventies can be seen as an antecedent of hip-hop and contemporary R&B and shows the filiation of the blues with most modern R&B music.

Before World War II, the difference between blues and [jazz](#) was sometimes vague. Usually jazz was more impregnated by harmonic structures stemming from [brass bands](#). However, the jump blues is a clear example of mix between both styles. After the war, the influence of blues on jazz was tremendous, and most of the [bebop](#) classics, such as Charlie Parker's "Now's the Time", are based on the extensive use of the pentatonic scale and blue notes. However, this influence was purely formal. Bebop marked a major shift of jazz from pop music for dancing to a high-art, less-accessible, cerebral "musician's music". The audience for both blues and jazz definitively split, and it was at this time that the border between blues and jazz became the most defined. Artists straddling the border between jazz and blues are categorized into the [jazz-blues](#) sub-genre.

The influence of both the twelve-bar structure and the blues scale on [rock-and-roll](#) music was so profound that rock and roll can properly be classified as an outgrowth of blues, or even "blues with a back beat". Elvis Presley's "Hound Dog", with its unmodified twelve-bar structure (in both harmony and lyrics) and a melody centered on flatted third of the tonic (and flatted seventh of the subdominant), is a blues song transformed to a new genre by rhythm and sheer energy. One can hardly find a major song from rock-and-roll's revolutionary period that is not, at its roots, a blues composition transformed by rhythm: "Johnny B. Goode", "Blue Suede Shoes", "Whole Lotta' Shakin' Going On", "Tutti-Frutti", "Shake, Rattle, and Roll", "What'd I Say", and "Long Tall Sally". The early African American rock musicians retained the frank sexual themes of blues. "Got a gal named Sue, knows just what to do" or "See the girl with the red dress on, she knows how to do it all night long" are hard to mistake. Even the subject matter of "Hound Dog" contains well-hidden sexual double entendre. More sanitized early "white" rock borrowed both the structure and harmonics of blues, although minimizing harmonic creativity and sexual nuance, such as Bill Haley's "Rock Around the Clock". Many white musicians who covered black rock songs would go so far as to change the words; possibly the most famous example was Pat Boone's cover of "Tutti Frutti", which originally started "Tutti frutti, loose booty . . . a wop bop a lu bop, a good Goddamn."

## Social impact

Like [jazz](#), [rock and roll](#) and [hip hop music](#), blues has been accused of being the "devil's music" and of inciting violence and other poor behavior. In the early 20th century, the blues was considered disreputable, especially as white audiences began listening to the blues during the 1920s. In the early twentieth century, W.C. Handy was the first to make the blues more respectable to non-black Americans.

Now blues is a major component of the African American and American cultural heritage in general. This status is not only mirrored in scholar studies in the field[42] but also in main stream movies such as *Southern* (1972), *the Blues Brothers* (1980 and 1998), and *Crossroads* (1986). The *Blues Brothers* movies, which mix up almost all kinds of music related to blues such as R&B or Zydeco, have had a major impact on the image of blues music. They promoted the standard traditional blues "Sweet Home Chicago", whose version by Robert Johnson is probably the best known, to the unofficial status of Chicago's city anthem. More recently, in 2003, Martin Scorsese made significant efforts to promote the blues to a larger audience. He asked several famous directors such as Clint Eastwood and Wim Wenders to participate in a series of films called *The Blues*. He also participated in the reedition of compilations of major blues artists in a series of high quality CDs.

## Blues ballad

The **blues ballad** synthesizes [blues](#) feeling and attitudes (using the blues scale and chord progressions) with the conventional 32-bar popular song from Tin Pan Alley.

Among the best known blues ballads are Percy Mayfield's love song in the form of a prayer, "Please Send Me Someone to Love" and Buddy Johnson's "Since I Fell for You", most successfully recorded by Lenny Welch. B.B. King has recorded several blues ballads, "You Know I Love You", his second hit, and "Sneakin' Around". Bobby Blue Bland recorded as many blues ballads as he did straight blues. Clarence Carter's "Slip Away" is another notable example.

Blues ballads are also popular in [country music](#). Hank Williams's "Your Cheating Heart" and Freddy Fender's two classics, "Wasted Days and Wasted Nights" and "Before the Next Teardrop Falls", for example.

The blues ballad differs from conventional blues in its structure. Blues ballads have the 32-bar A-A-B-A form of verse-verse-bridge-verse, while blues songs have the 12-bar A-A-B form or its 8-bar A-B variant. Both blues and blues ballads rely on the mainstay three chords and the blues scale.

Conversely, the blues ballad differs from bluesy pop songs like Harold Arlen's "Blues in the Night" by simpler harmonies and more direct language. That said, in the hands of a skillful and emotional performer like Dakota Staton or Etta James songs like "Mean to Me" or Cole Porter's "Love for Sale" can be hard to distinguish from formal blues ballads.

# Blues-rock

**Blues-rock**, is a hybrid musical genre combining elements of the [blues](#) with [rock and roll](#). It began to develop as a particular style in the mid-1960s through the work of bands such as The Rolling Stones, who experimented with music from the old bluesmen like Elmore James, Howlin' Wolf, and Muddy Waters.

While rock and blues have historically always been closely linked, blues-rock as a distinct genre did not arise until the late 1960s. Blues-rock was characterized by bluesy improvisation, extended boogie [jams](#) typically focused on the [electric guitar](#) player, and often a heavier, riff-oriented sound and feel to the songs than might be found in traditional [Chicago-style blues](#). The genre was originally British, with artists like Alexis Korner and John Mayall forming groups that acted as a training ground for future stars of the genre such as Free, Savoy Brown and the earliest incarnations of Fleetwood Mac, while American players like Johnny Winter, Paul Butterfield and the group Canned Heat were also pioneers. The virtuoso electric blues playing of Jimi Hendrix (a veteran of many American [rhythm & blues](#) and [soul](#) groups from the early-mid 1960s) and his [power trios](#) - The Jimi Hendrix Experience and Band of Gypsys - has had broad and lasting influence on the development of blues-rock, especially for guitarists.

Blues-rock's best-known artist is probably Eric Clapton, whose work in the mid-60s with The Yardbirds, the supergroup Cream, as well as Derek and the Dominos beginning in 1970 followed by an extensive solo career, have all been seminal in bringing of blues-rock into the mainstream (although blues-rock was just one of the styles those bands played).

In the late 60s Jeff Beck, another former member of The Yardbirds, revolutionised blues rock into a sort of Heavy Rock, taking the UK and the USA by storm with his band, The Jeff Beck Group which had among its members a young Rod Stewart on vocals and an even younger Ronnie Wood on bass. Jimmy Page, a third alumnus of The Yardbirds, went out to form 'The New Yardbirds' which would soon become known as Led Zeppelin. Led Zeppelin was a huge force in the early 70s blues-rock scene but their music soon turned towards [hard rock](#) or [heavy metal](#). Other blues-rock musicians influential on the English scene of the 1970s included Rory Gallagher (who was actually Irish) and Robin Trower.

Beginning in the early 1970s, American blues-rock grew to include [Southern rock](#) and [hard rock](#) bands like the Allman Brothers Band, the James Gang, Stevie Ray Vaughan, Fabulous Thunderbirds and ZZ Top, while - except for the advent of groups such as Foghat (founded by former Savoy Brown members) - the British scene became focused on [heavy metal](#) innovation. Blues-rock had a re-birth in the early 1990s and continues to be a smouldering fire with lasting influence today, with many artists such as Tracy Conover, Kenny Wayne Shepherd, The Mods, Jonny Lang, Tommy Castro, Big Sugar, Anthony Gomes, The Black Crowes, The Black Keys, The White Stripes, Joe Bonamassa and Corby Yates performing and releasing albums to enthusiastic fans. Five Horse Johnson is often considered borderlining between acid blues and blues rock, due to their strange guitar riffs.

A classic example of blues-rock is Cream's "Crossroads", adapted from Robert Johnson's "Cross Road Blues" and "Traveling Riverside Blues"; it fuses some of the lyrical and musical styles of blues with rock-styled tempo and guitar solos. Other great examples are found in almost all that Eric Clapton played with The Yardbirds, particularly on their version of Howlin' Wolf's "Smokestack Lightning."

# Bomba

**Bomba** is one of Puerto Rico's most famous musical styles. Although there is some controversy surrounding its origin, most agree that it is a largely African music. The rhythm and beat are played by a set of west African drums called [congas](#). [Dance](#) is an integral part of the music: the dancers in move their bodies to every beat of the drum, making bomba a very wild and rich dance. Bomba is described to be a challenge between the drummer and the dancer. The drummer will beat the drums and the dancer is to dance as fast as the drummer is beating the drum. The dancer must be in great physical shape to keep up and the challenge usually continues until either the dancer or drummer discontinues. The main instrument used in bomba style music are low pitched bomba drums which usually supports the rhythm of bomba music called the buleador. Other instruments used are the palitos or clave, which are sticks that are struck together to form the sound similar to a cowbell. Maracas and a güiro are also heard in many bomba songs, which are instruments created and used by the Taino Indians of the Caribbean Basin.

The basic music style was brought to Puerto Rico during the colonial slave trade. It originates in Ghana, West Africa, although the majority of slaves can be traced back to 31 different areas of West and Central Africa. The dance was mostly practiced at the northern, southern and western coasts of the island where the majority of Africa's descendants lived. The dance was used to mock the slave owners. The men used to use a series of pelvic thrusts while the women would swish their skirts around. The traditional clothing for Bomba for men was a white outfit and fedora hat. The women wore big plantation skirts, Santería beads (of Yoruba origin), and a head scarf or bundaloo.

The name of the drums is not "congas". The genre actually takes its name from the drums that are called "bombas". They are also called "barriles". The high pitch drum is called "subidor" or "primo", and the low pitch drum is called "buleador" or "segundo". In the traditional bomba two other percussion instruments are used: a large maraca and a pair of sticks that beat on the side of the buleador. The sticks as well as the rhythm they played are called "cuás". There are several styles of bomba called "seises de bomba".

# Boogaloo

**Stylistic origins:** [jump blues](#), [mambo](#), [R&B](#)

**Cultural origins:** 1960s New York

**Typical [instruments](#):**

**Mainstream popularity:** Late 1960s

New York, Colombia

**Boogaloo (shing-a-ling, popcorn music)** is a [genre](#) of Latin music and [dance](#) that was very popular in the United States in the late 1960s. Boogaloo originated in New York City among teenage Cubans and Puerto Ricans. The style was a fusion of popular African American [R&B](#), [rock and roll](#) and [soul](#) with [mambo](#) and son montuno. Boogaloo entered the mainstream through the American Bandstand television program.

## Dance

The boogaloo dance was loose and interpretive in style. Early Boogaloo used a twelve-step sequence that was later sped up into a thirty-step sequence. The most common musical feature was a mid-tempo, looping melody that doubled as the anchoring rhythm, often played on piano or by the horn section. The presence of vocals, especially a catchy, anthemic chorus, was another distinguishing feature, especially in comparison to more instrumental dances like the mambo, guajira and guaracha. The Latin boogaloo (also spelled "bugalu") is to be distinguished from the Electric Boogaloo, a funk-oriented dance style from the 1970s, which came originally from Fresno, California in the 1960s.

## History

In the 1950s and 60s, African Americans in the United States listened to a number of styles of music, including [jump blues](#), [R&B](#) and doo wop. Puerto Ricans in New York City shared in these tastes, but also listened to genres like mambo or chachacha. There was much intermixing of Latinos, especially Puerto Ricans and Cubans, and African Americans, and clubs that catered to both groups tried to find musical common ground to attract both. Boogaloo was the result of this search, a marriage of many styles including Cuban son montuno and guajira, Puerto Rican/Cuban guaracha, mambo and most uniquely, American R&B/soul. Boogaloo can be seen as "the first Nuyorican music" (René López), and has been called "the greatest potential that (Latinos) had to really cross over in terms of music" (Izzy Sanabria). Styles like doo wop also left a sizable influence, through Tony Pabón (of Pete Rodríguez Band), Bobby Marín, King Nando, Johnny Colón and his vocalists Tony Rojas and Tito Ramos. Puerto Ricans (Herman Santiago and Joe Negroni) played a foundational role in the major doo wop group Frankie Lymon & the Teenagers. Herman Santiago was the author of the groups #1 "hit" *"Why Do Fools Fall In Love"*.

Though boogaloo did not become mainstream nationwide until later in the decade, two early Top 20 hits came in 1963: Mongo Santamaria's performance of the Herbie Hancock piece "Watermelon Man" and Ray Barretto's "El Watusi". Inspired by these two successes, a number of bands began imitating their infectious rhythms (which were Latinized R&B), intense [conga](#) rhythms and clever novelty lyrics. Some long-time veteran Latin musicians played an occasional boogaloo number, including Perez Prado and Tito Puente, but most of the performers were teenagers like The Latin Souls, The Lat-Teens, Pucho & His Latin Soul Brothers, Joe Bataan and The Latinaires. The older generation of latin musicians have even been accused of initially using their influence to repress this youth-oriented movement. The term boogaloo was probably coined in about 1966 by Richie Ray and Bobby Cruz. The biggest boogaloo hit of the 60s was "Bang Bang" by the Joe Cuba Sextet, which achieved unprecedented success for Latin music in the United States in 1966 when it sold over one million copies. Other hits included Johnny Colón's "Boogaloo Blues," Pete Rodríguez's "I Like It Like That," and Hector Rivera's "At the Party". Boogaloo also spread to Puerto Rico, where top band El Gran Combo released some material. Though the dance craze was over by the turn of the decade, boogaloo was popular enough that almost every major and minor Latin dance artist of the time recorded at least a few boogaloos on their albums.

The same year as Joe Cuba's pop success, 1966, saw the closing of New York City's Palladium Ballroom, a well-known venue that had been the home of big band mambo for many years. The closing marked the end of mainstream mambo, and boogaloo ruled the Latin charts for about two years before salsa music began to take over.

Boogaloo remains extremely popular to this day in Cali, Colombia, where the genre is played extensively, along with salsa and pachanga, in various FM and AM radio stations and hundreds of dance clubs. The Caleños prefer their boogaloo sped up, from 33 to 45 RPM, to match the city's fast dance style.

## Bootleg recording

A bootleg recording is an [audio](#) or video recording of a performance that was not officially released by the artist or under other legal authority. A great many such recordings are simply copied and traded among fans of the artist without financial exchange, but some bootleggers are able to sell these rarities for profit, sometimes by adding professional-quality sound engineering and packaging to the raw material.

Some artists consider any release for which they do not receive royalties to be equivalent to a bootleg, even if it is an officially licensed release. This is often the case with artists whose recordings have either become public domain or whose original agreements did not include reissue royalties (which was a common occurrence in the 1950s and before).

The market outlets for bootlegs-for-sale have been varied. Swap meets, street vending, record collector shows, and smaller record stores would stock them. Mail order and Internet sources were advertised by word of mouth, and there have been assorted unique sources for individual bands. There were major bootleg markets in Japan and Europe for bands like KISS, The Rolling Stones, Led Zeppelin, and Queen.

## Sources of material

Some bootlegs consist of works-in-progress or discarded material without the artist's involvement, and sometimes against his or her will; these might be made from master recordings stolen or copied from a recording studio or a [record label's](#) offices, or from [demo recordings](#).

## Live bootlegs

Bootlegs can also be recorded "unofficially" with gear smuggled into a [live concert](#)—many artists and most live venues prohibit this form of recording (many, on the other hand, actually *allow* this—The Grateful Dead is famous for explicitly allowing their shows to be taped), but modern portable technology has made such bootlegging increasingly easy and has dramatically improved the quality of "audience" recordings.

A number of bootlegs originated with FM radio broadcasts of live or previously recorded live performances.

## "Official" bootlegs

Many recordings first distributed as bootleg albums were later released officially by the copyright holder; for instance in 2002 Dave Matthews Band released *Busted Stuff* in response to the Internet-fueled success of *The Lillywhite Sessions* which they had not intended to release, while The Beatles' release of their *Anthology* albums effectively killed the demand for many Beatles bootlegs previously available.

- Bob Dylan has released an entire bootleg series, which as of 2005 had seven "volumes" (but only five discrete releases).
- Frank Zappa released two series of *Beat the Boots* recordings in 1991 and 1992, remastered directly from bootleg discs. Zappa also copied the packaging directly from the bootleg releases, adding no additional material other than a cardboard box (they were available as a boxed set of LPs or as individual CD releases).
- In 1994, Prince finally released *The Black Album*, initially shelved in 1987 and widely bootlegged since then.
- The Smashing Pumpkins' last official album, *MACHINA II/The Friends & Enemies of Modern Music*, was distributed to fans on vinyl and released independently as a gesture of defiance to Virgin Records, who the band felt didn't give them the support they needed.
- Dream Theater drummer Mike Portnoy is one of the most vocal pro-bootleg musicians (despite the band not having an open taping policy), running an official bootleg label called YtseJam Records.

## Authorized live bootlegs

An increasing number of artists, such as the Grateful Dead, Metallica, Phish, Dave Matthews Band, The Smashing Pumpkins, U2, Ween, the German electronic music ensemble Tangerine Dream, and Medeski Martin & Wood have allowed and encouraged live audience recording, but they and their fans generally consider selling such recordings—as opposed to keeping them for one's own personal enjoyment or trading them for other audience recordings—to be illegitimate bootlegging. The Mars Volta also encourage bootlegging, and nearly every show the band has ever played has been recorded, but when the band released their live album *Scabdates*, sales did not seem to suffer.

Fans cite the encouragement of these recordings as a key factor in their long-term loyalty to these bands.

A few artists like Peter Dinklage, Jimmy Buffett, Fugazi, Pearl Jam and Duran Duran have responded to the demand for bootleg concert recordings by experimenting with the sale of authorized bootlegs made directly from the unmixed soundboard feeds, or from on-the-fly multi-track mixes, and thus superior to surreptitious audience recordings which are typically marred by crowd noise. These releases are generally available a few days to a few weeks after the concert.

In the mid-2000s, improving technology in high-speed CD reproduction made some of these "official boots" available to audience members immediately as they leave the concert; however, a key patent in the process (that of dividing the single recording into discrete digitally marked tracks) was bought by media giant Clear Channel

Communications, which has led to complaints from smaller competitors and uncertainty on the future development of the technology in the United States.

## Bootlegging in the vinyl era

In Los Angeles there were a number of record mastering and pressing plants that were not "first in line" to press records for the major labels, usually only getting work when the larger plants were overloaded. These pressing plants were more than happy to generate income by pressing bootlegs of dubious legality. Sometimes they just hid the bootleg work when record company executives would come around (in which case the bootleg record labels could show the artist and song names) and other times secrecy required labels with fictitious names. For example, a 1972 Pink Floyd bootleg called Brain Damage was released under the name The Screaming Abdabs.

Collectors generally relied on Hot Wacks, which was a catalog of known bootlegs published annually, for the actual artists and track listings as well as source and sound quality information.

# Bastard pop

*Main article:* [bastard pop](#)

In the early 2000s, "bootleg" became an alternate term for [bastard pop](#) or "mashups", a style of [remix](#) melding two or more music records into each other to make a new piece of music out of the old components. The term was likely derived from the fact that early examples copied sound clips without paying royalties to the original artist. Among the most popular artists in this genre are The Freelance Hellraiser, Soundhog, Go Home Productions, Soulwax and Lionel Vinyl.

## Bootlegging vs. piracy vs. counterfeiting

Bootlegging is often incorrectly referred to as piracy but there are important differences between the two terms. Bootlegging is trafficking in recordings that the record companies have not commercially released and may or may not be legal. Piracy is the illegal copying/sale of recordings that are available commercially or are planned/scheduled for commercial release.

A pirate release is further distinguished from a counterfeit. Counterfeits attempt to mimic the look of officially released product; pirate releases do not necessarily do so, possibly substituting cover art or creating new compilations of a group's released songs. A counterfeit is always a pirate but a pirate is not necessarily a counterfeit. Historically, pirate (but not counterfeit) releases were widespread in the 8-track cartridge format, many with labels spuriously claiming that "all royalties have been paid."

"Bootlegging" is sometimes also used to refer to the unlicensed filesharing of copyrighted music but, as alluded to above, the term piracy is often more appropriate.

## Border ballad

The English/Scottish border has a long and bloody history of conquest and reconquest, raid and counter-raid (see Wars of Scottish Independence). It also has a stellar tradition of balladry, such that a whole group of songs exists that are often called "**border ballads**", because they were collected in that region.

Border ballads, like all traditional ballads, were traditionally sung unaccompanied. There may be a repeating motif, but there is no "chorus" as in most pop songs. The supernatural is a common theme in Border ballads, as are recountings of raids and battles.

Representative samples include "Thomas the Rhymer" (aka "True Thomas", Thomas of Erceldoune"), which opens in the English town of Erceldoune; and the very famous "Tam Lin".

The interested reader is referred to *Minstrelry of the Scottish Border* by Sir Walter Scott.

## Bounce music

**Bounce music** is an energetic style of New Orleans Rap music, taking off in the early 1990s, but dating back to 1980s. It is characterized by call and response party chants and dance call-outs typically sung over the "Triggaman" (from the song "Drag Rap" by the Showboys) and/or "Brown Beat" samples. The genre maintains widespread popularity in New Orleans, but is relatively unknown outside of the area. MC T. Tucker is noted as an early pioneer of the genre, if not its creator. The genre evolved quickly through the 90s. Throughout this decade the Take Fo' record label dominated the scene with artists such as DJ Jubilee, Da' Sha Ra', and Willie Puckett .Katey Red, also a Take Fo' artist, contributed significantly to the genre (as well as to the larger rap world) through being its first self-proclaimed homosexual artist. Following her arrival to the scene, so-called "Sissy" rappers have multiplied exponentially. Recent developments in the genre display an increased intensity and speed, perhaps best demonstrated by 10th Ward Buck's song "Fasta."

While Bounce may be most identifiable by its dance-call outs and lyrical stylings, its use of sampling is remarkably distinct. In stark contrast to hip-hop's early years, when DJs would scrape the labels off their records to preserve their originality and create a certain mystique, Bounce feeds off the relentless pillaging of the Drag Rap sample. Nearly every second of this 1986 single has made its way into Bounce jams: its opening chromatic tics, the immediately identifiable Drag Rap sample, the shouting out of "break" (emulated throughout Outkast's Stankonia), the whistling breakdown, the vocodered "drag rap", the minimal drum machine verse.

Despite the genre's relative seclusion, elements of Bounce have influenced a variety of other southern rap styles and have even slipped their way into the mainstream. Atlanta's [Crunk](#) artists such as Lil Jon and the Ying Yang Twins frequently cite Bounce chants in their songs ("it must be your money cuz it ain't your dick" or "it must be your pussy cuz it ain't your face"), David Banner's hit "Like A Pimp" is constructed around a slowed down "Triggaman" sample and Memphis' DJ Paul has slipped many a Bounce reference into his production work for La Chat, Gangsta Boo and Three Six Mafia.

Bounce coverage is also making its way into journalism. Nik Cohn's *Triksta: Life and Death and New Orleans Rap* reports on the author's own involvement with this genre, one certainly complicated by his own simultaneous obsession and distaste for the music.

[Electronic musical instrument](#) – [Computer music](#)

**Bouncy techno** (also known as hardcore, techno or happy gabba - see terminology) is a rave hardcore dance music style circa 1992, mostly emanating from the United Kingdom and the Netherlands. Originally, it was influenced by the music found in the rave scene in the north of the United Kingdom (Scotland, North East England and Northern Ireland), where European (mostly from Belgium and Italy) produced [techno music](#) was widely played.

Seen as a combination of European techno-inspired riffs with faster toughened beats, this offbeat sounding music was highly popular in the north United Kingdom rave scene and soon, also in the Netherlands. Scottish artists released this music on Dutch record labels, with the Dutch - deeming it a more melodious variant of gabba - quickly producing similar sounding music in large quantities.

This music would later emerge to the remainder of the United Kingdom, specifically altering the English [happy hardcore](#) style away from its breakbeat origins. By the mid-1990s, much of the music in the rave scene would be a combination of bouncy techno and happy hardcore.

## Characteristics

This was music designed for raves, by way of participation through dancing (likely bouncing) and generating crowd noise at key moments during these simple techno hook lines. The music would be "basic", with much of the components occurring on the off-beat, creating this distinct bouncy feel. Tracks would also sound primitively produced.

Typical characteristics for bouncy techno are for compositions to be around a tempo of 160 to 180 BPM (beats per minute) using a 4/4 signature of 4 cycle segments, where different elements would be gradually layered into the mix.

Drum instruments will be minimal, usually consisting of a hard bass drum, sharp open hi-hat, hand clap, on-beat snare drum, ride and a splash cymbal, using the like of DrumStation, SP-1200, or TR-909 machines. Kicks would either be straight or possibly with some distortion.

These would be arranged using a constant thumping kick with on beat snare, along with a tandem offbeat hi-hat, offbeat hand clap and essential offbeat bouncy techno stab. The stab is somewhat reminiscent of Rotterdam Termination Source - Poing! (Rotterdam Records, ROT 004, 1992). A quick drum roll would lead into the main hook part.

A single fat techno riff arpeggio of sucking or buzzing sounds was used as the hook for the track. This would usually be altered through time using resonance filters before hitting another bouncy segment. A second variance of the arpeggio likely occurs towards the remainder of the track.

Tracks would be either [instrumental](#) or perhaps use a short snappy sample, cut and repeated through various points of the track.

# History

## Overview

With the hotpot of different music in fluxing raves since the early 1990s, the north of the United Kingdom would prefer European produced [techno music](#) to be played. This was in contrast to the rave scene found in the south of the United Kingdom where their own emerging [breakbeat hardcore](#) style was being produced in great quantities. This division caused the scene in the north to differ musically from the south, thus evolve differently.

Scott Brown, one of the most prolific names on the world [hardcore music](#) scene, concurred in an interview on February 14, 2004, that "In the past a lot of DJs said that there was a definite musical divide between the north and the south [of the United Kingdom], the north preferring it a lot harder..."

Excluding any southern based [DJs](#) occasionally playing in the north, the south based breakbeat style received little or no coverage on the radio or magazines dedicated to the Scottish rave scene. The few Scottish based breakbeat DJs found it very difficult to promote this music, even with Scottish ravers going to such extremes to shun them by way of petitions.

DJ Kid, the original Scottish breakbeat stalwart recalled the situation on his website, saying that "when trying to introduce the all new breakbeat sound to Scotland - nobody liked ANY of the records I played. I constantly pushed the breakbeat sound whilst the other DJs played underground techno". DJ Kid once stormed offstage at a Scottish rave during his breakbeat set when objects were thrown at him by disgruntled ravers.

## Beginnings

Much like other rave across Europe, the ever growing northern United Kingdom rave scene created its own network of [DJs](#) and artists that played a certain brand of music, eventually carving out a unique sound akin to the particular tastes of its own listening audience.

During 1992, it was not uncommon to see DJs like Bass Generator, DJ ZBD and Tom Wilson playing a variety of [techno music](#) from mostly Belgium and Italy, along with the new native produced stuff from Scotland by bands including Ultra-Sonic, Suburban Delay and The Time Frequency. Artists from Belgium and Italy, like Praga Khan, Jade 4U and DJ Professor toured extensively at raves in Scotland.

New producers from Scotland influenced by the music played in the domain would soon emerge, most noticeably Scott Brown. Brown had formed Q-Tex and soon Bass X (a play on words with "basic"), with their Hardcore Disco (Shoop!, SHOOP 2, 1993) release considered to be amongst the first - if more quintessential sounding - bouncy techno releases.

This was a basic blend of very fast (for that time) techno riffs along with a characteristic - somewhat repetitive - offbeat bassline stab at stages. None the less, the track was hugely successful across the north of the United Kingdom and soon heralded many similar sounding tracks from Brown and other artists.

Amongst other emerging releases was Brown's co-worked Bass Reaction - Technophobia (Shoop!, SHOOP 8, 1993) release. The track proved very popular in the

Netherlands scene, with DJ Paul Elstak citing it back then as his favourite of 1994. Technophobia would soon be relicensed in The Netherlands (Terror Traxx) and Italy (Do It Yourself Entertainment) that year to meet demands.

Asked for his proudest piece of production on August 11, 2004, Scott Brown answered, "I've made some important tracks which have helped create or change the scene in many ways, such as 'Technophobia' or 'Now Is The Time' which helped shape the Dutch and Scottish scenes for years."

Having had a number of records out on different labels, Scott Brown would establish his own record label on January 1, 1994 - Evolution Records - based in Cumbernauld. Described as being dedicated to bouncy techno, other labels of his catering for this type of music would soon appear that year to keep up with the demands not only in the Scottish scene but outside too. Other record labels would release much material dedicated specifically to this sound, with it being exported far and wide.

Renowned record distributor Mo's Music Machine stated of the Shoop! record label (that released most of the earliest bouncy techno material) in 1996, "The 12 inch vinyl releases almost enjoy legendary status in Australia, The Netherlands and Germany. The Scottish Techno sound has reverberated around the World..."

With this new scene in full swing, hiring the big named [breakbeat hardcore](#) playing DJs from the south of the United Kingdom was no longer needed as they were now playing music out of touch with the majority of the listening audience.

The Rezurection rave promotion - synonymous with the Scottish rave scene - concurs on their website that, "New Year's Eve 1993 proved to be a watershed event for Rezurection, as 1994 saw the demise of the traditional London style breakbeat sound favored by regular Rez DJs like Grooverider, SS and Seduction... as hard trance, bouncy techno and gabba dominated the Scottish scene."

## **Growth**

### **Netherlands**

During this time, leading Dutch DJs such as Buzz Fuzz and Paul Elstak combined the Scottish records with their own Dutch gabba tracks at raves in the Netherlands such as Hellraiser and A Nightmare In Rotterdam. The boom for this type of music resulted in Scottish artists including Casio Brothers, Davie Forbes, Hyperact, Technosis, Ultimate Buzz and The Scotchman - who significantly was the debut release on Rotterdam's own Dwarf Records in 1994 - exported this sound on several Dutch based record labels. A number of tracks were relicensed on Dutch compilations.

By 1995, new Dutch labels such as Babyboom, Dwarf, Pengo, Forze Records and others produced much similar sounding material, combining it with gabba in different ways. By now, the Dutch DJs and artists were in-demand at Scottish raves, regularly appearing at events in the country.

Scott Brown collaborated with several leading Dutch and American producers including Paul Elstak, Omar Santana and Bass-D & King Matthew, and also released a number of tracks on their own native labels, leaving his influence on subsequent music emanating from the Netherlands.

DJ Smurf, one of the leading hardcore DJs who is listed in the Billboard music encyclopaedia concurs that, "Scotland created there own 'bouncy techno' sound by weakening down gabber kick drums and adding happier sounds. The Dutch soon followed suit, except they kept the kick drums hard and created 'happy gabber' which stayed around for a few years."

### **Scotland**

The bouncy techno style dominated the Scottish scene, peaking during the Rezerrection rave promotion's annual Event series on September 2, 1995 - the biggest rave to occur in Scotland. Their 20-hour Event 3: Equinox rave extravaganza attracted a reported 17,000 people with no less than 47 different international artists, with many of those being listed as playing bouncy techno DJ sets on the heavily distributed flyer.

The event itself naturally attracted much media attention. Tom Wilson's popular prime time dance music radio show - Steppin' Out - even transmitted live especially from the venue. Dance music magazine Eternity also ran a four page review of the show - the non-breakbeat music preference evident.

"Next up in the Sunset tent at 05.00am was Marc Smith... he had been booked to play a Jungle set. I watched as two thirds of the tent left. One of the things I like about Rezerrection and Scotland in general is that they love their Techno. At 10.03am it's Marc Smith in the Eclipse tent, but this time he was playing the Techno set he had been booked to play. No problem this time, he rocked the place. Two hours left and Davey Murray takes the controls... this guy went down well to say the least, nice bouncy stuff."

Elsewhere, the sound also had grabbed Northern Ireland, with DJ Tizer at the forefront. During an interview for the Fantazia rave promotion in 1995, DJ Tizer said that, "The Scottish scene is really buzzin' at the moment, which is good, because I'm really into the Scottish bouncy techno that is so popular here."

## England

Due to the north following a different musical route to the south, their [breakbeat hardcore](#) splintering into the breakbeat driven [happy hardcore](#) and jungle techno styles had been mostly oblivious in the Scottish scene.

The breakbeat happy hardcore DJs however increasingly combined bouncy techno into their mix sets at raves. This mixing of two different styles considered the point where bouncy techno traits in-part influenced the happy hardcore productions by taking on similar mannerisms.

By late 1995, happy hardcore had gradually de-emphasised its inherent breakbeat traits and instead utilised the 4/4 tempo heavy kick drum and off-beat techno stab, whilst retaining its own piano melodies, effectively becoming a hybrid of the two styles in varying amounts - something known then as happy bouncy techno (or happy techno).

New English based labels such as Bounce!, Bouncy Tunes, Digital International Techno, Mental Platinum, Techno Tunes and Punisher, started to produce bouncy techno music outright, though most English productions tended to be released on their already established labels and usually swayed more to their happy origins.

## Decline

Despite a huge rave scene, the Scottish rave and music scene pretty much vanished by the late 1990s due to a combination of factors. This scene was much a part of culture in the young adult demographic. It also had bad media press, associated with Scottish ravers experimenting with hard drugs [9] linked with much publicised deaths at raves. In one year, there was a reported 60 rave deaths in Strathclyde. This had cast a shadow over the Scottish scene.

At that time in 1996, where previously the English [happy hardcore](#) style had been all but unheard of in the Scottish rave scene due to its original breakbeat nature, it returned bigger than before under its new breakbeat-less guise - something that was now influenced by bouncy techno - but with full-on lyrics and large piano breakdowns.

Rezerrection concurs that "By 1996, happy hardcore was growing and DJs like Hixxy and Billy Reid joined regulars Marc Smith, Bass Generator and Technotrance". Only reflecting this new change, bouncy techno had now been added last on the Rezerrection flyer and magazine advertising - behind happy hardcore.

This introduction of happy hardcore was a way to change the scene's current music direction away from its apparent connected drug image by introducing a happy vibe whilst breathing new life into the dormant scene. This change of direction resulted in the phasing out the harder edge sounds of bouncy techno and happy gabber, in-turn isolating much of its rave fan base. Happy hardcore also appealed to a new generation of much younger people attending raves.

By 1997, the scene was destined to disintegrate as society disassociated itself with the movement, making it near impossible for the scene and its inherent music to survive. Leading Scottish rave venues including the Metro and FUBAR had swiftly dropped hardcore, even dance music all together. Radio stations soon followed. There was also much problems in staging raves due to the police and councils through the years. Rezerection - the country's largest and most successful rave promoter - was declared bankrupt, staging their last show on May 31, 1997.

Due to demand, Scott Brown hailed the return of bouncy techno in 1998 by launching the fittingly named Bouncy Techno Records - it did not last. "Bouncy techno is BACK!!! Well it was for a while anyway! 6 releases taking you back to the old bouncy sound.... Bouncy Techno was originally distributed by 'eclipse' until they went bust, taking the label down with them."

The Judgment Day promotion looked to fill the void left by Rezerection's demise, with raves fittingly held at their former venue in Edinburgh. Their Hogmany event on 31 December, 1997, stated that it was "hopefully putting an end to the ideas that the Scottish hardcore scene is dead!". Despite this, the scene was miniscule in comparison to that of years gone by.

## 21st Century

There has been demand from the enthusiast, or disillusioned follower, for a return of the original bouncy techno style. Through lineage, bouncy techno remnants are found in the current United Kingdom based hardcore style, known as UK Hardcore. During the course of this new music being produced in the early 21st century, some labels such as Quosh and Evolution Plus started to reintroduce the bouncy offbeat stab elements into the more [trance](#) influenced UK Hardcore side of things.

Quosh ran a production competition in May 2003, specifically "in aid of a bouncy techno revival". The duo Al Twisted & DJ JFX released what in the press statement was called an "update on Scotland Bouncy Techno sound" with Let's Get Wet (Quosh, QU069, 2005) on Quosh.

Scott Brown - the pioneer - had remixed old bouncy techno tracks, with some dating back to 1993, including Hardcore Disco (Evolution Records, EV081, 2005) and Detonated (Evolution Plus, PLUS28, 2005), with the original 1990s re-edits included as a mark of respect pleasing both old and new fans. Created in 2006, Evolved is a new record label of Brown's, specifically remixing and re-releasing various old material.

DJ Devastate looked to incorporate elements more on the harder side of UK hardcore, with Bedlam Records, Thin 'N' Crispy, Uprising Records, and a handful of others coming up with a few releases bordering on some form of evolved style.

English Scott Majestik stated in July 20, 2003, "Higher Order Recordings HO002 - the wait is over! For all you bouncy techno fans get ready because the bounce is back. This choon is currently killing dance floors across the UK & abroad and proves to everyone that bouncy techno is back and it's here to stay."

This new material can sometimes be described on relevant online music forums as a "nu style" bouncy techno, though none really have the trademark techno riffs and basics.

In this small but developing hardcore music scene in the United Kingdom, bouncy techno still plays a part in the current live events; the old records played to a new audience. Amongst many rave reviews detailing its inclusion, the Elation event in London of July 22, 2005, stated that "Brisk and Sharkey doing what they specialise in.

Classic Freeform Hardcore and Bouncy Techno at its best. Like I said, Bouncy Techno at it best and the assembled ravers loved every minute of it."

Makina is a Spanish style that uses offbeat stabs reminiscent of bouncy techno but in far greater quantities.

## Terminology

It is believed the actual bouncy techno term originated during 1992, derived from crowds bouncing to this bouncy sounding [dance music](#) at [raves](#). The first printed usage of the term may likely have been in Clubscene - a monthly Scottish dance music magazine with a 50,000 readership. In the December 1992 issue, DJ ZBD from Shoop! Records described local band Q-TeX latest release as "going from strength to strength and this bouncy techno cut should do their reputation a power of good."

**Bouncy hardcore** is more or less just than an alternative name to the original term, fitting in with the hardcore lingo. One reason for '[techno](#)', and not 'hardcore' being used, was that it was the preferred way to describe the music found in the early 1990s rave scene from a United Kingdom standpoint, much like jungle techno was the original term used in the early 1990s to describe jungle music.

**Happy gabber** is an ambiguous term more directed to the [gabber](#) side of productions during the mid-1990s period. The Dutch introduced elements such as pianos, vocal samples and breakbeats into the already existing bouncy techno format in different and ever increasing ways, more so than the original Scottish productions that were originally quite sparse and basic.

'Funcore' is a scarcely used word that is only associated with the Dutch based Babyboom Records label, as such likely just a slogan. Describing itself as "the funcore label", the music does not differ in any way to bouncy techno.

## Selected bouncy techno information

**Artists** Bass Reaction, Bass X, Casio Brothers, Davie Forbes, DJ Ten, Gordon Tennant, Hyperact, Infernus, Interstate, Marc Smith, Q-TeX, Ryan Campbell, Scott Brown, Technosis, The Rhythmic State, Ultimate Buzz

**DJs** Bass Generator, Brisk, Carl Cox, Davie Forbes, DJ Dado, DJ Obsession, DJ Rab S, DJ Ten, DJ ZBD, Marc Smith, Nicky Modlin, Scott Brown, Technotrance, Tom Wilson

**Raves** Awesome 101, Colosseum, Dance Concept, Dreamscape, Fantazia, FUBAR, Hanger 13, Helter Skelter, Hysteria, Judgement Day, Nightmare in Rotterdam, Nosebleed, Rezerection

**Record labels** Babyboom Records, Bass Generator Records, Bounce!, Breeze Records, Clubscene Records, Dwarf Records, Evolution Records, Forze Records, Jolly Roger Records, Massive Respect Records, Screwdriver Records, Shoop!, Twisted Vinyl

# Bouzouki

The **harp** is a [stringed instrument](#) which has its strings positioned perpendicular to the soundboard. All harps have a neck, resonator and strings. Some, known as *frame harps*, also have a forepillar; those lacking the forepillar are referred to *open harps*. Harp strings can be made of nylon (sometimes copper-wound), gut (more commonly used than nylon), or wire.

Various types of harps are found in Africa, Europe, North and South America, and a few parts of Asia. In antiquity harps and the closely related [lyres](#) were very prominent in nearly all musical cultures, but they lost popularity in the early 19<sup>th</sup> century in Western music, being mainly played by women or as a minor ensemble member. There was no harp-exclusive museum until the North Italian harp building firm of Victor Salvi started one in 2005.

The aeolian harp (wind harp) and autoharp are technically not harps because their strings are not perpendicular to the soundboard.

## Origins of the harp

The harp's origins may lie in the sound of a plucked hunter's bow string. The oldest documented references to the harp are from 4000 BC in Egypt (see Music of Egypt) and 3000 BC in Mesopotamia. While the harp is mentioned in most translations of the Bible, King David being the most prominent musician, the Biblical "harp" was actually a kinnor, a type of [lyre](#) with 10 strings. Harps also appear in ancient epics, and in Egyptian wall paintings. This kind of harp, now known as the folk harp, continued to evolve in many different cultures all over the world. It may have developed independently in some places.

The lever harp came about in the second half of the 17<sup>th</sup> century to enable key changes while playing. The player manually turned a hook or lever against an individual string to raise the string's pitch by a semitone. In the 1700s, a link mechanism was developed connecting these hooks with pedals, leading to the invention of the single-action pedal harp. Later, a second row of hooks was installed along the neck to allow for the double-action pedal harp, capable of raising the pitch of a string by either one or two semitones. With this final enhancement, the modern concert harp was born.

# Types of harps, harp-playing and harp-building

## Playing style of the European-derived harp

Most European-derived harps have a single row of strings with strings for each note of the C Major scale (over several octaves). Harpists can tell which strings they are playing because all F strings are black or blue and all C strings are red or orange. The instrument rests between the knees of the harpist and along their right shoulder. The Welsh triple harp and early Irish and Scottish harps, however, are traditionally placed on the left shoulder. The first four fingers of each hand are used to pluck the strings; the pinky fingers are too short and cannot reach the correct position without distorting the position of the other fingers, although on some folk harps with light tension, closely spaced strings, they may occasionally be used. Also, the pinky is not strong enough to pluck a string. Plucking with varying degrees of force creates dynamics. Depending on finger position, different tones can be produced: a fleshy pluck (near the middle of the first finger joint) will make a warm tone, while a pluck near the end of the finger will make a loud, bright sound.

## The pedal/concert harp

The **pedal harp**, or **concert harp**, is large and technically modern, designed for classical music and played solo, as part of chamber ensembles, and in symphony orchestras. It typically has six and a half octaves (46 or 47 strings), weighs about 80lb (36 kg), is approximately 6 ft (1.8 m) high, has a depth of 4 ft (1.2 m), and is 21.5 in (55 cm) wide at the bass end of the soundboard. The notes range from three octaves below middle C (or the D above) to three and a half octaves above, usually ending on G. The tension of the strings on the sound board is roughly equal to a ton (10 kilonewtons). The lowest strings are made of copper or steel-wound nylon, the middle strings of gut, and the highest of nylon.

The pedal harp uses the mechanical action of pedals to change the pitches of the strings. There are seven pedals, one for each note, and each pedal is attached to a rod or cable within the column of the harp, which then connects with a mechanism within the neck. When a pedal is moved with the foot, small discs at the top of the harp rotate. The discs are studded with two pegs that pinch the string as they turn, shortening the vibrating length of the string. The pedal has three positions. In the top position no pegs are in contact with the string and all notes are flat. In the middle position the top wheel pinches the string, resulting in a natural. In the bottom position another wheel is turned, shortening the string again to create a sharp. This mechanism is called the double-action pedal system, invented by Sébastien Erard in 1810. Earlier pedal harps had a single-action mechanism that allowed strings to play sharpened notes.

Lyon and Healy, Camac Harps, and other manufacturers also make electric pedal harps. The **electric harp** is a concert harp, with microphone pickups at the base of each string and an amplifier. The electric harp is a little heavier than an acoustic harp, but looks the same.

## Folk harps/lever harps

The **folk harp** is small to medium-sized and usually designed for traditional music; it can be played solo or with small groups. It is prominent in Irish, Scottish and other Celtic cultures within traditional or folk music and as a social and political symbol. Often the folk harp is played by beginners who wish to move on to the pedal harp at a later stage, or by musicians who simply prefer the smaller size.

The folk or lever harp ranges in size from two octaves to six octaves, and uses levers or blades to change pitch. The most common size has 34 strings: Two octaves below middle C and two and a half above (ending on A), although folk or lever harps can usually be found with anywhere from 19 to 40 strings. The strings are generally made of nylon, gut, carbon fiber or fluorocarbon or wrapped metal, and are plucked with the fingers using a similar technique to the pedal harp.

Folk harps with levers installed have a lever close to the top of each string; when it is engaged, it shortens the string so its pitch is raised a semitone, resulting in a sharped note if the string was a natural, or a natural note if the string was a flat. Lever harps are often tuned to the key of E-flat. Using this scheme, the major keys of E-flat, B-flat, F, C, G, D, A, and E can be reached by changing lever positions, rather than re-tuning any strings. Many smaller folk harps are tuned in C or F, and may have no levers, or levers on the F and C strings only, allowing a narrower range of keys. Blades and hooks perform the same function as levers, but use a different mechanism. The most common type of lever is either the Camac or Truitt lever although Loveland levers are still used by some makers. Amplified (electro-acoustic) and solid body electric lever harps are produced by some harpmakers.

## **Wire-strung harps (*clàrsach* or *cláirseach*)**

The Gaelic wire-strung harp is called a *clàrsach* in Scotland or a *cláirseach* in Ireland. The origins go back at least the first millennium. There are several stone carvings of harps from the 10th century, many of which have simple triangular shapes, generally with straight pillars, straight string arms or necks, and soundboxes. There is stone carving evidence that supports the theory that the harp was present Gaelic/Pictish Scotland well before the 9<sup>th</sup> century.

The earliest descriptions of a triangular framed harp i.e. harps with a fore pillar are found on 8th century Pictish stones, Pictish harps were strung from horsehair. The instruments apparently spread south to the Anglo Saxons who commonly used gut strings and then west to the Gaels of the Highlands and to Ireland. Historically the carvings were made in the period after the establishment of the Gaelic kingdom of Dál Riata. Despite the lack of direct evidence, some argue for a Gaelic influence. However, there are only thirteen depictions of any triangular chordophone from pre-11<sup>th</sup> century Europe, and all thirteen of them come from Scotland. Moreover, the earliest Irish word for a harp is in fact *Cruit*, a word which strongly suggests a Pictish provenance for the instrument.

The harp was perhaps the most popular musical instrument used in both medieval Scotland and Ireland.

This most ancient instrument was brought to us from Ireland (as Dante says *c. 1300*) where they are excellently made, and in great numbers, the inhabitants of that island having practised on it for many and many ages; nay, they even place it in the arms of the kingdom, and paint it on their public buildings, and stamp it on their coin, giving as the reason their being descended from the royal prophet David. The Harps which these people use are considerably larger than ours, and have generally the strings of brass, and a few of steel for the highest notes, as in the clavichord. The musicians who perform on it keep the nails of their fingers long, forming them with care in the shape of quills which strike the strings of the spinnet.

— *Vincenzo Galilei (father of Galileo Galilei)*

Scotland, because of her affinity and intercourse [with Ireland], tries to imitate Ireland in music and strives in emulation. Ireland uses and delights in two instruments only, the harp namely, and the tympanum. Scotland uses three, the harp, the tympanum and the crowd. In the opinion, however, of many, Scotland has by now not only caught up on Ireland, her instructor, but already far outdistances her and excels her in musical skill. Therefore, [Irish] people now look to that country as the fountain of the art.

— *Gerald of Wales*

The harp played by the Gaels of Scotland and Ireland between the 11<sup>th</sup> and 19<sup>th</sup> centuries was certainly wire-strung. The Irish Maedoc Book Shrine dates from the 11th century, and clearly shows a harper with a triangular framed harp including a "T-Section" in the pillar (or Lamhchrann in Irish) indicating the bracing that would have been required to withstand the tension of a wire-strung harp.

By the Later Middle Ages, the Gaelic language word *clàrsach* or *cláirseach* described a wire-strung harp with a massive carved soundbox, a reinforced curved pillar and a substantial neck, flanked with thick brass cheek bands. The wire-strung harp was played with the fingernails, and it produced a brilliant ringing sound. This is the style of harp on Irish coins and the Guinness label. Especially popular in 16<sup>th</sup> and 17<sup>th</sup> century English courts, it was played all over Europe and was usually called the 'Irish' harp.

By the 18<sup>th</sup> century, harps of any sort had fallen out of use in Scotland and Ireland due to changing social, political and economic conditions. At the same time, new chromatic harps were being created on the Continent for a bourgeois audience; harps with multiple rows of strings and harps with sharpening mechanisms for playing the fashionable music of the time. In the mid-19<sup>th</sup> century, a revival of all things Celtic brought attention back to Gaelic culture, sparking interest in native language and music.

*The Irish and Highland Harps* by Robert Bruce Armstrong is an excellent book describing these ancient harps. There is historical evidence that the types of wire used in these harps are iron, brass, silver, and gold. Three pre-16th century examples survive today; the Trinity College harp in Ireland, and the Queen Mary and Lamont harps, both in Scotland.

One of the largest and most complete collections of 17<sup>th</sup> century harp music is the work of Turlough O'Carolan, a blind, itinerant Irish harper and composer. At least 220 of his compositions survive to this day.

Edward Bunting was commissioned to notate the music played by the harpers at the 1792 Belfast Harp Festival. He published his first volume in 1796. He continued to collect the music of the *cláirseach* and published his second and third volumes in 1809 and 1840 respectively. A reprint of the 1840 edition is now available from Dover Publications.

Dennis Hempson (O'Hampsey) was the last of the harpers who played in the old style using the fingernails to pluck while the finger pads are used to damp. He also was one of the last to use the left hand in the treble. He was in his 90s at the 1792 festival and died in the beginning of the 19<sup>th</sup> century. He took the unbroken tradition of wire-strung harping with him to his grave.

Since the 1970s, the tradition has been revived. Ann Heymann has done the most pioneering work in reviving this tradition by playing the instrument as well as studying Bunting's original manuscripts in the library of Queens University, Belfast. Other notable players include Patrick Ball, Cynthia Cathcart, Alison Kinnaird, Bill Taylor, Siobhán Armstrong and others.

As performers have become interested in the instrument, harp makers ("luthiers") such as Jay Witcher, David Kortier, Ardival Harps, and others have begun building wire-strung harps. The traditional wire materials are used, however iron has been replaced by steel and the modern phosphor bronze has been added to the list. The phosphor bronze and brass are most commonly used. Steel tends to be very abrasive to the nails. Silver and gold are used to get high density materials into the bass courses of high quality *clàrsachs* to greatly improve their tone quality. In the period, no sharpening devices were

used. Harpers had to re-tune strings to change keys. This practice is reflected by most of the modern luthiers, yet some allow provisions for either levers or blades.

## Multi-course harps

A **multi-course harp** is a harp with more than one row of strings. A harp with only one row of strings is called a **single-course harp**.

A **double harp** consists of two rows of [diatonic](#) strings one on either side of the neck. These strings may run parallel to each other or may converge so the bottom ends of the strings are very close together. Either way, the strings that are next to each other are tuned to the same note. Double harps often have levers either on every string or on the most commonly sharped strings, for example C and F. Having two sets of strings allows the harpist's left and right hands to occupy the same range of notes without having both hands attempt to play the same string at the same time. It also allows for special effects such as repeating a note very quickly without stopping the sound from the previous note.

A **triple harp** features three rows of parallel strings, two outer rows of diatonic strings, and a center row of [chromatic](#) strings. To play a sharp, the harpist reaches in between the strings in either outer row and plucks the center row string. Like the double harp, the two outer rows of strings are tuned the same, but the triple harp has no levers. This harp originated in Italy in the 16<sup>th</sup> century as a low headed instrument, and towards the end of 1600s it arrived in Wales where it developed a high head and larger size. It established itself as part of Welsh tradition and became known as the **Welsh harp** (*telyn deires*, "three-row harp"). The traditional design has all of the strings strung from the left side of the neck, but modern neck designs have the two outer rows of strings strung from opposite sides of the neck to greatly reduce the tendency for the neck to roll over to the left.

The **cross harp** consists of one row of diatonically tuned strings and another row of chromatic notes. These strings cross approximately in the middle of the string without touching. Traditionally the diatonic row runs from the right (as seen by someone sitting at the harp) side of the neck to the left side of the sound board. The chromatic row runs from the left of the neck to the right of the sound board. The diatonic row has the normal string coloration for a harp, but the chromatic row may be black. The chromatic row is not a full set of strings. It is missing the strings between the Es and Fs in the diatonic row and between the Bs and Cs in the diatonic row. In this respect it is much like a [piano](#). The diatonic row corresponds to the white keys and the chromatic row to the black keys. Playing each string in succession results in a complete chromatic scale.

## Harp technique

Harp playing uses all of the fingers except for the pinky, which is generally too short and weak to effectively pluck a string. In order to make notation of fingerings easier, each finger is given a number, "1" for the thumb, "2" for the index finger, "3" for the middle finger, and "4" for the ring finger. Most types of harp only require use of the hands. The exception is the pedal (concert) harp, where the harpist pushes the pedals with his or her feet.

There are two main methods of classical harp technique in the United States: the French method (associated in the United States with the French-American harpist Marcel Grandjany) and the Salzedo method, developed by Carlos Salzedo. Neither method has a definite majority among harpists, but the issue of which is better is sometimes a source of friction and debate. The distinguishing features of the Salzedo method are the encouragement of expressive gestures, elbows remain parallel to the ground, wrists are comparatively still, and neither arm ever touches the soundboard. The Salzedo method also places great emphasis on specific fingerings. The French method advocates lowered elbows, fluid wrists, and the right arm resting lightly on the soundboard. In both methods, the shoulders, neck, and back are relaxed. Some harpists combine the two methods into the technique that works best for them.

On the wire strung clarsach, a thumb under technique is also used.

As in all baroque instrumental techniques, the underlying principle is that of strong and weak articulation. The player only uses three fingers of each hand, and the thumb moves under the other fingers, rather than being held very high as in modern harp technique. The thumb and third fingers are "strong" fingers and the second finger is a "weak" finger. Scales are fingered with alternating strong and weak fingers - that is, a scale fingering could be either 1 2 1 2 1 2 or 3 2 3 2 3 2. In contrast, classical harp technique uses a fingering of 4 3 2 1 4 3 2 1 going up and 1 2 3 4 1 2 3 4 going down.

Another approach to "thumb under" technique as described above is to place the thumb so that it passes over the second finger, rather than under it. There is equal evidence for both thumb over and thumb under playing techniques on historical harps.

In this second approach it is important to note that the fingers are placed on the strings an equal distance up the string from the soundboard. This may be as little as 5-8 inches on very lightly strung harps. If you begin by making a circle with your thumb and second finger, placing both the thumb and the second finger on the same string, open your thumb and place your thumb on the string above, also placing the third (and fourth – if you choose to use it) on the neighbouring strings below the second finger. The fingertips placed on the strings should loosely form a straight line parallel to the soundboard of the harp.

As you play each finger, the aim is to roll the string over the end of your finger as you release it rather than pulling the string into your hand. This should require very little finger action to produce a warm and well rounded sound. Each finger produces a subtly different tone articulation. When playing scales down the harp, after playing the thumb it passes just over the second finger onto the string below, with the second finger falling onto the string below the thumb after releasing its note. Otherwise, as with thumb under technique, all scales are played alternating strong and weak fingerings.

## Other harps around the world

In South America, there are Mexican, Andean, Venezuelan, and Paraguayan harps. They are derived from the Baroque harps that were brought from Spain during the colonial period: wide on the bottom and narrow at the top, with perfect balance when being played but unable to stand independently for lack of a base. The Paraguayan harp is the most popular, and is Paraguay's national instrument. It has about 36 strings with narrower spacing and lighter tension than other harps, and so has a slightly (four to five notes) lower pitch. It does not necessarily have the same string coloration as the other harps. For example, some Paraguayan harps may have red B's and blue E's instead of red C's and blue F's. This harp is also played mostly with the fingernails.

All of Africa's harps are open harps because they lack the forepillar. With the exception of Mauritania's ardin, which is a true harp, most West African harps, such as the kora, are technically classified as harp-lutes because of their two rows of strings which are strung parallel to each other but perpendicular to the soundboard.

In Asia, there are very few harps today, though the instrument was popular in ancient times; in that continent, [zithers](#) such as China's guqin and Japan's koto predominate. However, a few harps exist, the most notable being Burma's saung-gauk, which is considered the national instrument in that country. The Chinese konghou, which died out, is being revived in a modernized form. Turkey had a harp called the çeng that has also fallen out of use.

There are no harps indigenous to Oceania or the Americas.

## The harp in music

The harp is used sparingly in most classical music, usually for special effects such as the glissando, arpeggios, and bisbigliando. Italian and German opera uses harp for romantic arias and dances, an example of which is Musetta's Waltz from *La bohème*. French composers such as Claude Debussy and Maurice Ravel composed harp concertos and chamber music widely played today. In the 19th century, the French composer and harpist Nicolas-Charles Bochsa composed hundreds of pieces of all kinds (opera transcriptions, chamber music, concertos, operas, harp methods). Henriette Renié and Marcel Grandjany have composed many lesser-known solo pieces and chamber music. Modern composers utilize the harp frequently because the pedals on a concert harp allow many sorts of non-diatonic scales and strange accidentals to be played (although some modern pieces call for impractical pedal manipulations).

See List of compositions for harp for the names of some notable pieces from the classical repertoire.

There have been harpists active in [jazz](#) and [free improvisation](#), including:

- Dorothy Ashby
- Edmar Castañeda
- Alice Coltrane
- Park Stickney
- Zeena Parkins
- Deborah Henson-Conant

In current pop music, however, the harp appears relatively rarely. Joanna Newsom and Dee Carstensen have separately established images as harp-playing singer-songwriters with signature harp and vocal sounds. A pedal harpist, Ricky Rasura, is a member of the "symphonic pop" band The Polyphonic Spree, and Bjork sometimes features acoustic and electric harp in her work. Art in America was the first known rock band featuring a pedal harp to appear on a major record label, and released only one record, in 1983. The pedal harp was also present in the Michael Kamen and Metallica concert/album *S&M* as part of the San Francisco Symphony orchestra. Some Celtic-pop crossover bands and artists such as Clannad and Loreena McKennitt include folk harps.

# As a symbol

## Political

The harp has been used as a political symbol of Ireland for centuries. It was used to symbolise Ireland in the Royal Standard of King James VI/I of Scotland, England and Ireland in 1603 and had continued to feature on all English, British and United Kingdom Royal Standards ever since, though the style of harp used differed on some Royal Standards. It was also used on the Commonwealth Jack of Oliver Cromwell, issued in 1649 and on the Protectorate Jack issued in 1658 as well as on the Lord Protector's Standard issued on the succession of Richard Cromwell in 1658. The harp is also traditionally used on the flag of Leinster.

Independent Ireland continued to use the harp as its state symbol on the Great Seal of the Irish Free State, featuring it both on the coat of arms and on the Presidential Standard and Presidential Seal - as well as on various other official seals and documents. The harp also appears on Irish coinage from the Middle Ages to the current Irish euro coins.

A South Asian version of harp known in Tamil as 'yaal', is the symbol of City of Jaffna, Sri Lanka, whose legendary root originates from a harp player.

## Corporate

The harp is also used extensively as a corporate logo - both private and government organisations. For instance; Ireland's most famous drink, Guinness, also uses a harp, but in reverse and also less detailed than the state arms - Harp Lager is also produced by Guinness and uses the harp.

Relatively new organizations also use the harp, but often modified to reflect a theme relevant to their organization, for instance; Ryanair uses a modified harp, somewhat in the form of an angel taking flight, and the State Examinations Commission uses it with an educational theme.

Other organizations in Ireland use the harp, but not always prominently; these include the National University of Ireland and the associated University College Dublin, and the Gaelic Athletic Association. In Northern Ireland the Police Service of Northern Ireland and Queen's University of Belfast use the harp as part of their identity.

## Boxed set

A **boxed set** (now often referred to as a **box set**) is one or more musical recordings, films, or television programs that are contained in a box. In the case of music, boxed sets are usually made up of three or more discs, covering a broad range of the music of a given artist or genre. They often serve as an especially large Greatest Hits compendium, usually including rare and never-before-released tracks.

## Notable music-recording boxed sets

In order of release date:

- (1971) Chicago at Carnegie Hall - Chicago
- (1978) The Beatles Collection - The Beatles
- (1985) Biograph - Bob Dylan
- (1986) Bruce Springsteen & the E Street Band Live/1975-85 - Bruce Springsteen
- (1988) Crossroads - Eric Clapton
- (1988) The Beatles Box Set - The Beatles
- (1989) The Good, the Bad and the Live - Metallica
- (1990) Led Zeppelin Box Set - Led Zeppelin
- (1990) This Woman's Work - Kate Bush
- (1990) Complete Recordings - Robert Johnson
- (1990) To Be Continued... - Elton John
- (1990) Lennon - John Lennon
- (1991) Singles Box Set (Volumes 1-3) - Depeche Mode
- (1991) Yesyears - Yes
- (1991) Star Time - James Brown
- (1991) The Bootleg Series Volumes 1-3 (Rare & Unreleased) 1961-1991 - Bob Dylan
- (1991) The Birth Of Soul : The Complete Atlantic Rhythm & Blues Recordings, 1952-1959 - Ray Charles
- (1992) Hitsville USA: The Motown Singles Collection 1959-1971 - Various Motown artists
- (1992) Shine On - Pink Floyd
- (1992) Boats, Beaches, Bars, and Ballads - Jimmy Buffett
- (1992) Jefferson Airplane Loves You - Jefferson Airplane
- (1992) Time3 - Journey
- (1992) Onobox - Yoko Ono
- (1992) The Queen of Soul: The Atlantic Recordings - Aretha Franklin
- (1992) Songs of Freedom - Bob Marley & The Wailers
- (1992) Roots 'N Blues: The Retrospective, 1925-1950 - various artists
- (1993) Live Shit: Binge & Purge - Metallica
- (1993) Complete Studio Recordings - Led Zeppelin
- (1993) Led Zeppelin Box Set II - Led Zeppelin
- (1993) Otis! The Definitive Otis Redding - Otis Redding
- (1993) What Goes On - The Velvet Underground
- (1993) Rare, Live & Classic - Joan Baez
- (1994) The Instant Monty Python CD Collection
- (1994) Thank You For The Music - ABBA
- (1994) Box of Fire - Aerosmith
- (1994) Emperors of Soul - The Temptations
- (1994) 35th Anniversary Collection - Smokey Robinson & the Miracles
- (1994) Thirty Years of Maximum R&B - The Who
- (1994) Permanent Record: Al In The Box - "Weird Al" Yankovic
- (1995) Peel Slowly and See - The Velvet Underground
- (1995) The Thrill of It All - Roxy Music
- (1995) The Master: 1961/1984 - Marvin Gaye
- (1995) Clouds In My Coffee - Carly Simon

(1995) Revolutions of Time: The Journey 1975-1993 - Willie Nelson  
(1995) Strait Out of the Box – George Strait  
(1996) Down Every Road – Merle Haggard  
(1996) The Aeroplane Flies High - The Smashing Pumpkins  
(1996) Box Set - The Misfits  
(1997) The Doors Box Set - The Doors  
(1997) Heart and Soul - Joy Division  
(1997) Genius & Soul: The 50th Anniversary Collection - Ray Charles  
(1998) Genesis Archive, Vol. 1: 1967-1975 - Genesis  
(1998) Anthology - John Lennon  
(1998) Tracks - Bruce Springsteen  
(1998) Ray Charles: The Complete Country & Western Recordings 1959-1986  
- Ray Charles  
(1998) The Crown Jewels - Queen  
(1999) The Life and Crimes of Alice Cooper - Alice Cooper  
(1999) Music Bank - Alice in Chains  
(1999) At the Close of a Century - Stevie Wonder  
(2000) Hitsville USA: The Motown Singles Collection 1972-1992 - Various  
Motown artists  
(2000) The Eternal Dance - Earth, Wind & Fire  
(2000) The Essential George Jones: The Spirit of Country - George Jones  
(2000) The Jimi Hendrix Experience - The Jimi Hendrix Experience  
(2000) The Supremes - The Supremes  
(2000) Salival - Tool  
(2000) All the Young Dudes - Mott the Hoople  
(2000) Merzbox - Merzbow  
(2000) Genesis Archive, Vol. 2: 1976-1992 - Genesis  
(2000) EBX 1 - Erasure  
(2000) EBX 2 - Erasure  
(2001) EBX 3 - Erasure  
(2001) EBX 4 - Erasure  
(2001) The Box Set - KISS  
(2001) Final V.U. 1971-1973 - The Velvet Underground  
(2001) The Columbia Studio Recordings (1964-1970) - Simon And Garfunkel  
(2002) Eddie's Archive - Iron Maiden  
(2002) Retro - New Order  
(2002) Soul Spectacular! The Greatest Soul Hits of All Time - Various Soul  
music artists  
(2002) Sex Pistols Box Set - Sex Pistols  
(2003) Unearthed - Johnny Cash  
(2003) Soundtrack to the Apocalypse - Slayer  
(2003) Exclusive Fan Edition boxed set - Ace of Base  
(2003) TG24 - Throbbing Gristle  
(2004) Black Box - Black Sabbath  
(2004) 100 Million Bon Jovi Fans Can't Be Wrong - Bon Jovi  
(2004) Join the Dots - The Cure  
(2004) Singles Box Set (Volumes 4-6) - Depeche Mode  
(2004) The Dark Horse Years 1976-1992 - George Harrison  
(2004) With the Lights Out - Nirvana  
(2004) Michael Jackson: The Ultimate Collection - Michael Jackson  
(2004) Metalogy - Judas Priest  
(2004) The Capitol Albums, Volume 1 - The Beatles  
(2004) The Complete U2 - U2 (A "digital box set" available only on the iTunes  
Music Store.)  
(2004) Queen - The Platinum Collection: Greatest Hits I, II & III  
(2005) Prince Of Darkness - Ozzy Osbourne

(2005) The Platinum Collection - Genesis  
(2005) Pure Genius: The Complete Atlantic Recordings (1952-1959) - Ray Charles  
(2005) Boxed - Eurythmics  
(2006) Ray Stevens Box Set - Ray Stevens  
(2006) The Capitol Albums, Volume 2 - The Beatles

## Boy band

A **boy band** (or **boyband**, British English) is a type of [pop group](#) featuring between three and six young male [singers](#) who are usually also dancers. In addition to pop music, boy bands also sing [R&B](#) songs and sometimes [hip-hop](#) songs as well. They can evolve out of church choral or [gospel music](#) groups, but are often put together by managers or producers who audition the groups for appearance, dancing, and singing ability (often in that order), and often seem to be prefabricated. Boy bands are similar in concept to [girl groups](#). However, even though they are "bands," they rarely play instruments, and the acts are basically "vocal harmony groups." Due to this and the fact that the acts are aimed at a "teenybopper" or "tween" audience, the term has negative connotations in the rock press. For this reason, acts such as Pete Waterman's One True Voice try not to be labeled "boy bands."

## Definition

Maurice Starr is usually credited with starting the trend, with his protégés New Kids On The Block (though the term "boy band" did not exist until later in the 1990s). Starr's brainwave was to take the traditional template from the R&B genre (in this case his teenage band New Edition) and apply it to a pop genre. This formula was in turn redefined by a number of European managers such as Nigel Martin-Smith and Louis Walsh, till the UK pop marketplace was saturated with the genre.

Though the term is mostly associated with groups from the 1990s onwards, antecedents exist throughout the history of pop music. The Beatles, The Beach Boys, & The Temptations, popular in the 1960s, may be considered boy bands, while The Monkees certainly were prefabricated, and Latin boy band Menudo was founded in 1977. Boy bands often achieve great commercial success.

Equally important to the group's commercial success is the group's image, carefully controlled by managing all aspects of the group's dress, promotional materials (which are supplied to teen magazines), and [music videos](#), the most famous boy band manager being Lou Pearlman. Typically, each member of the group will have some distinguishing feature and be portrayed as having a particular personality stereotype, such as "the baby," "the bad boy," "the nice boy." While managing the portrayal of popular musicians is as old as [popular music](#), the particular pigeonholing of band members is a defining characteristic of boy and girl bands.

In most cases, their music is written, arranged and produced by a producer who works with the band at all times and controls the group's sound - if necessary, to the point of hiring session singers to record guide vocals for each member of the group to sing individually (if the members cannot harmonize together well). A typical boy band performance features elaborately [choreographed](#) dancing, with the members taking turns singing and/or rapping(or, sometimes, lip-syncing. Even some of Pearlman's bands have been known to) to pre-recorded vocals and music. Boy bands generally do not compose or produce their own material, unless the members lobby hard enough for creative control (e.g. The Monkees and \*NSYNC).

Boy bands tend to be heavily criticized by certain musical press for appealing only to pubescent female teenagers and for emphasizing marketing and packaging over quality of music. Such views are reflected in the humorous definition in the Chambers Dictionary: "a pop group, targeting mainly the teenage market, composed of young males chosen because they look good and can dance and sometimes even sing." Some critics compare boy band output to the "machine-generated" popular music found in George Orwell's novel, Nineteen Eighty-Four, noting that much of their music (as well as the bands' compositions) is extremely formulaic. Other critics point to boy bands (and related musical groups) as case studies in commercialism and [postmodernism](#), with little cultural content. Such criticisms can become extremely scathing:

*After scouring the country for five boys who could belt out tunes while doing the splits, (Lou Pearlman) assembled a clean-cut collection of effeminate white and Latino-looking boys, all pink cheeks and crew cuts with peroxidized tips. Just like the Backstreet Boys and \*NSYNC, there's the cute blond guy, one with curly hair, the dark one with big dimples, the guy with the funny facial hair and the less cute, but really sensitive, guy.*

*Pearlman herded them into a tiny apartment, forcing these guys in their late teens and early 20s to share bedrooms (hey, less opportunity for illicit*

*sexual activity - at least with the opposite sex), and forbade them to stay out past midnight. He dressed them in coordinated red and silver "rave" outfits and spoon-fed them sugary-sweet lyrics like "Would I cross an ocean just to hold you ... Would I give up all I have to see you smile?" And then he set them loose on concert halls full of 12-year-old girls, who dutifully screamed their lungs out in a kind of mass orgasm fueled by all that scrubbed-clean testosterone. (Janelle Brown, "Sluts and Teddy Bears," Salon.com, 2001).*

Though some fans are wildly supportive of the music, the commercial success of specific boy bands does not tend to last long. As the fans (mostly teen girls) age and their musical tastes evolve, they tend to outgrow such groups' appeal. If success is sustained, often one or more members of the band will leave and seek a solo career (particularly if they have some songwriting ability), often with some success (for instance: Michael Nesmith, Michael Jackson, George Michael, Robbie Williams, Justin Timberlake, Ronan Keating, Ricky Martin). Certain boybands have continued to thrive long after the members have ceased to be 'boys', particularly in Asia-- i.e., SMAP of Japan and Shinhwa of Korea. In these cases, the members have developed into stars in their own right, starring in television shows, movies, and commercials.

## **Male/Female vocal groups of the boy band era**

These groups are similar in style to boy bands and marketed at the same "tween" and "teenybopper" markets, but they are mixed gender groups:

A\*Teens (Sweden)

4ORCE (Style 2 Style managed band not to be confused with 4ORCE from the play "boyband") (United Kingdom)

Hear'say (United Kingdom)

S Club 7 (United Kingdom)

Six (Ireland)

Scooch (United Kingdom)

Steps (United Kingdom)

## Parodies

The television series *2gether* created a parody boy band with five personality types.

In a week-long spoof in 1999, talk show host Conan O'Brien, complaining that he couldn't find a decent "musical guest" for his show, created his own boy band, **Dudez-A-Plenti**, after randomly selecting five out-of-work actors. A series of humorous sketches ensued, culminating in a Friday performance of a song O'Brien apparently made up himself: "*Baby, I Wish You Were My Baby*."

The Norwegian movie *Get Ready to be Boyzvoiced* is a mockumentary about the boy band Boyzvoice, their fans and management.

In *South Park*, Cartman formed a boy band named Fingerbang.

The 2001 film *Josie and the Pussycats* featured a fictional boy band named "Du Jour."

In *The Simpsons*, Bart is recruited to a boy band named Party Posse that is secretly a vehicle for subliminal navy recruitment messages. The members of 'N Sync cameoed in the episode as themselves. Contrary to popular belief they did not do the "Party Posse" voices. Members of Lou Pearlman's other band Natural provided most of the voices. (Marc Terenzi did Nelson while Michael 'J' Horn did Milhouse; the rest are unknown.)

On the Veggie Tales video *The Ballad of Little Joe*, Larry, Mr. Lunt, Jimmy, and Junior do a parody of a boy band video for the original song "Bellybutton."

The Meaty Cheesy Boys were a fictional band created during an ad campaign for Jack in the Box restaurants.

In WCW, a group of three cruiserweight wrestlers (Evan Karagias, Shane Helms and Shannon Moore) formed a boy band in order to get more attention from women. The group 3 Count performed several songs on WCW Monday Nitro and even acquired a roadie in former-UFC-fighter Tank Abbott.

A play (with music) called *Boyband*, featuring a band named 4ORCE and parodying the boy band phenomenon of the 90s with songs such as "Coming from Behind," "Our Love is Like Water - H40" and "Integrity," was performed at the Seymour Centre in Sydney, Australia for 2 weeks in 2005 and is returning for a four-week season in March 2006. (Note: not to be confused with the Style 2 Style managed band 4ORCE from Manchester, United Kingdom, who were a male/female vocal group).

In an episode of the Disney Channel series *That's So Raven*, Raven wants a boy band named the "Boyz in Motion" to perform in front of her friends.

# Brass band

A **brass band** is a musical group consisting mostly of [brass instruments](#), often with a [percussion](#) section. In some traditions other types of instruments like a [clarinet](#) or [saxophones](#) may be added, but most traditions do not accept [woodwinds](#) as part of a brass band, it would then be termed a wind band, or a [military band](#).

While brass instruments had long been used together in various contexts, the first modern bands were developed early in the 19th century in Prussia, when all military and government bands were issued the new technology of rotary valve instruments and instructed to use standard tuning. This allowed musicians to much more easily play with other bands and for smaller bands to be combined into large bands. A separate tradition also emerged in the United Kingdom, mainly due to the importing of the new French instruments, the saxhorns, invented by Adolphe Sax. These were adopted into existing british bands, and the saxhorn bands were very successful at competitions. By the early 20th century, the instrumentation had been mostly standardised, mainly by music publishers and an impressario named John Henry Iles.

## United Kingdom

Brass bands in the British tradition are limited to [cornets](#), flugelhorns, tenor horns, baritones, euphoniums, [trombones](#), [tubas](#) (known as basses in brass bands), and percussion; but not [trumpets](#) or [french horns](#), since they are [orchestral](#) and [Concert band](#) instruments.

Most bands compete against each other in contests and are graded according to their results from Championship Section (being the highest) to 4th Section, with a separate Youth Section (usually up to and including 19 years of age). The grading of a band can also be indicative of the commitment required, be it a once a week engagement for 4th Section, or 3 or more times a week for the Championship Section bands.

Competitions among bands usually consist of a performance of at least one of the following: a test piece (which may be set by the contest organisers or chosen by the band), a march, a [hymn](#), or an entertainment selection. In British National Championships, only one - usually newly written - test piece will be performed by all bands. The most important contests, which are all held annually, are the British Open (held at Symphony Hall, Birmingham), the Nationals (held at the ICC in Harrogate and the Royal Albert Hall in London) and the All English International Masters (held annually at the Corn Exchange, Cambridge).

Other popular national contests include the Pontin's Harry Mortimer Memorial Championships (held in Prestatyn), the Butlin's Mineworkers Open (held in Skegness) and the Brass in Concert Championships (held at the Sage Gateshead).

There is also an annual European Championship the venue for which changes every year.

Marches performed in contests are not usually street marches, since contest marches are usually too difficult for use on the road and are usually played at a faster tempo. Contest marches are a sub-genre in their own right. The most famous march contest is the annual Whit Friday march held in the villages of the Saddleworth and Tameside areas to the north and east of Manchester.

The instrumentation used in brass bands is:

- Cornet in Eb; (called a soprano cornet)
- Cornets in Bb; (solo(x4), repiano, 2nd(x2), 3rd(x2))
- Flugelhorn in Bb;
- Tenor Horns in Eb; (solo, 1st, 2nd)
- Baritones (Treble Clef Bb;) (1st, 2nd)
- Tenor Trombones (Treble Clef Bb;) (1st, 2nd)
- Bass Trombone (Bass Clef)
- Euphoniums (Treble Clef Bb;)(x2)
- Eb; Basses (x2)
- Bb; Basses (x2)
- Percussion (x2/3/4)

The make-up of a Salvation Army Band is very similar to a competing band, except the Repiano Cornet is called the First Cornet, there is no 3rd cornet part, and some parts (solo horn, 1st trombone) *may* use more than one player. There are standard make ups for smaller bands in the Salvation Army, and much of the music produced by the Salvation Army is written for these bands.

With the exception of the bass trombone and percussion, all parts are transposing and written in the treble clef, which means that for every instrument, from the big Basses right up to the Soprano Cornet, the fingering for the written notes is always the same.

This system, which is unique to UK-style Brass Bands, ensures most parts can be covered when there is less than a full complement of players.

Many of the UK's bands originated as works bands or bands sponsored (and long identified with) various industrial concerns and coal mines. Of the leading bands, the Black Dyke Mills Band was sponsored by a wool mill, The YBS Band was until recently sponsored by the Yorkshire Building Society and originally the Hammond Sauce Works, the Foden, Fairey and Leyland Bands by the respective truck, vehicle and aircraft manufacturers, and the Grimethorpe Colliery Band was composed of miners and members of the associated coalfield community. With the decline of these industries the links between bands and their origins were dissolved, and membership is now drawn from all industries and parts of the community. Sudden loss of sponsorship, however, has caused many a top band to die. The Brighouse and Rastrick Brass Band have operated continually at the highest level without the aid of sponsorship; the band makes money to survive from their regular concerts, by selling recordings and other merchandise, and from public donations.

The leading bands in Wales are *Buy As You View Band* (formally known as *The Cory Band*) and *Tredegar Band* and in Scotland, the *Scottish Co-op Band* (formally *CWS Glasgow*), *Whitburn Band*, and *Kirkintilloch Band*. All these bands compete at the highest level in the banding movement.

Date: 1934

Description: Amington Bandsmen pictured here with their trophies at Amington.

Amington Band was started in 1917, with Roland Davis as Bandmaster. The band began by using old instruments, until they could raise enough money to buy new ones. After they had raised enough money, they also employed a professional tutor, William Pollard. They began to enter competitions and soon began to win them, including the National Brass Band contest held in Crystal Palace, London, in 1924. Much success followed and in 1928 they built their own band room in Sharpe Street and also performed on the BBC. They became one of the leading bands in the country and are still in existence.

## **Australia**

The Australian derivation of a brass band is the same as the UK brass band, i.e. standard instrumentation with no woodwind. Contesting bands in Australia are graded from A Grade to D Grade, and in past years, a separate Country or E Grade was also used. National Contests are held each year at Easter, with the location moving from state to state. Each state also conducts their own championships. National and state contests are generally of the same format: a set test piece for each grade, a hymn, an own choice piece (usually of the same standard as the test), and a street march. Smaller regional contests often replace the major works with an own choice concert program.

## Ireland

There is an existing - though small - Brass Band movement in Ireland, with more than twenty competing bands and a number of non-contestants (see below). These bands have their biggest venue each year on St. Patrick's Day.

A small number of non contesting brass bands still exist, however due to the difficulties of recruiting players, these bands tend to change to a "Concert Band" format, which includes woodwind, trumpets and other instrumentation.

The Salvation Army also has a large number of brass bands for use in their services, however, these bands do not participate in competition.

## **Switzerland**

Homepage der Brass Band Berner Oberland. Die Brass Band Berner Oberland ist die erfolgreichste Brass Band der Schweiz.

## United States

The US derivation of a brass band is notably varied from the UK standard in that sousaphones, [saxophones](#), [flutes](#) and other instruments are included. This evolved into the [community band](#) which can be either or both a [concert band](#) or [marching band](#). However brass bands in the British tradition are becoming more popular through the efforts of the North American Brass Band Association .

Brass bands were very popular throughout the United States in the late 19th century and the early decades of the 20th century. Composers like John Philip Sousa and Karl King wrote many pieces for them. Well known bands of virtuoso musicians toured widely, and most towns had their own bands that put on weekend music concerts. Other groups, ranging from Benevolent societies to large factories, would often have a band. The brass band movement has undergone a resurgence in the late twentieth century, lead by the North American Brass Band Association. The United States boasts a number of professional brass bands, including the River City Brass Band.

The vibrant brass band tradition in New Orleans, Louisiana was key in the formation of [jazz](#) around the start of the 20th century. Brass bands remain a part of many ceremonies and celebrations (including funerals) in the city, some playing not only marches and jazz, but [funk music](#) and [hip hop](#) influenced music as well.

Among American college marching bands, all brass bands are fairly common in order to fill large stadiums with music. The two best examples of all brass college marching bands are the: Spartan Marching Band and the Ohio State University Marching Band.

## **Latin America**

Brass bands long enjoyed popularity in many parts of Latin America as well. In 19th century Mexico very large bands were formed, such as that of composer Juventino Rosas. In parts of Mexico brass band concerts remain a popular entertainment.

## Canada

Brass bands in the British tradition, sometimes sponsored by employers, existed in Canada in the late 19th and early 20th centuries. The geography of Canada (e.g., large distances between communities, making regular contests and migration of players difficult) was a key factor among many challenges that led to the demise of most such bands.

Today, excepting the Salvation Army bands, there are few British-style brass bands (perhaps fewer than two dozen) in Canada, most of which are in Ontario. Most operate as recreational, amateur, "community" bands. An exception is the professional Hannaford Street Silver Band which is widely recorded and broadcast. There is no organized, regular contesting in Canada.

## **Germany**

Brass bands in Germany are not as widespread as in other European countries like Switzerland or the Netherlands. There are just a few bands (about five) playing in authentic British instrumentation. This is primarily due to the popularity of wind bands, particularly in Southern Germany.

# Repertoire

Brass Band repertoire is as wide and as varied as one's imagination. For example a typical brass band will play items from Bach's Air on a G String, to Atomic Kitten's/The Bangles' Eternal Flame to brand new compositions commissioned for the National Finals held at the Royal Albert Hall, in recent years these have been commissions by Michael Ball and "...All The Flowers of the Mountain..." and John Pickard's "Eden" which incorporates new complex time signatures.

Several notable composers have written music specifically for Brass Band. These include:

A Moorside Suite: Gustav Holst

The Severn Suite: Edward Elgar

Variations for Brass Band: Ralph Vaughn Williams

Kenilworth: Arthur Bliss

A Comedy Overture: John Ireland

Cloudcatcher Fells: John McCabe

Prague: Judith Bingham

Categories: [Brass bands](#) | [Brass instruments](#) | [Musical groups](#)

## Brass instrument

A **brass instrument** is a [musical instrument](#) whose tone is produced by vibration of the lips as the player blows into a tubular resonator (mouthpiece). They are also called *labrosones*, literally meaning "lip-vibrated instruments" (Baines, 1993).

The view of most scholars (see organology) is that the term "brass instrument" should be defined by the way the sound is made, as above, and not by whether the instrument is actually made of brass. Thus, as exceptional cases one finds brass instruments made of wood, like the [cornett](#), and [woodwind instruments](#) made of brass, like the [saxophone](#).

# Families of brass instruments

Modern brass instruments generally come in one of two families:

- **Valved** brass instruments use a set of valves (typically 3 or 4 but as many as 7 or more in some cases) operated by the player's fingers that introduce additional tubing into the instrument, changing its overall length. This family includes all of the modern brass instruments except the trombone: the [trumpet](#), [horn](#), euphonium, and [tuba](#), as well as the [cornet](#), flugelhorn, baritone horn, sousaphone, mellophone, and the old saxhorn. As valved instruments are predominant among the brasses today, a more thorough discussion of their workings can be found below. The valves are usually piston valves, but can be rotary valves. Rotary valves are the norm for the [horn](#) and are also prevalent on the [tuba](#).
- **Slide** brass instruments use a slide to change the length of tubing. The main instruments in this category are the [trombone](#) family, though valve trombones are occasionally used, especially in [jazz](#). The trombone family's ancestor the sackbut and the folk instrument bazooka are also in the slide family.

There are two other families that have now become functionally obsolete, though instruments of both types are sometimes used for [period-instrument performances](#) of Baroque- or Classical-era pieces.

- **Natural** brass instruments, where the player can only play notes in the instrument's harmonic series, for example the bugle. The [trumpet](#) was a natural brass instrument prior to about 1795, and the [horn](#) before about 1820. Natural instruments are still played for some ceremonial functions, as well as period performances.
- **Keyed or Fingered** brass instruments used holes along the body of the instrument, which were covered by fingers or by finger-operated pads (keys) in a similar way to a [woodwind instrument](#). These included the [cornett](#), serpent and keyed trumpet. They are more difficult to play than valved instruments.

## Some other wind instruments

Alphorn (wood)  
Conch (shell)  
Didgeridoo (wood, Australia)  
Natural horn  
Shofar (horn)  
Vladimirsky rozhok (wood, Russia)  
Wagner tuba

## Valves

As noted above, valves allow brass players to change pitches. A piston valve is a device used to change the pitch of a **brass instrument**; three or more piston valves can be found on [trumpets](#), [tubas](#), and the like. When opened ("pressed" and "pushed down"), each valve changes the pitch by diverting the air stream through additional tubing, thus lengthening the instrument and lowering the harmonic series on which the instrument is vibrating. The additional tubing usually features a short tuning slide of its own for fine adjustment of the valve's tuning, except when it is too short to make this practicable.

An alternate to the piston valve is the *rotary valve*.

The first piston valve instruments were developed just after the start of the 19th century. The *Stölzel valve* (invented by Gottfried Heinrich Stölzel in 1814) was an early variety. In the mid 19th century the *Vienna valve* was an improved design. However most professional musicians preferred rotary valves for quicker, more reliable action, until better designs of piston valves were mass manufactured towards the end of the 19th century. Since the early decades of the 19th century, piston valves have been the most common on brass instruments.

The following list shows how each valve or combination of valves will affect the pitch from the fundamental; this is true of all brass instruments.

- second valve - one half step
- first valve - one whole step
- first and second valves - one and a half steps. This is also achievable by third valve alone but the note will usually be flat (see below).
- second and third valves - two whole steps
- first and third valves - a perfect fourth, or two and a half steps. This combination will be noticeably sharp unless some means of *compensation* is used.
- first, second, and third valves - a tritone, or three whole steps. Will be very sharp unless some means of compensation is used.

Note that the mentioned tuning deficiencies are unavoidable; they are inherent in the construction of the instrument (see below).

In most trumpets and cornets, the "*compensation*" must be provided by extending the third valve slide with the fourth finger to lower the pitch of 1-3 and 1-2-3 combinations.

In instruments with a fourth valve, such as tubas, euphoniums, and piccolo trumpets, that valve lowers the pitch by a perfect fourth; this is used partly to compensate for the sharpness of the final two valve combinations (4 for 1-3, 2-4 for 1-2-3). Of course, the other three valves can be used as normal to lower the pitch in combination with the fourth valve, so a fourth valve also extends the instrument's range downward by a perfect fourth, though with increasingly severe intonation problems.

When four-valved models without any kind of compensation play in the corresponding register, the sharpness becomes so severe that players must finger the note a half-step below the one they are trying to play. This eliminates the note a half-step above their open fundamental.

To correct for these problems, manufacturers of low brass instruments may choose one or a combination of four basic approaches, whose respective merits are subject to debate:

## **Compensation system**

Each of the first two (or three) valves has an additional set of tubing extending from the back of the valve. When the third (or fourth) valve is depressed in combination with another one, the air is routed through both the usual set of tubing plus the extra one, so that the pitch is lowered by an appropriate amount. This allows compensating instruments to play with accurate intonation in the octave below their open second partial, which is critical for tubas and euphoniums in much of their repertoire.

There are also compensating French horns. While these are popular with beginners as they weigh less, most advanced players disapprove of them, criticizing their sound and response.

## **Additional valves**

Initially, compensated instruments tended to sound stuffy and blow less freely due to the air being doubled back through the main valves. In early designs, this led to sharp bends in the tubing and other obstructions of the air-flow. Some manufacturers therefore preferred adding more 'straight' valves instead, which for example could be pitched a little lower than the 2nd and 1st valves and were intended to be used instead of these in the respective valve combinations. While no longer featured in euphoniums for decades, professional tubas are still built like this, with five valves being the norm on CC- and BBb-tubas and five or six valves on F-tubas.

## **Additional sets of slides on each valve**

Another approach was the addition of two sets of slides for different parts of the range. There used to be euphoniums and tubas built like this, but today, this approach has become highly exotic for all instruments - except French horns for which it is the norm, usually in a double, sometimes even triple configuration.

## **Trigger mechanism**

A mechanical lever is provided to pull out the main tuning slide or a valve slide. This is found as an additional intonation aid on some euphoniums and on many five-valved F-Tubas.

## Sound production in brass instruments

Because the player of a brass instrument has direct control of the prime vibrator (the lips), brass instruments exploit the player's ability to select the harmonic at which the instrument's column of air will vibrate. By making the instrument about twice as long as the equivalent woodwind instrument and starting with the second harmonic, players can get a good range of notes simply by varying the tension of their lips (see embouchure). Brass players call each harmonic a "partial" because it causes only a part of the tubing to vibrate (whereas at the fundamental the entire tubing will vibrate).

Most brass instruments are fitted with a removable mouthpiece. Different shapes, sizes and styles of mouthpiece may be used to suit different embouchures, or to more easily produce certain tonal characteristics. [Trumpets](#) are characteristically fitted with a cupped mouthpiece, while [horns](#) are fitted with a conical mouthpiece.

One interesting difference between a [woodwind instrument](#) and a brass instrument is that woodwind instruments are non-directional. This means that the sound produced propagates in all directions with approximately equal volume. Brass instruments, on the other hand, are highly directional, with most of the sound produced traveling straight outward from the bell. This difference makes it significantly more difficult to record a woodwind instrument accurately. It also plays a major role in some performance situations, such as in marching bands.

## Pedal Tone

All brass instruments that have cylindrical bores will naturally produce only odd-numbered partials. This is due to the fact that all brass instruments are closed at one end (the mouth end), and therefore obey the physics of stopped air columns. Since instruments such as the trumpet and trombone are only able to play 7 distinct semitones in a given partial, they need access to all the partials in order to play [chromatically](#) in the low registers. This deficiency is fixed by the special shapes of the bell and mouthpiece. This causes every partial to become available except for the fundamental (Bb1 on the trombone and Bb2 on the trumpet). However, if the player vibrates his/her lips at the fundamental frequency, the resonance of the instrument will support all of the overtones of the note, and the note will sound. This is what is referred to as the pedal tone, or missing fundamental. Since the instrument does not actually resonate at the fundamental frequency of the note heard, this partial has a slightly different [timbre](#) than the other partials.

## **Didactics**

Children may start to learn a brass instrument as soon as all their permanent teeth have arrived, usually at age 11. It is possible to start earlier, but as long as the teeth are still changing, the embouchure will have to be adjusted occasionally and pressure on the lips and teeth should be avoided especially carefully.

## Virtual band

A **brass quintet** is a five-piece musical ensemble composed of [brass instruments](#). The most common instrumentation is two [trumpets](#) or [cornets](#), one French horn, one [trombone](#), and one [tuba](#) or bass trombone. As an ensemble type, the brass quintet is very flexible, with a repertoire encompassing musical genres from [madrigals](#) to [jazz](#) and everything in between.

## **Famous brass quintets**

American Brass Quintet  
Annapolis Brass Quintet  
Atlantic Brass Quintet  
Boston Brass  
Canadian Brass  
Empire Brass  
Meridian Arts Ensemble  
Rhythm & Brass  
St. Louis Brass

# Brazilian funk

**Funk** is a popular form of music in Brazil that has its roots in [Miami Bass](#) style rap music. The beats are deep and rapid, and the voice aggro.

Funk has its origins in the Favela culture of Rio De Janeiro. As the favelas are frequently the feared and ignored half of metropolitan Brazil, funk is a reflection of this cultural division. Much like rap and hip hop culture is wildly popular yet feared in the United States, funk is viewed as an overly loud, aggressive, sociopathic form of music by many of Brazilian elite... yet the kids just love it.

Much like any kind of dance music, funk lifts heavily on samples - international rips, as well as rips on previous funk music. Much of the production occurs in small scale studios in Rio, and achieve distribution through hand-burned CDs in the markets throughout Rio, São Paulo, and Salvador.

# Break

A **break** is an [instrumental](#) or [percussion](#) section or interlude during a song derived from or related to stop-time – being a "break" from the main [parts](#) of the [song](#) or [piece](#).

For example, in DJ parlance, a break is where all elements of a song (e.g., pads, basslines, vocals), *except for percussion*, disappear for a time. (Not to be confused with a breakdown.) In hip hop and electronica, a short break is also known as "the drop", and is sometimes accented by cutting off even the percussion.

It may be described as when the song takes a "breather, drops down to some exciting percussion, and then comes storming back again" and compared to a fake ending. Most songs have a break at two-thirds to three-quarters of their length and the break is usually visible on a record as a dark ring. (Brewster and Broughton 2003, p.79)

According to Peter van der Merwe (1989, p.283) a break "occurs when the voice stops at the end of a phrase and is answered by a snatch of accompaniment," and originated from the [bass runs](#) of marches of the "Sousa school". In this case it would be a "break" from the vocal part.

According to David Toop (1991), "the word *break* or *breaking* is a music and [dance](#) term (as well as a proverb) that goes back a long way. Some tunes, like 'Buck Dancer's Lament' from early this century, featured a two-bar silence in every eight bars for the break--a quick showcase of improvised dance steps. Others used the same device for a solo instrumental break: one of the most fetishized fragments of recorded music is a famous four-bar break taken by Charlie Parker in Dizzy Gillespie's tune 'Night in Tunisia'."

Most well known are breaks from [soul](#) and [funk](#) music such as the [Amen break](#) and the [Funky drummer](#). On [disco](#) 12" records nearly every song has a break, most often multiple breaks, usually after a chorus. This allowed [DJs](#) to mix between songs. Tom Moulton may have been the originator of the disco break, which he says was required when mixing between two songs in a different [key](#). So as to not have the [harmonies](#) clash, everything but the percussion was taken out.

## Break beat

A **break beat** is the sampling of breaks as drum loops (beats), originally from soul tracks, and using them as the rhythmic basis for [hip hop](#) songs. It was invented by DJ Kool Herc, the first to buy two copies of one record so as to be able to mix between the same break (as Bronx DJ Afrika Bambaataa described it, "that certain part of the record that everybody waits for—they just let their inner self go and get wild"), extending its length through repetition (Toop, 1991). The dance the boys and girls ended up doing to break beats was called the Break, later break dancing. Breaking was abandoned in favor of doing the Freak in 1978, until it was revived and enhanced by Crazy Legs, Frosty Freeze, and the Rock Steady Crew. More recently electronic artists have created "break beats" from other electronic music. Compare with [Breakbeat](#).

Paul Winley Record's bootleg *Super Disco Breaks* were the first break beat compilations. Another series is *Ultimate Breaks and Beats* of which there are 25 volumes, also bootleg. Hip hop break beat compilations include *Hardcore Break Beats* and *Break Beats*, and *Drum Drops* (ibid).

## List of notable breaks

"Amen, Brother" by The WinStons (otherwise known as the "Amen break")  
"Soul Pride" by James Brown (1969)  
"Tighten Up" by James Brown (1969)  
"Synthetic Substitution" by Melvin Bliss (heavily sampled break)  
"N.T." by Kool & the Gang  
"Fencewalk" by Mandrill, used by Kool DJ Herc (ibid)  
"Funky Nassau" by The Beginning of the End (ibid)  
"Funky Drummer" by James Brown (ibid)  
"Handclapping Song" by The Meters  
"Here Comes the Metermen" by The Meters  
"Pass the Peas" by The JB's  
"Grunt" by The JB's  
"Sing A Simple Song" by Sly & the Family Stone  
"Rock Creek Park" by The Blackbyrds  
"Get Out of My Life, Woman" by Lee Dorsey. Most famously used by Biz Markie for "Just A Friend"  
"Get Out of My Life, Woman" by Solomon Burke  
"Scratchin'" by Magic Disco Machine  
"Kissing My Love" by Bill Withers  
"Scorpio" by Dennis Coffey  
"Super Sperm" by Captain Sky  
"Take Me To The Mardi Gras" by Bob James, cover of Paul Simon's "Take Me To The Mardi Gras". Used by Run DMC on "Peter Piper".  
"Nautilus" by Bob James. Also used by a countless number of artists.  
"Impeach the President" by The Honeydrippers  
"Pot Belly" by Lou Donaldson  
"Ode to Billy Joe" by Lou Donaldson  
"I Get Lifted" by George McCrae  
"I Get Lifted" by KC & The Sunshine Band  
"Ashley's Roachclip" by The Soul Searchers. Used by Eric B. & Rakim for "Paid In Full". Also used by PM Dawn and Milli Vanilli.  
"Soul Makossa" by Manu Dibango  
"Easy Dancin'" by Wagadu-Gu  
"In The Bottle" by Gil Scott-Heron  
"Apache" by the Incredible Bongo Band. Used by Kool DJ Herc, The Sugarhill Gang in "Apache", West Street Mob in "Break Dancin' - Electric Boogie". (ibid)  
"Think (About It)" by Lyn Collins  
"Funky Worm" by The Ohio Players  
The Tramen break  
"Assembly Line" by The Commodores  
"It's a New Day" by Skull Snaps  
"When the Levee Breaks" by Led Zeppelin  
"Catch A Groove" by Juice  
"The Mexican" by Babe Ruth  
"Do the Funky Penguin" by Rufus Thomas  
"The Breakdown" by Rufus Thomas

# Breakbeat

## Breakbeat

**Stylistic origins:** [Rave](#), [Techno](#), [Hip-hop](#), Dancehall

**Cultural origins:** mid-1990s, London, Brighton, Bristol

**Typical instruments:** [Synthesizer](#) - [Drum machine](#) - [Sequencer](#) - [Keyboard](#) - [Sampler](#) - Laptop

**Mainstream popularity:** Small, largely in late 1990s United Kingdom and Europe. Australia has taken up the reputation among the major breaks DJs as the home of breaks world wide, specifically Sydney. Main room dance floors of clubs will often feature a breaks DJ, to a massive crowd, when the usual combination of House gets boring & old.

**Derivative forms:** Big beat

## [Subgenres](#)

2Step - [Hardcore](#) - [Breakcore](#) - [Brokenbeat](#) - [Drill n bass](#) - [Drum'n'bass](#) - [Grime](#) - [Jungle](#) - [Nu skool breaks](#) - Techstep

**Breakbeat** (sometimes **breakbeats** or **breaks**) is a term used to describe a collection of sub-[genres](#) of [electronic music](#), usually characterized by the use of a non-straightened 4/4 drum pattern (as opposed to the steady beat of [house](#) or [trance](#)). These rhythms may be characterised by their use of syncopation and polyrhythms, which are prominent in all music of African origin, including much Afro-American music.

# History

In the 1970s, [hip-hop DJs](#) (starting with DJ Kool Herc) began using several [breaks](#) (the part of a [funk](#) and [jazz](#) song in which the music breaks to make room for the rhythm section only) in a row to use as the rhythmic basis for hip-hop songs.

In the early 1990s, [acid house](#) artists and producers started using breakbeat samples in their music to create [breakbeat hardcore](#), aka rave music. The hardcore scene then diverged with one of the main offshoots being [jungle music](#) which had a darker sound and focused more on developing the use of complex breaks within its tracks. Jungle itself eventually diverged into various genres commonly known as [drum and bass](#).

In recent times, the term *breakbeat* has become synonymous for many with the genres of breaks music which have become popular within the global dance music scene, including [nu skool breaks](#) and progressive breaks, with DJs from a variety of genres such as house and [techno](#) working breaks tracks into their sets. This may occur because the tempo of breaks tracks (ranging from 115 to 150 beats per minute) means they can be readily mixed with these genres, whereas the comparatively fast speed of jungle and drum and bass (165-180 bpm) may have restricted the utility of these subgenres to DJs playing slower-tempo music.

[Trip hop](#) and [instrumental hip hop](#) are also breakbeat genres, but [downtempo](#). The tempo of these genres is closer to rap and R&B than to house and techno.

Breakbeat (or *funky breakbeat*) may also refer to the music of bands such as Breakestra, who play funk and soul music with an emphasis on the elements that would become popular in hip-hop and later breaks-based music.

# Breakbeat hardcore

## Breakbeat hardcore

**Stylistic origins:** [Acid house](#), [Breakbeat](#), [Techno](#), Italo house, [Reggae/Ragga](#)

**Cultural origins:** 1990, United Kingdom

**Typical instruments:** [Synthesizer](#), [Drum machine](#), [Sequencer](#), [Keyboard](#), [Sampler](#)

**Mainstream popularity:** Large in the United Kingdom

**Derivative forms:** [Jungle](#), [Darkcore](#)

## [Subgenres](#)

[Happy hardcore](#), [4-beat](#)

## **Fusion genres**

none

## **Other topics**

[Electronic musical instrument](#) - [Computer music](#)

**Breakbeat hardcore** (popularly known as **rave** music, originally referred to as simply **hardcore** in the United Kingdom, with **old school hardcore** a common term in the 21st century) is a style of [electronic music](#) that primarily uses [breakbeats](#) for its rhythm lines. It was an early 1990s offshoot of the [acid house](#) scene of late 1980s Britain and was the precursor to various genres including [jungle/drum and bass](#) and UK hardcore.

## Origins

Hardcore emerged as an irreverent response to the soothing, soulful direction that [techno](#) had taken in the early iterations of [trance](#) and [deep house](#). In contrast with lushly produced house music, hardcore emphasized a cheap, harsh, aggressive sound that drew strongly from [hip-hop](#) and early acid house. It added a hip-hop influence with the addition of [breakbeats](#) and increased the tempo. A strong [reggae](#) and [ragga](#) influence emerged in 1991/92, with uplifting piano melody loops or Jamaican [reggae](#) samples used at normal speed layered on top of frenetic 150 to 170 bpm breakbeats. The music itself very much reflected the effects of the rave scene's drugs of choice, Ecstasy, LSD and amphetamines, with its bombastic beats, manic synths, sped-up vocal samples and rumbling bass-lines. Evoking the anarchist spirit of embattled underground parties, hardcore glorified quick production with minimal hardware, Made in 2 Minutes as the title of a track by Plastic Jam proclaimed. The music, although in retrospect poorly produced and amateur (part of its charm), was generally extrovert, uplifting, gritty and hypnotic.

## The rave scene

*Main article:* [Rave](#)

The scene revolved around the M25 motorway (London's orbital motorway), and its audience was mainly urban teenagers and lower middle-class suburban teenagers with cars. The audience was very much multi-cultural, with black and white influences resulting in a unique sound. The scene expanded rapidly in 1991, with large raves of 30 to 50,000 people attending in open air venues around England, put on by Spiral Tribe and other free party soundsystems held at numerous locations up and down the length of England. This scene spawned the idea of holding huge parties rather than small clubs.

## Effect and fragmentation

Between 1993 and 1994 the scene fragmented, and forked off into two distinct styles - [Jungle](#) (later known as [Drum and Bass](#)) and [4-beat](#) (alternatively known as happy hardcore). Jungle's sound was more focused on basslines, whilst 4-beat retained the rave synths, the 4/4 kickdrum, and happier piano elements. By 1996, most 4-beat had dropped its breakbeats (in-part due to [bouncy techno](#)), whilst drum and bass had long dropped the techno style synth stabs, thus further separating the two styles.

## **21st century**

Since the mid-2000s, several new record labels have appeared that are dedicated to the development of breakbeat hardcore, with the aim of recreating the sound and vibe of the early 1990s. Compositions stay faithful to the original sound by using a combination of old and new piano melodies, techno riffs and breaks, whilst taking advantage of technological advances in music productions of the 21st century.

## **Selected information**

### **Artists**

Acen, Altern-8, Automation, Brainstorm Crew, Ellis Dee, DJ Freshtrax, DJ Seduction, Genaside II, Kicksquad, Nebula 2, Luna-C, Nookie, Ray Keith, Release, Smart E, SL2, Sonz Of A Loop Da Loop Era, The Prodigy, Two Bad Mice, Urban Shakedown

### **DJs**

Carl Cox, Fabio, DJ Rap, DJ Seduction, DJ SS, DJ Sy, DJ Hype, Dougal, Ellis Dee, Grooverider, Jumping Jack Frost, Micky Finn, Ratty, Slipmatt, Swan-e, Phantasy, LTJ Bukem, Top Buzz, Ratpack, Stu Allan, Krome & Time,

### **Record labels**

786 Approved, Absolute 2, Awesome Records, Boogie Beat Records, Contagious, Full Effect Recordings, Great Asset, Kickin Records, Little Giant Music, Moving Shadow, Production House, Reinforced Records, Suburban Base, Triple Helix, Formation5, FFRR, XL Recordings

### **Raves**

Amnesia House, Dance Planet, Dreamscape, Eclipse/Edge , Ektos, Fantazia, Helter Skelter, Interdance at Sterns Nightclub, Obsession, Pandemonium, Perception, Quest, Raindance, Technodrome, Vision, Shelleys Laserdome, Quest, Diehard,

### **Releases**

# Breakcore

**Breakcore** is a loosely defined [electronic music](#) style that brings together elements of [jungle](#), [hardcore techno](#) and [IDM](#) into a [breakbeat](#)-oriented sound that encourages speed, complexity, impact and maximum sonic density. Similar to [punk](#) or [jazz](#) music, breakcore adheres to a loose set of stylistic 'rules'. Musically, breakcore is centered around the deconstruction and creative reassembly of common [breakbeats](#) from other music genres.

# History

The style began to emerge at the end of the late 90's as hardcore techno artists were feeling a staleness in the Roland TR-909 and Roland TB-303 [drum machine](#)-based sounds, the commercial "childish" elements in Dutch [gabber](#) and the overall assaults of [speedcore](#) began to be adapted. Others felt an urge to take the ideas of early 1990s [jungle music](#) and [acid techno](#) one step further.

Artists began to incorporate more breakbeats (especially the [Amen break](#)), taking the conceptual extremity of hardcore and harsh [industrial music](#) and applying it to the [drum and bass](#) template. Straining out much of the "[rave](#)" influence on hardcore and adding a degree of complexity, breakcore was a more palatable genre for music fans who were turned off by the rave scene, and so there is something of a crossover audience for fans of [extreme music](#) of all types, including [grindcore](#), harsh industrial music, [noise music](#) and [IDM](#). This advance in "complexity" was made possible primarily by the proliferation of cheap computers and it is worth noting that the majority of breakcore was produced on cheap computers using free software, especially trackers.

There is no one clear point of generation, but some key locations include Berlin, France (especially Rennes and Toulouse), South London, Newcastle, New South Wales, and the midwest U.S. and Canada (including Milwaukee, Wisconsin, Minneapolis, Minnesota, and Winnipeg, Manitoba). The first widely-known efforts did probably come from Force Inc./Riot Beats and Digital Hardcore Recordings. Breakcore as it is currently known has many of its origins on the internet, specifically around mailing lists like c8 and can be traced back to early efforts by the Bloody Fist camp in Australia; Ambush, Praxis, DHR, Breakcore Gives Me Wood and others in Europe; and Addict, Drop Bass, History of the Future and Low Res in the Midwestern U.S.

Breakcore related artists tend not to be loyal to one label, through label-artist links and artist-promoter links, the scene is very close knit, even with its occasional conflicts. For a list of some more widely known Breakcore labels see below. Many hardcore/gabber, noise, breakbeat, and other [experimental](#) labels also have breakcore artists and releases in their rosters as well. A growing trend sees the rise and proliferation of the 'Netlabel', wherein artists freely or cheaply distribute music via the internet, usually in the form of .mp3 or CDR.

# Breakdance

**Breakdance**, also known as **breaking** or **b-boying**, is a street dance style that evolved as part of the [hip hop](#) movement in the South Bronx of New York City during the early 1970s. It is the best known of all [hip hop dance](#) styles.

Breakdancing is one of the four original elements of hip hop, the others being [rapping](#), [DJing](#), and graffiti.

## Etymology

Breakdancing was never a term used by its original practitioners, who preferred to refer to themselves as "B-boys" and "B-girls". The term was popularized in the '80s when it became more of a media phenomenon. David Toop describes breakdancing as being an adaptation of the Break, a dance popular before being replaced by the Freak (popularized by CHIC's "Le Freak" in 1978), but then revived by artists such as the Nigga Twins, Spy, and the Zulu Kings. He also explains that it may have originated from a literal break in the song: "the word break or breaking is a music and dance term (as well as a proverb) that goes back a long way. Some tunes, like "Buck Dancer's Lament" from the early 20th century, featured a two-bar silence every eight bars for the break - a quick showcase of improvised dance steps." However, in the documentary "The Freshest Kids," hip hop pioneer DJ Kool Herc insists that the name breaking originated in the slang term "break," meaning someone going "off" or crazy, as the dancers seemed to do when driven by the right beat.

## Origin: From Street to Dance

There is a widespread belief that breakdancing (b-boying), in its organized form seen today, began as a way for rival gangs of the ghetto to mediate their differences. This dynamic, however, is but a result of speculation by the media at time of the dance's emergence into popularity in the early 1980s. The general consensus amongst members of the scene is that while the dance may have had the effect of mediation, successful mediation was not the intent nor always the outcome of "battles" (Often, violence was incited a result of such battles).

Exhibiting routines of stylish but sometimes violent implications, winners were determined by the dancer who could outperform the other, that is, display a set of more innovative maneuvers unmatched in difficulty and style.

Through the highly energetic performances of funk legend James Brown and the rapid-growth of dance teams like the Rock Steady Crew of New York City. The competitive ritual of gang warfare evolved into a pop-culture phenomenon. Under the label of "breakdancing," b-boying received massive media exposure. Soon nearly all the parties, disco clubs, and talent shows showcased signs of competitive dance, especially for gang members, where passion for dance served as a positive diversion from the threats of city life.

Though its intense popularity eventually faded in the 1980s, breakdancing is still a mainstream phenomenon, maintaining exposure through comical portrayals in commercials and movies. For the enthusiasts, however, b-boying remains a pastime, and for a rare few, a way of life through commercial endorsements.

## Style

Before evolving into its present form, breakdancing was a homogenization of four distinct styles of dance: breaking, dancing, locking (dance), and popping. Breakdance is commonly associated with, but distinct from, popping, and locking (dance), which are two elements of the funk styles that evolved independently in California during the late 1960s, however elements of popping or poppin itself may have existed as a style or subculture of dance as early as the 1920's when it, or the general sub culture of dance associated with Afro-Americans was known as Boogaloo. Evidence of this is found in the form of statements made by certain "founding" poppers or originators of the modern styles, regarding witnessing or having knowledge of senior citizens and elders whom could either pop or boogie, or taught them about some aspect of the art. Other styles of dance associated with the funk styles include locking, tutting, boogaloo and liquid dancing. These styles are sometimes more "contortionistic" than "athletic," although they are often incorporated by breakdancers who wish to widen their expressive range.

## Breakdance moves

All of the above styles factor heavily into the breaker's movements while standing, called **toprock**. Topleft is the name given to any part of a breakdancing routine that is performed principally from a standing position. Topleft moves depend upon coordination, flexibility, and style. They are less physically demanding than most downrock moves, but perfecting them is a never-ending process. Topleft often begins the routine, and while it serves as a good warm-up for the more athletic moves that may follow, it is first and foremost a display of style. It is unorthodox-looking in general, and breakdancers take pride in inventing ever-more unique topleck. (Note: Uprock is sometimes incorrectly used as a synonym of *toprock*)

As opposed to topleck, **downrock** encompasses all moves performed with hands, arms, or a part of the torso in contact with the floor. **Footwork** is nearly synonymous with downrock, but is a more restrictive term usually applied to any downrock moves which are not power moves. Downrock is generally much more athletic, acrobatic, and akin to gymnastics. Topleft and downrock are often discussed independently, but good breakers can combine them seamlessly, especially once they master some basic transitions.

Breakers usually begin by toplecking, and then drop down to the floor, typically into some variation of the foundational 6-step. The 6-step can be combined with, or transitioned into, most other breakdancing moves, including some of the most recognizable power moves such as the swipe, windmill, and flare. After performing the techniques, the breakdancer will often end the dance on his feet, contorted into a freeze, or apparently injuring himself with a suicide.

## Style vs technique

One of the greatest divides in breakdancing is the give-and-take between style and technique (or *power*). Devotees of each aspect are commonly known as styleheads and powerheads. Styleheads focus on the dancing side of breakdance. They may look down

on powerheads as hack gymnasts who have eschewed the fundamental dance aspect for flashy acrobatics. Powerheads would respond that styleheads are little different from dancers from other styles because they neglect the difficult athletic moves that make breakdancing so unique.

## **Battles**

Battles are breakdancing events in which breakers form a circle and take turns trying to show each other up through either better style, more difficult moves, and/or combinations of both. Battles can pit individuals against one another, but often take place between two opposing breakdance crews.

Today serious battles are usually held at organized b-boy events. The battles are usually part of a tournament-style competition with cash prizes, or they are featured [[each crew is paid to dance. It's not uncommon that spontaneous battles will happen at events as well, when rival crews show up with most of their members. These events are called "jams," and generally consist of several hours of "cyphering" (open circles), followed by the main battle event.

The largest competition each year is probably Battle of the Year (BOTY), held in Germany since 1990, and featuring crews from around the world. Despite its name, BOTY focuses on choreographed routines. After judges rate the routines, the final winner, and de facto world champion crew, is decided in a final battle (along with 2nd, 3rd, and 4th places). Recent winners have been from France, Korea, Germany, and Hungary. While crews from the USA have won in the past, the claim is that they are not often winners of BOTY because competitions in the USA are almost exclusively battles and hip hop dances, whereas in the rest of the world, dance routine competitions are more common. Additionally, until recently (August 21 2005), the USA has not held a BOTY USA national event and thus has not had a crew to send to the finals in Germany. BOTY USA 2005 was the first; at this event, Knucklehead Zoo defeated Renegades in the finals and won Best Show to secure their victory and entry in the BOTY finals. Nonetheless, this is a good indicator of how widespread the practice and high ability level of this American folk art form has become.
