Stravinsky's rival for a time in neo-classicism was the German Paul Hindemith, who mixed spiky dissonance, polyphony and free ranging chromaticism into a style which was "useful". He produced both chamber works and orchestral works in this style, perhaps most famously "Mathis der Maler". His chamber output includes his Sonata for French Horn, an expressionistic work filled with dark detail and internal connections.

Sergei Prokofiev's Symphony No. 1 (1917), which remains one of his most popular works, is generally considered to be the composition that first brought this renewed interest in the [classical music era](#) in audible form to a wide public.

Busoni wrote in a letter to Paul Bekker, "By 'Young Classicalism' I mean the mastery, the sifting and the turning to account of all the gains of previous experiments and their inclusion in strong and beautiful forms." (p.20) Roman Vlad has contrasted the "classicism" of Stravinsky, external forms and patterns used in works, with the "classicality" of Busoni, internal disposition and attitude of the artist towards works (Samson 1977).

Neo-classicism found a welcome audience in America, the school of Nadia Boulanger promulgated ideas about music based on their understanding of Stravinsky's music. Students of theirs include neo-

classicists Elliott Carter (in his early years), Aaron Copland, Roy Harris, Darius Milhaud, Astor Piazzolla and Virgil Thomson.

# Neofolk

## Neofolk

|                                    |  |
|------------------------------------|--|
| <b>Stylistic origins:</b>          | <a href="#">Folk</a><br><a href="#">Experimental</a><br><a href="#">Industrial</a> |
| <b>Cultural origins:</b>           | 1980s, Europe  |
| <b>Typical <i>instruments</i>:</b> | <a href="#">Folk instruments</a>   |
| <b>Mainstream popularity:</b>      | Minor  |
| <b>Derivative forms:</b>           | <a href="#">Martial music</a>  |

## [Subgenres](#)

None

**Neofolk** is a form of [folk music](#) that emerged from European ideals and post-industrial music circles. Neofolk can either be solely acoustic folk music or a blend of acoustic folk instrumentation aided by varieties of accompanying sounds such as pianos, strings and elements of [industrial music](#) and [experimental music](#). The genre encompasses a wide assortment of themes including traditional music, heathenry, [romanticism](#) and occultism. Neofolk musicians often have ties to other post-industrial genres such as [neoclassical](#) and [martial music](#), or have links with Heathen circles and various other societies.

## History

The term "neofolk" originates from esoteric music circles who started using the term in the late 20th Century to describe music influenced by musicians such as Douglas Pearce (Death In June), Tony Wakeford (Sol Invictus) and David Tibet (Current 93) who collaborated heavily for a period of time. These musicians were part of a post-industrial music circle who later on incorporated folk music based upon traditional and European elements into their sound. Folk musicians as far back as the 1960s were creating music similar to neofolk in terms of sounds and themes. These musicians could be considered harbingers of the sound that later influenced the neofolk artists. However, the distinction must be made that it was the aforementioned artists who were involved in the *dark music* scene throughout the 1980s and 1990s that contributed specifically to the emergence of neofolk. Neofolk is seen by many as an extension of post-industrial music into the folk music genre which did not occur until the late 20th Century.

## **Culture**

The spirit of neofolk contains parallels to the ideals of American and British folk movements of the 1960s. The basis of this music is built upon principles against commercialization and popular culture. However the themes of neofolk and folk music are drastically different. A majority of artists within the neofolk genre focus on archaic symbols of culture, myths and beliefs. Local traditions and indigenous beliefs tend to be portrayed heavily as well as esoteric and historical topics. Homages and tributes to figures some may consider controversial such as Friedrich Nietzsche, Julius Evola, and Leni Riefenstahl as well as the usage of war themes, imagery and historical imagery by some musicians have drawn misguided criticisms and links between neofolk and right wing establishments from various sources.

## **Heathenry**

Of particular mention is Heathenry or Germanic Neopaganism. This subject plays a large part in the thematic elements touched upon by many modern and original neofolk artists. Runes, pagan European sites and other means of expressing an interest in the ancient and ancestral occurs often in neofolk music. Aesthetically, references to this subject occur within band names, album artwork, clothing and various other means of artistic expression. This has led to some forefathers of the genre and current artists within the genre attributing it to being part of a broader Heathen revival.

## Related terms and styles

### Apocalyptic folk

**Apocalyptic folk** is a term that predates neofolk and was used by David Tibet to describe the music of his band Current 93 (C93) during a period in the late 1980s and early 1990s. The term was applied to most artists on the now-defunct World Serpent Distribution company and music influenced directly by C93's Thunder Perfect Mind era.

Gnostic and Thelemic themes are often featured in the works of these artists, as well as influences from 1960s psychedelia and [psych folk](#). It is also sometimes used to describe the side-projects of Swans member Michael Gira.

### Folk Noir

**Folk Noir** was a term originally coined by photographer David Mearns to describe the music of mid-period Sol Invictus. It is generally related to Tursa (music label of Tony Wakeford) bands. It is sometimes found on webzines as a more neutral term, without the specific connotations of 'neofolk' but the meaning is largely the same but the usage of the term 'noir' hints at an overall dark subject matter relating to historical, often British, subjects.

Other vague terms sometimes used to describe artists of this genre include **Dark Folk** and **Pagan Folk**. These terms are large umbrella terms that could also describe various other forms of unrelated music.

### Martial Music

*For more details on this topic, see [Martial music](#)*

Martial music or **military pop** is a genre that shares a lot in common with neofolk and developed very close to it. A number of artists that could be classified as neofolk also regularly work with and play shows with martial music acts or produce martial music.

Other related styles include [dark ambient](#), [neoclassical](#), [dark cabaret](#), industrial and post-industrial music or a mixture of all these, such as music created that fits under the heading of martial music.

# Neoromanticism

**Neoromanticism in music** was a trend in [European classical music](#) started in second half of 19th century in Germany. It is sometimes referred to as post-romanticism. The composers of that period underlined the strong links between music and literature. Among the most prominent composers of the neoromanticism are Franz Liszt, Richard Wagner, Anton Bruckner, Richard Strauss, Gustav Mahler and Hugo Wolf.

In early 20th century the neo-romanticism gradually evolved into [expressionism](#). However, its ideas were continued by several latter composers, among them Virgil Thomson, who describes: "Neo-Romanticism involves rounded [melodic](#) material (the [neo-Classicalists](#) affected angular [themes](#)) and the frank expression of personal sentiments. The neo-Romantics position is an esthetic one purely, because technically we are eclectic. Our contribution to contemporary esthetics has been to pose the problems of sincerity in a new way. We are not out to impress, and we dislike inflated emotions. The feelings we really have are the only ones we think worthy of expression....Sentiment is our subject and sometimes landscape, but preferably a landscape with figures." (Hoover and Cage, 1959)

According to Daniel Albright (2004), "In the late twentieth century, the term Neoromanticism came to suggest a music that imitated the high emotional saturation of the music of (for example) Schumann [ Romanticism ], but in the 1920s it meant a subdued and modest sort of emotionalism, in which the excessive gestures of the [Expressionists](#) were boiled down into some solid residue of stable feeling." Thus, originally, neoromanticism in music was not a return to romanticism, but literally a *new* romanticism. See: [Romantic music](#) and [Neoclassicism \(music\)](#).

In pop music, neoromanticism strongly influenced [gothic music](#) and the goth subculture. ([New Romantic](#))

## Nerdcore hip hop

**Nerdcore hip hop**, or **geeksta rap**, is a [subgenre](#) of [hip hop music](#) that is performed by nerds, and is characterized by themes and subject matter considered to be of general interest to nerds. Self-described nerdcore musician MC Frontalot coined the term in 2000 in the [song](#) "Nerdcore Hip-Hop." Frontalot, like most nerdcore artists, self-published his work. As a niche genre, nerdcore has a strong amateur tradition of self-publishing and self-production.

Of all nerdcore artists, Frontalot and mc chris are probably the most widely known.

Popular nerdcore subject matter includes Star Wars (Frontalot's "Yellow Lasers", 2 Skinnee J's "Mind Trick", mc chris's "Fett's Vette"), science (MC Hawking's "Entropy", 2 Skinnee J's "Pluto"), and computers. Some non-nerdcore hip hop [compositions](#) exist that focus on similar topics.

The word "nerdcore" is also occasionally used as an adjective meaning "hardcore nerd", that is, someone who publicly takes pride in being nerdy.

## **Notable nerdcore artists**

2 Skinnee J's  
Beefy  
Commodore 64  
Grand Buffet  
Jesse Dangerously  
mc chris  
MC Frontalot  
MC Hawking  
MC Lars  
MC Paul Barman  
MC Plus+  
Monzy  
Optimus Rhyme  
Ultraklystron  
YTCracker

## Related artists and songs

Although the following artists' commercially-released albums and songs are not technically nerdcore, they do feature themes typical of the genre:

Deltron 3030

Del Tha Funkee Homosapien

Elemental Science Project (ESP)

Dream Warriors – "Twelve Sided Dice" (1991)

Eric Schwartz – Wimp Pimp (2005)

General Patton vs. The X-Ecutitioners – "L.O.L.- Loser On Line (Hate the Player, Hate the Game)" (2005)

Jason Brannon and Bentframe – "Star Wars Gangsta Rap"

KOMPRESSOR performs more in the genre of electronic music, but often speaks words rhythmically over the music. Also did a collaboration track with MC Frontalot

Kool Keith as Dr. Octagon

The Lonely Island's fictional rap group Incredibad verges on nerdcore in several songs, especially "Lazy Sunday".

MC 900 Ft. Jesus

MF DOOM

"Weird Al" Yankovic – "It's All About The Pentiums" (1999)

# Neurofunk

## Neurofunk

**Stylistic origins:** Techstep, [Drum and Bass](#), [Funk](#), [Jazz](#), [Techno](#), [Trance](#)

**Cultural origins:** late-1990s, London, Scotland, Europe, eastern United States

**Typical instruments:** [Synthesizer](#) - [Drum machine](#) - [Sequencer](#) - [Keyboard](#) - [Sampler](#) - Laptop - desktop

**Mainstream popularity:** Small

## [Subgenres](#)

none

**Neurofunk** is a subgenre of [Drum and bass](#) pioneered by producers Ed Rush, Optical and Matrix circa 1997/1998 as a progression of Techstep. It was further developed by juxtaposing elements of heavier and darker forms of [Funk](#), characterized by consecutive stabs over the bass line and rhythmically structured by rock solid back beats where overall [Dark ambient](#) atmospheric production is prominent. The prototype sound of the early evolution of Neurofunk in transition from Techstep and at it's most creative period which defined the style, can be heard on the essential live mix by Ed Rush & Optical for Radio 1 (1998).

Since it's rise in the late 90's, Neurofunk has taken a faster paced, [Minimal techno](#) approach between 2002 and 2005 when it came under the influence of colder and more precise beat engineering with harder stabs over the bassline coming from the 2nd and 3rd waves of producers such as Sinthetix, Cause 4 Concern, Silent Witness & Break, Mayhem, Noisia, Phace, The Upbeats and Misanthrop. According to british writer Simon Reynold's view, Neurofunk "is the fun-free culmination of [Jungle](#)'s strategy of cultural resistance: the eroticization of anxiety".

## **Lyrical Content**

As a producer/MC, Rymetyme personalized Neurofunk as an integral member of Ed Rush & Optical's live sets and studio productions. His abstract lyrical flow and futurist manifestations can be heard on Neurofunk classics such as "Resurrection" (co-produced with Ed Rush & Optical), and "Fastlane" (by Ed Rush & Optical), as co-producer on "Lightsleeper" (with Matrix & Fierce), and "Fever" (with Younghead). Rymetyme's original style was influential on Neurofunk's 2nd wave of MC's most notable on Mc Mecha's (ex-Sinhetix) chopped-up spoken word roundabout drawing parallels to Rymetyme's progressive poetic impact.

## Roots

No one truly knows where the term "Neurofunk" originated but one first reference is a mention in the book *Energy Flash* by Simon Reynolds (ISBN 0-330-35056-0), a history of [rave](#) and [dance music](#) culture. The roots of Neurofunk can be traced back to the late 60s to mid 70s period of Miles Davis when he fused [Jazz](#), [Rock](#) and [Funk](#) rhythms while switching his trumpet on to Marshall stacks and Wah-wah pedals giving it a loud, distorted and twisted sound effect to it. His drummers often used the technique of advancing and delaying the back beats simultaneously in interaction with a dynamic system of dark trumpet modes and a repetitive riff driven wall of sound of heavy rock funk guitars and bass lines, pioneering a new form of electric trance induced dance music.

Miles Davis' seminal albums from this period "In a Silent Way" (1969), stated by Matrix as an influence on his work, "On The Corner" (1972), and "Get Up With It" (1975) were the breeding ground for Drum and bass driven Neurofunk. Some of the tracks by Miles Davis which can best translate the foundations of early Neurofunk are "Black Satin" from "On The Corner" and "Rated X" from "Get Up With It".

Another influence on the early Neurofunk sound of Virus Recordings stated by Optical, was producer George Clinton's highly technical studio experimentations for Funkadelic during their early to mid 70's period when he shaped Funk into a heavier, darker style of psychedelic dance music by using long range [instrumentals](#) as tools for incorporating powerful reverberating low end driven bass lines on the forefront of his mixes rather than as standard back-up for guitar and drums.

- Sinthetix: Jungle Zone Radio mix (09/07/2002)

## New Age music

**New Age music**, sometimes referred to as **space music**, is a vaguely defined style of [music](#) that is generally quite melodic and often primarily instrumental. Defining certain groups or albums as New Age can be a source of contention among fans, since the borders of this genre are not well defined. Partly due to some artists' affiliation with [New Age](#) beliefs, many other artists and bands have specifically stated that they do not consider their own music to be *New Age*.

A large percentage of music described as New Age music is [electronic](#) and [instrumental](#), frequently relying on sustained pads or long sequencer-based runs. Very long songs, up to 20 minutes and more, are not uncommon. Vocal arrangements and usage of acoustic instruments is less common (in many cases, high-quality samples are used instead of the latter). Recordings of naturally occurring sounds are sometimes used as an introduction to a track or throughout the piece. Said features also apply to many sub-genres of [ambient music](#) as well, and there is no boundary defined between ambient music and New Age music.

## Definitions

There are three major groups of fans with different beliefs as to what New Age music is and which artists should be classified as New Age artists. The three points of view are:

- that New Age music is a branch of electronic music that includes melodic, non-dance pieces with miscellaneous kinds of arrangements (as opposed to typical dance styles such as [techno](#) and its sub-genres, experimental electronic music that can be non-melodic, [noise music](#), several sub-genres of ambient music, etc). According to this point of view, artists and bands like Michael Cretu's Enigma, Enya, Loreena McKennitt, Jean-Michel Jarre, Kitaro, Popol Vuh, Klaus Schulze, Suzanne Ciani, Tangerine Dream, Vangelis and Yanni all belong to the New Age category. This is somewhat problematic for two reasons: first, artists like Enya, Vangelis and Tangerine Dream's Edgar Froese stated that they do not consider their music to be New Age, some of them perceiving "New Age music" as a genre necessarily connected with the religious movement. Second, music by artists like Tangerine Dream and Vangelis is stylistically very varied, with many albums that cannot be classified as New Age (for instance, Vangelis' output includes musical collages and experimental electronic music), and so it is unclear whether it would be fair to label the artists *New Age*.
- that New Age music is a branch of electronic music which appears mostly on the so-called [meditation](#) or relaxation CDs, which are frequently seen in New Age bookshops and music stores. Most of this music is calm, melodic and can seem a bit monotonous. Artists include Anugama, Cusco, David Arkenstone, Gandalf, G.E.N.E., Karunesh, Kitaro, Software and Space. This definition's accuracy can be questioned, since virtually all the artists mentioned above have numerous pieces that are stylistically reminiscent of meditation CDs.
- that New Age music is electronic music that is melodic, soothing and relatively simple sound-wise, with wide pads, gentle melodies and long tracks. This definition is also not accurate. However, since many artists confine themselves to creating only this specific kind of music, it is widely used. According to it, some Vangelis and Tangerine Dream albums can be called New Age music, but the artists can't be called New Age since their output is very varied. Similarly, Suzanne Ciani's music is New Age, but Klaus Schulze's and Enya's is probably not, because both have a very distinct style, different from generic melodic, soothing electronic music.

## Influences and themes

Obvious influences are early electronic music, [classical music](#), [ambient music](#) pioneers like Brian Eno and Popol Vuh, ethnic music, [world music](#) and artists such as Klaus Schulze, [prog-rock](#) and [Krautrock](#).

The [minimalism](#) of Terry Riley and Steve Reich (Indian influenced in the former case) can also be cited as an influence, along with artists like Tony Conrad, LaMonte Young who utilized drones since the early 1960s. Connected to the creation of New Age music is the resurgence of interest in [Gregorian Chant](#) during the second half of the 20th century.

Popular themes in New Age music include Space and the Cosmos, Environment and Nature, Wellness in being, Harmony with one's self and the world, Dreams or Dreaming and Journeys of the mind or spirit. G.E.N.E. produced a string of albums that described, musically, places like Pacific and Mediterranean islands, and a special CD with recordings of sounds of different oceans. The band Software has several albums that specifically state the electronic aspect of music, such as *Chip Meditation*, *Electronic Universe* (both in two parts) and *Digital Dance*. Titles of New Age songs are frequently descriptive: examples include *Principles of Lust* (Enigma), *Purple Dawn* (Anugama), *Shepherd Moons* (Enya), *Straight' a Way To Orion* (Kitaro), *The Quiet Self* (Gregorian).

## New Complexity

**New Complexity** is a school of avant garde [classical music](#) dating from the 1980s. From its earliest identifiable advocates, the school has been associated with British composers influenced by the work of Brian Ferneyhough. Like all such [movements](#), the impact of "new complexity" has extended beyond its territorial/national origins and has greatly impacted the musical thinking of musicians throughout Europe and the U.S.

It is characterised by complex [textures](#), striking [timbres](#), and an ever-present exploration of new models of [musical form](#). The impact of the French "musique spectrale" cannot be overestimated.

Associated "members" of this school have included:

Richard Barrett

James Clarke

Chris Dench

James Dillon

Richard Emsley

James Erber

Brian Ferneyhough

Michael Finnissy

Roger Redgate

Non-UK:

Dominik Karski (Australia)

Liza Lim (Australia)

Joël-François Durand (France)

Klaus K. Hübler (Germany)

Claus-Steffen Mahnkopf (Germany)

Aaron Cassidy (USA)

Jason Eckardt (USA)

Michael Edgerton (Sweden)

Few of these composers wholly approve of the term.

Though it is not relevant to the style of the music, New Complexity composers tend also to have very clear musical handwriting; their published [scores](#) are often facsimiles of the composer's manuscript.

## New Flamenco

**New Flamenco** ("Nuevo Flamenco") is the name for a [Flamenco](#) music style, which is influenced by many different modern [musical genres](#). The most notable of these are: [Rumba](#), Salsa, [Pop](#), [Rock](#) and [Jazz](#) music.

## History of New Flamenco

This Flamenco fusion style has its roots in the 1980s, when many younger flamenco artists were influenced by other musical genres from around the world.

The most important early pioneers of New Flamenco are the guitarist Paco de Lucía and singer Camarón de la Isla. Between 1968 and 1979 they enjoyed a fruitful collaboration which produced 10 albums, of which many introduced fresh musical concepts into the traditional and somewhat 'dusty' music style that flamenco had become. After their collaboration Paco de Lucía went on to develop flamenco music into many different directions, even back into the direction of the Moorish music origins of traditional flamenco music.

## New Flamenco Artists

The group Ketama has a salsa derived New Flamenco style and has become one of the most important New Flamenco groups from Spain.

Saxophonist Jorge Pardo, pianist Chano Dominguez and guitarist Gerardo Nuñez are all Jazz inspired New Flamenco musicians, and can be called acknowledged flamenceros.

More multi-faceted artists, such as singers Pata Negra, Alejandro Sanz, Diego El Cigala and guitarists Jesse Cook, Ottmar Liebert and Luis Villegas have fused flamenco with such diverse styles as [latin jazz](#), [rock](#), [pop](#), [blues](#) and son.

Outside of Spain, one of the most famous New Flamenco groups is the French group Gipsy Kings, which developed traditional "[Rumba Flamenca](#)" into a popular New Flamenco style. Also from France, Louis Winsberg founded the group Jaleo, which takes Flamenco fusion even one step further, introducing elements from arabic, indian and african music traditions.

## New jack swing

**New jack swing** is a hybrid style of [rhythm and blues](#) (R&B) combined with [hip hop](#), popular from the late 1980s to early/mid-1990s. Its sound is a blend of the sporadic hip hop "swing" beats (so called because of the extreme use of rhythmic improvisation), which were popular during the [golden age of hip hop](#), with contemporary r&b style singing.

Also called "new jack R&B" or "swingbeat", the term was coined either by journalist and New Jack City co-writer Barry Michael Cooper or music artist and producer Teddy Riley who invented this style in the experiment of integrating various rhythms, samples and production techniques with the urban contemporary sound of R&B. The style developed in a way similar to many previous styles, as a new combination of older styles. Some songs were comprised of rhythmic beats with music, while others had singing alternating with rap sections over this same type of music. In short, New jack swing is mellifluously soulful solo or harmonizing vocals sung over rhythms and "street" beats derived from urban musical influences. This style of music melded into the form of hip-hop that is widely popular in today's music. New jack swing is also known for its aggression, swaggering and addressing romantic themes and lyrics. The [music](#) also had an impact on other musical genres and resulted in a new jack swing era, which lasted from 1987 to approximately 1994. That era was celebrated by all things "urban" in popular culture across the mass media.

*New jack* is a slang term that has several, different meanings, but most obviously, simply means someone who or something that is new. *Swing* refers to the rhythmic pattern, which always consists of straight 8ths, 16th note shuffles and 16th note swing patterns.

## New Orleans blues

The [blues](#) have been an important part of New Orleans, USA music since the earliest years of the 20th century. Buddy Bolden's band was noted for playing blues before 1906, and white bands are documented as playing the blues here at least by 1908. New Orleans [jazz](#) is heavily inflected with the blues, as exemplified by Louis Armstrong.

The phrase **New Orleans blues** is sometimes used to refer to a type of [blues](#) or [R&B](#) music that is characterized by extensive use of [piano](#) and [horn](#) sections, complex rhythms and celebratory lyrics. The lazy, plodding rhythms are perhaps most distinctive of all of [Louisiana blues](#).

Artists in this style include:

Johnny Adams

James Booker

Sugar Boy Crawford

Champion Jack Dupree

Snooks Eaglin

Guitar Slim, Jr.

Guitar Slim

Earl King

Smiley Lewis

Professor Longhair

Tommy Ridgley

Tuts Washington

Katie Webster

## New Romantic

**New Romantic** was a [New Wave music](#) subgenre and fashion movement that occurred primarily in England during the early 1980s. Its genesis took place largely through clubs such as Billy's in Great Queen Street, London, England, which ran Bowie and Roxy Music nights in the [post-punk](#) aftermath, evolving into the highly successful and elitist Blitz Club, which featured Steve Strange as doorman and Boy George as cloakroom attendant. The club spawned a hundred suburban spin-offs in and around London, among which were Croc's in Rayleigh, Essex, and The Regency in Chadwell Heath, where Depeche Mode and Culture Club had their debut gigs as fledgling bands.

The New Romantic phenomenon was similar to that of [glam rock](#) during the early 1970s, in that (male) New Romantics dressed in effeminate clothing, often with frilly "fop" shirts, and wore cosmetics. David Bowie was an obvious influence, and his 1980 single "Fashion" could be considered an anthem for the New Romantics. However as with many art school-based youth movements, by the time this 'anthem' was pronounced, the movement itself, although successfully projecting many new stylish futuristic ideas and visions (with lots of various references to sci-fi), had been seized upon by commercial forces, and watered-down versions were being cheaply reproduced for the High Street. There was also discernable difference in emphasis and mood, from the frenzied screeching of Slade roaring "Coz I Luv You" to the more ethereal languor of Visage and their "Fade to Grey".

The main difference from [glam](#), however, was that instead of guitar rock, the music was largely [synthesizer](#)-based [electropop](#) music (German electronic-music pioneers Kraftwerk were another significant influence), intelligently introducing plenty of innovative and experimental sounds. Rhythm machines were also widely in use.

In the mid-1990s, New Romantic was briefly revived as a movement called Romo.

## **New Wave music**

**New Wave** is a term that has been used to describe many developments in music, but is most commonly associated with a movement in American, Australian, British, Canadian and European [popular music](#), in the late 1970s and early 1980s born out of the [punk rock](#) movement. The genre was fashionable during the 1980s, but became somewhat popular again during the 2000s.

## Overview

The term New Wave itself is a source of much confusion. Originally, Seymour Stein, the head of Sire Records, needed a term by which he could market his newly signed bands, who had frequently played the club CBGB. Because radio consultants in the US had advised their clients that punk rock was a fad (and because many stations that had embraced [disco](#) had been hurt by the backlash), Stein settled on the term "new wave." He felt that the music was the musical equivalent of the French New Wave film movement of the 1960s. Like those film makers, his new artists (most notably Talking Heads) were anti-corporate, experimental, and a generation that had grown up as critical consumers of the art they now practiced. Thus, the term "new wave" was initially interchangeable with "punk rock".

Very soon, listeners themselves began to see these musicians as different from their compatriots. Music that followed the anarchic garage band ethos of The Ramones (such as the Sex Pistols) was distinguished as "punk", while music that tended toward experimentation, lyrical complexity, or more polished production, such as Talking Heads, Television, Patti Smith, Devo, and Tubeway Army, among others, were called "New Wave". However, those artists were *all* originally classified as punk.

Tom Petty has (probably in jest) taken credit for "inventing" New Wave. In the book *Conversations with Tom Petty* by Paul Zollo (Omnibus, 2005) he says journalists struggled to define the band, recognising they were not [punk rock](#), but still wanting to identify them with Elvis Costello and the Sex Pistols. He also suggests — again, probably half joking — that the song *When the Time Comes* from the *You're Gonna Get It!* album (1978) "might have started New Wave. Maybe that was the one."

Eventually, the term was applied indiscriminately to any punk band that did not embrace the loud-fast playing style, whether that meant that their sound was [reggae](#), [ska](#), or experimental. Thus, The (English) Beat, R.E.M., and The Police were equally New Wave, even though these bands would have as little in common with each other as they would with nominally punk bands such as The Clash.

Later still, *New Wave* came to imply a less noisy, poppier sound, and to include acts manufactured by record labels, while the term [post-punk](#) was coined to describe the darker, less pop-influenced groups. Although distinct, punk, New Wave, and post-punk all shared common ground: an energetic reaction to the supposedly overproduced, uninspired popular music of the 1970s. Many groups fit easily into two or all three of the categories over their lifespan.

When MTV started broadcasting in 1981, New Wave got a boost as many [music videos](#) were of this genre. New Wave artists had been innovators in the use of using videos to promote themselves in the years prior to birth of MTV by showing them primarily in clubs. Subsequently, New Wave became strongly associated with the decade, often being seen as the quintessential 1980s music.

New Wave is sometimes considered to have died by about 1986, although it still influenced pop music production up to about 1992. In the late 1990s, the Omaha, NE based band, The Faint, drew heavily upon New Wave to create its debut album Media, which was released on Saddle Creek Records in 1998. In the 1990s, the popular band No Doubt exemplified a new wave style in many ways. In the first decade of the 21st century, the [electroclash](#) scene in Brooklyn and London (at clubs like Luxx and Nag Nag Nag) ironically revived the new wave aesthetic for kids born in the 80s. Many other [indie rock](#) bands re-popularized new wave sounds with varying success, most popularly Interpol and The Killers.

## New Wave fashion

New Wave is also commonly used to describe the style and fashion associated with New Wave music. Examples include hairstyles of the band A Flock of Seagulls and Kajagoogoo, and Elvis Costello's bi-colored glasses poster.

As fashion, there were two major components of New Wave adornment. First, there was an eclectic revivalism. This included iconic revival fashions of the 1950s and 1960s. For example, thin neckties, [rockabilly](#) fashions, and mod culture from the 1950s, as well as Paisley prints from the 1960s.

The other part was a desire to embrace contemporary synthetic materials as a protest and celebration of "plastic". This involved the use of spandex, bright colors (such as fluorescents), and mass-produced, tawdry ornaments. As a fashion movement then, New Wave was both a post-modern belief in creative pastiche and a continuation of Pop Art's satire and fascination with manufacturing.

New Wave revivalists are currently very popular in New York and LA (centering around nightclubs like New York's Misshapes and featured in art and fashion magazines like Visionaire). The style has also recently been a major influence in high fashion, for example in the most recent collections of designers like Scott Gerst and Hedi Slimane.

### [Timeline of alternative rock](#)

The **New Wave of New Wave** (NWONW) was a term coined by music journalists to describe a sub-genre of the British [alternative rock](#) scene in the early 90s. NWONW bands typically consisted of young, white, working class males playing guitar-based [rock music](#). The movement was short lived and several of the bands involved were later linked with the more popular and commercially successful [Britpop](#).

The term "New Wave of New Wave" referred to the apparent parallels between the music scene emerging in the early 90s and that of the [New Wave](#) or [punk](#) scenes of the 1970s and 80s. NWONW bands were often politically outspoken and critical of the then British prime minister, John Major, but lacked any specific political ideology.

The NWONW movement was linked with use of the drug "speed" which led to the band members being characterized as skinny and pale.

Record label Fierce Panda's first release, Shagging in the Streets, was a tribute to the scene, featuring S\*M\*A\*S\*H, Blessed Ethel, Mantaray, Done Lying Down, These Animal Men and Action Painting!. Other bands associated with genre have included Elastica, Sleeper, Echobelly and Compulsion.

## New Weird America

**New Weird America** describes a musical movement in the 2000s of psychedelic folk music. The term was coined by David Keenan in *The Wire* in 2004 following the Brattleboro Free Folk Festival organized by Matt Valentine and is a play on Greil Marcus's phrase Old Weird America as used in his book *Invisible Republic* which deals with the lineage connecting the pre-war folk performers on Harry Smith's *Anthology of American Folk Music* to Bob Dylan and his milieu. The style of this movement is mainly derived from folk and psychedelic groups from the 1960s and 1970s, including American performers Holy Modal Rounders and English group Pentangle, but also finds inspiration from such disparate sources as [heavy-metal](#), [free jazz](#), [electronic music](#), [noise music](#) as well as early- and mid-20th century American folk music. The bands of this movement are usually classified as [psych folk](#), acid folk or most notably as freak-folk.

Most works of the genre are issued in small editions and distributed independently. The music has been covered extensively by L.A. based *Arthur Magazine*, which has run in-depth pieces on Devendra Banhart, Joanna Newsom, Animal Collective, and Six Organs of Admittance; released the definitive New Weird America compilation *The Golden Apples of the Sun*; and curated 2006's Arthur-Ball and 2005's Arthur-Fest events, which featured a variety of artists from the movement.

New Weird America is not a unified movement. It was a term derived by journalists such as post-rock and indie rock. Many of these bands do not identify with this term but have been lumped into it by the press. The underground American scene has been around for a long time.

Some bands and musicians classified with this movement include:

- 500mg
- Akron/Family
- Alec K Redfearn
- Animal Collective
- Andrew Bird
- Andrew Phillip Tipton
- Antony and the Johnsons
- Ariel Pink
- Baptist Generals
- Black Dice

## Nightclubs

A **nightclub** (often shortened to **club**) is an entertainment venue which does its primary business after dark. In most other languages, nightclubs are referred to as "discos" or "discothèques" (French: *discothèque*; German: *Disko* or *Tanzveranstaltungen*). In Japanese  $\text{Ç£}^{13}$ , *disuko* refers to an older, smaller, less hip venue; while  $\text{éÖ}$ , *kurabu* refers to a more recent, larger, more popular venue. The term **night** is often used to refer to an event hosted within a nightclub.

## Introduction

Nightclubs are associated with socializing and [music](#) and are usually distinguished from other forms of drinking establishment, such as a bar, pub or tavern, by the inclusion of a dance floor, although a club may also feature other forms of entertainment; possibly unsuitable for minors, such as podium dancers, a floor show or strippers (see [strip club](#)). Music may be [live](#) or mixed by a [DJ](#) and is often amplified using a PA system, and can range from [blues](#), [jazz](#), [country](#), [disco](#), [hip-hop](#), [rock](#) and [metal](#) to [electronic music](#) styles such as [house](#), [techno](#), [trance](#), [drum and bass](#) and alternative electronic. Most clubs or club nights have a specific musical theme and generally cater to fans of a few particular [music genres](#).

Gatherings in nightclubs that primarily involve music mixed by a DJ involve dancing and in most cases alcohol. Illegal use of recreational drugs such as ecstasy are commonplace in many modern clubs featuring electronic dance music. Clubs are often advertised by the handing out of flyers on the street, in record shops, and at other clubs and events, they are often highly decorative and eye-catching.

Nightclubs often feature lighting and other effects: flashing lights of many colors, moving light beams, laser light shows and smoke machines. One common item is a disco ball: a rotating football-sized spheroid at the ceiling, covered with many small flat mirrors, with a light beam directed on it; the reflections form a multitude of moving light spots on the floor and on the people. Some nightclubs will throw foam parties where the dance floor is filled with soap suds.

## Types of Clubs

From time to time, variations enter the market, such as non-smoking and alcohol-free nightclubs. Also, restaurants or supper clubs may provide music and entertainment similar to that provided by a nightclub, the main difference being that food is the main attraction at these establishments, whereas entertainment is the main attraction at a nightclub. Comedy clubs are one type of venue which provides entertainment.

Another type of club is a concert club, which specializes in hosting performances of live music. In contrast to regular night clubs, concert clubs are usually only open when a performance is scheduled.

Not all nightclubs last all night, the bigger ones such as Pacha in London and Tiger Tiger finish around 2 or 3 in the morning whereas the smaller nightclubs, which could also be described as bars but with entertainment could close at 12 or 1. Some nightclubs may have bands playing as a form of entertainment, this helps to attract large crowds and as nightclubs normally appeal to teenagers, or people in their twenties, having a famous band in your venue will normally always be successful.

Clubs differ all over the world, In England for example, they may have a lot of drum n bass clubs or [house music](#) clubs as these are popular music genres in England. Whereas in Spain they may have a lot of salsa clubs, as this specialises in the type of dancing spaniards enjoy.

## **Venue**

There are several traditional venues that are often used as nightclubs. Nightclubs need to be insulated from the outside to prevent noise from escaping, and to prevent light and noise entering from outside. This allows the nightclub to have more control over the environment inside the building. It also creates an idea of timelessness which customers often prefer. This idea is also illustrated by the fact that many nightclubs do not have clocks visible to the public.

## **Underground**

Underground installations are often the perfect place for nightclubs and an often popular choice of venue. The reasons are:

### **Advantages**

- Location: The buildings (such as railway arches, or former storage areas) are often in prime locations in city centres. Their underground nature means that the rent paid for them is relatively cheap compared to the same floorspace overground.
- Nature of the building; underground spaces have large expanses of space, without taking regard for building size and shape in the area above (some underground spaces might span several blocks).
- Seclusion: being underground means that there are no windows to block, very little soundproofing (most soundproofing would be natural).

### **Disadvantages**

- Infrastructure: the building may lack any form of infrastructure such as toilets, heating, electricity or water supply.
- Ventilation: Depending on what the area was used for before, large amounts of money might need to be spent to ensure an adequate air supply is present.
- Fire escapes: an underground locker might have been designed only to have around 4-5 workers in it any time, when it is transformed into a

nightclub it could have 2000 people in it, and more consideration needs to be taken of fire escapes.

## **Former Theatres / Cinemas**

The past 50 years has seen a huge reduction in the amount of cinema-going around the world and especially so in the western world. This has meant that many former theatres and cinemas were no longer needed. A former theatre can make a very good home for a nightclub:

### **Advantages**

- Location and local knowledge: The theatre might be so well known that the nightclub can just take on its name. For example the Astoria nightclub in London or The Empire "the Theatre" in Middlesbrough.
- Infrastructure: The buildings would have already been made to accommodate a large amount of people, so toilets, fire escapes and even bars would already be present.
- Seclusion: Theatre buildings obviously to have control over outside noise and light, the buildings will already likely be insulated against these.
- Acoustics: The theatre would be custom built to have noise travel around the building.
- Presence of a stage: many theatres turned nightclubs could also host concerts.

### **Disadvantages**

- Nature of the building: The building would often be the main auditorium and foyer. This can be restrictive for nightclubs that want to have more than one type of music, or a VIP lounge. The new business is also restricted in terms of what changes it can make, for example, many ex-cinemas still maintain the same design as when they were theatres.
- Association with an older era: customers might associate a new nightclub in an old theatre with the type of customers who used to go to the old one.
- Planning Permission: many countries have rules concerning the decorations inside old historic buildings, which could for example mean a new nightclub has 100 year old cherubs painted on the wall

### **Custom Built**

Again these seem to look like the best option but there are several other considerations:

### **Advantages**

- Exact Specifications: The new business can specify exactly where it wants the bars, the toilets, the fire escapes, how many rooms it wants etc.
- Other features can be incorporated: Like disco rounds, or revolving stages.

### **Disadvantages**

- Most custom built venues would be above ground where the cost would be very high.
- The re-sellability of the venue would be taken into account; if the business did not work, what else could the area be used for, and who would buy it?

### **Stationary boat**

#### **Advantages**

- Moored boats could be in very prestigious surroundings, for example by the River Thames or on the banks of the Hudson. Places in which land rent is very high.
- Glamour: What could look more glamorous than a nightclub in a boat?

#### **Disadvantages**

- Safety, but not only in terms of the boat sinking, but having sufficient fire escapes, protection from the weather, and provision for drunk customers being so close to water
- Life of the boat: Boats often wear out fast, and would not last as long as a building.
- Difficulty of use: hooking up lights and sound systems could be difficult on a boat.
- Infrastructure: toilets, electricity, gas supply (for drinks), getting drink deliveries, air conditioning all need to be considered.

- Rocking motion: which can give people motion sickness.

## **Moving Boat**

Again most of the advantages and disadvantages are the same as for a stationary boat, but some extra ones arise:

- Security: How could an unruly customer be ejected if the venue is 5 miles from the pier?
- Safety: Provision for the boat sinking will need to be made.
- Crew: Special training will need to be given to all the staff on board the boat.

## History

In the U.S., the repeal of Prohibition in February 1933 sparked the revival of nightclubs, which had gone underground as speakeasies. In New York City, three famous Midtown nightclubs from the "Golden Age" were the Stork Club, El Morocco and the Copacabana, while uptown in Harlem the Cotton Club was king.

Before 1953 and even some years thereafter, most speakeasies bars and nightclubs used jukebox or mostly live bands but then in a Paris club named 'Whisky-a-Gogo', Regine Zylberberg laid down a dance-floor, suspended coloured lights and for the first time ever replaced the juke-box with two turntables so there would be no breaks between the music. While Regine's was a bar with music, Mark Birley in 1962 was the first to open a member-only discotheque nightclub, Annabel's, in Berkeley Square, London. Setting into place the standards' elements of the *discothèque* as known in it's modern form.

The first [rock and roll](#) generation did not favor nightclubs, but the club returned in the 1970s as the "[disco](#)," from the French *discothèque* (although by the early 2000s, the term "disco" had largely fallen out of favor in North America). Two early discos in New York were "Le Club" and "Regine's." Today in Europe, nightclubs play techno, house music or any sort of dance music from nu-jazz to electro or trance for the most part. Some nightclubs in the U.S. play trance and techno, but it is still not as popular.

## No Wave

**No Wave** was a short-lived but influential offshoot of [punk rock](#) centered in New York City during the late 1970s and early 1980s. The term No Wave was partly a satiric wordplay rejecting the commercial elements of the then-popular [New Wave genre](#), and also a declaration of the music's experimental nature: *No Wave* music belonged to no fixed style or genre.

In many ways, *No Wave* is not a clearly definable genre. There is, for example, no fixed [harmony](#) as in most [rock music](#) and [blues music](#). There are some elements common to many No Wave performers, including abrasive atonal sounds, strong emphasis on repetitive rhythm, and more emphasis on mood and texture than on conventional melody. Lyrics often focused on nihilism and confrontation ("Little orphans running through the bloody snow/No more ankles and no more clothes"-Teenage Jesus and the Jerks), or were puzzlingly abstract ("Why be ashamed of hatred/There's nothing wrong with burning"-Swans).

No Wave also drew on performance art. DNA, for example, was formed by three people with little or no experience playing musical instruments or performing live. Rather than play songs using "proper" methods, DNA quickly utilized their naïveté and played strikingly unique sounds.

Performers classified as No Wave generally had little music style in common: Various groups drew on such disparate styles as [funk](#) and [jazz](#) (James Chance), blues, aleatoric music and punk rock. Mars, Swans and The Static experimented with extremely loud, droning music that was frequently characterized by repetitive drumbeats and explicitly nihilistic lyrics.

No Wave had an important impact on noise and [industrial bands](#) who formed after, like Big Black, Lev Six, Helmet, and Live Skull. Sonic Youth emerged from this scene by creating music-as-art that eventually reached mass audiences and critical acclaim.

The Brian Eno-"produced" (1) album No New York is perhaps the best example of this genre, featuring songs by Mars, Teenage Jesus & the Jerks, DNA and James Chance.

Simon Reynolds, author of *Rip It Up and Start Again : Postpunk 1978-1984* , wrote

*And although "affection" is possibly an odd word to use in reference to a bunch of nihilists, I do feel fond of the No Wave people. James Chance's music actually stands up really well, I think; there are great moments throughout Lydia Lunch's long discography, and Suicide's records are just beautiful. (Listen to James Chance & the Contortions, "Contort Yourself," 1979; and Suicide, "Touch Me," 1980.)*

Also during this time there was a period of No Wave Cinema which was an underground film movement in the East Village. No Wave filmmakers included Amos Poe, John Lurie, Scott B and Beth B, and led to the Cinema of Transgression and work by Nick Zedd and Richard Kern.

Late outliers of this movement included groups such as Skeleton Key, Cop Shoot Cop, VPN and others.

**[Protopunk](#)**

## Noise music

**Noise music** is [music](#) that uses sounds regarded as unpleasant or painful under normal circumstances. "Noise" music is regarded by some as a contradiction in terms, because "noise" is generally defined as unwanted and undesigned or unintentional sound and music as the opposite (see [Definition of music](#)). However, "noise" in a more general sense refers to any extremely loud or discordant sound, and that these sounds are often the basis of noise music. Secondly, as famous noise musician Masami Akita said, "If by noise you mean uncomfortable sound, then pop music is noise to me." Noise music is not necessarily "noise" to the listeners, although it is certainly "noisy" in the more general sense of the term.

## Characteristics and influences

Noise music is loosely related to [industrial](#), sharing its DIY ethos, independence and ethic of using "non-musical" sources. It also shares with early, Throbbing Gristle-era Industrial, a fascination with the hypnotic, and magical qualities of sound. Often punishing and abrasive, **Noise music** can be difficult listening, ranging from the free-form extreme electronic music of Merzbow and Masonna to the more sculptured sounds of Otomo Yoshihide and Aube, to the cold haiku sound-scapes of Ryoji Ikeda or Toshimaru Nakamura.

# History

## Luigi Russolo

Luigi Russolo, a Futurist painter of the very early 20th century, was perhaps the first Noise Musician. His 1913 manifesto *L'Arte de Rumori* (*The Art of Noises*) stated that the industrial revolution had given modern men a greater capacity to appreciate more complex sounds. Russolo found traditional melodic music confining and envisioned Noise Music as its future replacement. He designed and constructed a number of noise-generating devices called *Intonarumori* and assembled a noise orchestra to perform with them. A performance of his *Gran Concerto Futuristico* (1917) was met with strong disapproval and violence from the audience, as Russolo himself had predicted. None of his intoning devices have survived. Although Russolo's works bear little resemblance to modern Noise Music, his pioneering creations cannot be overlooked as an essential stage in the evolution of this genre, and many artists are familiar with his manifesto.

## Other early composers

Beginning in the 1920s, composers (in particular Edgard Varèse and George Antheil) began to use early mechanical musical instruments--such as the player piano and the siren--to create music that referenced the noise of the modern world. John Cage began composing his Imaginary Landscape series in 1939, which combined elements like recorded sound, percussion, and (in the case of Imaginary Landscape #4) twelve radios. After the second world war, other composers (including Pierre Schaeffer, Iannis Xenakis, and Karlheinz Stockhausen) started to experiment with early [synthesizers](#), tape machines and radio equipment to produce [electronic music](#), often with very abstract sounds and structures. Much of this music has proven influential on the creators of noise music.

With the advent of the radio, Pierre Schaeffer coined the term [musique concrete](#) to refer to the peculiar nature of sounds on tape, separated from the source that generated them initially. His ideas about non-referential sounds take their most extreme form in noise music, which often blurs or obscures the actions which produced the sounds while also suggesting the physicality of sound itself.

In all the cases of these forerunners, the sudden affordability of home recording technology in the 1970s with the simultaneous influence of [punk](#)

[rock](#) established a new aesthetic of non-musicians creating music. When anyone could produce noise, and anyone could record and distribute it, then noise music provided a way for any person (artist or non-artist) to experiment with sound as a painter might with visual material. Noise began in earnest when classical avant-garde ideas became democratized, separated from the academic thought that started it, and experimented with by laymen with nothing at stake other than making music for its own end.

## **Boyd Rice**

American archivist and writer Boyd Rice has been a seminal influence on Noise music. Starting in 1975, Rice began experimenting with the possibilities of pure sound. In his live performances, he attached an electric fan to an [electric guitar](#) and also used an electric shoe polisher as an instrument. He created extremely loud, cascading walls of noise and played pieces of recorded conversations, news reports, and music just beneath the threshold of comprehensibility. Rice has created works that combine brutal soundscapes with various poetics. He has also structured noise elements into harmonious, rhythmic pieces that defy easy categorization.

## **Japan**

Originally influenced by the sounds of European bands like Whitehouse, Japanese style noise music then pushed this approach to an extreme of loudness and density, which in turn became a major influence on western noise bands. Sometimes known as "Japnoise" (not just as a pun in English, but even in Japanese: ジャノイズ ), it is usually associated with "harsh" characteristics including walls of white noise, non-linear pulses, beats, sampled loops, dialogue, and sirens. Since the late 1980's this Japanese style has been probably the most prolific and noticeable part of the Noise Music scene. Thus in magazines and the popular imagination the term Noise Music is often closely associated with this style. Likewise the popularity and prolific output of musicians such as the aforementioned Noise Music figurehead/posterboy Merzbow, Otomo Yoshihide and other names like KK Null, Masonna, The Gerogerigegege and Hanatarash (founded by Boredoms frontman, Yamatsuka Eye) have made Japan something of a Mecca for many noise fans. In terms of sales, Noise music is not particularly more popular in Japan than in Europe or America. However, there is perhaps a higher level of recognition from crossover with mainstream genres and events, such as fashion shows or dance performances with music by noise artists, and a comparatively large number of noise live performances are held in Tokyo.

Also, in more recent years, the onkyo style of noise/[free improv](#) is becoming more prevalent in Japan. Centered around the Off Site club in Tokyo, and including artists such as Sachiko M, Otomo Yoshihide, Toshimaru Nakamura, Shigeru Kan-no and Taku Sugimoto, it is a form of electro-acoustic improv that focuses on quiet, pure tones, static and space. As with most genre descriptors, there is a backlash against the term, feeling that it solidifies the style into a fixed form (obviously the death knell for any free improv), but for now, it serves as a simple way to convey the general style of modern Japanese improvisational music.

## **Albums and non-noise influences**

Lou Reed's double-LP album *Metal Machine Music* released in 1975 is an early, well-known example of noise music. A lesser known, but perhaps more prophetic release regarding the future of Noise music, is Boyd Rice's 1978 LP, *Pagan Muzak*. Reed's Velvet Underground cohort John Cale's electronic drone music with artists such as Tony Conrad and LaMonte Young in the mid-60s can also be cited as having been influential. (see the CD release of *Inside the Dream Syndicate Volume 1: Day of Niagra*).

## **Mixing of forms**

In recent years European musicians associated with [jazz](#), [electronica](#) and [black metal](#) have been active in the Noise music arena. In Canada the Nihilist Spasm Band has been performing acoustic-based noise music for decades. In the early 1990s, the noise operas of Lisa Crystal Carver and Costes in Suckdog placed a new emphasis on drama and histrionics in noise music. This led, in part, to Chicago's free glam movement adding an emphasis on cultural and social dissonance to the concept of noise music. The aptly named [noise rock](#) fuses [rock](#) to noise, usually with recognisable "rock" instrumentation, but with greater use of distortion and electronic effects, varying degrees of atonalism, improvisation and white noise. One of the best-known bands of this genre is Boredoms. This style is more like a "traditional" band compared to abstract or electronic noise and sometimes bears a similarity to [grindcore](#). The name noisecore is also used to refer to noise-influenced [hardcore techno](#) or rock.

Fans of the genre sometimes distinguish between "harsh noise", the more well-known super-dense and abrasive sounds of Merzbow, Masonna and similar artists, and other loose sub-genres like "rhythmic noise", "power electronics", "free noise" and so on. Confusingly, some industrial techno sub-genres have very similar names, i.e. [power noise](#). Power noise is

comparatively conventionally musical, and is not to be confused with power electronics, the synthesizer based subgenre of abstract and experimental noise performed by Whitehouse.

Other artists mix Noise with subtle [ambient](#) shades to create ambient noise music.

One possible influence of noise music has been to change the way of thinking about what is "musical" or "unmusical" noise, and recently many different genres, such as techno and hip-hop, include some kinds of sounds that could be viewed as "noise".

## Noise pop

**Noise pop** is a term used to loosely describe a number of [alternative rock](#) bands that fuse [punk rock](#)'s attitude and anger with the atonal noise, feedback, and free song structures of noise music, presented in a decidedly pop context. Most noise pop bands owe a heavy debt to the influence of the Velvet Underground, but the style truly began in the 1980s underground scene: chief purveyors include The Jesus and Mary Chain, My Bloody Valentine, Sonic Youth, Yo La Tengo, and Dinosaur Jr. Noise pop bands are considered inspirations for the [shoegazing](#) scene of the late 80's and early 90's; in fact, many shoegaze bands could be considered noise pop. The genre continues to be a force in the [indie rock](#) scene of today. Some more modern, but lesser-known examples are Deerhoof, Xiu Xiu and The Double, all of whom are popular with the [indie](#) music website Pitchfork Media.

[History](#) - [Indie \(music\)](#)

## Noise rock

**Noise rock** is a musical genre that developed in the 1980s as an experimental outgrowth of [punk rock](#). Fusing punk rock's attitude with the atonal noise and unconventional song structures of early [industrial](#) and [noise music](#), the noise rock introduced a new kind of avant-garde music to the [alternative rock](#) landscape. The style is sometimes referred to as "noisecore", though this term can also refer to a variety of fast, distorted [hardcore techno](#) music.

## History

Some influences on the early breed of noise rockers were the stark [rock and roll](#) of The Velvet Underground (most notably their "White Light/White Heat" album), the bluster of the Stooges, the no wave movement of the late 1970s, and Lou Reed's Metal Machine Music. Later, Sonic Youth, for instance, propelled the No Wave aesthetic into the new direction of noise rock.

Later, the sound became associated with Japanese artists such as Boredoms and Melt-Banana, who incorporated the influences from Japanese noise music even further, and occasionally adopted completely chaotic structures creating extremely short, fast "songs" which were marked by blasts of rhythm, screaming, and extremely overloaded guitars.

At around the same time, [grindcore](#) bands such as Napalm Death and The Locust were developing a similar style which is also often referred to as "noisecore". In many cases, although the backgrounds of the bands are different, the "art" influenced noise rock bands and "heavy metal" grindcore bands both have similarly high levels of technical playing ability and have often collaborated on new music.

## Nonchord tone

A **nonchord tone**, **nonharmonic tone**, or **non-harmony note** is a note in a piece of [common practice](#) music which is not in the [chord](#) that is formed by the other notes; for example, if a piece of music is currently on a C Major chord, the notes CEG are members of that chord, while any other note played at that time is a nonchord tone. While such tones are most obvious in homophonic music, they can occur in [contrapuntal music](#) as well.

A nonchord tone is a dissonance and is required to resolve to a chord tone in conventional ways. If the note fails to resolve until the next change of harmony, it may instead create a seventh chord or extended chord. While it is theoretically possible that for a three-note chord there are (in equal temperament) nine possible nonchord tones, nonchord tones are usually in the prevailing [key](#).

The following list is not exhaustive, but identifies the most common types of nonchord tones.

## Anticipation

- An **anticipation** occurs when a note is played before the chord to which the note belongs to and resolves when the "anticipated" chord is reached:

## Neighbor tone

- A **neighbor tone** or **auxiliary note** is a nonchord tone which is preceded by a chord tone directly above or below it and resolves to the same tone:

## Passing tone

- A **passing tone** or **passing note** is the nonchord tone of a part which had started at one chord tone and moved up or down through one (or more) nonchord tone and resolving to another chord tone (possibly of another chord, often of the same chord):

## Suspension

- A **suspension** occurs when the harmony shifts from one chord to another, but one or more notes of the first chord are temporarily held over into the second in which they are nonchord tones before resolving to a chord tone:

Suspensions may be further described using the number of the [interval](#) forming the suspension and its resolution; e.g. **4-3 suspension**, **7-6 suspension**. Most suspensions resolve downwards, the example shown above, a **7-8 suspension**, is a rare example of an upwards resolution (also called a **retardation**). A suspension must be *prepared* with the same note (in the same voice) using a chord tone in the preceding chord; otherwise it is an **appoggiatura**. The notes are often tied, but this is optional.

A suspended chord is an added tone chord with a "suspended" fourth or second as an added tone which doesn't resolve.

For an audiovisual illustration of the concept of harmonic suspension, visit [external link suspension and pedal point](#).

## Escape tone

- An **escape tone** is a movement by step in the opposite direction of the harmonic motion in that voice and is resolved by leap in the direction of harmonic motion:

Appoggiatura are sometimes used to provide this function.

## Pedal point

Another form of nonchord tone is a pedal point or **pedal tone** or **note**, almost always the tonic or dominant, which is held through a series of chord changes. The pedal point is almost always in the lowest voice (the term originates from [organ](#) playing), but it may be in an upper voice; then it may be called an *inverted pedal*. It may also be between the upper and lower voices, in which case it is called an *internal pedal*.

- [Ornament](#)

Category: [Musical techniques](#)

# Nonet

In [music](#), a **nonet** is a composition which requires nine musicians for a performance, or a musical group that consists of nine people. Unlike some other [musical ensembles](#) such as the [string quartet](#), there is no established or standard set of instruments in a nonet. Composers of nonets often mix stringed instruments with winds, or woodwinds with brass, choosing the instruments so that each subgroup can form complete four-part harmony. For example, Franz Schubert's *Eine kleine Trauermusik* (1812) is for two [clarinets](#), two [bassoons](#), contrabassoon, two [horns](#), and two [trombones](#), while Louis Spohr's *Nonet in F major* (1813) is for [flute](#), [oboe](#), clarinet, bassoon, horn, [violin](#), [viola](#), [cello](#), and double bass. Heitor Villa-Lobos and Bohuslav Martinu are among the twentieth-century composers who have written nonets. Trumpeter Miles Davis also formed a [Jazz](#) nonet that was later known as "The Birth of the Cool".

# Nortec

**Nortec** (from the combination of "[norteño](#)" and "techno") is an [electronic musical genre](#) from Tijuana, a city in the north of Mexico that first gained popularity in the late 1990s. Nortec music is characterized by hard dance beats and samples from traditional forms of Mexican music such as Banda sinaloense and [Norteño](#) - unmistakably Mexican horns are often used.

Situated near the United States border, and the US cities of Los Angeles and San Diego, Tijuana's musical scene is heavily influenced by tourism, and in particular, an international night life, a co-operative local musical community, and a steady supply of visiting [DJ's](#) from the US. Many Mexicans from Mexico City frequently shuttle between Tijuana and Ibiza, Spain (a world renowned party club location), further exchanging and enriching the music.

As a result, Tijuana has around 40 nightclubs that play music that, by normally conservative club standards, is contemporary and even avant-garde. The [DJ's](#) of these clubs have unique non-competitive associations and share music. The result is a wide variety of dance beats in the clubs.

# Norteno

**Norteño** (literally meaning "northern" in Spanish, and also known as **conjunto**) is a traditional style of [Mexican music](#) that originated in rural northern Mexico in the early 20th century, a form of music based largely on corridos and [polka](#). The [accordion](#) and the bajo sexto is the music's most characteristic instruments. Norteño is extremely popular among first-generation Mexicans in both the inner city barrios and the rural countryside of the United States and Mexico.

Norteño is the most popular subgenre of the Tex-Mex musical category. It is not to be confused with tejano music, which is more similar to rock music.

In the 1950s, the spread of conjunto and norteño into southern Texas gave rise to Tejano (or "Tex-Mex"), which in its modern version is also influenced by [rock](#) and [swing](#). Another norteño-derived style is banda, which uses solely [brass instruments](#) instead of accordions and guitars.

Some of the most popular norteño artists include Los Tigres del Norte, Ramón Ayala y sus Bravos del Norte, Los Gavilanes, Carlos y Jose, Los Alegres de Terán, Los Huracanes del Norte, Los Tucanes De Tijuana, and others.

## The sound of norteño

In the past, norteño bands consisted of an [accordion](#) as the lead instrument, with the bajo sexto (a type of 12-string Mexican [guitar](#)) serving as the roots of the music. Today, a modern Norteño band usually consists of an [accordion](#), a bajo sexto, a bass guitar, a [drum](#) set. Occasionally, a [saxophone](#) or electronic keyboard may also be included.

Norteño has many different regional styles. Norteño in Texas, for example, is very likely to be influenced by American music, while norteño from Tijuana and Tamaulipas may sometimes have influences from the Caribbean. Durango and Sinaloa have also produced norteño bands, even though the two states are more closely associated with the musical styles of duranguense and banda, respectively. Chihuahua and Zacatecas norteño often incorporates the [saxophone](#) into their bands, creating a saxophone-accordion duet. Additionally, norteño music from Guanajuato and Chiapas sometimes employs synthetic marimbas in their music instead of the usual accordion.

Each norteño band also has its own unique adorno (music which interrupts the lyrical lines in between). For example, one of Los Tigres del Norte's adornos is a series of flutters, while Los Rieleros del Norte's adornos are characterized by descending scales.

## **North American music**

## Northern soul

**Northern Soul** is a style of music with associated dance styles and fashions that developed in the north of England in the late 1960s. In the beginning, the dancing was athletic, featuring spins, flips, and drops. The music originally consisted of obscure American soul recordings with an uptempo beat, very similar to and including Tamla Motown and more obscure labels (e.g. Okeh) from northern United States cities like Detroit and Chicago (in contrast to southern styles like Memphis soul). By 1970, British performers were recording numbers for this market, and the scarcity of soul records with the required rhythm led to the playing of stompers, records by any artist that featured the right beat. The phrase 'Northern Soul' was coined by journalist Dave Godin sometime around 1971 in his column in Blues and Soul magazine.

A large proportion of Northern Soul's original audience came from the mod movement, with their love of soul music. As some mods turned away from these sounds to embrace the psychedelic movement of the late 1960s, many mods - especially those in northern England - elected to stick to the original soundtrack of soul and [ska](#). Some became what would eventually be known as skinheads, and others formed the basis of the Northern Soul scene.

Early Northern Soul fashion included bowling shirts, button-down collar shirts, blazers with centre vents and unusual numbers of buttons, and baggy trousers. Many dancers wore badges representing membership in clubs organized by dance halls.

The first club that effectively defined the Northern Soul sound was northern England's Twisted Wheel Club. Other early clubs were the Torch in Stoke, Wigan Casino, the Blackpool Mecca, the Mojo in Sheffield and Cleethorpes Winter Gardens (still a Northern Soul venue today) and Va Va's (where Richard Searling used to DJ).

Northern Soul is among the most expensive of musical genres to collect. Hundreds of 7" vinyl discs have broken the £1,000 (c.\$2,000) barrier. Frank Wilson's "Do I Love You" sold several years ago for £15,000 (c.\$30,000). The value of many discs has appreciated due to rarity, quality of the beat, melody and lyrics (often expressing heartache, pain or joy related to romantic love). In later years, many Northern Soul fans went on to expand their collections and accommodated the richer and more complex Modern soul sound in the early-1970s and beyond (tracks such as Garfield Fleming's - "Please Don't Send Me Away" exemplify this).

Many Northern Soul artists attempted stardom without all of the necessary ingredients in place. Low-budget independent labels couldn't

deliver the necessary promotion and radio play. Many artists had to go back to their day jobs, thinking themselves failures, with their records sinking into obscurity, until they were revived in the Northern Soul circuit. Songs by the Fascinations and the Velvelettes that were released in the 1960s became top 40 UK hits in 1970. The Fascinations made #30 with "Girls Are Out to Getcha" and the Velvelettes made #35 with "These Things Will Keep Me Loving You."

Some acts have been over to England to perform their golden oldies at all-nighters, often many years after the original releases. In the 21st century, rare 1960s soul sounds are still being discovered by fans, and Northern Soul is still going strong around the world.

## Note

In [music](#), a **note** is either a unit of fixed [pitch](#) that has been given a name, or the graphic representation of that pitch in a [notation](#) system (and sometimes its [duration](#)) or a specific instance of either, so one can speak of "the second note of *Happy Birthday to You*" for example. The general and specific meanings are freely mixed by musicians, although they can be initially confusing: "the first two notes of *Happy Birthday to You* are the same note", meaning, "the first two sounds of *Happy Birthday to You* have the same pitch." A note is a discretization of musical or sound phenomena and thus facilitates [musical analysis](#) (Nattiez 1990, p.81n9).

## Note name

A note with doubled frequency as another sounds very similar, and is commonly given the same name, called pitch class. The span of notes within this doubling is called an octave. The complete name of a note consists of its pitch class and the octave it lies in. The pitch class uses the first seven letters of the Latin alphabet: A, B, C, D, E, F, and G (in order of rising pitch). The letter names repeat so that the note above G is A (an octave higher than the first A) and the sequence continues indefinitely. Notes are used together as a musical [scale](#) or tone row.

Because there are actually 12 notes needed by diatonic music, the 7 letter names can also be given a modifier. The two main modifiers are sharps and flats which respectively raise or lower the pitch of a note by a semitone. These are used to create the additional five notes necessary to complete the [chromatic scale](#). The sharp symbol is ♯ (similar to the pound symbol, #), the flat symbol is ♭ (similar to lower-case italic b). These accidentals are written after the note name; for example F♯ represents the note F sharp, B♭ is B flat.

In music notation the symbols are placed before the note symbol or at the beginning of the line as a key signature. The natural symbol (♮), can be inserted before a note to cancel a flat or sharp in the signature.

Sharps can also be applied to notes B and E creating notes that are equal to C and F respectively (in modern western musical practice). Similarly flats applied to C and F are other names for B and E. Pushing this further, double-sharps and double-flats are used to indicate raised sharps and lowered flats. For example B♭♭ is another name for A.

Another style of notation, rarely used in English, uses the suffix "is" to indicate sharp and "es" (only "s" after A and E) for a flat, e.g. Fis for F♯, Bes for B♭, Es for E♭. In parts of Europe, the letter H is sometimes used instead of B, in which case B represents B♭.

| Name                                    | prime | second | third | fourth | fifth | sixth | seventh |
|---|-------|--------|-------|--------|-------|-------|---------|
| <b>Natural</b>                          | C     | ■ D    | ■ E   | F      | ■ G   | ■ A   | ■ B     |
| <b>Sharp (symbol)</b>                   |       | Co     | Do    |        | Fo    | Go    | Ao      |
| <b>Flat (symbol)</b>                    |       | Dm     | Em    |        | Gm    | Am    | Bm      |
| <b>Sharp (text)</b>                     |       | Cis    | Dis   |        | Fis   | Gis   | Ais     |
| <b>Flat (text)</b>                      |       | Des    | Es    |        | Ges   | As    | Bes     |
| <b>French/Italian (only in C major)</b> | Do    | Re     | Mi    | Fa     | Sol   | La    | Si      |
| <b>Variants</b>                         | Ut    | -      | -     | -      | So    | -     | Ti      |

|                       |     |         |         |     |         |         |         |   |
|-----------------------|-----|---------|---------|-----|---------|---------|---------|---|
| <b>German</b>         | C   | D       | E       | F   | G       | A       | B       | H |
| <b>Frequency [Hz]</b> | 262 | 277 294 | 311 330 | 349 | 370 392 | 415 440 | 466 494 |   |

The octaves of doubled frequency are indicated in various ways as shown in the table below. Octaves count from C to B. The traditional system starts from the great octave (with capital letters) and small octave (with minuscule letters). Lower octaves are named "contra" (with primes before), higher ones "lined" (with prime after). Another system suffixes a number (starting with 0). In this system A4 is nowadays standardised to 440 Hz, lying in the octave containing notes from C4 (middle C) to B4. The lowest note on most pianos is A0, the highest C8. The MIDI system for electronic musical instruments and computers uses a straight count starting with 0 for C0 up to 127 for G10.

| <b>Octave naming systems</b> |                   |                         |             | <b>frequency</b> |
|------------------------------|-------------------|-------------------------|-------------|------------------|
| <b>traditional</b>           | <b>shorthand</b>  | <b>numbered MIDI nr</b> | <b>of A</b> | <b>[Hz]</b>      |
| subsubcontra                 | '''C - '''B       | C0-B0                   | 0-11        | 13.75            |
| subcontra                    | "C - "B           | C1-B1                   | 12-23       | 27.5             |

| four-lined                   | c'''' - b''''     | C8-B8                   | 96-107      | 3520             |
| five-lined                   | c''''' - b'''''   | C9-B9                   | 108-119     | 7040             |
| six-lined                    | c'''''' - b'''''' | C10-B10                 | 120-127     | 14080            |

## Written notes

A written note can also have a [note value](#), a code which determines the note's relative [duration](#). These note values include quarter notes (crotchets), eighth notes (quavers), and so on.

When notes are written out in a [score](#), each note is assigned a specific vertical position on a staff position (a line or a space) on the staff, as determined by the clef. Each line or space is assigned a note name, these names are memorized by the [musician](#) and allows him or her to know at a glance the proper pitch to play on his or her instrument for each note-head marked on the page.

The staff above shows the notes C, D, E, F, G, A, B, C and then in reverse order, with no key signature or accidentals.

## Note frequency (hertz)

In all technicality, *music* can be composed of notes at any arbitrary frequency. Since the physical causes of music are vibrations of mechanical systems, they are often measured in hertz (Hz), with 1 Hz = 1 complete vibration per second. For historical and other reasons especially in Western music, only twelve notes of fixed frequencies are used. These fixed frequencies are mathematically related to each other, and are defined around the central note, A4. The current "standard pitch" or "concert pitch" for this note is 440 Hz. Actual practice may vary. In the past there has been a rising tendency.

The note naming convention specifies a letter, any sharp/flat, and an octave number. Any note is exactly an integer number of half-steps away from central A (A4). Let this distance be denoted  $n$ . Then,

$$\text{Frequency [Hz]} = 440 \times 2^{n/12}$$

For example, let's find the frequency of the C above Middle A (C5). There are +3 half-steps between A4 and C5

- A — (1) ' A $\sharp$  — (2) ' B — (3) ' C

$$f = 440 \times 2^{3/12} = 523.2511 \text{ Hz (approximately)}$$

It is important to keep the sign of  $n$  in mind. For example, the F below Middle A is F $_4$ . There are -4 half-steps:

- A — (1) ' A $\flat$  — (2) ' G — (3) ' G $\flat$  — (4) ' F

... each of these is descending the scale. Thus:

$$f = 440 \times 2^{-4/12} = 349.2290 \text{ Hz (approximately)}$$

Finally, it can be seen from this formula that octaves automatically yield factors of two times the original frequency (in fact this is the means to derive the formula, combined with the notion of equally-spaced intervals).

## History of note names

Music notation systems have used letters of the alphabet for centuries. The 6th century philosopher Boethius is known to have used the first fifteen letters of the alphabet to signify the notes of the two-octave range that was in use at the time. Though it is not known whether this was his devising or common usage at the time, this is nonetheless called **Boethian notation**.

Following this, the system of repeating letters A-G in each octave was introduced, these being written as minuscules for the second octave and double minuscules for the third. When the compass of used notes was extended down by one note, to a G, it was given the Greek G (γ), gamma. (It is from this that the French word for scale, *gamme* is derived, and the English word *gamut*.)

The remaining five notes of the chromatic scale (the black keys on a piano keyboard) were added gradually; the first being B which was flattened in certain modes to avoid the dissonant augmented fourth interval. This change was not always shown in notation, but when written, Bm (B flat) was written as a Latin, round "b", and Bn (B natural) a Gothic b. These evolved into the modern flat and natural symbols respectively. The sharp symbol arose from a barred b, called the "cancelled b".

In parts of Europe, including Germany, the natural symbol transformed into the letter H: in German music notation, H is Bn (B natural) and B is Bm (B flat).

In Italian notation the notes of scales are given in terms of Do - Re - Mi - Fa - Sol - La - Si rather than C - D - E - F - G - A - B. These names follow the original names given by Guido d'Arezzo, who had taken them from the first syllables of the first seven verses of a [Gregorian Chant](#) called *Ut queant laxis*, which began on the appropriate scale degrees. These became the basis of the solfege system. "Do" later replaced the original "ut", for ease of singing, though "ut" is still used in some places. "Si" or "ti" was added as the seventh degree (which is not from a word in the chant).

Categories: [Musical notation](#)

## Note value

In [music notation](#), a **note value** indicates the relative [duration](#) of a [note](#), using the color or shape of the *note head*, the presence or absence of a *stem*, and the presence or absence of *flags*.

A rest indicates a silence of an equivalent duration.

## Names and symbols

A note value does not stand for any absolute duration, but can only be understood in relation to other note values. In the table below, each symbol is exactly twice as long in duration as the symbol below it.

| Note                         | Rest                    | American name | British name |
|------------------------------|-------------------------|---------------|--------------|
| longa (music)                | longa (music)           |               |              |
| breve (or double whole note) | breve                   |               |              |
| whole note                   | semibreve               |               |              |
| half note                    | minim                   |               |              |
| quarter note                 | crotchet                |               |              |
| eighth note                  | quaver                  |               |              |
| sixteenth note               | semiquaver              |               |              |
| thirty-second note           | demisemiquaver          |               |              |
| sixty-fourth note            | hemidemisemiquaver      |               |              |
| hundred twenty-eighth note   | quasihemidemisemiquaver |               |              |

The earliest use of the hundred-twenty-eighth note is in the first movement of Beethoven's Sonata "Pathétique" Op. 13.

## Variations

The breve appears in several different versions, as shown at right.

Sometimes the longa is used to indicate a very long note of indefinite duration, as at the end of a piece.

When a stem is present, it can go either up (from the right side of the note head) or down (from the left side, except in the case of the *longa*). In most cases, the stem goes down if the notehead is on the center line or above, and up otherwise. Any flags always go to the right of the stem.

When two or more notes which would normally have flags (eighth notes or shorter) appear successively, the flags may be replaced by beams, as shown at right. Notes are typically beamed only if they appear in the same beat within the bar.

## Modifiers

A note value may be augmented by adding a dot after it. This dot adds the next lower note value, making it 1.5 times its original duration. Two dots add two lower note values, making a total of 1.75 times its original duration. The rare three dots make 1.875 the duration, and so on.

To divide a note value into three equal parts, or some other value than two, triplets may be used. However, see [swung note](#) and [notes inégales](#).

# History

## Gregorian chant

Although note heads of various shapes, and notes with and without stems appear in early [Gregorian chant](#) manuscripts, most scholars agree that these symbols do not indicate different durations, although the dot is used for augmentation.

In the 13th century, chant was sometimes performed according to rhythmic modes, roughly equivalent to [meters](#); however, the note shapes still did not indicate duration in the same way as modern note values.

## Mensural notation

Around 1250, Franco of Cologne invented different symbols for different durations, although the relation between different note values could vary; three was the most common ratio. Philippe de Vitry's treatise *Ars nova* (1320) described a system in which the ratios of different note values could be 2:1 or 3:1, with a system of mensural time signatures to distinguish between them.

This black [mensural notation](#) gave way to *white mensural notation* around 1450, in which all note values were written with white (outline) noteheads. In white notation the use of triplets was indicated by coloration, i.e. filling in the noteheads to make them black (or sometimes red). Both black and white notation periodically made use of ligatures, a holdover from the clivis and porrectus neumes used in [chant](#).

Around 1600 the modern notational system was generally adopted, along with barlines and the practice of writing multipart music in scores rather than only individual parts. In the 17th century, however, old usages came up occasionally. Here's an example from 1692, by Marc-Antoine Charpentier:

## Origins

The British names go back at least to English renaissance music, and the terms of Latin origin had international currency at that time. Obviously, *longa* means 'long', and the rest mostly indicate relative shortness. *Breve* is from Latin *brevis*, 'short', *minim* is from *minimus*, 'very small', and *quaver* refers to the quivering effect of very fast notes. The elements *semi-*, *demi-* and *hemi-* mean 'half' in Latin, French and Greek respectively, while *quasi-* means 'almost'. The chain semantic shift whereby notes which were originally perceived as short came progressively to be long notes is interesting both linguistically and musically. However the *crotchet* is named after the shape of the note, from the Old French for a 'little hook', and it is possible to argue that the same is true of the *minim*, since the word is also used in palaeography to mean a vertical stroke in mediaeval handwriting.

The American names are loan translations of the German terms: when American orchestras were first established in the 19th century they were populated to a significant degree by German emigrants.

Category: [Musical notation](#)

## Notes inégales

In music, ***notes inégales*** (French: unequal notes) refers to a performance practice, mainly from the [Baroque](#) and [Classical](#) music eras, in which notes with equal written time values are performed with unequal durations, usually as alternating long and short. The practice was especially prevalent in France in the 17th and 18th centuries, with appearances in other European countries at the same time; and it reappeared as the standard performance practice in the 20th century in [jazz](#).

## History

The practice of applying unequal treatment to successive notes with the same notated value may go as far back as the earliest music of the [Middle Ages](#); indeed some scholars believe that some plainchant of the Roman Catholic Church, including [Ambrosian](#) hymns, may have been performed as alternating long and short notes. This interpretation is based on a passage in Saint Augustine where he refers to the Ambrosian hymns as being in *tria temporum* (in three beats) (1); e.g. a passage rendered on the page (by a later transcriber) as a string of notes of equal note value would be performed as half-note, quarter-note, half-note, quarter-note, etc., thus in groups of three beats.

The rhythmic modes, with their application of various long-short patterns to equal written notes, may also have been a precursor to *notes inégales*, especially as they were practiced in France, specifically by the Notre Dame School. However the gap between the late 13th century ars antiqua use of the rhythmic modes and the middle of the 16th century, when Loys Bourgeois first mentioned notes inégales, is a large one, and little trace of the practice can be found in the fluid polyphony of the intervening period.

## France

It was in France, beginning in the late 16th century, that *notes inégales* began to take on a critical role in performance practice. The earliest treatises that mention inequality of notes in performance indicate that the reason for this practice is to add beauty or interest to a passage which otherwise would be plain. Over 85 [music theory](#) and performance treatises from France alone mention the topic between 1550 and 1810, with the large majority written between 1690 and 1780. Within this body of writing there is considerable inconsistency, but by the late 17th century a consensus practice began to emerge.

The typical rule, from the late 17th century until the French Revolution, is that *notes inégales* applies to all notes which have a duration of *one quarter the denominator of the meter*, e.g. eighth notes in a meter of 2/2, or sixteenth notes in a meter of 4/4; and *one half the denominator of the meter* in cases of triple or compound meter, e.g. eighth notes in 3/4, sixteenth notes in 3/8, 6/8, 9/8, etc. In addition, the *inégales* could only function on one metrical level; for example, if sixteenths are to be played long-short, long-short, an even eighth-note pulse must be carefully maintained for the music to retain its shape.

Sometimes the *notes inégales* are notated as unequal, for example in some of the keyboard works of François Couperin, where he uses a dot to indicate the lengthened note; however it is uncertain whether this means to apply an even greater amount of inequality to dotted eighth-sixteenth note pairs than to eighth-eighth pairs, which are already understood to be played unequally. The exact amount of inequality to apply — whether to render eighth-eighth as dotted-eighth-sixteenth, or as a two-to-one division of a triplet — is also uncertain. Most of the treatises leave this detail to the taste of the performer, so it could have varied from double-dotted to almost imperceptible, depending on the context, and probably on the historical era as well.

There were situations which were understood to be exempt from application of *notes inégales*. The most obvious and prevalent was the use of a broken arpeggiated figuration in the left hand, such as an Alberti bass, which was always understood to be played regularly. Passages which mixed many note values may have been exempted from the practice. Occasionally a long slur printed over a series of notes was understood to imply that all the notes should be played evenly, except that the first note under the slur could be accented. Passages which were highly disjunct were also less likely to be played unequally than conjunct passages, although the sources are not unanimous on even this.

Occasionally the long-short version of *notes inégales* was reversed to a short-long, known sometimes as the Lombard rhythm or the Scotch snap.

## Outside of France

One of the best sources for understanding the situation of *notes inégales* in France is the notation of music by composers from other European countries who wrote imitations of it. Music from Italy, Germany and England all borrowed this feature of French music, with the critical difference that the inequality of note values was notated, since performers could not be expected to add the *notes inégales* themselves.

Application of *notes inégales* to contemporary performance of music not written in France, for example the music of J.S. Bach, is extremely controversial, and indeed resulted in one of the most heated debates in 20th century musicology. One school of thought attempted to show that the French practice was actually widespread in Europe, and performance of music by composers as diverse as Bach and Scarlatti should be suffused with dotted rhythms; another school of thought held that even-note playing was the norm in their music unless dotted rhythms were explicitly notated in the score. Evidence on both sides of the argument is compelling, for example 17th century English writings recommending unequal playing (Roger North's

autobiographical Notes of Me, written around 1695, describes the practice explicitly, in reference to English [lute](#) music), as well as François Couperin, who wrote in *L'art de toucher le clavecin* (1716), that in Italian music, Italians always write the notes exactly the way they want them played. Then again, the practice may have been more widespread in some areas, such as England, than others, such as Italy and Germany.

J.S. Bach famously imitated the style in Contrapunctus II from the Art of Fugue; however in this piece the *notes inégales* are written out as dotted rhythms.

## Present day

### Jazz

A similar practice to *notes inégales* occurs from the 20th century to the present day, in [jazz](#), although the term "[swung note](#)" is used by jazz musicians and listeners. Indeed, it is so universally understood that a stream of eighth-notes is to be rendered unequally that the phrase "straight eighths" is used whenever a jazz arranger wants a performer to play eighth-notes evenly. In jazz practice, in addition, it is common for the notes not only to differ in duration but in intensity. Swung eighths written on the beat are generally read as quarter-note triplets, while notes written on off-beats are played as eighth note triplets. Therefore, the underlying rhythmic grid to most jazz music is an eighth note triplet pattern. Most musicians don't do the math involved in playing notes, instead simply feeling an uneven subdivision. Occasionally, sixteenth notes are swung and played fitting into a sixteenth-note triplet grid.

The similarity to the "rule" of 17th century France is striking, in that jazz is organized in rhythmic layers, with chord changes often at the level of the bar or half-bar, followed by a quarter-note beat, and an eighth-note level in which notes are played freely, and almost always unevenly. Some scholars (2) have speculated a connection by way of the influence of French music in New Orleans on early jazz styles.

### Sacred Harp

Traditional Sacred Harp singers often sing in the rhythm of notes *inégales*, thus deviating from the printed notes; for details see How Sacred Harp music is sung.

## Novelty and fad dances

**Fad dances** are [dances](#) which are characterized by a short burst of [popularity](#), while **Novelty dances** typically have a longer-lasting popularity based on their being characteristically humorous or humour-invoking, as well as the sense of uniqueness which they have.

## Fad dances

These are also called "dance crazes". Dancing style fads have always been a part of social dancing, sometimes gliding smoothly into tradition after their "newness" has faded, and sometimes simply fading away into oblivion. Dances such as the [waltz](#), jitterbug, or the Charleston were once fads, that have become a part of dance tradition.

In modern times the rate in which new dances ("fads") are introduced seems to be much faster and more often. This is certainly spurred by modern communication improvements (printed media, radio, movies, television, internet).

During the 1960s and 1970s new dances appeared almost every week, often [choreographed](#) to popular songs such as "Mashed Potato Time" by Dee Dee Sharp, and "The Twist" by Chubby Checker. Their steps were often printed in dance magazines. Dance crazes have continued into the 1980s with "YMCA", and the 1990s with "Macarena". Contemporary sources for dance crazes include [music videos](#) and movies.

There are fad dances which are meant to be danced individually (solo), others are [partner dances](#), and yet others are danced in [groups](#). Some of them were of freestyle type, i.e., there were no particular step patterns and they were distinguished by the style of the dance movement (Twist, Shake, Swim, Pony, Hitchhike). Only some of them survived until now, sometimes only as the name of a step (Suzie Q, Shimmy) or of a style (Mashed Potato) in a recognized dance. Fad dances are in fashion at the time of their popularity. They are associated with a specific time period, and evoke a nostalgia when danced nowadays.

## **Novelty dances**

**Novelty dances** might include quirky and unusual steps, or have an unusual name. Novelty dances may also have been fad dances which have remained popular over a longer period. It is not necessary that they ever were fashionably popular. These are also referred to as "party" or "dance party" dances. Novelty dances that have remained popular are no longer associated with a specific time period--they are timeless. Novelty dances are meant to be funny, and to evoke general mirth verging on silliness in participants.

## List of novelty and fad dances

## Novelty song

A **novelty song** is a usually intentionally humorous [song](#), usually in published or recorded form. These songs may take the form of a parody, or a comedic take on current events or fads and may defy the usual categorization of music, or may not even be music. Many use unusual lyrics, subjects, or instrumentation. Novelty songs are frequently unexpected hits, and may bring their authors or singers unexpected, though often temporary, fame.

Some novelty songs are the work of '[one hit wonders](#)', but some mainstream artists do occasional novelties, and a few artists have made successful careers out of novelty songs. Sometimes a novelty song may be made by a singer famous in another sphere, such as comedians, actors, or even sports stars.

### Examples of novelty songs:

"Itsy Bitsy Teenie Weenie Yellow Polka Dot Bikini" by Brian Hyland  
"Alley Oop" by The Hollywood Argyles (Gary Paxton)  
"Along Came Jones" by The Coasters  
"The Streak" by Ray Stevens  
"Another One Rides the Bus" by "Weird Al" Yankovic  
"Witch Doctor" by Ross Bagdasarian  
"Purple People Eater" by Sheb Wooley  
"Monster Mash" by Bobby "Boris" Pickett  
"Ape Call" by Nervous Norvus  
"Transfusion" by Nervous Norvus  
"Beep Beep (Little Nash Rambler)" by The Playmates  
"They're Coming to Take Me Away, Ha-Ha!" by Napoleon XIV  
"King Tut" by Steve Martin and the Toot Uncommons  
"Snoopy vs. the Red Baron" by The Royal Guardsmen  
"Wet Dreams" by Kip Adotta  
"Disco Duck" by Rick Dees  
"Elvis Was a Narc" by Pinkard & Bowden  
"Funky Moped" by Jasper Carrott, which reached the top of the charts entirely because of the obscene parody of The Magic Roundabout on the B-side.  
"Star Trekkin'" by The Firm  
"Do the Bartman" by Bart Simpson  
"The Ying-tong song" by The Goons

"Axel F" by Crazy Frog  
"The Curly Shuffle" by Jump 'n the Saddle  
"Du The Dudek" by The Trophy Boyz  
"Super Bowl Shuffle" by members of the Chicago Bears  
"Van Lingle Mungo" by Dave Frishberg  
"Mexican Radio" by Wall of Voodoo  
"Agadoo" by Black Lace  
"Aliens Really Stink" by UFO Phil

**Disc jockeys who feature novelty songs:**

- Dr. Demento

**Performers well known for novelty songs**

The Arrogant Worms  
The Goodies (UK)  
Spike Jones  
Cledus T. Judd  
Legendary Stardust Cowboy  
Roger Miller  
Perrynoid  
Pinkard & Bowden  
Luke Ski  
Ray Stevens  
Tiny Tim  
UFO Phil  
"Weird Al" Yankovic  
Brobdingnagian Bards

## Nu-jazz

**Nu-jazz** (sometimes **electro-jazz**, **jazztronica**, or **phusion**) was coined in the late 1990s to refer to styles which combine [jazz](#) textures and sometimes jazz instrumentation with [electronic music](#). Like the term [electronica](#), nu jazz is a loosely defined umbrella [musical style](#). It ranges from combining live instrumentation with beats of **jazz house** (exemplified by French St Germain, German Jazzanova and Fila Brazillia from the UK) to more band-based improvised jazz with electronic elements (such as that of the British The Cinematic Orchestra, the Belgian PhusionCulture Nu-jazz improvisation collective and the Norwegian **future jazz** style pioneered by Bugge Wesseltoft, Jaga Jazzist, Nils Petter Molvær and others).

Nu-jazz typically ventures farther into the electronic territory than does its close cousin, [acid jazz](#) (or groove jazz), which is generally closer to earthier [funk](#), [soul](#) and [rhythm and blues](#), although releases from noted groove jazz artists such as the Groove Collective blur the distinction between the styles.

## Nu metal

**Nu metal** (also called *aggro metal*, or *nü metal* using the traditional heavy metal umlaut) is a musical genre that has origins in the mid 1990s. It typically fuses influences from the [grunge](#) and [alternative metal](#) of the early 1990s with [hip hop](#), [electronic music](#) and other [metal genres](#), most often [thrash metal](#). The popularity and perceived vast commercialization of such music in the late 1990s and early 2000s led to widespread negative associations with the term nu metal, which in turn led to many fans and artists rejecting it.

## Overview

The origins of nu metal can be pinpointed to the Lollapalooza music festival in the 1990's which increased the exposure of bands who performed brands of metal and metal-influenced alternative music that had little to do with traditional genre approaches (see [Alternative metal](#)). The [funk](#) influence of Primus, The Red Hot Chili Peppers and Fishbone, the [hip hop](#) crossover of Rage Against the Machine and Urban Dance Squad, the [industrial metal](#) of Nine Inch Nails and Ministry, and the aggressive experimental rock of Tool have been mentioned numerous times as influences who toured on the festival by nu metal bands who gained mass-media exposure at the end of the millennium.

Nirvana frontman Kurt Cobain's death in 1994 would signal the beginning of the decline of [alternative rock](#) (and [grunge](#) in particular) as the driving force in modern American rock music, paving the way for nu metal to gain ground with the public. [Grunge](#) is perhaps the most recognizable ancestor of nu metal; the quick jolts of distorted [guitar](#) chords, tortured vocals and [lyrics](#) of angst associated with grunge have found clear public display in signature nu metal artists, including those with a reputation for integrating [hip hop](#) into their sound.

While Deftones, P.O.D., Korn, Limp Bizkit and Slipknot are typically cited as the genre's instigators, bands like Fishbone, Body Count, Urban Dance Squad, Faith No More, Helmet, and others are also proclaimed as progenitors. Linkin Park is the best selling nu metal act with 35 million copies sold out of their first two full-lengths, Hybrid Theory and Meteora (and of the collateral remixes and live albums). Producer Ross Robinson was labelled by some as "The Godfather of Nu Metal" due to his producing of several notable Nu Metal albums. Nu metal bands also typically claim influence by more conventional metal acts, particularly Black Sabbath; it also has some sonic similarity with [death metal](#) as well as [thrash metal](#) bands like Metallica and Megadeth [3]. *Entertainment!*, the 1979 debut from British [post-punk](#) group Gang of Four has been cited as an indirect influence. Critic Andy Kellman suggests that the album's "vaguely [funky](#) rhythmic twitch, its pungent, pointillistic guitar staccattos, and its spoken/shouted vocals have all been picked up by many."

Heavy metal bands are usually said to have a harder sound and/or appearance, but with the trend of nu metal bands becoming harder, this subject could be debated in the years to come. In any case, one should note that the terms "heavy" and "hard" are quite subjective and are likely to have different meanings for different people.

The term "nu metal" was coined in the late nineties to denote the resurgence of metal in the public eye with the rise in popularity of bands such as Korn, Limp Bizkit, and the Deftones, as well as the success of the traveling Ozzfest festival. Ozzfest, unlike the diverse Lollapalooza, provided a venue solely for the metal scene. Mainstream metal had been largely derided in America for most of the decade as [glam metal](#) excess had been eliminated by the success of alternative rock, but Ozzfest demonstrated that a sizable audience existed for new heavy metal sounds. Unlike previous eras who held bands such as Led Zeppelin and Judas Priest as their icons, the newer bands typically drew direct inspiration from more recent metal movements (particularly thrash and alternative metal).

Some of the genres first instigators P.O.D with their first release coming out in 1991, saw an emcee put with a metal guitarist. While Korn had released their first album in 1994 at the height of alternative rock's popularity, their true breakthrough came with the release of their 1998 album *Follow the Leader* and the accompanying Family Values Tour that year, which also included Limp Bizkit, Incubus, Orgy, Ice Cube and Rammstein. Soon other bands gained major radio airplay and rotation on MTV's Total Request Live program, leading critics to declare a resurgence in rock music as a whole.

The sentiment was reinforced by MTV's "Return of the Rock" specials which featured Korn, Limp Bizkit, and related bands. Other acts, such as Slipknot, Adema, Godsmack, Papa Roach, P.O.D., and Incubus, also managed major mainstream success at the turn of the century. Nu metal became a term not only encompassing alt-metal bands like Korn, but also a large number of bands who were considered a revitalization of metal by adopting and updating the extreme aggression and tropes of metal such as showmanship and machismo for the turn of the century. Instead of dressing up in spandex, conjuring up images of the occult and dating models, nu metal bands like Korn and Limp Bizkit mixed hip hop and skateboarding fashion, the goatees, tattoos, and piercings of the alternative scene from the early and mid 1990's (Korn bassist Fieldy), painted their faces (Limp Bizkit guitarist Wes Borland), expressed angst about relationships and childhoods, and dated porn stars, models, actress, pop stars etc.

### **Mainstream success and criticisms**

Nu metal bands essentially defined the image of modern metal music in the late 90s/early 2000s by headlining major rock concerts like the Ozzfest festival and Woodstock 1999 as well as dominating the playlists of both Modern Rock and hard rock radio stations, to the chagrin of many. Criticisms included the incorporation of hip hop and electronic sounds, the emphasis of groove and texture over traditional metal hallmarks such as solos and

intricate riffing, the mass appeal that some viewed as [selling out](#) and a faux rebellion, and particularly the emphasis on angst and aggression in the music. Many disapproved of the rapping and screaming of Nu Metal frontmen, favoring the more ambitious vocal performances of classic metal acts. Fans of [rap music](#) often feel that their genre has been adapted tastelessly by nu metal bands (Papa Roach's Jacoby Shaddix, for example, for this reason has abandoned rapping in his band's most recent work). And even P.O.D. with the introduction of a new self-titled album in 2003 (with new guitarist Jason Truby) discarded their rap-style vocals for the first time ever, but was re-introduced afterwards, and the band remains one of the only rap-style nu metal bands to still release that type of music (it sometimes leads many classifying P.O.D. as rapcore rather than nu metal). Limp Bizkit's Fred Durst, too, tried to give up rapping in most songs from Results May Vary.

Many people refer to fans of nu metal as "mallgoths," "mini-moshers," or "angsters," claiming that nu-metal fans are subversive "rebels without a cause" (whose rebellious attitude is questionable because of their allegiance to corporate vehicles). Some people believe that the entire nu-metal genre was invented by record executives (similar claims have been made about [Post-Grunge](#)). The [postmodern](#) art design of nu-metal albums and music videos has come under criticism for attempting to appear raw and gritty in spite of the multimillion dollar production teams behind such designs.

A pivotal moment in nu metal's history was Woodstock 99 where a large number of nu metal acts appeared on the bill. After the three-day festival ended in rioting, many blamed the aggressive nature of nu metal bands for the destruction; Limp Bizkit's set drew particular scorn, in particular their performance of the song "Break Stuff" where some believed frontman Fred Durst encouraged the audience to engage in violence. However, nu metal continued to be quite popular, and in 2000 Limp Bizkit's Chocolate Starfish and the Hot Dog Flavored Water became the rock record to debut with the biggest first-week sales in the SoundScan era up to that point. Another Family Values tour launched in 2001, with Fred Durst label signings Staind headlining the tour.

## **Abandoning the Term**

Many bands have tried to distance themselves from the "nu metal" tag over the years, particularly the Deftones, who early in their career stopping touring and collaborating with Korn partly out of fear of being classified as part of a generic sound. This partially had to do with the use of the term nu metal as an insult by many people, including extreme metal fans and alternative rock fans. It is argued by detractors that Nu metal is not a 'true' type of metal, but a form of alternative music. A few bands also dislike to be pigeonholed

into a single movement they felt they had no real connection with. Quite a few nu metal bands, including Papa Roach and Limp Bizkit, abandoned the integration of hip hop (once viewed as vital to the sound of nu metal, mainly for its vocals) and experimented with different sounds on their later albums, often with less success than they had previously. Currently nu metal has declined in popularity in the United States as [Indie rock](#), [Emo](#), [Metalcore](#), and other genres have gained support, although it is still considered an active force in the music mainstream, particularly overseas in places like the United Kingdom.

Nu metal bands that still remain popular to today's standards Korn, Limp Bizkit, Deftones, P.O.D., Disturbed, Blindside, Adema, Drowning Pool, Papa Roach, A Perfect Circle and Linkin Park, and even heavier bands such as Slipknot, Mudvayne and Spineshank still seem to remain popular in rock sales, even due to the so called 'end of the nu-metal era'.

Categorization of specific artists as "nu metal" is difficult, considering the widespread mistrust of the term among artists and fans alike, and the "edges" are fuzzy where nu metal bleeds into other genres. In general, the artists in question are American bands that found their first success in the early and mid- to late 1990s. Immediately, other artists began shaping their sound to resemble the new groove-driven metal.

## Musical traits

### Guitar

Unlike traditional metal, the overall defining trait of nu metal guitar-playing is the emphasis on mood and texture over melody or complex instrumentation, achieved largely through performance or effects. Generally speaking, the emphasis in the music is on either communicating feelings of angst and hostility, or motivating a crowd to move with the beat -- ideally, both at once. However, guitar-playing in nu metal still often varies vastly in complexity, sound and usage. Bands take elements from several forms of music when composing the riffs for their guitars, causing a high variance between the bands. One common trait of most nu metal bands however, is to emphasize the guitar as a rhythmic instrument. Riffs often consist of only a few different [notes](#) or power chords played in rhythmic, syncopated patterns. To emphasize this rhythmic nature, nu metal guitarists generally make liberal use of palm muting, that is often widely spaced out and blend easily into the surrounding riffs.

Another common technique with nu metal guitarists is the use of de-tuned strings whose lower [pitch](#) creates a thicker, more resonant sound. Strings 'de-tuned' in this way, are often drop-D or lower, sometimes adding a seventh string. Guitar solos are generally not part of nu metal songwriting, and when they do appear they are often short and uncomplex when compared to those of other metal genres. Some even consider these as more like melody lines for their short length.

Linkin Park, Spineshank and Static-X are three bands that may be considered to represent examples of many techniques common to nu metal. There are exceptions in the genre however, with some bands using few to none of these common traits, such as Korn.

### Bass

The speed and skill of a bassist in traditional heavy metal plays a large part of outcome in the band's sound, complementing percussive tempos (and occasionally the guitar riffs) to add a strong rhythm to the tone.

In nu metal, the bass is often the main focus of the music, acting often as the lead instrument, setting the bands other instruments as acting as rhythm. The nu metal bass is often slow and reminiscent of hip hop or pop music,

strutting a funky, loud sound that would arguably compete with the presence of the band's vocalist, however this is not always the case.

## **Drums**

Nu metal drumming usually consists of 4/4 beats, often believed to come from the genre's [hip hop](#) influence. These 4/4 beats are sometimes used as a sole drumming pattern. One of the most important aspects of nu metal drumming, is that tempo rises above the established midtempo range on chorus lines and bridges. This is an almost universal rule, with a relatively small number of bands, including Slipknot and System of a Down, being the rare exceptions. Also, many notable nu metal bands feature a [DJ](#) for additional rhythmic instrumentation (especially scratches and [electronic](#) backgrounds). Two of the more famous nu-metal DJs are DJ Lethal of Limp Bizkit and Joe Hahn of Linkin Park.

## **Vocals**

Nu metal bands often feature aggressive vocals that range from melodic [singing](#) akin to [pop music](#) music style, guttural screaming and shouting from various forms of metal music and [metalcore](#) types, and [rapping](#).

Some distinction is usually maintained between bands that use rapping vocals extensively, and those that don't. Bands featuring almost exclusively rap vocals are sometimes loosely called 'rap metal', while the less common term [rapcore](#) is term used by fans to describe bands that use a combination of singing, screaming, and/or rapping (for example, the vocals of Limp Bizkit, Linkin Park and P.O.D. , some b-sides by Korn's work, and most songs from Papa Roach's early releases). Moreover, it's very difficult saying if Corey Taylor raps or not in several songs by his band Slipknot.

Tool has been a recognizable origin for some nu metal vocal styles, Chevelle's Pete Loeffler, Taproot's Stephen Richards and even Limp Bizkit's Fred Durst have cited Maynard James Keenan's signature style as an influence. Keenan however has expressed distaste for this and has stated that he does not see the influence, specifically referring to Limp Bizkit.

## **Lyrical themes**

The [lyrics](#) of most nu metal bands reflect on the stresses and mishaps of everyday life. Topics covered in this manner range from childhood alienation or abuse, socio-economic status and relationship/marital difficulties. Political progressivism and activism is a less common theme, but still noticeable in

many nu metal bands. More often, this is usually discussed candidly rather than in songs.

## Nu skool breaks

**Nu skool breaks** is a form of [breakbeat](#) music genre, combining the futuristic sense of [drum and bass](#), the sounds of [techno](#), the bass of [dub](#) and the beats from real drummers and [drum machines](#). The genre also prominently features [electro](#) and [hip-hop](#) influences and tracks typically run at 130 to 140 bpm.

## Origins

TCR label founder Rennie Pilgrem coined the term to promote his then club night, Friction, differentiating it from the increasingly boorish Big Beat scene. He also released two highly successful compilations, Nu Skool Breaks, Volume 1 and 2, through UK based Kickin Records in 1998. The first volume of these was recorded live at the aforementioned London club night Friction, an influential breaks night that provided a springboard for the careers of producers Adam Freeland and Tayo, as well as promoters Ian Williams and Pilgrem who collectively founded the night. Friction became a focal point for their emerging styles of breakbeat-centered music and the night was boosted by its initial launch at Bar Rumba, a club known for its competent soundsystem and intimate basement space.

Recently, the UK sound has begun to devolve, losing the characteristic breakbeat that defines the sound, and replacing it with a beat that more resembles house music. The term 'plod' has been coined for this style - describing the nature of the beats sound as if they are plodding along like a horse's hooves. This new style of nu skool has also gained a bad reputation among the nu skool "purists", and in most circles is frowned upon as even being called "Breaks".

The sound is now split into two main camps - Tech-Breaks and Bassline-Breaks. The former sound runs closer to Techno and Progressive House, but with a tougher sound, while the latter borrows heavily from electro, two-step, ragga and dub. Although the sounds are different there are many similarities and the current trend in the world of Breaks would appear to be the two sounds are uniting as Breaks continues to expand as one of the most adaptable and progressive undergrounds dance music styles. There has also been a recent trend towards rock/breaks crossover tracks, but the original specific sound of Nu-Skool Breaks is beginning to fragment into many new styles.

## Artists

Popular breakbeat producers include Tipper, Uberzone, Freq Nasty, IIs, Influenza, Koma & Bones, Peo de Pitte, Baobinga, Aquasky vs. Masterblaster, The Breakfastaz, Hybrid and The Plump DJs. The major producers have remixed and/or produced tracks for big acts such as Orbital, \*NSYNC, Kelis and New Order.

In the UK the scene is dominated by acts like the Autobots, Plump DJs, Krafty Kuts, Evil Nine, Precision Cuts, Adam Freeland and Lee Coombs. In the USA, known for its more [acid](#)-based breaks sound, the sound has gained popularity, especially on the West Coast. American artists include DJ Icey, Crystal Method, ESKMO, Influenza, FACTORe. Australia also has a burgeoning scene with popular artists including Bass Kleph, Nick Thayer, Nubreed, Phil K, Luke Chable, Dopamine, Andy Page and Kid Kenobi.

Newer artist albums include "Midi Style" by General Midi and "Teampayers" by Aquasky.

# Nu-NRG

**Nu-NRG** is a form of electronic dance music that evolved from the 1980s [hi-NRG](#). Pioneered by Peter Harris in the late 1990s, Nu-NRG is similar to epic trance and mainstream European [house music](#) but harder and faster beat. Some nu-NRG tracks are [melodic](#), and may be accompanied by [soprano](#) or [mezzo-soprano vocals](#).

## House

[Acid](#) - [Ambient](#) - [Chicago](#) - [Dark](#) - [Deep](#) - Dream - [Garage](#) - [Ghetto](#) - [Hard](#) - [Hip](#) - Italo - [Latin](#) - [Minimal](#) - [Microhouse](#) - Progressive - [Pumpin'](#) - [Tech](#) - [Tribal](#)

Other [electronic music](#) genres

[Ambient](#) | [Breakbeat](#) | [Drum and bass](#) | [Electronica](#) | [Electronic art music](#) | [Hard dance](#) | [Hardcore](#) | [House](#) | [Techno](#) | [Trance](#) | [Industrial](#) | [Synthpop](#)

## Nursery rhyme

A **nursery rhyme** is a traditional [song](#) or poem taught to young children, originally in the nursery. Learning such verse assists in the development of vocabulary, and several examples deal with rudimentary counting skills. ("Eeny, meeny, miny, moe" is an example of a counting-out game.) In addition, specific actions, motions, or dances are often associated with particular songs.

Many cultures (though not all; *see below*) feature children's songs and verses that are passed down by oral tradition from one generation to the next (either from parent to child, or from older children to younger children). In the English language, the term "nursery rhyme" generally refers to those of European origin, and the best known examples are English and originated in or since the 17th century. Their origins were possibly a form of oral political cartoon, from an era when free speech could get the speaker imprisoned.

Some nursery rhymes, however, are substantially older. "Sing a Song of Sixpence" exists in written records as far back as the Middle Ages. Arguably the most famous collection of nursery rhymes is that of Mother Goose. Some well known nursery rhymes originated in the United States, such as "Mary had a little lamb".

"Ring-Around-the-Rosie" (alternatively "Ring a Ring O'Roses") is popularly believed to be a metaphorical reference to the Great Plague of London, although this has been widely discredited, particularly as none of the "symptoms" described by the poem even remotely correlate to those of the Bubonic plague, and the first record of the rhyme's existence was not until 1881.

A credible interpretation of "Pop Goes the Weasel" is that it is about silk weavers taking their shuttle or bobbin (known as a "weasel"), to a pawnbrokers to obtain money for drinking. It is possible that the "eagle" mentioned in the song's third verse refers to The Eagle freehold pub along Shepherdess Walk in London, which was established as a music hall in 1825 and was rebuilt as a public house in 1901. This public house bears a plaque with this interpretation of the nursery rhyme and the pub's history. Alternatively, the term "weasel" might be Cockney rhyming slang for a coat ("weasel and stoat" = "coat"), and the coat itself was pawned.

An amusing and ironic accidental hoax involving the rhyme "Sing a Song of Sixpence" was perpetrated on the Urban Legends Reference Pages.

Scholars occasionally think they have "all" nursery rhymes written down, or know the last time that a rhyme was in use (some fall out of favor). However, as nursery rhymes are mainly an oral tradition, nursery rhymes will

surface anew (see Bill Bryson's book *Made in America : An Informal History of the English Language in the United States* for an excellent example).

There are some indigenous peoples which consider music sacred, so that only elder men may sing songs, and the songs are taught during sacred rituals in adulthood. It is forbidden for women or children to sing. Hence, these cultures do not have these kinds of songs.

## List of nursery rhymes

Alphabet song

"As I Was Going by Charing Cross"

"As I Was Going to St Ives"

"Baa, Baa, Black Sheep"

"Bye, baby bunting"

"Christmas is Coming"

"Ding Dong Bell"

"Doctor Foster"

"Five little speckled frogs"

"Froggy would a-wooing go"

"Georgie Porgie"

"Goosey Gander"

"Grand old Duke of York"

"Hey Diddle Diddle"

"Hickory Dickory Dock"

"Horsey Horsey"

"Hot Cross Buns"

"Humpty Dumpty"

"Hush Little Baby"

"I'm a Little Teapot"

"Itsy Bitsy Spider"

"Jack and Jill"

"Jack Be Nimble"

"Jack Sprat"

"Kookaburra sits in the old gum tree"

"Ladybird Ladybird"

"Little Bo Peep"

"Little Boy Blue"

"Little Jack Horner"

"Little Miss Muffet"

"Little Tommy Tucker"

"London Bridge is falling down"

"Lucy Locket"

"Mares eat oats"

"Mary Had a Little Lamb"

"Mary, Mary, Quite Contrary"

"Monday's Child"

"Nuts in May"

"Old King Cole"  
"Old Mother Hubbard"

"Pop Goes the Weasel"  
"Pussy Cat Pussy Cat"  
"Rain Rain Go Away"  
"Ride a cock horse to Banbury Cross"  
"Ring Around the Rosie" or "Ring a Ring O'Roses"  
"Rock-a-bye Baby"  
"Row, row, row the Boat"  
"Rub A Dub Dub"  
"See Saw Margery Daw"  
"Simple Simon"  
"Sing a Song of Sixpence"  
"Star Light, Star Bright"  
"Solomon Grundy"  
"The Name Game"  
"The Queen of Hearts"  
"There Was A Crooked Man"  
"There Was An Old Lady Who Swallowed A Fly"  
"There Was An Old Woman Who Lived In A Shoe"  
"This Is The House That Jack Built"  
"This Little Piggy"  
"This Old Man"  
"Three Blind Mice"  
"Tinker, Tailor"  
"Tom, Tom, the Piper's Son"  
"Twinkle Twinkle Little Star"  
"Two Little Dickie Birds"  
"Wee Willie Winkie"  
"What Are Little Boys Made Of?"  
"Who Killed Cock Robin?"

## Popular culture

Stand up comic Andrew Dice Clay has performed "vulgar" versions of old standards in his act. The humor was often based on shock value and abrupt resolutions which identified a more practical or realistic result. As an example, in Clay's version of "Jack and Jill", Jill is implied to be a prostitute:

Jack and Jill went up the hill,  
Both with a buck and a quarter.  
Jill came down with two-fifty.

Other rhymes Clay has modified are "Three Blind Mice", "Twinkle Twinkle Little Star", "The Little Old Woman Who Lived in a Shoe", "Little Boy Blue", "Hickory Dickory Dock", and "Little Jack Horner".

Metal band, Korn's song "Shoots and Ladders" from their self-titled first album, Korn, consists almost entirely of nursery rhymes in its lyrics.

# Oboe

The **oboe** is a double reed musical instrument of the woodwind family. It is a descendant of the shawm. The word "oboe" is derived from the French word *hautbois*, meaning "high wood". It is still on rare occasion called *hautboy* in English. A [musician](#) who plays the oboe is called an oboist. Careful manipulation of embouchure and air pressure allows the player to express a huge range of emotions and moods.

## The instrument

It is more difficult to play and produce a good tone on the oboe compared to woodwind instruments such as the [flute](#) or [clarinet](#). Beginners often produce a nasal, often out-of-tune, and strident tone that is difficult to blend with other instruments, but an advanced oboist can produce a rich, warm, and beautiful tone. It is pitched in C.

In comparison to other modern woodwind instruments, the oboe has a very clear and somewhat piercing tone, because it emphasizes the even harmonics. Its uniquely penetrating [timbre](#) gives it the ability to cut through and be audible over other instruments in large ensembles, making it easy to tune to. Orchestras usually set the [pitch](#) by listening to the oboe playing concert A. Setting the pitch of the oboe is achieved by changing the position of the reed in the instrument, or by permanently altering the scrape of the reed itself. Subtle changes in pitch are also possible by adjusting the embouchure. Some changes can also be made by meticulously adjusting the reed position.

### Baroque oboe

The oboe first appeared in French courts around 1650. In the 17th century Jean Hotteterre and Michel Danican Philidor modified the shawm, so that the new oboe had a narrower bore and a reed which is held by the player's lips near the end. Henry Purcell was the first composer to specifically score for it and Johann Sebastian Bach wrote extensively for it. It was the main melody instrument in early military bands until ousted by the [clarinet](#).

Baroque oboes were generally made from boxwood or fruit wood, with a wider bore and wider reed than the modern instrument, giving it a "creamier" and more clarinet-like timbre. In the [Baroque](#) era the oboe had two brass [keys](#), one the C-key and the other the Em-key. This instrument had no C<sub>4</sub> nor were there octave-keys. Notes in the successive octaves were reached through overblowing. Notable oboe-makers of that period are the German Denner and the English Stanesby. The range for the Baroque oboe extends from C<sub>4</sub> to E<sub>m6</sub>. In the 20th century, a few makers began producing new Baroque oboes to specifications from surviving historical instruments, for use in the performance of early music.

### The Classical oboe

Later, in the [classical](#) period, the oboe became outfitted with eight keys, among them the so-called Go-key and the long-awaited octave-key, which allowed the player to play in the higher ranges without overblowing the instrument. The range for the Classical oboe extends from C4 to F6.

## **Modern oboe**

The modern oboe was developed in the mid-19th century by the Triebert family of Paris. Using the Boehm flute as a source of ideas for key work, Guillaume Triebert and his sons Charles and Frederic devised a series of increasingly complex yet functional key systems. A variant form using large tone holes, the Boehm system oboe, was never popular in orchestral work but was used in military bands on the continent well into the 20th century. F. Lorée of Paris developed the modern oboe, the so-called System 6 bis, in 1905. Minor improvements to the bore and key work have continued through the 20th century, but there has been no fundamental change to the character of the instrument; 21st century oboes are louder and have more even scales than their equivalents of a century ago, but are essentially the same instrument .

The modern oboe is most commonly made from grenadilla (or African blackwood) and some manufacturers also make oboes out of other members of the dalbergia family of wood (cocobolo; rosewood; violetwood), or high-quality plastic resin. The oboe has an extremely narrow conical bore. It does not have a mouthpiece like the clarinet or saxophone; instead it has a double-reed consisting of two thin blades of cane tied together on a small-diameter metal tube (staple). The reed is held on the lips. The commonly accepted range for the oboe extends from Bm3 to G6, over two and a half octaves, though its common tessitura lies from D4 to Em6, and can play from Bm3 to C#7. Together with the flute and recorder, it is one of the oldest [woodwind](#) instruments.

The modern oboe has more than 20 keys which are usually silver-plated or occasionally gold-plated. The oboe is fingered similarly to the flute and saxophone. The modern oboe mechanism is mainly of two types: (a) the French conservatoire system and (b) the English thumbplate system. There is also a combination system where the French system has a thumbplate added, and also a German system involving fully automatic octaves.

In Vienna, an oboe preserving the bore and tonal characteristics has continued in use to the present day. This Akademiemodell oboe, invented in the early 20th century by Hermann Zuleger, is now made by a select few makers, notably Guntram Wolf and Yamaha. Apart from the major Viennese orchestras, which continue to exploit the Akademiemodell's unique color, it is not used.

## Other members of the oboe family

The oboe has several siblings. The most widely known today is the cor anglais, or English horn, the tenor (or alto) member of the family. A transposing instrument, it is pitched in F, a perfect fifth lower than the standard oboe. The oboe d'amore, the alto (or mezzo soprano) member of the family, is pitched in A, a minor third lower than the oboe. J.S. Bach used both the oboe d'amore as well as the taille and oboe da caccia, Baroque antecedents of the cor anglais, extensively. Even less common is the bass oboe (also called baritone oboe), which sounds one octave lower than the regular oboe. Delius and Holst both scored for it, and today it is used increasingly often. Almost a museum piece is the more powerful heckelphone, which has a wider bore and larger tone than the bass oboe. Only 165 heckelphones have ever been made, and competent players are hard to find. The least common of all is the musette (also called oboe musette or piccolo oboe), the sopranino member of the family; it is usually pitched in E-flat or F above the standard oboe.

Keyless folk versions of the oboe (most descended from the shawm) are found throughout Europe. These include the musette (France) and bombarde (Brittany), the piffero and ciaramella (Italy), and the xirimia (Spain). Many of these are played in tandem with local forms of [bagpipe](#). Similar oboe-like instruments, most believed to derive from Middle Eastern models, are also found throughout Asia as well as in North Africa.

## Classical works featuring the oboe

Wolfgang Amadeus Mozart, Oboe Concerto in C major, Quartet in F major  
Antonio Vivaldi, Oboe Concerti  
Johann Sebastian Bach, Brandenburg Concertos nos. 1 and 2, Concerto for Violin and oboe  
Tomaso Albinoni, Oboe Concerti  
George Frideric Handel, The Arrival of the Queen of Sheba, Oboe Concerti and Sonate  
Georg Philipp Telemann, Oboe Concerti and Sonate  
Richard Strauss, Oboe Concerto  
Joseph Haydn, Oboe Concerto in C major  
Vincenzo Bellini, Concerto in E major  
Luciano Berio, Sequenza VII  
Domenico Cimarosa, Oboe Concerto in C major  
Francis Poulenc, Oboe Sonata  
Benjamin Britten, 6 Metamorphoses after Ovid  
Robert Schumann, 3 Romanzen for Oboe and Piano  
Carl Nielsen, Two Fantasy Pieces for Oboe and Piano  
Karl Ditters von Dittersdorf, Oboe Concertos  
Georg Philipp Telemann, Sonata in A minor  
Alessandro Marcello, Concerto in D minor  
Ralph Vaughan Williams, Concerto for Oboe and Strings and Ten Blake Songs for oboe and tenor

## The oboe in non-classical genres

While the oboe is rather rarely used in musical genres other than Western classical, there have been a few notable exceptions.

### Traditional and folk music

Although keyless folk oboes are still used in many European folk music traditions, the modern oboe has been little used in traditional music. One exception was the late Derek Bell, harpist for the Irish group Chieftains, who used the instrument in some performances and recordings. The U.S. contra dance band Wild Asparagus, based in western Massachusetts, also uses the oboe, played by David Cantieni. REM, a rock band from Athens, GA features the oboe in several tracks of their album *Out of Time*, most notably as the lead melodic instrument on the wordless song "Endgame."

### Jazz

Although the oboe never featured prominently in [jazz](#) music, some early bands, most notably that of Paul Whiteman, included it for coloristic purposes. The multi-instrumentalist Garvin Bushell (1902-1991) played the oboe in jazz bands as early as 1924 and used the instrument throughout his career, eventually recording with John Coltrane in 1961.[1] Though primarily a tenor saxophone player, Yusef Lateef was among the first (in 1963) to use the oboe as a solo instrument in modern jazz performances and recordings. The 1980s saw an increasing number of oboists try their hand at non-classical work, and many players of note have recorded and performed alternative music on oboe.

### Other oboists performing in non-classical genres

Marshall Allen (with Sun Ra Arkestra), jazz, free jazz  
Kyle Bruckmann, free improvisation  
Garvin Bushell, jazz  
Joseph Celli, free improvisation, contemporary classical music  
Brian Charles  
Gene Cipriano  
Lindsay Cooper, art rock

Caroline Glass, indie rock  
Robbie Lynn Hunsinger  
Joseph Jarman, jazz, free jazz  
Karl Jenkins  
Rahsaan Roland Kirk  
Marta Konicek  
Yusef Lateef, jazz  
Caris Liebman  
Andy Mackay (with Roxy Music), art rock  
Charlie Mariano  
Paul McCandless (with Paul Winter Consort and Oregon), jazz  
Makanda Ken McIntyre, jazz  
Janey Miller (with New Noise)  
Mitch Miller  
Roscoe Mitchell, jazz, free jazz  
Manuel Munzlinger  
Romeo Penque  
Dewey Redman, jazz  
Don Redman, jazz  
Nancy Rumbel easy listening  
Brenda Schumann-Post world, jazz  
Matt Sullivan  
Sufjan Stevens, indie rock

## **Fictional oboist**

- Tess Bagthorpe (in the *Bagthorpe Saga* by Helen Cresswell)

## Oboe manufacturers

A majority of professional oboists in the United States favor instruments made by the French company F. Lorée. Following is a list of the major oboe manufacturers.

- Buffet  
Cabart ( A Division of F. Lorée )  
Covey  
Fossati  
Fox  
Frank  
Howarth  
A. Laubin  
F. Lorée  
Marigaux  
Mönnig  
Patricola  
Rigoutat  
Selmer  
Yamaha

Categories: [Woodwind instruments](#)

## Octet

In [music](#), an **octet** is a [musical ensemble](#) consisting of eight [instruments](#) or a musical composition written for it.

The two best known octets in [classical music](#) are probably those by Felix Mendelssohn (which is for a double [string quartet](#)) and Franz Schubert (which is for [clarinet](#), [bassoon](#), [horn](#), [violin](#), [viola](#), [cello](#), and double bass). Igor Stravinsky also wrote an octet for [wind instruments](#) (an unusual grouping of [flute](#), clarinet, two bassoons, two [trumpets](#), and two [trombones](#)) and Paul Hindemith wrote a lesser known piece for clarinet, bassoon, horn, violin, two violas, cello, and double bass. Dimitri Shostakovich also wrote a string octet which utilizes his typical atonal techniques difficult for musicians.

"Octet" is also rarely (and strangely) used as a name for a vocal performing group, not necessarily of eight members, as proven by the Glens Falls High School Octet in New York State. This particular group has forty-nine (49) members.

Saxophonist David Murray leads a famous experimental jazz octet, the David Murray Octet.

# Oi!

---

**Stylistic origins:**

1950s [R&B](#), [rock and roll](#), [country](#), and [rockabilly](#), 1960s [garage rock](#), frat rock, [psychedelic rock](#), [pub rock](#), [glam rock](#), and proto-punk

**Cultural origins:**

Mid 1970s United States, Australia and United Kingdom.

**Typical instruments:**

Vocals – [Guitar](#) – [Bass](#) – [Drums](#)

**Mainstream popularity:**

Chart-topping in the UK, less success elsewhere. Some success for [pop punk](#), especially [ska punk](#) and [Two Tone](#)

**Derivative forms:**

[Alternative rock](#) – [Emo](#) – [Gothic rock](#) – [Grunge](#) – [Math rock](#) – [New Wave](#) – [Post-punk](#) – [post-punk revival](#)

---

[Anarcho-punk](#) – [Christian punk](#) – [Crust punk](#) – [Garage punk](#) – [Hardcore](#) – [Horror punk](#) – **Oi!** – [Pop punk](#)

[Anti-folk](#) – Chicano punk – [Death rock](#) – [Funkcore](#) – Jazz punk – [Psychobilly](#) – [Queercore](#) – [Ska punk](#) – [Two Tone](#)

[History](#) – [Cassette culture](#) – [Fashion](#)

**Oi!** is a sub-genre of [punk rock](#) that sought to align punk with a working-class "street level" following, originating in the United Kingdom. It began in the latter part of 1977, fusing the styles of early punk bands such as the Clash and the Ramones; early British rock like the Rolling Stones and The Who; football (soccer) chants; pub rock like the 101ers and Eddie and the Hot Rods; and glam rock bands like Slade and Sweet.

The music was seen as promoting unity between punks, skinheads and other working class youths. Originally, the style was called "[streetpunk](#)" or "reality-punk." It wasn't until the early 1980s that music journalist Garry Bushell labeled the movement Oi!, supposedly derived from the Cockney Rejects song *Oi! Oi! Oi!*.

The original Oi! bands included Cock Sparrer, the Cockney Rejects, Angelic Upstarts, and Sham 69, although some of them were around for years before the word Oi! was used to describe their style of music. They were followed by The Business, The Last Resort, The 4-Skins, Combat 84, Condemned 84, Infa-Riot, The Blood, The Oppressed and Anti-Heros.

Because many skinheads were recruited by racist organizations such as the National Front, some histories of rock music dismiss all Oi! as racist.

However, none of the original streetpunk bands were particularly racist, and some, such as the Angelic Upstarts, were associated with the left wing and joined anti-racist campaigns. One definite exception is Skrewdriver. The band's early material is sometimes considered classic Oi!. But by the mid-1980s Skrewdriver were leading a small neo-Nazi rock scene. Apart from lead singer Ian Stuart Donaldson, the band had a different lineup from that of the late 1970s. Their music was recognizably Oi!, but they sought to distance themselves from punk in general, preferring the term "R.A.C." ("Rock Against Communism" — a reaction to Rock Against Racism). Members of the earlier incarnation of Skrewdriver have stated that they do not wish to be associated with Donaldson's later version.

The media associated Oi! with far right politics following the events of July 4, 1981 at the Hamborough Tavern in Southall, London, when a concert by the bands The Business, the Last Resort and the 4-Skins was followed by violent clashes between the predominantly white audience and the local Asian population, who firebombed the tavern. However it is worth recording that in the aftermath many Oi! bands were not slow to condemn racism in all its forms, as well as categorically denying any association with fascism.

Unfortunately these denials were met with cynicism from some quarters following the release of the *Strength Thru Oi* compilation album around the same time. Not only was its title a play on a Nazi slogan (Strength Through Joy) but the cover featured Nicky Crane, a Nazi activist who was serving a four year prison sentence for racist violence. Garry Bushell, who was responsible for compiling the album, claimed however that its title was a pun on The Skids album Strength Through Joy. He also denied knowing the identity of the skinhead on the album's cover until it was exposed by the Daily Mail two months later. Bushell, who was a socialist at the time, later noted the irony of being branded a far-right activist by a paper who "had once supported Oswald Mosley's Blackshirts, Mussolini's invasion of Abyssinia, and appeasement with Hitler right up to the outbreak of World War Two."

The Oi! movement soon after began to lose momentum in the UK, but Oi! scenes were forming elsewhere in continental Europe, Japan, and North America. In the United States, the Oi! phenomenon was mirrored by the Hardcore explosion of the early 1980s, especially by bands such as Agnostic Front, Iron Cross, and S.S. Decontrol. Although similar in spirit and influence to Oi! (particularly in the earlier stages), Hardcore expounded itself in a peculiarly American middle class (rather than working class) fashion as its influences spread. In the mid-1990s, a revival of interest in Oi! music began, with new bands emerging and older bands receiving more recognition. With this revival came a further concerted effort to distance Oi! from racism.

More recent Oi! bands include The Templars, Oxblood, Wretched Ones, Those Unknown, Nuts and Bolts, The Bruisers, Hanover Saints,

Bonecrusher, Discipline, Retaliator, The Lager Lads, Oxymoron and Hard Skin.

[Anarcho-punk](#) - [Anti-folk](#) - [Crust punk](#) - [Garage punk](#) - [Hardcore](#) - [Post-hardcore](#) - [Horror punk](#) - [New Wave](#) - [No Wave](#) - [Noise rock](#) - [Oi!](#) - [Pop punk](#) - [Post-punk](#) - [Psychobilly](#) - [Deathcountry](#) - [Riot grrrl](#) - Ska punk - [Streetpunk](#) - [Two Tone](#)

## Old school hip hop

**Old school hip hop** is the very first [hip hop music](#) to come out of the block parties of New York City in the 1970s and early 1980s. The old school era ended and the [golden age](#) began with the popularity of Run-DMC's 1986 album, Raising Hell. In modern usage, the term is often used to refer to hip hop from the early 1990s by numerous radio stations and television channels, including BET.

## History

The first recordings of old school hip hop were the Fatback Band's "King Tim III" and The Sugarhill Gang's "Rapper's Delight". While "King Tim III" is widely regarded as the first recorded hip hop song, it was the Sugarhill Gang that won hip hop its first mainstream popularity.

Old school hip hop would often sample [disco](#), [soul](#), and [funk](#) tracks. In the case of the Sugarhill Gang, a live band was used for samples. However, the old school sound soon became based largely on drum machines and popular "[break](#)" samples.

In contrast with the later rhymes of new school hip hop, old school rap was relatively simple in its [rhythms](#) and cadences.

Old school rap was often focused on good times, parties and friendship. An exception was "The Message", a rap song written by Melle Mel for his hip hop group, Grandmaster Flash and The Furious Five. The popularity of "The Message" led the "message rap" to gain a place in the hip hop canon.

# Oldschool jungle

## Oldschool jungle

**Stylistic origins:** [Breakbeat hardcore](#), [Techno](#), Rare groove, [Reggae](#), [Darkcore](#)

**Cultural origins:** Early 1990s, United Kingdom

**Typical instruments:** [Synthesizer](#) - [Drum machine](#) - [Sequencer](#) - [Sampler](#)

**Mainstream popularity:** Low

**Derivative forms:** [Drum and bass](#)

### **Subgenres**

Ragga jungle, Darkside jungle, [Intelligent jungle](#)

**Oldschool jungle** is the name given to a style of [electronic music](#) that incorporates influences from genres including [breakbeat hardcore](#), [techno](#), rare groove and [reggae/dub](#)/dancehall. There is significant debate as to whether Jungle is a separate genre from [drum and bass](#) as some use the terms interchangeably.

## Subgenres

Subgenres of oldschool jungle include:

- ragga jungle; more Jamaican-Ragga influenced styles and lyrics (circa 1992-6),
- darkside jungle; instrumental jungle with a more minimal focus (1994-today),
- [intelligent jungle](#); a more [ambient](#) sound, focusing on mood, synthesis and production methods (1996-today).

The fast tempos (150 to 170 bpm), [breakbeats](#), other heavily syncopated percussive loops, samples and simple synthesized effects makes up the easily recognizable form of Jungle. Producers create the tell-tale drum patterns; sometimes completely off-beat, by cutting apart [breakbeats](#) such as the [Amen break](#). Jungle producers incorporated classic Jamaican/Caribbean sound-system culture production-methods. The slower, deep basslines and simple melodies (which are directly descended from dub, reggae and dancehall) accentuated the overall production and hence gave Jungle its 'rolling' quality.

# History

## The term *Jungle*

While the use of the word to describe what is now known as 'Jungle' music is debatable, the emergence of the term in musical circles can be roughly traced to Jamaican/Caribbean toasting (a pre-cursor to modern MCs), circa 1970. References to 'Jungle', 'Junglists' and 'Jungle music' can be found throughout dub, reggae and dancehall genres from that era up until today.

It has been suggested that the term 'Junglist' was a reference to a person either from a section of Kingston known as 'The Concrete Jungle' or from a different area, 'The Gardens', which was a leafy area colloquially referred to as 'The Jungle'.

The first documented use of the term is within a song featuring Jungle producer and lyricist Rebel MC. In which a sample was taken from a much older dancehall tune containing the lyrics "Rebel got this chant - "alla the junglists".

At one time there was even some confusion and debate as to whether the use of the word "Jungle" was a racist referral to its apparently blacker, reggae-influenced sound and fans. This seems unlikely as whilst it has been suggested that it was the black youth of Britain who fueled the early Jungle and drum and bass scenes . This was only the reality very early on and is now a racially diverse mix of fans and producers alike.

Some early proponents preferred to define the "Jungle" element as representing the deeper and darker sound of the heavy beats and bass lines, while others saw a connection with tribal drumming, percussion and simplicity.

Producers and DJs of the early 90's; MC 5ive '0, Groove Connection and Kingsley Roast, place the origin of the word in the scene with pioneers like Moose and Danny Jungle.

"a guy called Danny Jungle - he is the first person I always quote. ... As soon as the breakbeat started he was calling it that."

## The emergence of the Jungle sound

In the summer of 1992, a Thursday [night club](#) in London called "Rage" was changing in response to the commercialization of the [rave](#) scene (see

[breakbeat hardcore](#)). Resident DJs Fabio and Grooverider; amongst others, began to take the [Hardcore](#) sound of to a new level. The speed of the music increased from 120bpm to 145bpm, whilst more ragga and dancehall elements were brought in and Techno, Disco and House influences were decreased.

Eventually the music became too fast and different to be mixed with more traditional [rave music](#), creating a division with the other popular electronic genres. When it lost the four-on-the-floor beat, and created percussive elements solely from raw, 'chopped up' breakbeats, the old-school ravers would complain that it had "gone all jungle-techno".

The club 'Rage' finally shut its doors in 1993, but the new legion of "[Junglists](#)" had evolved, changing dancing styles for the faster music, enjoying the off-beat rhythms and with less reliance on the chemical stimulation of the rave era.

## **Jungle's decline**

Jungle reached the peak of its popularity between 1994 and 1995. It was toward the end of this period that the genre diversified into [drum and bass](#) as most producers started to incorporate new sounds and rhythms into their music. The co-produced "Timeless" by Goldie and Rob Playford (released on Playford's Moving Shadow record label) is the clearest example of a track from this time period which is not considered Jungle. Showcasing the new wave of high-tech music production tools being created and computer and audio-software possibilities, 1995 ushered in many of the biggest names in drum and bass today. The term 'Jungle' was then used to describe a large range of electronic dance music and so has become too vague to be useful.

## **Jungle today**

Today jungle can be used as a synonym for drum and bass. Some may use the term 'Jungle' to denote a more ragga, "old skool" or mid-90s sound, although some feel drum and bass and Jungle are in fact completely separate genres. Very fast, almost undanceable beats ragged are sometimes referred to as Jungle by this group, which has formed an underground scene throwing free parties and other underground raves. In this underground scene, popular drum and bass is frowned upon by some as it is seen to be too mainstream.

## Old-time music

**Old-time music** is a form of North American [folk music](#), with roots in the folk music of many countries, most notably: England, Scotland, Ireland, and Africa. This musical form developed along with various North American folk dances, such as square dance. The genre also encompasses ballads and other types of folk songs. It is played on acoustic instruments, generally centering on the fiddle.

## History

Reflecting the cultures that settled North America, the roots of old-time music are based in the traditional musics of the British Isles (primarily England, Scotland, and Ireland), with a strong admixture of African music. In some regions French and German sources are also prominent. While many dance tunes and ballads can be traced to European sources, many others are of purely North American origin.

### The term "old-time"

With its origins in the traditional musics of Europe and Africa, old-time music represents perhaps the oldest form of North American traditional music other than Native American music, and thus the term "old-time" is an appropriate one. As a label, however, it dates back only to 1923.

Fiddlin' John Carson made some of the very first commercial recordings of traditional American country music for the Okeh label. The recordings became hits. Okeh, which had previously coined the terms "hillbilly music" to describe Appalachian and Southern fiddle-based and religious music and "race recording" to describe the music of African-American recording artists, began using "old-time music" as a term to describe the music made by artists of Carson's style. The term, thus, originated as a euphemism, but proved a suitable replacement for other terms that were considered disparaging by many inhabitants of these regions. It remains the term preferred by performers and listeners of the music.

### Other sources

During the late 19th and early 20th centuries, minstrel, Tin Pan Alley, gospel, and other popular music forms also entered the genre. While old-time music was practiced in all regions of the United States in the 18th and 19th centuries, by the 20th century it had come to be associated primarily with the Appalachian region.

### Revival

Old-time music experienced a great revival in the early 1960s in areas such as Chapel Hill, North Carolina. Alan Jabbour, founding director of the

Folklife Center at the Library of Congress, became a leader of this revival while a student at Duke University. Other important revivalists include Mike Seeger and Pete Seeger, who brought the music to New York City as early as the 1940s.

## Instrumentation

Old-time music is played using a wide variety of stringed instruments. The instrumentation of an old-time group is often determined solely by what instruments are available, as well as by tradition. The most common instruments are acoustic string instruments. Historically, the fiddle was nearly always the leading melodic instrument, and in many instances (if no other instruments were available) dances were accompanied only by a single fiddler, who often also acted as dance caller.

By the early 19th century, the [banjo](#) (originally an instrument played exclusively by persons of African descent, both enslaved and free) had become an essential partner to the fiddle, particularly in the southern United States. The banjo, originally a fretless instrument and frequently made from a gourd, played the same melody as the fiddle (though in a lower register), while simultaneously providing a rhythmic accompaniment incorporating a high drone provided by the instrument's "drone string." The banjo in old-time music is typically a 5-string model. It is most commonly played clawhammer or with two fingers, rather than the three-finger Scruggs style common in bluegrass, and is usually open-back, i.e. it lacks the resonator found on most bluegrass banjos. However, important figures such as Uncle Dave Macon and Dock Boggs often played in idiosyncratic three finger styles, that were clearly distinct from the Scruggs rolls. Some, such as Scrugg's influence Snuffy Jenkins, played in a style that blurred the line between oldtime and bluegrass, using a three-finger roll that was idiomatically more oldtime than bluegrass.

During the 19th and early 20th centuries, other stringed instruments began to be added to the fiddle-banjo duo; these included the [guitar](#), mandolin, and double bass (or washtub bass), which provided chordal and bass line accompaniment (or occasionally melody also). Such an assemblage, of whatever instrumentation, became known simply as a "string band." Occasionally the cello, [piano](#), hammered dulcimer, Appalachian dulcimer, tenor banjo, tenor guitar, mouth bow, or other instruments were used, as well as such non-string instruments as the jug, harmonica, jew's harp, concertina, [accordion](#), washboard, or spoons.

The fiddle is sometimes played by two people at the same time, with one player using the bow and fingers, while another player stands to the side and taps out a rhythm on the fiddle strings using small sticks called fiddlesticks (also spelled "fiddle sticks"). This technique (also sometimes called "beating the straws") is utilized in performance most notably by the duo of Al and Emily Cantrell.

## Old-time music as dance music

Instrumental old-time music is traditionally played for dances, and is considered to be [dance music](#). As such, there is not much showiness, generally with no solos, but always carrying a strong beat. This contrasts with [bluegrass music](#) which was developed in the 1940s as a form of concert music. Bluegrass music, however, developed from old-time music, and shares many of the same songs and instruments, but is more oriented toward solo performance than is old-time music.

While in the British Isles reels and jigs both remain popular, the reel is by far the predominant metric structure preferred by old-time musicians in the United States (though a few hornpipes are also still performed). Canadian musicians, particularly in the Maritime provinces where the Scottish influence is strong, perform both reels and jigs (as well as other types of tunes such as marches and strathspeys).

Each regional old-time tradition accompanies different dance styles. Some of these include clogging and flatfoot dancing (Appalachia), contradancing (New England, square dancing (Southern states) and step dancing (Nova Scotia, particularly Cape Breton Island), though there is some overlap between regions.

## **Learning old-time music**

Players traditionally learn old-time music by ear; even those musicians who can read music generally learn and play old-time tunes by ear. A broad selection of written music does exist, however, it is widely acknowledged that the style of old-time music cannot be practically notated by written music.

Although it is one of the oldest and most prominent forms of traditional music in the United States and Canada, old-time music (with a few notable exceptions) is generally not taught in North American primary schools, secondary schools, or universities. Although square dancing is still occasionally taught in elementary schools (generally with recorded, rather than live music), old-time instruments and dances are not included in the educational system, and must be studied outside the school system.

## Regional styles

There are numerous regional styles of old-time music, each with its own repertoire and playing style. Nevertheless, some tunes (such as "Soldier's Joy") are found in nearly every regional style, though played somewhat differently in each.

### Appalachia

This section applies primarily to the "Southern Appalachian" region of the United States (the Central Appalachians being in the northeastern U.S. and the Northern Appalachians stretching into Quebec, Canada).

Appalachian folk music is a distinctive [genre](#) of [folk music](#). Appalachian music is believed to have developed from traditional Scottish, English and Irish music brought to the United States by immigrants from those countries, and in turn it influenced [country music](#) and old-time music.

A Scottish fiddler named Neil Gow is usually credited with developing (during the 1740s) the short bow sawstroke technique that defines Appalachian fiddling. This technique was altered during the next century, with European waltzes and polkas being most influential.

While in the year 2000 African Americans made up only 8 percent of the Appalachian population, their numbers were greater in the 19th and early 20th centuries, due not only to the presence of slaves but also free blacks working in timber, coal mining, and other industries. Their music has exerted a great influence on Appalachian music in its instrumentation (the banjo was adopted from them by white musicians following the Civil War) as well as ornamentation (the "blue note" third and seventh, and sliding tones which are not found in British Isles folk music (outside of certain styles of Irish music, whose influence on Appalachian music is considered minimal - this may be indicative of parallel evolution, since the early Appalachian settlers were generally of other than Irish extraction)). Even into the early 20th century, it was common for young white musicians to have learned the banjo or other instruments from older African American musicians living in their area.

Appalachian folk became a major influence on styles like [country music](#) and [bluegrass](#). It is one of the few regional styles of old-time music that, since World War II, has been learned and widely practiced in all areas of the United States (as well as in Canada, Europe, Australia, and elsewhere). In some cases (as in the Midwest and Northeast), its popularity has eclipsed the indigenous old-time traditions of these regions. There is a particularly high

concentration of performers playing Appalachian folk music on the East and West Coasts (especially in New York City, Los Angeles, San Francisco, and the Pacific Northwest). A number of American classical composers, in particular Henry Cowell and Aaron Copland, have composed works that merge the idioms of Appalachian folk music with the Old World–based classical tradition.

Appalachian old-time music is itself made up of regional traditions. Some of the most prominent traditions include those of Mount Airy, North Carolina and Grayson County/Galax, Virginia (Tommy Jarrell), West Virginia (the Hammons Family), East Kentucky (J. P. Fraley and Lee Sexton), and East Tennessee (Roan Mountain Hilltoppers).

Notable North Carolina traditional banjo players and makers include Frank Proffitt, Frank Proffitt, Jr. and Stanley Hicks, who all learned to make and play fretless mountain banjos from a family tradition. These players, among others, learned their art primarily from family and show fewer traces of influence from commercial hillbilly recordings. The Proffitts and Hicks were heirs to a centuries-old folk tradition, and through the middle to late 20th century and they continued to perform in a style older than the stringbands often associated with old time music. Their style has been recently emulated by contemporary musician Tim Eriksen.

Old-time music has also been adopted by a few Native American musicians; the eminent Walker Calhoun of Big Cove, in the Qualla Boundary (home to the Eastern Band of Cherokee Indians, just outside the Great Smoky Mountains National Park in western North Carolina) plays three-finger-style banjo, to which he sings in the Cherokee language.

## **New England**

The New England states, being among the first to be settled by Europeans, have one of the oldest traditions of old-time music. Although the Puritans (the first Europeans to settle in the region), frowned upon instrumental music, dance music flourished in both urban and rural areas beginning in the 17th century. Primary instruments include the fiddle, piano, and guitar, with the wooden flute sometimes also used. As with Appalachian folk, a number of classical composers have turned to New England folk music for melodic and harmonic ideas, most famously Charles Ives, as well as Aaron Copland, William Schuman, and John Cage, among others.

## **Midwest**

Beginning in the early 19th century, when the Midwestern states were first settled by immigrants from the eastern United States and Europe, the Midwest developed its own regional styles of old-time music. Among these, the Missouri style is of particular interest for its energetic bowing style.

## **The non-Appalachian South**

The Southern states (particularly coastal states such as Virginia and North Carolina) also have one of the oldest traditions of old-time music in the United States. Bascom Lamar Lunsford is perhaps the best known.

It is in this region that the music of Africa mixed most strongly with that of the British Isles. Records show that many African slaves (some of whom had been musicians in Africa or the Caribbean, where they had lived prior to the United States) were talented musicians, playing, as early as the 18th century, instruments such as the fiddle, banjo, and piano. Slave documents and advertisements of the time often listed musical abilities of individual African slaves as a selling point, as slaves were frequently asked to perform for their masters.

The banjo, an essential instrument for Southern and Appalachian old-time music, is believed to have derived from a West African skin-covered lute; such instruments (generally with four strings) are still played today in Senegal, Gambia, Mali, and Guinea, where they are called *ngoni*, *xalam*, or various other names.

States of the Deep South such as Alabama, Mississippi, Georgia, and Louisiana also have their own regional old-time music traditions and repertoires. While the [music](#) of the Louisiana [Cajuns](#) has much in common with other North American old-time traditions it is generally treated as a tradition unto itself and not referred to as a form of old-time music.

## **Texas and the West**

Texas developed a distinctive twin-fiddling tradition that was later popularized by Bob Wills as "Western swing" music. Fiddle music has also been popular since the 19th century in other Western states such as Oklahoma and Colorado. The National Oldtime Fiddlers' Contest has been held each year in Weiser, Idaho since 1953.

Oklahoma, with its high concentration of Native American inhabitants, has produced some Native American old-time string bands, most notably Big Chief Henry's Indian String Band (consisting of Henry Hall, fiddle; Clarence Hall, guitar; and Harold Hall, voice), which was recorded by H. C. Speir for the Victor company in 1929.

## **Canada**

Among the prominent styles of old-time music in Canada are the Scottish-derived tradition of Nova Scotia (particularly Cape Breton Island), the French Canadian music of Quebec and Acadia, the old-time music of Ontario, and the prairie fiddling traditions of the central provinces. It is here (primarily in Manitoba and Saskatchewan) that the fiddle tradition of the Métis people is found.

# One-hit wonder

In the music industry, a **one-hit wonder** is an artist who is generally known for only one hit [single](#).

Because one-hit wonders are only popular for a brief time, their hits often have significant nostalgia value and are often featured on era-centric compilations and [soundtracks](#) to period films.

The hits of many one-hit wonders are novelty songs that are, to an extent, deliberately short-lived, recorded for humor or to cash in on a pop culture fad. Examples include Rick Dees's "Disco Duck," related to the disco craze of the late 1970s, and Buckner & Garcia's "Pac Man Fever," related to the arcade game Pac Man. More commonly however, one-hit wonders are serious-minded musicians who struggled to continue their success after their popularity waned. Some artists have only had one chart success due to untimely death, such as Minnie Riperton and Blind Melon.

One-hit wonders are common in any era of [pop music](#) but are most common during reigns of entire genres that do not last for more than a few years, such as [disco](#) and [new wave](#).

Though the term is sometimes used in a derogatory sense, fans often have a great passion for these memorable songs and the artists that created them. Some one-hit wonder artists have embraced this following openly, while others distance themselves from their hit in an attempt to craft successful songs with different sounds.

## Questions of Definition

Performers who are successful in one country or continent but who are known for only one song in another are usually considered one-hit wonders in the latter. Germany's Nena, Europe's Boney M, Scotland's Simple Minds, England's Frankie Goes to Hollywood and Canada's Crash Test Dummies have each had considerable success in their homelands but are considered one-hit wonders in the United States.

Similarly, some performers are considered one-hit wonders in general but have had considerable success within their respective genres. [Celtic music](#) singer Loreena McKennitt, [heavy metal](#) band Uriah Heep, and [Christian rock](#) group Jars of Clay are each stars within their respective genres but are known for only a single [crossover hit](#) each by the general public.

The term one-hit wonder does not, however, usually refer to performers who have had only limited success on the singles chart, but who are considered significant for other reasons, such as [album](#) sales, live concerts and influence on other musicians. Jimi Hendrix, Frank Zappa, Roxy Music, Lou Reed, Janis Joplin, Rush, The Grateful Dead, Iggy Pop, Beck and Radiohead have each had only one song in Billboard Magazine's Top 40, yet none are considered one-hit wonders.

The term is also not usually applied to performers with a single hit as a solo artist but who built a reputation in a group, such as Steely Dan's Donald Fagen, The Lovin' Spoonful's John Sebastian or The Beach Boys' Brian Wilson. Alternatively, Derek & the Dominoes are not considered one-hit wonders because their sole hit, "Layla," is generally considered within the context of group leader Eric Clapton's career.

By analogy, artists and bands (such as Golden Earring) who produce two major hits before fading into obscurity are sometimes called "two-hit wonders", but this term is not as commonly used.

Also, some artists may be considered one-hit wonders despite not strictly meeting the definition. For example, a-ha made the top 10 of VH1's 100 Greatest One-hit Wonders in 2002, despite having had two singles make the Billboard Top 40. Their first hit, "Take on Me", was far more successful (in the U.S.) and is more widely remembered than their other U.S. chart hit, "The Sun Always Shines on TV" (which, incidentally, was #1 in the United Kingdom). Great White is also called a one-hit wonder, for the #5 1989 hit "Once Bitten Twice Shy," but they had another Top 40 single, "Angel Song", the same year, as well as several lower-charting hits throughout their career. Many so-called one-hit wonders had a single top 40 hit, but several others in the lower regions of the Billboard Hot 100 (#41-#100), and these lower-

charting songs are still "hits" in the strictest sense. The defining factor seems to be how well the band is *remembered* for other factors than the "one big hit".

## "One hit wonders" in classical music

While the term "one hit wonder" generally refers to sales in popular music, the term has sometimes been used to describe various composers of [classical music](#). In this context, it is often used to describe composers who are well known mostly because of only a single piece of music.

Extending the term to classical [composers](#) is more subjective since there are no comparable sales rankings for [classical music](#). The primary problem is determining what constitutes a "hit" in classical music. Without ready access to recording sales records and classical concert programs this must be determined by a subjective guess. This guess can only be based on a collective idea of what is frequently performed in concerts, played by classical radio stations and recorded by a variety of [orchestras](#).

What is popular is also highly subject to change over the years, particularly considering the sheer amount of time in which classical music has existed (taking the more liberal use of "classical" to cover music of the [Renaissance](#) through contemporary classical). What was popular during a composer's lifetime may not be popular today, an issue compounded by many works achieving popularity through appearances in film and other mass media.

The sheer volume of music composed by any serious classical composer is not overall comparable to what is produced by many popular music artists. Some pop one hit wonders produce only a single album (generally slightly more than half an hour of music) while any classical composer will have produced hours upon hours. While only a single short piece might be a "hit", in most cases other works will have been recorded by multiple performers, and occasionally find their way into the repertoire of others, skewing the comparison with popular musicians.

Furthermore, what is considered a "hit" will vary greatly when one considers the disparity between the general public and devoted fans of classical music. Edward Elgar's Pomp and Circumstance March No. 1, for example, is known widely in the United States as the music associated with graduation, and many U.S. lay people would not recognize a single other work by him (or, indeed, much of that piece itself, except for the commonly quoted part); and in the UK the same music is widely known as "Land of Hope and Glory", a song of Empire. However, any person reasonably well versed in classical music knows of Elgar as a respected composer of a variety of works. Likewise the final section of the overture to Rossini's William Tell is known to millions of people through its association with The Lone Ranger, but most opera-lovers are probably *more* familiar with some of his

other overtures. Conversely, there are various composers by whom even classical music buffs would be hard pressed to identify more than one work, and with whom laymen and casual listeners would be utterly unfamiliar, making their claim of even a single "hit" problematic.

## Other uses

The term one-hit wonder is occasionally used to refer to an artist or a professional athlete other than a musical performer who is best known for a single work. For example, author Joseph Heller wrote several novels but is still best known for *Catch-22* and actress Natasha Henstridge has yet to match the success of the film *Species*.

In video games, the term one-hit wonder is used to describe a video game character that dies after one hit. A good example is Billy Bob from Capcom's *Gun.Smoke*.

## Trivia

- The phenomenon of one-hit wonders was celebrated in Tom Hanks's film *That Thing You Do!*, which featured a fictional 1960s band from Erie, Pennsylvania called The Wonders that broke up shortly after their one and only hit single. In fact, the name "Wonders" was originally spelled "Oneders", a deliberate play on the term. Ironically, while the movie was in theaters, the soundtrack hit #26 on the charts, recorded under the name "The Wonders", but actually recorded by Fountains Of Wayne. "The Wonders" never made it to the charts again, so they were, essentially, both a real and fictitious one-hit wonder band.
- In a stand-up routine on the Dr. Demento basement tapes, comedian Rob Paravonian humorously noted that Johann Pachelbel was the original one-hit wonder. See Pachelbel's canon.
- Norman Greenbaum is a double one-hit wonder. In 1968, under the name Dr. West's Medicine Show and Junk Band, he had a semi-hit with the novelty song "The Eggplant That Ate Chicago" and, two years later, score a hit under his own name "Spirit In The Sky". Ironically, another group, Doctor and the Medics, became a one-hit wonder with their version of "Spirit In The Sky" in 1986. British television stars The Kumars also became one-hit wonders when they reached no.1 with Gareth Gates with the same song in 2003.
- Limahl is also a double one-hit wonder in the United States, though not in the United Kingdom. In 1983, the band he fronted, Kajagoogoo, had its only U.S. hit with "Too Shy" (although the band had several other hits in the UK). The following year, after he had left the band, he had a solo hit with the eponymous theme to the children's film *The NeverEnding Story*.
- Benny Mardones has had only one hit, "Into the Night," making him a "one-hit wonder"; however, his hit song hit the Top 10 twice -- in 1980 and again in 1990.
- A small number of artists have the distinction of being regarded as one hit wonders in both the USA and UK, but with different songs:

| <b>Artist</b>      | <b>US hit</b>        | <b>UK hit</b>           |
|--------------------|----------------------|-------------------------|
| Carole Bayer Sager | Stronger Than Before | You're Moving Out Today |
| Mouth and Macneal  | How Do You Do        | I See A Star            |
| Art and Dotty Todd | Chanson D'Amour      | Broken Wings            |

- In his book *One Hit Wonderland* (Ebury Press, 2003), British writer and comedian Tony Hawks describes his attempts to shake off his one hit wonder status by having another hit somewhere in the world. The book describes several aborted attempts before he achieves a top twenty hit in Albania with veteran comic actor Norman Wisdom.

## **Lists of greatest one-hit wonders**

### **VH1's list of "100 greatest one-hit wonders"**

In 2002, the American cable network VH1 aired a countdown of the 100 Greatest One-hit Wonders. The top ten consisted of:

- Los Del Rio - "Macarena" (1996)
- Soft Cell - "Tainted Love" (1982)
- Dexys Midnight Runners - "Come On Eileen" (1982)
- Right Said Fred - "I'm Too Sexy" (1991)
- Toni Basil - "Mickey" (1982)
- Baha Men - "Who Let the Dogs Out?" (2000)
- Vanilla Ice - "Ice Ice Baby" (1990)
- a-ha - "Take On Me" (1985)
- Gerardo - "Rico Suave" (1991)
- Nena - "99 Luftballons" (1984)

### **Brent Mann's 100 "all-time great one-hit wonders"**

In 2003, music journalist Brent Mann released the book 99 Red Balloons and 100 Other All-Time Great One-Hit Wonders. The list was based on Mann's professional opinion, and did not include many of hits from the VH1 one list. Instead, Mann reaches back as early as the 1950s, and thus includes some songs perhaps unfamiliar to modern audiences. He also included a number of artists who had many hits in the United Kingdom (or other markets, such as Germany), but not in the United States. His number one choice was "Walking in Memphis" by Marc Cohn.

### **Channel 4's "50 Greatest One Hit Wonders"**

A 2006 poll conducted by Channel 4 television in the UK asked viewers to select their favourite one hit wonder from a shortlist of 60 . Respondents could also vote by email to select a song that was not on the original list, if they so wished. The top five were:

- Kung Fu Fighting - Carl Douglas
- 99 Red Balloons - Nena
- Because I Got High - Afroman

Sugar, Sugar - The Archies  
Can You Dig It? - The Mock Turtles

The composers DG includes in this compilation are: Richard Addinsell, Tomaso Albinoni, Hugo Alfvén, Samuel Barber, Luigi Boccherini, Joseph Canteloube, Marc-Antoine Charpentier, Jeremiah Clarke, Léo Delibes, Paul Dukas, Reinhold Gliere, Ferde Grofé, Mikhail Ippolitov-Ivanov, Dmitri Kabalevsky, Aram Khachaturian, Edward MacDowell, Pietro Mascagni, Jules Massenet, Jean-Joseph Mouret, Carl Orff, Johann Pachelbel, Amilcare Ponchielli, Heitor Villa-Lobos, Emil Waldteufel, Peter Warlock, and Charles-Marie Widor.

# Opera

**Opera** refers to a dramatic art form, originating in Europe, in which the emotional content or primary entertainment is conveyed to the audience as much through music, both vocal and instrumental, as it is through the lyrics. From the beginning of the form (about 1600), there has been contention whether the music is paramount, or the words, a theme that Richard Strauss took up in his final opera, *Capriccio* (1942). Also, dramatic speech in opera is often sung in recitative. By contrast, in [musical theater](#), dialogue is spoken and an actor's dramatic performance is generally more important than in opera.

Comparable art forms from various parts of the world, many of them quite ancient in origin, exist and are also sometimes called "opera" by analogy, usually prefaced with an adjective indicating the region (for example Chinese opera). However, other than superficial similarities, these other art forms developed independently from and are completely unrelated to opera but are art forms in their own right, not derivatives of opera.

The drama is presented using the primary elements of theatre such as scenery, costumes, and acting. However, the words of the opera, or [libretto](#), are customarily [sung](#) rather than spoken. The [singers](#) are accompanied by a [musical ensemble](#) ranging from a small instrumental ensemble to a full symphonic [orchestra](#).

Besides words and music, opera draws from many other art forms. The visual arts, such as painting, scenery and sculpture, are employed to create the visual spectacle on the stage; in the [Baroque](#) "English opera" or Restoration spectacular, visual arts are especially important, even predominant. Finally, [dancing](#) is often part of an opera performance, particularly in France. Generally, however, opera is distinguished from other dramatic forms by the importance of song.

Singers and the roles they play are initially classified according to their vocal ranges. Male singers are classified by [vocal range](#) as [bass](#), [bass-baritone](#), [baritone](#), [tenor](#) and countertenor. Female singers are classified by vocal range as contralto, [mezzo-soprano](#) and [soprano](#).<sup>[1]</sup> Additionally, singers' voices are loosely identified by characteristics other than range, such as timbre or color, vocal quality, agility, power, and tessitura. Thus a soprano may be termed a lyric soprano, coloratura, soubrette, spinto, or dramatic soprano; these terms, although not fully describing a singing voice, associate the singer's voice with the roles most suitable to the singer's vocal characteristics. The German Fach system is an especially organized system of classification. A particular singer's voice may change drastically over his or

her lifetime, rarely reaching vocal maturity until the third decade, and sometimes not until middle age.

Traditional opera consists of two modes of singing: recitative, the dialogue and plot-driving passages often sung in a non-melodic style characteristic of opera, and [aria](#), during which the movement of the plot often pauses, with the music becoming more melodic in character and the singer focusing on one or more topics or emotional affects. Short melodic or semi-melodic passages occurring in the midst of what is otherwise recitative are also referred to as *arioso*. In the late 19th century, many composers abolished much of the distinction between recitative and aria, writing opera that is essentially presented in a restlessly melodic arioso style throughout. All types of singing in opera are accompanied by [musical instruments](#), though until the late 17th century generally, and persisting until even later in some regions, recitative was accompanied by only the continuo group (harpsichord and 'cello or bassoon). During the period 1680 to roughly 1750, when composers often used both methods of recitative accompaniment in the same opera, the continuo-only practice was referred to as "secco" (dry) recitative, while orchestral-accompanied recitative was called "accompagnato" or "stromentato." The complexity of orchestral accompaniment to recitative continually tended to become more complex until, in the late 18th century, composers began to write recitativo obbligato at dramatic junctures of [opera seria](#), in which the orchestra has independent passages of a violent or pathetic character, sometimes reflecting musical motifs or the melodies of important arias.

Some genres of opera use spoken dialogue accompanied or unaccompanied by an orchestra rather than recitative. Such dialogue also is the essential feature of melodrama, in its original 19th century sense. Such melodrama grew partly from the practice that seems to have originated in the 16th century of writing [incidental music](#) to stage plays, either those already existing or newly composed. The most familiar example of such to most readers will probably be Mendelssohn's music for A Midsummer Night's Dream; this work is almost certainly the most frequently performed of the genre in a context separate from its accompanying play, and has been transcribed for nearly all imaginable chamber combinations, as well as concert band. The pit orchestra underscoring the dramatic action in 19th century melodrama survives in today's tradition of [film scores](#), and spectacular films incorporating serious music can be considered the direct heirs of melodrama. Perhaps such film scores can in some sense even be considered both the heirs and the competitors of [grand opera](#).

# History

## Origins

The word *opera* means "work" in Italian (from the Latin), the plural of *opus* suggesting that it combines the arts of solo & choral singing declamation, and dancing in a staged spectacle. "Dafne" by Jacopo Peri was the earliest composition considered opera, as understood today. It was written around 1597, largely under the inspiration of an elite circle of literate Florentine humanists who gathered as the "Camerata". Significantly Dafne was an attempt to revive the classical Greek drama, part of the wider revival of antiquity characteristic of the [Renaissance](#). The members of the Camerata considered that the "chorus" parts of Greek dramas were originally sung, and possibly even the entire text of all roles; opera was thus conceived as a way of "restoring" this situation. "Dafne" is unfortunately lost. A later work by Peri, *Euridice*, dating from 1600, is the first opera score to have survived to the present day.

Peri's works, however, did not arise out of a creative vacuum in the area of sung drama. An underlying prerequisite for the creation of opera proper was the practice of monody. Monody is the solo singing/setting of a dramatically conceived melody, designed to express the emotional content of the text it carries, which is accompanied by a relatively simple sequence of chords rather than other polyphonic parts. Italian composers began composing in this style late in the 16th century, and it grew in part from the long-standing practise of performing polyphonic [madrigals](#) with one singer accompanied by an instrumental rendition of the other parts, as well as the rising popularity of more popular, more homophonic vocal genres such as the [frottola](#) and the [villanella](#). In these latter two genres, the increasing tendency was toward a more homophonic texture, with the top part featuring an elaborate, active melody, and the lower ones (usually these were three-part compositions, as opposed to the four-or-more-part madrigal) a less active supporting structure. From this, it was only a small step to fully-fledged monody. All such works tended to set humanist poetry of a type that attempted to imitate Petrarch and his Trecento followers, another element of the period's tendency toward a desire for restoration of principles it associated with a mixed-up notion of antiquity.

The solo madrigal, frottola, villanella and their kin featured prominently in semi-dramatic spectacles that were funded in the last seventy years of the 16th century by the opulent and increasingly secular courts of Italy's city-states. Such spectacles, called *intermedi*, were usually staged to

commemorate significant state events; weddings, military victories, and the like, and alternated in performance with the acts of plays. Like the later opera, an *intermedi* featured the aforementioned solo singing, but also madrigals performed in their typical multi-voice texture, and dancing accompanied by the present instrumentalists. The *intermedi* tended not to tell a story as such, although they occasionally did, but nearly always focused on some particular element of human emotion or experience, expressed through mythological allegory.

Another popular court entertainment at this time was the "madrigal drama," later also called "madrigal opera" by musicologists familiar with the later genre. This, as can probably be guessed, consisted of a series of madrigals strung together to suggest a dramatic narrative.

In addition to opera in Italy, developing concurrently in the late 16th-early 17th centuries were the English masque and the French ballet au court, which were similar to the Italian *intermedi* in many respects. In both cases, the main difference apart from local musical style was a greater degree of audience (at this time, of course, the audience consisted only of invited nobles and courtiers) participation in the form of staged or processional dances. The English masque also featured a culminating "revel," in which the performers drifted into and cavorted with the audience. Opera was imported into both countries before the middle of the 17th century, where it fused with the local incipient genres. This led to the dominance of ballet in opera of the French tradition, while the thriving English tradition of incidental music, as well as the totalitarian Cromwell regime at mid-century, made it difficult for Italian-style opera to take hold there.

In earlier times, music had been part of medieval mystery plays, with the composer of these best-known to modern audiences being Hildegard of Bingen. Whether these are to be regarded as possible progenitors of opera is highly debatable. At the time of their original performance, they were easily regarded as liturgical accretions. Such accretions to the generally prescribed system of chants were quite common, and the liturgical ceremony was itself dramatic to a degree, often featuring elaborate processions, to which the actions associated with liturgical drama may have been considered merely a minor addition. A new, 17th century form of religious drama, the [oratorio](#) did arise shortly after the advent of opera, though it owes at least as much to the (originally secular) non-dramatic recitative-aria form of the [cantata](#).

## **Baroque opera**

Opera did not remain confined to court audiences for long; in 1637 the idea of a "season" (Carnival) of publicly-attended operas supported by ticket

sales emerged in Venice. Influential 17th century opera composers included Francesco Cavalli and Claudio Monteverdi whose *Orfeo* (1607) is the earliest opera still performed today. Monteverdi's later *Il ritorno d'Ulisse in patria* (1640) is also seen as a very important work of early opera. In these early Baroque operas, broad comedy was blended with tragic elements in a mix that jarred some educated sensibilities, sparking the first of opera's many reform movements, sponsored by Venice's Arcadian Academy (not a physical school, but rather a group of like-minded aristocrats and pedants), but which came to be associated with the poet Pietro Trapassi, called Metastasio, whose librettos helped crystallize so-called [opera seria](#)'s moralizing tone. Once the Metastasian ideal had been firmly established, comedy in Baroque-era opera was reserved for what came to be called [opera buffa](#). Before such elements were forced out of opera seria, many librettos had featured a separately unfolding comic plot as sort of an "opera-within-an-opera." One reason for this was an attempt to attract members of the growing merchant class, newly wealthy, but still less cultured than the nobility, to the public opera houses. These separate plots were almost immediately resurrected in a separately developing tradition that partly derived from the *commedia dell'arte*, (as indeed, such plots had always been) a long-flourishing improvisatory stage tradition of Italy. Just as *intermedi* had once been performed in-between the acts of stage plays, operas in the new comic genre of "intermezzi", which developed largely in Naples in the 1710s and '20s, were initially staged during the intermissions of opera seria. They became so popular, however, that they were soon being offered as separate productions.

Italian opera set the Baroque standard. Italian libretti were the norm, even when a German composer like Handel found himself writing for London audiences. Italian libretti remained dominant in the [classical](#) period as well, for example in the operas of Mozart, who wrote in Vienna near the century's close.

## **Bel canto and Italian nationalism**

The [bel canto](#) opera movement flourished in the early 19th century and is exemplified by the operas of Rossini, Bellini, Donizetti, Pacini, Mercadante and many others. Literally "beautiful singing", *bel canto* opera derives from the Italian stylistic singing school of the same name. Bel canto lines are typically florid and intricate, requiring supreme agility and pitch control.

Following the bel canto era, a more direct, forceful style was rapidly popularized by Giuseppe Verdi, beginning with his biblical opera *Nabucco*. Verdi's writing demanded vocal endurance and strength more than the agility required in bel canto (although his work includes arias demanding great

vocal agility); his works were also more demanding dramatically, and many listeners prefer to hear his work sung by voices with great expressive quality, even at the sacrifice of beautiful tone.[2] Verdi's operas resonated with the growing spirit of Italian nationalism in the post-Napoleonic era, and he quickly became an icon of the nationalist movement (although his own politics were perhaps not quite so radical).

## French opera

In rivalry with imported Italian opera productions, a separate French tradition, sung in the French, was founded by Italian Jean-Baptiste Lully. Lully arrived at court as a dancer and companion for young Louis XIV, that he might practice his Latin by conversing with a native speaker. Despite his foreign origin, he established an Academy of Music and monopolized French opera from 1672; and thus an Italian championed the French style in the struggle for supremacy between the French and Italian operatic styles, which raged in the French press for over a century. Lully's overtures, fluid and disciplined recitatives, danced interludes, *divertissements* and orchestral *entr'actes* between scenes, set a pattern that Gluck struggled to "reform" almost a century later. The text was as important as the music: royal propaganda was expressed in elaborate allegories, generally with affirmatory endings. Opera in France has continued to include [ballet](#) interludes and feature elaborate scenic machinery.

Baroque French opera, elaborated by Rameau,[3] was in some sense simplified by the reforms associated with Gluck (*Alceste* and *Orfeo*) in the 1760s. Gluck's arias and choruses advanced the plot, a significant innovation to the static, even irrelevant, arias and choruses common at the time. The use of choruses at all had been unstylish, especially in Italy, for almost a century. While the methods of Gluck were partially derived from those of the more progressive Italians (particularly in comic operas such as Pergolesi's *La Serva Padrona*, which had been influential in France since its performance there in 1752), he also desired to strip opera of some Italian characteristics he considered superfluous and confusing. In this effort, he adopted such French tendencies as more syllabic text-setting, use of the chorus (still occasionally used in France, unlike Italy), and less adherence to the standard *da capo* aria form. Because Gluck combined Italian and French methods of undermining opera seria, his reforms united those styles, his response to an ever-continuing controversy. Later in the century and early in the first half of the 19th, French opera was influenced by the [bel canto](#) style of Rossini and other Italians. This international synthesis of styles leads directly into 19th century French "Grand Opera," the most grandiose operatic

genre of the 19th century with the possible exception of some Wagner works.

### **Other "comic" styles**

French opera with spoken dialogue is referred to as *opéra comique*, regardless of its subject matter — it can include serious and even tragic plots, such as Bizet's *Carmen* and Massenet's *Manon*. German opera of this type is called *Singspiel*. Depending on the weight of its subject matter, *opéra comique* shades into *operetta*, which arose as a wildly popular form of entertainment in the second half of the 19th century. Along with the music-hall potpourri called *vaudeville*, this gave rise to the 20th century genre of musical comedy, perfected in New York and London between the wars.

### **Romantic opera and French grand opéra**

The synthesis of elements that is French *grand opéra* first appeared in Daniel-François-Esprit Auber's *La muette de Portici* (1828), Rossini's *Guillaume Tell* (1829) and Meyerbeer's *Robert le Diable* (1831). Grand opera is usually in four or five acts and includes dance interludes for a complete ballet company. While this genre reached its apotheosis in Giuseppe Verdi's masterpiece *Don Carlos*, the most famous opera in the French grand opera tradition may be Gounod's *Faust*, particularly in the United States where it was a favorite at the Met for the better half of the 20th century. But it should be noted that *Faust* started out as an *opéra comique*, and did not reach grand opera status until later. By mid-century, opera practically meant Grand Opera; the works of Verdi, supposedly a quintessential Italian composer, owe much to this genre, as do those of Wagner, who was both influenced and made acceptable by the sheer extravagance of scale involved in such productions. The similarly extravagant production, including ballet set pieces, of such Russian works as Tchaikovsky's *Eugene Onegin* can probably be traced back to the grand opera tradition as well.

### **German-language opera**

Before the late 18th century, German-language opera was largely a copy of the Italian, although in early-century works of such composers as Reinhard Keiser, the German-speakers achieved a seriousness of tone and grandeur of scale rarely approached in Italy. The above-mentioned *singspiel* also flourished at this time, being descended from the school dramas with

interpolated songs that the students in Lutheran church-schools often produced.

Mozart's German [\*Singspiel\*](#) *Die Zauberflöte* (1791) stands at the head of a German opera tradition that was developed in the 19th century by Beethoven (who wrote only one, which actually stands more in the French Revolutionary "rescue opera" tradition of Balfe and Gretry), Heinrich Marschner, Weber (composer of the great *Der Freischütz*, containing elements of both *singspiel* and melodrama, and a major influence on several Romantic composers) and eventually Wagner.

Before Wagner, there had been little all-sung German language opera of any account for several decades. Though very much inspired by the works of Weber, Wagner pioneered a through-composed style, in which recitative and aria blend into one another and are constantly accompanied by the orchestra; this results in a sort of endless melody, which is perpetuated by the avoidance of any clear cadence until moments of great articulation. Wagner also made copious use of the [leitmotif](#), a dramatic device which associates a musical line with each character or idea in the story. Weber had used a similar device earlier, and was hardly the first to do so; in Wagner's work, however, leitmotifs are a main building-block of his scores, rather than mere recurring motifs.

## Other national operas

Spain also produced its own distinctive form of opera, known as zarzuela, which had two separate flowerings: one in the 17th century, and another beginning in the mid-19th century. During the 18th century, Italian opera was immensely popular in Spain, supplanting the native form.

Just as it was in Spain, Italian opera was highly popular in Russia. In the 19th century, Russian composers also began to write important operas based on nationalist themes, national literature, and folk tales, beginning with Mikhail Glinka (e.g. *Ruslan and Lyudmila*) and followed by Alexander Borodin (*Prince Igor*), Modest Mussorgsky (*Boris Godunov*, *Khovanshchina*), Nikolai Rimsky-Korsakov (*Sadko*), and Pyotr Tchaikovsky (*Eugene Onegin*). These developments mirrored the growth of Russian nationalism across the artistic spectrum, in part as a function of the more general Slavophilism movement.

Czech composers also developed a thriving national opera movement of their own in the 19th century. Antonín Dvořák, most famous for *Rusalka*, wrote 13 operas; Bedřich Smetana wrote eight (*The Bartered Bride* being the most famous); and Leoš Janáček wrote ten, including *Jenůfa*, *The Cunning Little Vixen*, and *Katya Kabanová*.

The key figure of Hungarian national opera in the 19th century was Ferenc Erkel, mostly dealing with historical themes. Among his most often performed operas are *Hunyadi László* and *Bánk bán*.

### **Verismo and after**

After Wagner, all opera for many decades laboured in his gigantic shadow. Nearly all composers felt they must react or respond to him in some way, and opera in the early 20th century took several paths. One fairly short-lived path was manifested in the sentimental "realistic" melodramas of verismo operas, a style introduced by Pietro Mascagni's *Cavalleria Rusticana*, Ruggiero Leoncavallo's *Pagliacci* and such popular operas of Giacomo Puccini as *La Bohème* and *Tosca*. Another reaction to Wagner's mythic medievalizing can be seen in the psychological intensity and social commentary of Richard Strauss (e.g. *Salome*, *Elektra*).

Throughout the 20th and 21st centuries, opera has enjoyed tremendous appeal and has been performed around the world. But only a few twentieth-century operas premièred after the first performance of Puccini's *Turandot* in 1926 are regularly performed: Strauss's *Arabella* and *Capriccio*, Berg's *Lulu*, Stravinsky's *The Rake's Progress*, Britten's *Peter Grimes* and *Billy Budd* and Poulenc's *Dialogues of the Carmelites* are among these.

## **Sociology of opera**

All art forms have a social context, and opera likewise cannot exist in a vacuum. A string quartet exists in manuscript and printed score, and a truly musical person, playing one part, or seated at a keyboard, can hear the intent of the music, but the printed score for an opera must be realized in a production, even a slender one, for its impact. Thus there exists a "sociology of opera", which would be as interesting to general social historians (who are unaware of it, on the whole) as it is to opera buffs. Operas have always been written with a specific audience in mind, whether more aristocratic or more popular, expressing their local prejudices and expectations, and even taking account of the vocal character of certain singers' voices. Operas have also been affected behind the scenes, by [opera house](#) politics and sometimes government censors. But, the idea that there is a canon of operas, an opera repertory which is reflected in a "List of famous operas," for example, is a late entry in the sociology of opera. Indeed, for most of opera's history, only new works were acceptable to audiences; an opera house that mounted productions of twenty year-old operas (or certainly any older) would with but few exceptions have been equivalent to a modern movie house showing similarly outdated films.

### **Development of the idea of "opera repertory"**

During the lifetimes of composers up to Meyerbeer there was no "repertory" of operas. Composers like Bellini and Donizetti were expected to come up with fresh material, season after season, even if they had to cannibalize their own works for material that had not been offered to that city's audience (compare pastiche). One common strategy was to imitate the work of other composers, especially when such work had achieved considerable success. The idea of an opera repertory originated with Richard Wagner, in his Festspielhaus in Bayreuth.

The list of famous operas is a good guide to the standard operatic repertory reflected in contemporary productions and recordings.

## Opera ballet

**Opera Ballet** (*ballets de cour*) is the name given to [ballets](#) performed in the 17th century that occurred within an [Opera](#). Jean-Baptiste Lully is considered the most important composer of music for Opera Ballet and was instrumental to the development of the form. During his employment by Louis XIV as director of the Académie Royale de Music he worked with Pierre Beauchamp, Molière, Philippe Quinault and Mademoiselle De Lafontaine, (the first professional female dancer and Premiere danseuse of the Paris Opera Ballet) to develop ballet as an art form equal to that of the accompanying music.

Beauchamp, *superintendent* of the ballet and director of the Académie Royale de Danse codified the five positions based on the foundations set down by Thoinot Arbeau in his 1588 Orchesographie. Emphasising the technical aspects of dance Beauchamp set out the first rules of ballet technique. Pierre Rameau expanded on Beauchamp's work in Dancing Master 1725 further detailing carriage of the body, steps and positions. Jean-Philippe Rameau's Les Indes Galantes (1735) is considered to be the work that signaled the divergence of social (ballroom) dance and ballet. The emphasis on turned out legs, light costumes, female dancers and long dance sequences (all first seen in L'Europe Galante (1697)) with light, flexible footwear was a turning point in ballet practice that lead to Pre romantic ballet era.

## Opera buffa

**Opera buffa** (a form of [comic opera](#)), also known as **Commedia per musica** (musical comedy), or **Dramma giocoso per musica** (musical dramatic comedy), is a genre of [opera](#). It developed in Naples in Italy in the first half of 18th century, and from there its popularity spread to Rome and northern Italy.

## History

In the sequence of musical epochs, Opera buffa follows the development of opera and of the so-called *opera seria*, which should have been perhaps a contrasting genre due to some of its formal and ideological characteristics. One of the functions of opera at the time was to bring some of the technique and aesthetic of serious music--*oratorio*, *cantata*, and other forms--into something more "accessible" by musicians and listeners, a process as culturally significant in 18th century Italy as it is today in other countries. The reason for the great success of opera in general, has been in this sort of "descent" to more popular and understandable themes, together with the contemporary approach to theatre (of universal comprehension, over an average moderated cultural requirement of the spectator).

In this climate, opera buffa was one among the many forms in which the evolution of music contacted the audience with more friendly "manners": the French *Opéra Comique*, or the German *Singspiel*, as well as the German *Melodram* (very similar to the French *Mélodrame*, but not related to the Italian *Melodramma*). These were all genres in which the recitative (the spoken, and not *sung*, part of the work) started to increase its presence within the body of related works, while the "purely" musical part was proportionally decreased. Music and talk (recitative, which in reality is recited over an essentially basic music, sometimes of chamberistic echoes) started then to experience an interesting symbiosis which the public seemed to enjoy. However, some of these evolutions were not going to completely abandon a formalist or emphatic state of mind, as happened for the French *déclamation chantée*, that soon re-joined the *tragédie-lyrique* of Jean-Baptiste Lully and was re-absorbed in more traditional measures.

Among the first composers of opera buffa were Giovanni Battista Pergolesi, Nicola Logroscino, Baldassare Galuppi and Alessandro Scarlatti, all of them Italians.

## Popularity as a goal

Popularity was the writers' intention, so these "experiments" (as they were called by resisting formalist musicians) also had intelligible vocal content. This is in contrast with traditional music that, after [Gregorian Chant](#), had passed to rigid formal schemes extended in Latin or in German, never comprehensible for the general public. Abandoning these languages for the more friendly Italian and French, Recitativo instead broke that habit (which also rendered music an exclusive interest for certain cultural communities, and not even all of them). The public was finally able to decipher the words that singers pronounced, the story beyond the music was intelligible. It was a relevant movement toward laical themes "de-sacralised" music, allowing acceptance of a concept of "music for mere entertainment".

Most of these facts regard opera in general, but Opera buffa in particular. It is indeed very difficult to adopt a formalist scheme for a classification of Opera buffa, since no one would ever deny the serious content and value of some among the best known works that are usually ascribed to its kind, even when they declaratively are a "Dramma giocoso" rather than expressedly an "Opera buffa", and we generally include them all in "Opera". Any distinctive element has therefore to be considered in a relative proportion, in comparison with the many singularities that each work showed.

Certainly, while Opera seria dealt with mythical subjects such as gods and ancient heroes, and only episodically contained comic scenes, Opera buffa had those scenes as its most important part, and sometimes the reason for the opera itself. Music was going in the direction of public, so what could be more appropriated than themes and stories that common people could have enjoyed? Comic stories in opera were the final translation (for the times) of music for entertainment.

In some of the Opere buffa, a language was used that the lower class would relate to, often in the local dialect, and used caricatures that were often found in Italian *commedia dell'arte*.

It is sometimes affirmed that in Opera buffa musical content is often simpler, maybe poorer, limited in length and in fantasy, and these would be sufficient reasons not to include it in the higher genres. Nevertheless, the (now) not discussed genius of Mozart didn't miss the chance of giving us a masterpiece (*Le nozze di Figaro* - in Italian), or perhaps two (with *Don Giovanni*) and was followed by pretty all the major composers. And it must not be forgotten that instruments and voices were developed within this musical area and later accepted for other compositions too, as the Puccini's *basso buffo* in *Tosca* (the Sacristan).

Obviously the role of the [libretto](#) writer became fundamental. It has been noted that while music was "popularising", librettos still used a language that remained far from the one commonly used (even if it was no longer Latin or German), and in some case what music had gained in simplicity, text had lost by preserving emphasis. The operistic composers that meant to finally be comprehensible with an entertaining music, found in Librettisti their "croce e delizia", their torture and delight. Librettos became the conservative part of Opera, and were the element of opera most contested by the public who often could not follow the content or, eventually, could misunderstand it. A famous emblematic case is in Verdi's *Il Trovatore*, where the verse of the Count: "Ah! l'amor, l'amore ond'ardo" (Ah, love, the love I'm burning of) was by assonance generally received as the more probable "Ah! l'amor, l'amore é un dardo" (Ah, love, love is an arrow) (an example of a mondegreen), and this only because the general style of language used would not allow a complete understanding by ear (without the written text to read), and because the general phraseologic sense of the duet was not simple. But rhyme reasons and poetical licenses were invoked by librettisti, frequently doubtfully discharged.

The type of comedy could vary, and the range was great: from Rossini's *The Barber of Seville* in 1816 which was purely comedic, to Mozart's *The Marriage of Figaro* in 1786 which added drama and pathos. The genre declined in the 19th century, and it is often considered that Verdi's *Falstaff*, in 1893 was the last of the Opera buffa.

Some authors have advanced the idea that one of the important aspects of Opera buffa would be that it imposed the attention on the audience, rather than "on conservatories", and this helped the greater Opera too to milder its melodies in order to be more easily and widely accepted. Also, it is said that Opera buffa was a sort of demonstration of the concrete possibility of breaking rigid rules, yet consolidated, that before were considered unchangeable. Moreover, some critics usually recall the famous insertions of popular themes (i.e. choruses and voices in Bizet's *Carmen*, as well as the *tarantella* in Tchaikovsky's all-musical *Capriccio Italiano*) as different examples on different fields of the constant need for musicians to get out of formalism, to let everyday life enter music, after the essential lesson of Opera buffa.

On an external side, French *Encyclopédistes* considered Opera buffa "à l'Italienne" a positive response to the imperative schemes then used, and made it become a sort of symbol of compositive freedom.

## Opera seria

**Opera seria** is an Italian musical term which refers to the noble and 'serious' style of Italian [opera](#) that predominated in Europe from the 1720s to ca 1770. The only popular rival to *opera seria* was [opera buffa](#), the 'comic' opera that took its cue from the improvisatory *commedia dell'arte*.

Italian *opera seria* (invariably to Italian [librettos](#)) was produced not only in Italy but also in Habsburg Austria, England, Dresden and other German states, even in Spain, and other countries. Only France had its own distinct operatic tradition.

## Structure

*Opera seria* built upon the strict *dramma per musica* ('drama through music') conventions of the High Baroque era by developing and exploiting the *da capo* aria, with its A-B-A form. The first section presented a theme, the second a complementary one, and the third a repeat of the first with ornamentation and elaboration of the music by the singer.

A typical opera would start with an instrumental overture of three movements (fast-slow-fast) and then a series of recitatives containing dialogue interspersed with arias expressing the emotions of the character. After an aria was sung, the character usually exited the stage, encouraging the audience to applaud. This continued for three acts before being concluded with an upbeat chorus or duet. The leading singers each expected their fair share of arias of varied mood, sad, angry, heroic or meditative.

## Metastasio

More than anyone else's, the dramatic conventions expressed by the librettos of Metastasio crystallized the format of opera seria. In 1722 Pietro Trapassi, called Metastasio, a brilliant and personable young poet, was called upon to supply a libretto as part of the festivities for the Empress of Austria's birthday. The piece was termed a 'serenata' (literally an 'evening's entertainment') but it was less like what we would recognize as a musical serenade and more in the tradition of the court masque. It was titled *Gli Orti Esperidi*, 'The Gardens of the Hesperides'. Nicola Porpora, (much later to be Haydn's master), set it to music, and the success was so great that the famed Roman prima donna, Marianna Bulgarelli, 'La Romanina,' sought out Metastasio, and took him on as her protégé. In La Romanina's household, Metastasio took music lessons and met all the leading composers.

Under her wing, Metastasio produced libretto after libretto, and they were rapidly set by the greatest composers in Italy and Austria, establishing the transnational tone of *opera seria*: *Didone abbandonata*, *Catone in Utica*, *Ezio*, *Alessandro nell' Indie*, *Semiramide riconosciuta*, *Siroe* and *Artaserse*. After 1730 he was settled in Vienna and turned out more librettos for the imperial theater, until the mid 1740s: *Adriano*, *Demetrio*, *Issipile*, *Demofonte*, *Olimpiade*, *La Clemenza di Tito*, *Achille in Sciro*, *Temistocle*, *Il Re Pastore* and his greatest libretto, *Attilio Regolo*. For the librettos, Metastasio and his imitators customarily drew on dramas featuring classical characters from antiquity bestowed with princely values and morality, struggling with conflicts between love, honour and duty, in elegant and ornate language. Useful stylistic comparisons with the High [Baroque](#) operas of the 17th century may find parallels in contemporary Late Baroque architecture: academic, more disciplined, self-consciously classicizing, a contrast between the High Baroque of Bernini and the Late Baroque of Jules Hardouin Mansart.

## The age of opera seria

The age of *opera seria* corresponded with the rise to prominence of the castrati, often prodigiously gifted male singers who had undergone castration before puberty in order to retain a high, powerful [soprano](#) voice backed by decades of rigorous musical training. They were cast in heroic male roles, alongside another new breed of operatic creature, the prima donna. The rise of these star singers with formidable technical skills spurred composers to write increasingly complex vocal music, and many operas of the time were written as vehicles for specific singers, of whom the most famous is perhaps Farinelli, whose debut in 1722, guided by Porpora, coincided with the arrival of *opera seria* itself.

Given the extensive stylistic conventions of opera seria, it was a considerable challenge to write an effective drama, and not surprisingly many opera seria consisted of little more than cardboard characters and vocal exhibitionism. However, several composers transcended the genre, most important of whom was the Prussian George Friderich Handel (1685 – 1759), who wrote some fifty operas, mostly for the theaters of London, where he spent most of his career. More famous than Handel in their lifetimes, however was Johann Adolph Hasse (1699 - 1783).

While obeying the conventions of opera seria, Handel developed real flesh-and-blood characters, thanks to his prodigious lyrical and dramatic gifts. But after Handel's death tastes changed, and his operas fell into obscurity, save the odd fragment, such as the ubiquitous larghetto from *Serse*, "Ombra mai fù", his most famous melodic structure.

However, beginning in the 1960s, the revival of interest in baroque music and original instrument playing styles, the development of the countertenor fach, and popularity of the long-playing record made rediscovery of Handel's Italian operas possible, and many have since been recorded and performed onstage. Of the fifty he wrote between 1705 and 1738, *Alcina* (1735), *Ariodante* (1735), *Orlando* (1733), *Rinaldo* (1711, 1731), *Rodelinda* (1725), and *Serse* (also known as *Xerxes*) (1738) stand out and are now performed regularly in opera houses and concert halls. His finest work however is *Giulio Cesare* (1724), a tour de force of superb vocal and orchestral writing, possibly the finest *opera seria* of all.

Wolfgang Amadeus Mozart (1756 –1791) was Handel's most direct descendant in the lineage of opera seria. His two notable contributions to the genre are *Idomeneo* (1780) and *La Clemenza di Tito* (1791). For most of the 19th and early 20th century both operas were virtually unknown, but starting in the 1960s, the two slowly regained a place in the standard operatic

repertoire. Mozart wrote some beautiful music for these operas, but the characters, drawn from classical antiquity in accordance with the conventions of the genre, did not inspire in him the same level of incandescent musical theater as the three operas to more modern librettos by Lorenzo da Ponte.

Other notable contributors to the *opera seria* genre were Christoph Willibald Gluck (1714 – 1787), Luigi Cherubini (1760 – 1842), and Gaspare Spontini (1774 – 1851). Gluck tried to reform opera seria by reinstating the supremacy of the drama over the singers; he also did away with the recitative. Cherubini and Spontini expanded upon his ideas. Greatly admired by fellow composers such as Beethoven and Berlioz, the three enjoyed greater critical acclaim than popular success, and following the Napoleonic era, when the brilliant, effervescent operas of Rossini swept the continent with their vocal pyrotechnics, their classically austere operas fell out of fashion. But even Rossini set Metastasio's libretti to the new music.

## **Operas by genre**

# Operetta

**Operetta** (literally, "little opera") is a performance art-form similar to [opera](#), though it generally deals with less serious topics. Often some of the [libretto](#) is spoken rather than sung (but this is true of some operas as well). Instead of moving from one musical number (literally so indicated in the scores) to another, the performers in operetta intersperse the musical segments (e.g. [aria](#), recitative, [chorus](#)) with periods of dialogue without any singing or musical accompaniment. When music accompanies spoken dialogue for special effect, the result is technically melodrama.

Operetta is often considered less "serious" than opera, although this has more to do with the generally comic plots than with the caliber of the music. Formerly, opera expressed politics in code in some countries, such as France; e.g., the circumstances of the title character in the opera "Robert le Diable" was a code for the parental conflict and resolution of king of France at its first performance. At such times, operetta was often actually despised for not being political whatsoever.

Operetta is the precursor of the modern [musical comedy](#). There is a fundamental but subtle distinction between the two forms. An operetta is more of a light opera with acting, whereas a musical is a play with singing. This can best be seen in the performers chosen in the two forms. An operetta's cast will normally be classically trained opera singers; indeed, there is essentially no difference between the scores for an opera and an operetta, except for the operetta's lightness. A musical uses actors who sing, but usually not in an operatic style. However W.S. Gilbert, for example, always preferred to use actors who could sing for his productions, while Ezio Pinza, a great Don Giovanni, appeared on Broadway in South Pacific, and there are features of operetta vocal style both in Kern's Show Boat (1927) as well as in Walt Disney's animated Snow White (1937).

Operetta grew out of the French *opéra comique* around the middle of the 19th century, to satisfy a need for short, light works in contrast to the full-length entertainment of the increasingly serious *opéra comique*. By this time the "comique" part of the genre name had become misleading: *Carmen* (1875) is an example of an *opéra comique* with a tragic plot. *Opéra comique* had dominated the French operatic stage since the decline of tragédie lyrique.

Jacques Offenbach is usually credited with having written the first operettas, such as his *La belle Hélène* (1864).

## History

The most significant composer of operetta in the German language was the Austrian Johann Strauss, Jr. (1825-1899). His first work in this genre is *Indigo und die vierzig Räuber* (1871) although it was his third operetta *Die Fledermaus* (1874) which became the most performed operetta in the world and remained his most popular stage work. In all, he wrote 16 operettas and one opera in his lifetime. Its libretto was based on a comedy written by Offenbach's librettists. In fact, Strauss may have been convinced to write the operetta by Offenbach himself although it is now suggested that his first wife, Henrietta Treffz who repeatedly encouraged Strauss to try his hand at writing for the theater. He went on to write 16 others, mostly with great success when first premiered although now largely forgotten, since his later librettists were not very talented and he worked for some of the time independent of the plot. His operettas, waltzes, polkas, and marches often have a strongly Viennese style and his great popularity has caused many to think of him as the national composer of Austria. In fact, when his stage works were first performed during its day the Theater an der Wien never failed to draw huge crowds for his operetta premieres and many of his numbers were noisily called for encores.

Franz von Suppé, a contemporary of Strauss, closely modeled his operettas after Offenbach. The Viennese tradition was carried on by Franz Lehár, Oscar Straus, Emmerich Kálmán and Sigmund Romberg in the 20th century.

Possibly the height of English-language operetta was reached by W. S. Gilbert and Sir Arthur Sullivan, who had a long-running musical collaboration in England during the Victorian era. With Gilbert writing the dialogue and lyrics (similar to the libretto of opera) and Sullivan composing the music, the pair produced operettas which were enormously popular in both Britain and elsewhere, especially the USA, and remain popular to this day. Works such as *The Pirates of Penzance* continue to enjoy regular performances and even some movie adaptations. The pair is popularly referred to as Gilbert and Sullivan.

# Oratorio

An **oratorio** is a large [musical composition](#) for [orchestra](#), vocal soloists and [chorus](#). It differs from an [opera](#) in that it does not have scenery, costumes, or acting. Oratorio closely mirrored opera in all ages in musical style and form, except that choruses were more prominent in oratorio than in opera. The peak period for composition of oratorios was the 17th and 18th centuries.

Most oratorios from the common practice period to the present day have biblical themes, but a number of composers, notably George Frideric Handel, wrote secular oratorios based on themes from Greek and Roman mythology. Whether religious or secular, the theme of an oratorio is meant to be weighty, and can include such topics as the creation of the world, the life of Jesus, or the career of a classical hero or biblical prophet.

The plot of an oratorio is often minimal, and some oratorios are not narratives at all. While operas are usually based on a dramatic narrative, in oratorios the aesthetic purpose of the narrative is more often to provide organization and significance to a large musical work.

Oratorios usually contain:

- An [overture](#)
- Various [arias](#), sung by the vocal soloists
- Ensemble singing
- [Recitative](#), usually employed to advance the plot
- Choruses, often monumental and meant to convey a sense of glory. Frequently the instruments for oratorio choruses include [timpani](#) and [trumpets](#).

Probably the best known oratorio in the English-speaking world is Handel's *Messiah*. Other well known oratorios include Handel's *Samson*, the *Christmas Oratorio* by Johann Sebastian Bach, *The Creation* by Joseph Haydn, Felix Mendelssohn's *Elijah*, and Igor Stravinsky's "[opera](#)-oratorio" *Oedipus Rex*.

# Orchestra

An **orchestra** is a [musical ensemble](#) used most often in [classical music](#). A small orchestra (about forty players) is called a *chamber orchestra*.

A full size orchestra (about sixty players) may sometimes be called a "**symphony orchestra**" or "philharmonic orchestra"; these prefixes do not necessarily indicate any strict difference in either the [instrumental](#) constitution or role of the orchestra, but can be useful to distinguish different ensembles based in the same city (for instance, the London Symphony Orchestra and the London Philharmonic Orchestra). A symphony orchestra will usually have over eighty [musicians](#) on its roster, in some cases over a hundred, but the actual number of musicians employed in a particular performance may vary according to the work being played, and the size of the venue. A leading chamber orchestra might employ as many as fifty members; some are much smaller than that.

## Instrumentation and Proportions

The typical symphony orchestra consists of four proportionate groups of similar [musical instruments](#), generally appearing in the musical score in the following order (with proportions indicated):

- the [woodwinds](#): 2 flutes\*, [piccolo](#), 2 [oboes](#)\*, cor anglais, 2 [clarinets](#)\*, bass clarinet, 2 [bassoons](#)\*, contrabassoon
- the [brass](#): 2\* to 6 [horns](#)\*, 2\* to 5 [trumpets](#)\*, 2 [trombones](#), bass trombone, [tuba](#)
- the [percussion](#): [timpani](#)\*, snare drum, bass drum, celesta, [piano](#), etc.
- the [strings](#): [harp\(s\)](#), 16 to 30 (or more) [violins](#)\*, 8 to 12 (or more) [violas](#)\*, 8 to 12 (or more) [cellos](#)\*, 5 to 8 (or more) double basses\*.

Instruments (and their minimum number) marked with an asterisk above are considered "core" symphonic instruments, and only in rarest of cases are not called for in most symphonic literature. Other instruments listed above are considered "auxiliary" instruments and are less frequently required, but still referred to as "standard". Late 19th-century symphonic works calling for *all* the auxiliary instruments, as well as a large number of strings, usually include the phrase "*for **large orchestra***" in their full titles. Example: Richard Strauss' *Ein Heldenleben*.

### Beethoven's Influence

The so-called "standard complement" of **double winds and brass** in the orchestra from the first half of the 19th century is generally attributed to the forces called for by Beethoven in his symphonies. With the sole exception of his Fourth Symphony (which specifies the singular [Flauto](#)), the composer's instrumentation always included paired flutes, oboes, clarinets, bassoons, horns and trumpets. The expansion of this timbral "palette" in Symphonies 3, 5, 6 and 9 is carefully calculated by Beethoven for particular effect. The third horn in the "Eroica" Symphony arrives not only to provide harmonic flexibility, but also a novel effect of "choral" brass in the Trio. Piccolo, contrabassoon and trombones add to the triumphal finale of his opus 67. A piccolo and a pair of trombones help deliver storm and sunshine in the Sixth. The mighty Ninth asks for a second pair of horns for the first time for reasons similar to the Eroica; Beethoven's use of piccolo, contra, trombones and percussion along with voices in his finale are his earliest suggestion that the timbral

boundaries of "symphony" might be expanded for good. But for several decades after his departure, **symphonic instrumentation** was faithful to Beethoven's well-established model, with few exceptions.

## **Expanded Instrumentation and Personnel**

Additional instruments are not considered standard but are *scored* occasionally. Examples of these instruments include the [saxophone](#), flugelhorn, [cornet](#), euphonium, glass harmonica, wagner tuba, [bells](#), cowbell, [accordion](#), theremin, ondes martenot, [mandolin](#), [guitar](#), [organ](#), and [harmonium](#). For example, saxophones are called for in a limited range of 19th and 20th century repertoire. While appearing only as featured solo instruments in some works, as in Maurice Ravel's orchestration of Modeste Mussorgsky's Pictures at an Exhibition, other Ravel works such as his Bolero contain writing for the sax as a member of the orchestral ensemble. Similarly, the euphonium is featured in a few [Romantic](#) and [20th century](#) works, and cornets appear in Tchaikovsky's ballet Swan Lake, Claude Debussy's La Mer, and several orchestral works by Hector Berlioz. Unless these instruments are played by members doubling with another instrument (for example, a trombone player changing to euphonium for a certain passage), orchestras will use freelance musicians to enable them to authentically present works which require instrumentalists that they do not have on staff. For instance, while most larger orchestras do employ a harpist, those that don't, or that require a second harp for a larger work, will hire non-roster players to assist in those performances.

## Organization

Between the instrument groups and within each group of instruments, there is a generally accepted hierarchy of leadership. Every instrumental group (or section) has a principal (or soloist) who is generally responsible for playing solos within and leading the group. The violins are divided into two groups, first violin and second violin, and therefore have two principals. The principal first violin is called the concertmaster (or leader) and is considered the leader of not only the string section, but of the entire orchestra, subordinate only to the Conductor. The principal trombone is considered the leader of the low-brass (trombone, bass-trombone, tuba) section, while the principal trumpet is generally considered the leader of the entire brass section. Similarly, the principal oboe (or sometimes the principal flute) is considered the leader of the entire woodwind section. The [horn](#), while technically a brass instrument, often acts in the role of both woodwind and brass. Most sections also have an Assistant principal (or Co-principal, or Associate principal), or in the case of the first violins, an Assistant concertmaster, who often plays a tutti part in addition to replacing the principal in his or her absence. A tutti (or section) player generally plays either a unique but non-solo part (in the case of winds, brass and percussion), or in unison with a group (in the case of the strings). Where a solo part is called for in a string section, for example in the violins, that part is invariably played by the section leader.

In modern times, the [musicians](#) are usually directed by a conductor, although early orchestras did not have one, using instead the concertmaster or the harpsichordist playing the continuo for this role. Some modern orchestras also do without conductors, particularly smaller orchestras and those specialising in historically accurate performances of [baroque music](#) and earlier.

The most frequently performed repertoire for a [symphony](#) orchestra is Western [classical music](#) or [opera](#). However, orchestras are sometimes used in [popular music](#), and are also used extensively in film music.

# History of the orchestra

## Early History

In the 15th and 16th centuries in Italy the households of nobles had musicians to provide music for dancing and the court, however with the emergence of the theatre, particularly opera, in the early 17th century, music was increasingly written for groups of players in combination: which is the origin of orchestral playing. Opera originated in Italy, and Germany eagerly followed. Dresden, Munich and Hamburg successively built opera houses. At the end of the 17th century opera flourished in England under Henry Purcell, and in France under Lully, who with the collaboration of Molière also greatly raised the status of the entertainments known as [ballets](#), interspersed with instrumental and vocal music.

In the 17th century and early 18th century instrumental groups were taken from all of the available talent. A composer such as Johann Sebastian Bach had control over almost all of the musical resources of a town, whereas Handel would hire the best musicians available. This placed a premium on being able to rewrite music for whichever singers or musicians were best suited for a performance—Handel produced different versions of the Messiah oratorio almost every year.

As nobility began to build retreats from towns, they began to hire standing bodies of musicians. Composers such as the young Joseph Haydn would have, then, a fixed body of instrumentalists to work with. At the same time, travelling virtuoso performers would write concerti that featured their skills, and travel from town to town, arranging concerts from whoever was there. The aristocratic orchestras worked together over long periods of time, making it possible for ensemble playing to improve over time.

## The Mannheim School: Form Follows Function

This change, from civic music making where the composer had some degree of time or control, to smaller court music making and one-off performance, placed a premium on music that was easy to learn, often with little or no rehearsal. The results were changes in musical style and emphasis on new techniques. Mannheim had one of the most famous orchestras of that time, where notated dynamics and phrasing, previously quite rare, became standard. It also attended a change in musical style from the complex [counterpoint](#) of the [baroque](#) period, to an emphasis on clear

[melody](#), homophonic textures, short phrases, and frequent cadences: a style that would later be defined as [classical](#).

Throughout the late 18th century composers would continue to have to assemble musicians for a performance, often called an "Academy", which would, naturally, feature their own compositions. In 1781, however, the Leipzig Gewandhaus Orchestra was organized from the merchants concert society, and it began a trend towards the formation of civic orchestras that would accelerate into the 19th century. In 1818, Boston's Handel and Haydn Society was founded, in 1842 the New York Philharmonic and the Vienna Philharmonic were formed, and in 1858, the Hallé Orchestra was formed in Manchester. There had long been standing bodies of musicians around operas, but not for concert music: this situation changed in the early 19th century as part of the increasing emphasis in the composition of [symphonies](#) and other purely instrumental forms. This was encouraged by composer critics such as E.T.A. Hoffmann who declared that instrumental music was the "purest form" of music. The creation of standing orchestras also resulted in a professional framework where musicians could rehearse and perform the same works over and over again, leading to the concept of a repertoire in instrumental music.

## **Habeneck, Beethoven, and Striving for Excellence**

### **Performance Standards**

In the 1830s conductor François Antoine Habeneck, in order to perform the symphonies of Beethoven, which had not been heard in their entirety in Paris, began rehearsing a selected group of musicians. He developed techniques of rehearsing the strings separately, notating specifics of performance, and other techniques of cueing entrances that were spread across Europe. His rival and friend Hector Berlioz would adopt many of these innovations in his touring of Europe.

### **Instrumental Craftsmanship**

This was paralleled by a rapid standardization of instruments. The invention of the piston or valve by Stolzel and Blümel, both Silesians, in 1815, was the first in a series of innovations, including the development of modern keywork for the flute by Theobald Boehm and the innovations of Adolphe Sax in the woodwinds. These advances would lead Hector Berlioz to write a landmark book on [instrumentation](#), which was the first systematic treatise on the use of instrumental sound as an expressive element of music.

The effect of the invention of valves for the brass was felt almost immediately: instrument-makers throughout Europe strove together to foster the use of these newly refined instruments and continuing their perfection; and the orchestra was before long enriched by a new family of valved instruments, variously known as [tubas](#), or euphoniums and bombardons, having a chromatic scale and a full sonorous tone of great beauty and immense volume, forming a magnificent bass. This also made possible a more uniform playing of notes or intonation, which would lead to a more and more "smooth" orchestral sound that would peak in the 1950s with Eugene Ormandy and The Philadelphia Orchestra and the conducting of Herbert von Karajan with The Berlin Philharmonic.

During this transition period, which gradually eased the performance of more demanding "natural" brass writing, many composers (notably Wagner and Berlioz) still *notated* brass parts for the older "natural" instruments. This practice made it possible for players still using natural horns, for instance, to perform from the same parts as those now playing valved instruments. However, over time, use of the valved instruments became standard, indeed universal, until the revival of older instruments in the contemporary movement towards [authentic performance](#) (sometimes known as "historically informed performance").

At the time of the invention of the valved brass, the pit orchestra of most operetta composers seems to have been fairly modest. An example is Sullivan's use of 2 flutes, 1 oboe, 2 clarinets, 1 bassoon, 2 horns, 2 cornets (a piston), 2 trombones, drums and strings.

## **The Importance of Orchestration**

New orchestral effects were possible now that standing orchestras had been formed, winds and brass had been expanded, and had an increasingly easy time playing in tune with each other: particularly the ability for composers to score for large masses of wind and brass that previously had been impractical. Works such as the Requiem of Hector Berlioz would have been impossible to perform just a few decades earlier, with its demanding writing for twenty woodwinds, as well as a gigantic brass ensemble including six horns, eight trumpets, eight trombones, and three tubas.

## **Wagner's Influence: The Large Orchestra**

The next major expansion of symphonic practice came, ironically, from Wagner's Bayreuth orchestra, founded to accompany his musical dramas. Wagner's works for the stage were scored with unprecedented scope and

complexity: indeed, his score to Das Rheingold calls for no less than eight [harps](#). Thus Wagner envisioned an ever-more-demanding role for the conductor of the theater orchestra, as he elaborated in his influential work "On Conducting". This brought about a revolution in orchestral composition, and set the style for orchestral performance for the next eighty years. Wagner's theories re-examined the importance of tempi, dynamics, bowing of string instruments and the role of principals in the orchestra. Conductors who studied his methods would go on to be influential themselves.

## **The 20th Century: Recordings and Motion Pictures**

As the early 20th century dawned, symphony orchestras were larger, better-funded, and better-trained than ever before; consequently, composers could compose larger and more ambitious works. With the recording era beginning, the standard of performance reached a pinnacle. In recordings, small errors in a performance could be "fixed," but many older conductors and composers could remember a time when simply "getting through" the music as best as possible was the standard. Combined with the wider audience made possible by recording, this led to a renewed focus on particular conductors and on a high standard of orchestral execution. As sound was added to silent film, the virtuoso orchestra became a key component of the establishment of motion pictures as mass-market entertainment.

## **A Counter-Revolution**

In the 1920s and 1930s economic as well as artistic considerations led to the formation of smaller concert societies, particularly those dedicated to the performance of music of the avant-garde, including Igor Stravinsky and Arnold Schoenberg. This tendency to start festival orchestras or dedicated groups would also be pursued in the creation of summer musical festivals, and orchestras for the performance of smaller works. Among the most influential of these was the Academy of St. Martin in the Fields under the baton of Sir Neville Marriner.

With the advent of the early music movement, orchestras where players worked on execution of works in styles derived from the study of older treatises on playing became common. These include the London Classical Players under the direction of Sir Roger Norrington and the Academy of Ancient Music under Christopher Hogwood, among others.

## **Recent Trends**

The late 20th century saw a crisis of funding and support for orchestras in the United States and, to a lesser extent, in Europe. The size and cost of a symphony orchestra, compared to the size of the base of supporters, became an issue that struck at the core of the institution. The drastic falling-off of revenues from recording, tied to no small extent to changes in the recording industry itself, began a period of change that has yet to reach its conclusion. Critics such as Norman Lebrecht were vocal in their diagnosis of the problem as the "jet set conductor" and the problems of orchestral repertory and management, while other music administrators such as Michael Tilson Thomas and Esa-Pekka Salonen argued that new music, new means of presenting it, and a renewed relationship with the community could revitalize the symphony orchestra.

In the meantime, orchestras made their way to the mass culture. Versatile composer Michael Jackson used symphonic orchestra to implement his artistic self-expression in [postmodern music](#) and neoclassical pieces (*Morphine*, 1997, *Childhood*, *Little Susie*, 1995, *Speechless*, 2001)

## Conductorless orchestras

The post-revolutionary 'Pervyi Simfonicheskii Ansambl' - First Symphonic Ensemble) was formed in the USSR in 1922. The unusual aspect of the orchestra was that, believing that in the ideal Marxist state all men are equal, its members felt that there was no need to be led by the dictatorial baton of a conductor; instead they were led by a committee. Although it was a partial success, the principal difficulty with the concept was in changing tempo. The orchestra survived for ten years and had to be disbanded only when the individual talents began to rebel against the rigid control under which they were expected to play.

Some ensembles, such as the Orpheus Ensemble, based in New York City, have had more success, although decisions are likely to be deferred to some sense of leadership within the ensemble (for example, the principal wind and string players).

Others have returned to the tradition of a principal player, usually a violinist, being the artistic director and running rehearsals (such as the Australian Chamber Orchestra).

## Other meanings

In ancient Greece the **orchestra** was the space between the auditorium and the proscenium (or stage), in which were stationed the chorus and the [instrumentalists](#). This is how the modern orchestra got its name.

In some theaters, the **orchestra** is the area of seats directly in front of the stage (called "prima fila" or "platea"); the term more properly applies to the place in a theatre, or concert hall set apart for the musicians.

# Organ

The **organ** is a [keyboard instrument](#) with one or more manuals, and usually a pedalboard. In contrast to most other keyboard instruments, the organ's sound output is continuous and constant for as long as a key is depressed. Unlike the [piano](#) or clavichord, the volume of the sound does not depend on how hard the key is struck, though some modern instruments are touch-sensitive. The organ is one of the oldest [musical instruments](#) in the [Western musical tradition](#), with a rich history connected with Christian liturgy and civic ceremony.

The most well-known type of organ is the [pipe organ](#), so named because it produces its sound through pipes, although many people simply refer to it as the "organ". Another type is the [electronic organ](#), which does not have pipes and propagates its electronically-produced sound through one or more loudspeakers. There are many other instruments that fall under the category of "organ"; see below.

A musician who plays the organ is an **organist**. A person who builds or maintains organs is an **organ builder**. The **organ repertoire** encompasses a wide variety of styles and eras; the most famous composer of music for the organ is Johann Sebastian Bach.

## Pipe organs

See the main article at [pipe organ](#) for details on history and construction.

The [pipe organ](#) is the grandest [musical instrument](#) in size and scope, and has been around in its current form since the 14th century. Along with the clock, it was considered one of the most complex man-made creations prior to the Industrial Revolution. Organs (the "pipe" designation is generally assumed) range in size from a single short keyboard to huge instruments which can have over 10,000 pipes. A large modern organ typically has three or four manuals with five octaves (61 notes) each, with a two-and-a-half octave (32-note) pedalboard.

Organs vary widely in design and in sound according to geography and time. In north Germany during the [Baroque](#) era, organs were built in such a manner that each division was readily apparent from the case design. The Hauptwerk (main-work) would be in the center of the case, with the Oberwerk (over-work) above and the Rückpositiv (back-positiv) on the balcony rail at the organist's back. The pedal division was usually set up in towers set at either side of the main case. This design is now called the Werkprinzip. Each division would routinely house complete principal and flute choruses and at least one reed stop. Meanwhile, in France, the separate divisions of the organ would not be evident from the case. Furthermore, the placement of stops followed a system whereby each division served a single musical purpose: the Grand orgue (great organ) would contain a complete principal chorus from 16' up through a high-pitched mixture, while the Echo division might have nothing more than a five-rank cornet stop from middle C up. And during the early twentieth century in America, organs were built to play transcriptions of [orchestral](#) literature. This required that each division be home to several stops designed to imitate orchestral instruments and that most of the divisions be enclosed in swell boxes, enabling the organ to create seamless crescendos and diminuendos.

## Church organs

The traditional purpose of most organs is to play in Christian church services, and an organ used for this purpose is generally called a **church organ**. An organ, with its sustaining tones, is ideally suited to accompany human voices, whether a congregation, a choir, or a soloist, and this is one of its key purposes. Most services also call for the playing of solo repertoire, as many traditions have a prelude and postlude during services, as well as

other solo performances. The introduction of church organs is traditionally attributed to Pope Vitalian in the seventh century.

## **Concert organs**

Organs, especially large ones, are also used to give concerts, called **organ recitals**. Generally, any instrument of a large enough size (twenty ranks or more) outside of a church is a **concert organ**. In the early twentieth century, **symphonic organs** flourished in secular venues in the U.S. and UK, designed to replace symphony orchestras by playing transcriptions of orchestral pieces.

## **Theatre organs**

The **theatre organ** or **cinema organ** is designed to accompany silent movies. Like a symphonic organ, it is made to replace an orchestra. However, it includes many more gadgets, such as percussions and special effects, to provide a more complete array of options to the theatre organist. Theatre organs tend not to take nearly as much space as standard organs, relying on extension and higher wind pressures to produce a greater variety of tone and larger volume of sound from fewer pipes. This extension is called "unification", meaning that instead of one pipe for each key at all pitches, the higher octaves of pitch (and in some cases, lower octaves) are achieved by merely adding 12 pipes (one octave) to the top and/or bottom of a given division. Since there are sixty-one keys on an organ manual, a classical or concert organ will have, for diapason stops at 8', 4' and 2' pitch, a total of 183 pipes (61 times 3). The same chorus of diapasons on a theater organ will have only 85 pipes, or 61 plus 12, plus 12. Some ranks, such as the *Tibia Clausa*, with up to 97 pipes, allow the organist to draw stops at 16', 8', 4', 2', and mutations from a single rank of pipes.

Unification gives a smaller instrument the capability of a much larger one, and works well for monophonic styles of playing (chordal, or chords with solo voice). The sound is, however, thicker and more homogenous than a classically-designed organ, and does not work very well for polyphonic music unless a larger number of reed stops and chromatic percussions are added. Unification also allows pipe ranks to be played from more than one manual and the pedals.

## Electronic organs

See the main article at [electronic organ](#) for more details and history.

Since the 1930s, pipeless electric instruments have been available to produce similar sounds and perform similar roles to pipe organs. Many of these have been bought both by houses of worship and other potential pipe organ customers, and also by many musicians both professional and amateur for whom a pipe organ would not be a possibility. Far smaller and cheaper to buy than a corresponding pipe instrument, and in many cases portable, they have taken organ music into private homes and into dance bands and other new environments, and have almost completely replaced the reed organ.

## Hammond organs

The **Hammond organ** was the first successful electric organ, released in the 1930s. It used mechanical, rotating tonewheels to produce the sound waveforms. Its system of drawbars allowed for setting volumes for specific sounds, and provided vibrato-like effects.

The Hammond organ became popular in [jazz](#), particularly [soul jazz](#), and in [gospel music](#). Since these were the roots of [rock and roll](#), the Hammond organ became a part of the rock and roll sound. It was widely used in rock and popular music during the 1960s and 1970s. Its popularity resurged in pop music around 2000, in part due to the availability of clonewheel organs that were light enough for one person to carry.

## Other organs

**Frequency divider organs** used oscillators instead of mechanical parts to make sound. These were even cheaper and more portable than the Hammond. They featured an ability to bend pitches.

In the 1940s until the 1970s, small organs were sold that simplified traditional organ stops. These instruments can be considered the predecessor to modern portable keyboards, as they included one-touch chords, rhythm and accompaniment devices, and other electronically assisted gadgets. Lowrey was the leading manufacturer of this type of organs.

In the '60s and '70s, a type of simple, portable electronic organ called the **combo organ** was popular, especially with pop and rock bands, and was a

signature sound in the pop music of the period, such as The Doors and Iron Butterfly. The most popular combo organs were manufactured by Farfisa and Vox.

### **Digital organs**

The development of the integrated circuit enabled another revolution in electronic keyboard instruments. Electronic organs sold since the 1980s utilize digital sampling to produce the sound.

Also available are hybrids, incorporating a few ranks of pipes to produce some sounds, and using digital samples for other sounds and to resolve borrowing collisions. Major manufacturers include Baldwin, Johannus, Eminent, Content, Viscount, Makin, Wyvern, Allen Organ and Rodgers.

## Reed organs

The **reed organ** was the other main type of organ prior to the development of electronic organs. It generated its sounds using reeds similar to those of a piano accordion. Smaller, cheaper and more portable than the corresponding pipe instrument, these were widely used in smaller churches and in private homes, but their volume and tonal range was extremely limited, and they were generally limited to one or two manuals, pedalboards being extremely rare.

A development of the reed organ was the chord organ, which provided chord buttons for the left hand, again similar to a piano accordion in concept. A few chord organs were later built using frequency divider technology.

## Organ music

### Classical music

*See the main article at **organ repertoire** for details on specific countries and styles.*

The organ has had a strong place in [classical music](#) throughout its history. Antonio de Cabezón, Jan Pieterszoon Sweelinck, and Girolamo Frescobaldi were three of the most important composers and teachers before 1650. Influenced by these composers, the North German school then rose to prominence with notable composers including Dieterich Buxtehude and especially Johann Sebastian Bach, considered by many to have achieved the height of organ composition. During this time, the French Classical school also flourished.

After Bach, the organ's prominence gradually lost ground to the [piano](#). Felix Mendelssohn, A.P.F. Boëly, and César Franck led a resurgence in the mid-1800s, leading a [Romantic movement](#) that would be carried further by Max Reger, Charles-Marie Widor, Louis Vierne, and others. In the 20th century, composers such as Marcel Dupré and Olivier Messiaen added significant contributions to the organ repertoire. Many new organ pieces are composed today, many sponsored by the AGO and made for use in church services.

Because the organ has both manuals and pedals, most organ music is notated on three staves. The music played on the manuals is laid out like music for other keyboard instruments on the top two staves, and the music for the pedals is notated on the third, bottom, staff. To aid the eye in reading so many staves at once, the bar lines are broken between the lowest two staves. The larger number of staves often makes organ music published in landscape format more convenient than the more commonly used portrait format, and for this reason many publishers print organ music in landscape format.

### Soap Operas

From their creation on radio in the 1930s to the times of television in the early 1970s, soap operas were perhaps the biggest users of organ music. Day in and day out, the melodramatic serials utilized the instrument in the background of scenes and in their opening and closing theme songs. Some of the more popular soap organists included Charles Paul, John Gart, and

Paul Barranco. In the early 1970s, the organ was phased out in favor of more dramatic, full-blown [orchestras](#), which in turn were replaced with more modern [pop](#)-style compositions.

## **Jazz**

The organ has occupied a significant role in [jazz](#) ever since Jimmy Smith made it popular in the 1950s. It can function as a replacement for both piano and bass in the standard jazz combo.

## Similar instruments

- Early instruments
  - the portative organ, a small portable medieval instrument
  - the positive organ, a somewhat larger though still portable medieval instrument
- Hand- or foot-powered instruments
  - the [accordion](#) and [concertina](#), in which the bellows is operated by the squeezing action of the instrumentalist;
  - the [Harmonium](#) or parlor organ, a reed instrument usually with many stops and two foot-operated bellows which the instrumentalist operates alternately;
  - the melodeon, a reed instrument with an air reservoir and a foot operated bellows, popular in the USA in the mid-19th century;
- Entertainment instruments
  - the barrel organ, made famous by the organ grinder in its portable form, and relatively invisible in its larger form because it was then often fitted out with keyboards to give the option for an entirely human performance
  - the steam calliope, a pipe organ operated on steam rather than air;
  - the fairground organ, a pipe organ which uses mechanical means instead of a keyboard to play a prepared song.
  - various sorts of novelty instruments operating on the same principles
- Mouth-played instruments
  - the [harmonica](#), where the musician effectively blows directly onto the reeds is also known as a mouth organ;
  - the [pan-pipes](#)
  - [bagpipes](#)

Mesopotamic Black Metal

[Timeline of heavy metal](#)

**Oriental metal** is a crossover between [death metal](#) and [doom metal](#), influenced by ancient Jewish traditions and the oriental culture.

The **Oriental metal** evolved in Israel, where bands from the local metal scene began writing metal songs related to Jewish tragedies and biblical stories. This change did not only have an effect on the [lyrics](#), but on the music as well; the bands added traditional instruments and singing to their slow Death metal riffs, creating moving, emotional, apocalyptic music. Some of the bands have also composed Death metal versions to ancient Jewish prayers and [Psalms](#) chants.

The most notable bands in this genre are the Israeli bands Salem and Orphaned Land.

**Salem** was a pioneer of combining metal with Jewish issues, and after a typical Death metal album in 1992, Salem produced the first **Oriental metal album** in 1994. The album is called Kaddish (literally "holiness", a Jewish prayer asking God to come to earth) which deals with the Holocaust and the massacre of six millions Jews by Nazi Germany. The most powerful song in the album is the metal revision of Ha'ayara Bo'eret - a song in Hebrew that was composed by a Holocaust survivor and depicts the burning of a Jewish town in Europe. The song was adapted to a slow Doom metal version, but sung in Hebrew. In 2002 Salem produced the album Collective Demise dealing with the atrocities of Palestinian suicide bombings against Israelis. In this album Salem wrote a metal adaptation to the Biblical [Psalms](#) chant *A/ Taster*. The song opened with Shofar blowing and the chant was sung by duet of clean female vocals and distorted male vocals.

**Orphaned Land** is in the core a [doom/death](#) metal band, but it was highly influenced by [folk music](#) and tradition of the Oriental Jews (Mizrahi). Their album Sahara (1994) was the first to include a combination of Death metal and traditional oriental music. In their second album El Norra Alila (1996), Orphaned Land elaborated the combination of metal and oriental music, including the addition of song with traditional oriental Jewish piyyut and Arab melodies. This album conveyed a message of co-existence between Jews and Muslims. Their third album, Mabool (the Hebrew name for the Deluge, depicted in the bible and Noah's story), 2004, was worked for seven years and takes the combination of doomdeath metal, oriental music and biblical issues to a new level. The album tells the story of three sons (one for each monotheistic religion) which try to warn humanity from a coming flood (deluge) as punishment for their sins. Musically, the album contain oriental instruments, two choruses, traditional Yemenite chants sung by Shlomit Levi and quotes of Biblical verses from the story, said by Kobi Farhi, one of Orphaned Land's founding members.

In Turkey, the pioneer of Oriental Metal is Pentagram (also known as **Mezarkabul** (Grave Acceptance) in Europe).

The Pentagram album Anatolia is a best selling metal album in Turkey.

## **Origins of music genres**

## Origins of rock and roll

**Rock and roll** emerged as a defined musical style in America in the 1950s, though elements of rock and roll can be seen in [rhythm and blues](#) records as far back as the 1920s. Early rock and roll combined elements of [blues](#), boogie woogie, [jazz](#) and [rhythm and blues](#), and is also influenced by traditional [folk music](#), [gospel music](#), black and white, and [country and western](#). Going back even further, rock and roll can trace a foundational lineage to the old Five Points district of mid-19th century New York City, the scene of the first fusion of heavily rhythmic African shuffles and sand dances with melody driven European genres, particularly the Irish jig.

## Origins of the name *rock and roll*

*Rocking* was a term first used by gospel singers in the American South to mean something akin to spiritual rapture. A double, ironic, meaning came to popular awareness in 1947 in blues artist Roy Brown's song "Good Rocking Tonight" (also covered the next year by Wynonie Harris in an even wilder version), in which "rocking" was ostensibly about dancing but was in fact a thinly-veiled allusion to sex. Such double-entendres were nothing new in blues music (which was mostly limited in exposure to jukeboxes and clubs) but were new to the radio airwaves. After the success of "Good Rocking Tonight" many other rhythm and blues artists used similar titles through the late 1940s including a song called "Rock and Roll" recorded by Wild Bill Moore in 1949. These songs were relegated to "race music" (the music industry code name for rhythm and blues) outlets and were barely known by mainstream white audiences. The phrase 'rock and roll' may first appear in a Louis Jordan version of Tamburitza Boogie recorded in New York City in 1950.

In 1951, Cleveland, Ohio [disc jockey](#) Alan Freed would begin playing this type of music for his white audience, and it is Freed who is credited with coining the phrase "rock and roll" to describe the rollicking R&B music that he brought to the airwaves. The term, with its simultaneous allusions to dancing, sex, and the sound of the music itself, stuck even with those who didn't absorb all the meanings.

Originally Freed used the name Moondog for himself and any concerts or promotions he put on. This arose from the fact he used a piece of music called "Moondog Symphony" by the street musician Moondog as his repeated opening music for his radio show. Moondog subsequently sued Freed on grounds that he was stealing his name. Since Freed was no longer allowed to use the term Moondog he needed a new catch phrase. After a night of heavy drinking he and his friends came up with the name "The Rock and Roll Party" since he was already using the phrase "Rock and Roll Session" to describe the music he was playing on his radio show. Since his show was extremely popular the term caught on and the subsequent public used it to describe a certain form of music.

## First record

According to some, notably music historian Peter Guralnick, the first rock and roll record was "Rocket 88", by Jackie Brenston and his Delta Cats (written by 19-year-old Ike Turner, also the session leader) and recorded by Sam Phillips for the Sun Records label, in 1951. Many other records recorded in the same period are also contenders for this title. Others have pointed to the later broad commercial success with white audiences of Chuck Berry's "Maybellene" or "Rock Around the Clock" by Bill Haley and his Comets as true starting points. Still others point out that performers like Fats Domino were recording blues songs as early as 1949 that are indistinguishable from later rock and roll, and that these blues songs were based on themes, chord changes, and rhythms dating back decades before that. Rhythm and Blues sax player and band leader Louis Jordan actually broke into the country charts in the forties with "Is you is or is you ain't my baby?". In 1947 Jack Guthrie and his group The Oaklahomans had a hit with "The Oakie Boogie", basically a mix of boogie woogie with hillbilly and an electric guitar thrown in (a fairly new invention in 1947). Benny Carter, a co-author of "Cow Cow Boogie" (Capitol Records first gold single) back in 1942, wrote the jazz-swing song "Rock Me to Sleep" with Paul Vandervoort II in 1950.

## Origins of the blues

Little is known about the exact origins of the music we now know as the [blues](#) . No specific year can be cited as the **origin of the blues**, largely because the style evolved over a long period of time and existed in something approaching its modern form before the term *blues* was introduced, before the style was thoroughly documented. One important early reference to something probably closely resembling the blues comes from 1901, when an archaeologist in Mississippi described the songs of black workers which had lyrical themes and technical elements in common with the blues .

The most important direct antecedent of the blues was the [spiritual](#), a form of religious song with its roots in the camp meetings of the Great Awakening of the early 19th century. Spirituals were a passionate song form, that "convey(ed) to listeners the same feeling of rootlessness and misery" as the blues . Spirituals, however, were less specifically concerning the performer, instead about the general loneliness of mankind, and were more figurative than direct in their lyrics . Despite these differences, the two forms are similar enough that they can not be easily separated — many spirituals would probably have been called *blues* had that word been in wide use at the time .

Aside from the spirituals, African American work songs were an important precursor to the modern blues; these included the songs sung by laborers like stevedores and roustabouts, and the [field hollers](#) of slaves .

There are few characteristics common to all blues, as the genre takes its shape from the peculiarities of each individual performance. Some characteristics, however, have been a presence since prior to the creation of the modern blues, and are common to most styles of [African American music](#). The earliest blues-like music was a "functional expression, rendered in a call-and-response style without accompaniment or harmony and unbounded by the formality of any particular musical structure". This pre-blues music was adapted from the field shouts and hollers performed during slave times, expanded into "simple solo songs laden with emotional content".

Many of these blues elements, such as the call-and-response format, can be traced back to the [music of Africa](#); author Sylviane Diouf has pointed to several specific traits, like the use of melisma and a wavy, nasal intonation that suggest a connection between the Muslim music of West and Central Africa and the blues [10]. African American composer W. C. Handy wrote in his autobiography of the experience of sleeping on a train traveling through (or stopping at the station of) Tutwiler, Mississippi, and being awakened by:

... a lean, loose-jointed Negro [who] had commenced plucking a guitar beside me while I slept. His clothes were rags; his feet peeped out of his shoes. His face had on it some of the sadness of the ages. As he played, he pressed a knife on the strings of the guitar. ... The effect was unforgettable. His song, too, struck me instantly. . . . The singer repeated the line ("Goin' where the Southern cross' the Dog") three times, accompanying himself on the guitar with the weirdest music I had ever heard.

African Muslim roots of certain elements of the blues have been posited by writers including the researcher Paul Oliver and the ethnomusicologist Gerhard Kubik, who describe how the knife technique Handy witnessed is a common one in West and Central Africa cultures, regions where Islam is strong and where the kora is often the stringed instrument of choice.

Blues later adopted elements from the "Ethiopian (here, meaning "black") airs" of minstrel shows and Negro spirituals, including instrumental and harmonic accompaniment. The style also was closely related to [ragtime](#), which developed at about the same time, though the blues better preserved "the original melodic patterns of African music". Songs from this early period had many different structures. A testimony of those times can be found for instance in Henry Thomas' recordings. However the twelve-, eight-bar, or sixteen-bar structure based on tonic, subdominant and dominant chords became the most common. Melodically, blues music is marked by the use of the lowered third and dominant seventh (so-called blue notes) of the associated major scale. What is now recognizable as the standard 12-bar blues form is documented from oral history and [sheet music](#) as appearing in African-American communities throughout the region along the lower Mississippi River during the decade of the 1900s (and performed by white bands in New Orleans at least since 1908). One of these early sites of blues evolution was along Beale Street in Memphis, Tennessee.

One of the first professional blues singers was Ma Rainey, who claimed to have coined the term blues; however, author Eileen Southern has pointed out several contrasting statements by old-time musicians. She cites Eubie Blake as saying "Blues in Baltimore? Why, Baltimore is the blues!" and Bunk Johnson as claiming that the blues was around in his childhood, in the 1880s

The most important reason for the lack of certain knowledge about the origins of the blues is the earliest blues musicians' tendency to wander through communities, leaving little or no record of precisely what sort of music they played or where it came from. Blues was generally regarded as lower-class music, unfit for documentation, study or enjoyment by the upper- and middle-classes .

Some scholars and performers have claimed that the tune associated with the song "Joe Turner" is the basis for all folk blues .

# Ornament

In [music](#), **ornaments** are musical flourishes that are not necessary to the overall melodic (or harmonic) line, but serve to decorate or "ornament" that line. They are performed as "fast notes" around a central note. The amount of **ornamentation** in a piece of music can vary from quite extensive (it was often so in the [Baroque](#) period) to relatively little or even none. The word *agrément* is used specifically to indicate the French Baroque style of ornamentation.

In the baroque period, it was common for performers to [improvise](#) ornamentation on a given melodic line. A singer performing a da capo aria, for instance, would sing the melody relatively unornamented the first time, but decorate it with additional flourishes the second time. Improvised ornamentation is also part of the Irish musical tradition<sup>[1]</sup> where it is not antiquated, although only a minority of Irish traditional musicians improvise.

Ornamentation may also be indicated by the composer. A number of standard ornaments (described below) are indicated with standard symbols in [music notation](#), while other ornamentations may be appended to the staff in small notes, or simply written normally. A **grace note** is a note written in smaller type, with or without a slash through it, to indicate that its [note value](#) does not count as part of the total time value of the measure.

In Spain, these ornaments were called "diferenzias", and can be traced back to the early 16th Century, when the first books with music for the guitar were produced.

## Types of ornament

### Trill

A trill is a rapid alternation between an indicated note and the one above, usually indicated by the letter *tr* written above the staff. The trill is also known as the *shake*.

Usually, if the music containing the trill was written before 1800 the trill is played by starting a note above the written note. If the music was written after 1800 then the trill is usually played by starting on the note written and going up to the note above. A printed score will often indicate which interpretation is to be used, either in the preface or by using a grace note.

### Mordent

The *mordent* is thought of as a rapid single alternation between an indicated note, the note above (called the *upper mordent*, *inverted mordent*, or *pralltriller*) or below (called the *lower mordent* or *mordent*) the indicated note, and the indicated note again.

The upper mordent is indicated by a short squiggle; the lower mordent is the same with a short vertical line through it:

As with the trill, the exact speed with which the mordent is performed will vary according to the tempo of the piece, but at moderate tempi the above might be executed as follows:

Confusion over the meaning of the unadorned word *mordent* has led to the modern terms *upper* and *lower* mordent being used, rather than *mordent* and *inverted mordent*. Practice, notation, and nomenclature vary widely for all of these ornaments, and this article as a whole addresses an approximate nineteenth-century standard. In the [Baroque period](#), a *Mordant* (the German equivalent of mordent) was what later came to be called an inverted mordent and what is now often called a lower mordent. In the 19th century, however, the name *mordent* was generally applied to what is now called the *upper* mordent. Although mordents are now thought of as just a single alternation between notes, in the Baroque period a *Mordant* may sometimes have been executed with more than one alternation between the indicated note and the note below, making it a sort of inverted trill. Mordents of all sorts might typically, in some periods, begin with an extra *inessential note* (the lesser, added note), rather than with the *principal note* as shown in the examples here. The same applies to trills, which in Baroque and Classical times would

standardly begin with the added, upper note. A *lower* inessential note may or may not be chromatically raised (that is, with a natural, a sharp, or even a double sharp) to make it just one semitone lower than the principal note.

## Turn

A short figure consisting of the note above the one indicated, the note itself, the note below the one indicated, and the note itself again. It is indicated by a mirrored S-shape lying on its side above the staff. An *inverted turn* (the note below the one indicated, the note itself, the note above it, and the note itself again) is usually indicated by putting a short vertical line through the normal turn sign, though sometimes the sign itself is turned upside down.

If the turn symbol is placed directly above a note, it is performed exactly as outlined above. If it is placed between two notes, however, the note before the symbol is played, then the turn, and then the following note. So the following turns:

might be executed like this:

The lower added note may or may not be chromatically raised (see *mordent*).

The exact speed at which the notes of a turn are played can vary, as can its rhythm. The question of how a turn is best executed is largely one of context, convention and taste.

## (Long) Appoggiatura

From the Italian word *appoggiare*, "to lean upon"; (pronounced approximately [Yìp°od'YÈtuÑ~Y]). The **long appoggiatura** is important melodically and often suspend the principal note by taking away the time-value of the *appoggiatura* prefixed to it (generally half the time value of the note, though in triple time, for example, it might receive two thirds of the time). The added note (the unessential note) is one degree higher or lower than the principal note; and, if lower, it may or may not be chromatically raised (see *mordent*).

The appoggiatura is written as a grace note prefixed to a principal note and printed in small character, usually without the oblique stroke:

This would be executed as follows:

Appoggiaturas are also usually on the strong or strongest beat of the resolution and are approached by a leap and leave by a step.

Musicians' mnemonic: the **appoggiatura** is longer than the *acciaccatura* because it is *podgy*.

## Acciacatura

From the Italian word *acciaccare*, "to crush"; (pronounced approximately [YìtʃækYÈtuÑ~Y]). The **acciaccatura**, or **short appoggiatura**) is perhaps best thought of as a shorter, less melodically significant, variant of the *long appoggiatura*, where the suspension of the principal note is scarcely perceptible - theoretically subtracting no time at all. It is written using a grace note (often a quaver, or eighth note), with an oblique stroke through the stem:

The exact interpretation of this will vary according to the tempo of the piece, but the following is possible:

Whether the note should be played before or on the beat is largely a question of taste and performance practice. Exceptionally, the acciacatura may be notated in the bar preceding the note to which it is attached, showing it is to be played before the beat. (This guide to practice is unfortunately not available, of course, if the principal note does not fall at the beginning of the measure.)

The word *acciaccatura* is strictly and originally applied to an ornament now obsolete, in which a principal note in a melody is struck together with an adjacent note, that adjacent note being at once released and the principal note held on.

## Outlaw country

**Outlaw country** was a significant trend in [country music](#) during the late 1960s and the 1970s. The focus of the movement has been on self-declared "outlaws" such as Waylon Jennings, Johnny Cash, Merle Haggard, David Allan Coe, Willie Nelson and Kris Kristofferson. The reason for the movement has been attributed to a reaction to the [Nashville sound](#), developed by record producers like Chet Atkins who softened the raw honky tonk sound that was predominant in the music of performers like Jimmie Rodgers, and his successors such as Hank Williams, George Jones and Lefty Frizzell. According to Aaron Fox (2004, p.51) "the fundamental opposition between law-and-order authoritarianism and the image of 'outlaw' authenticity...has structured country's discourse of masculinity since the days of Jimmie Rodgers."

The 1960s was a decade of enormous change and the change was reflected in the revolution in the music of the time. The Beatles, Bob Dylan, the Rolling Stones cast off the traditional role of the recording artist. They wrote their own material, they had creative input to their albums, they refused to conform to what society required of its youth. At the same time, country music was declining into a formulaic genre that appeared to offer the establishment what it wanted with artists such as Porter Wagoner and Dolly Parton making the kind of music that was anathema to the growing counter culture. While Nashville continued to be the heart of country music, some would say its soul was to be found in Lubbock, Tulsa, Bakersfield and Austin.

The term "outlaw country" is derived from the song "Ladies Love Outlaws" written by Lee Clayton and sung by Waylon Jennings on the 1972 album of the same name. It became associated with singers who grew their hair long, wore denim and leather and looked like hippies in contrast to the clean cut country singers in Nudie suits that were pushing the [Nashville sound](#). The success of these singers did much to restore the rawness and life force to country music. The songs were about drinking, drugs, hard working men and honky tonk heroes. The music was more like [rock and roll](#) and there were no strings in the background.

Although Jennings and Nelson are regarded as the stereotypical outlaws, there were several other writers and performers who provided the material that infused the movement with the outlaw spirit. Some people have noted that Waylon and Willie were Nashville veterans whose careers were revived by the movement and that they drew on the energy that was being generated in their home state of Texas to spearhead the attack on the Nashville producers. Waylon, in particular, forced his record company to let him produce his own albums. In 1973 he produced Lonesome, On'ry and

Mean. The theme song was written by Steve Young, a brilliant songwriter and performer who never made it in the mainstream but whose songs helped to create the outlaw style. The follow up album for Waylon was *Honky Tonk Heroes* and the songwriting hero was Texan Billy Joe Shaver. Like Steve Young, Billy Joe never made it big but his 1973 album *Old Five and Dimers Like Me* is a country classic in the outlaw genre.

Willie Nelson's career as a songwriter in Nashville peaked in the late 1960s. His "Crazy" was a massive hit for Patsy Cline, but as a singer, he was getting nowhere. He left Nashville in 1971 to return to Texas. The musicians he met in Austin had been developing the folk and rock influenced country music that grew into the outlaw genre. Performing and associating with the likes of Jerry Jeff Walker, Michael Martin Murphey and Billy Joe Shaver helped shape his future career. At the same time as Willie was reinventing himself, other significant influencers were writing and playing in Austin and Lubbock. Butch Hancock, Joe Ely and Jimmie Dale Gilmore formed The Flatlanders, a group that never sold huge numbers of albums but continues to perform. The three founders have each made a significant contribution to the development of the outlaw genre.

Other Texans like Townes van Zandt, Guy Clark and, latterly, Steve Earle have developed the outlaw ethos through their songs and their lifestyles.

# Overture

**Overture** (French *ouverture*, meaning opening) in [music](#) is the instrumental introduction to a dramatic, [choral](#) or, occasionally, [instrumental](#) composition.

Frequently an opening to a larger dramatic work such as an [opera](#), earlier usage of the word also referred to collections of movements, known as [suites](#). Later works, such as Beethoven's overture *Leonora No 3* mark a transition between the concept of overture as introduction to a dramatic entertainment, and musical forms such as the [symphonic poem](#), which are free-standing works in their own right.

# History

## 17th century

The notion of an overture has no existence until the 17th century. The toccata at the beginning of Monteverdi's Orfeo is a barbaric flourish of every procurable instrument, alternating with a melodious section entitled ritornello; and, in so far as this constitutes the first instrumental movement prefixed to an [opera](#), it may be called an overture. As an art-form the overture began to exist in the works of J-B Lully. He devised a scheme which, although he himself did not always adhere to it, constitutes the typical French overture up to the time of Johann Sebastian Bach and George Friderich Handel (whose works have made it classical). This French overture consists of a slow introduction in a marked "dotted rhythm" (i.e. exaggerated iambic, if the first chord is disregarded), followed by a lively movement in fugato style. The slow introduction was always repeated, and sometimes the quick movement concluded by returning to the slow tempo and material, and was also repeated (see Bach's French Overture in the *Klavierübung*). The operatic French overture was frequently followed by a series of dance tunes before the curtain rose. It thus became used as the prelude to a [suite](#); and the *Klavierübung* French Overture of Johann Sebastian Bach is a case in point, the overture proper being the introduction to a suite of seven dances. For the same reason Bach's four orchestral suites are called overtures; and, again, the prelude to the fourth *partita* in the *Klavierübung* is an overture.

Bach was able to use the French overture form for choruses, and even for the treatment of chorales. Thus the overture, properly so called, of his fourth orchestral suite became the first chorus of the church [cantata](#) "Unser Mund so voll Lachens"; the choruses of the cantatas "Preise Jerusalem den Herrn" and "Höchst erwünschtes Freudenfest" are in overture form; and, in the first of the two cantatas entitled "Nun komm der Heiden Heiland", Bach has ingeniously adapted the overture form to the treatment of a chorale.

## Sonata style

With the rise of dramatic music and the [sonata](#) style, the French overture became unsuitable for opera; and Gluck (whose remarks on the function of overtures in the preface to *Alceste* are historic) based himself on Italian models, of loose texture, which admit of a sweeping and massively contrasted technique. By the time of Wolfgang Amadeus Mozart's later

works the overture in the sonata style had clearly differentiated itself from strictly symphonic music. It consists of a quick movement (with or without a slow introduction), in [sonata form](#), loose in texture, without repeats, frequently without a development section, but sometimes substituting for it a melodious episode in slow time. Instances of this substitution are Mozart's [symphony](#) in G, which is an overture to an unknown opera, and his overtures to *Die Entführung* and to *Lo Sposo deluso*, in both of which cases the curtain rises at a point which throws a remarkable dramatic light upon the peculiar form. The overture to *Figaro* was at first intended to have a similar slow middle section, which, however, Mozart struck out as soon as he had begun it. In Beethoven's hands the overture style and form increased its distinction from that of the symphony, but it no longer remained inferior to it; and the final version of the overture to *Leonora* (that known as No. 3) is the most gigantic single orchestral movement ever based on the sonata style.

### **Overtures to plays**

Overtures to plays, such as Ludwig van Beethoven's to Coffin's *Coriolan*, tend to become detached from their surroundings; and hence arises the concert overture, second only to the symphony in importance as a purely orchestral art-form. Its derivation associates it almost inevitably with external poetic ideas. These, if sufficiently broad, need in no way militate against musical integrity of form; and Felix Mendelssohn's *Hebrides* overture is as perfect a masterpiece as can be found in any art. The same applies to Brahms's *Tragic Overture*, one of his greatest orchestral works, for which a more explanatory title would be misleading as well as unnecessary. His *Academic Festival Overture* is a highly organized working out of German [student songs](#).

### **Modern opera**

In modern opera the overture, *Vorspiel*, *Einleitung*, Introduction, or whatever else it may be called, is generally nothing more definite than that portion of the music which takes place before the curtain rises. *Tannhäuser* is the last case of high importance in which the overture (as originally written) is a really complete instrumental piece prefixed to an opera in tragic and continuous dramatic style. In lighter opera, where sectional forms are still possible, a separable overture is not out of place, though even *Carmen* is remarkable in the dramatic way in which its overture foreshadows the tragic end and leads directly to the rise of the curtain. Richard Wagner's *Vorspiel* to *Lohengrin* is a short self-contained movement founded on the

music of the Grail. With all its wonderful instrumentation, romantic beauty and identity with subsequent music in the first and third acts, it does not represent a further departure from the formal classical overture than that shown fifty years earlier by Méhul's interesting overtures to *Ariodant* and *Uthal*, in the latter of which a voice is several times heard on the stage before the rise of the curtain.

The *Vorspiel* to *Die Meistersinger*, though very enjoyable by itself and needing only an additional tonic chord to bring it to an end, really loses incalculably in refinement by so ending in a concert room. In its proper position its otherwise disproportionate climax leads to the rise of the curtain and the engaging of the listener's mind in a crowd of dramatic and spectacular sensations amply adequate to account for that long introductory instrumental crescendo. The *Vorspiel* to *Tristan* has been very beautifully finished for concert use by Wagner himself, and the considerable length and subtlety of the added page shows how little calculated for independent existence the original *Vorspiel* was. Lastly, the *Parsifal* *Vorspiel* is a composition which, though finished for concert use by Wagner in a few extra bars, asserts itself with the utmost lucidity and force as a prelude to some vast design. The orchestral preludes to the four dramas of the Ring owe their whole meaning to their being mere preparations for the rise of the curtain; and these works can no more be said to have overtures than Verdi's *Falstaff* and Strauss's *Salome*, in which the curtain rises at the first note of the music.

## **Broadway musicals**

Contemporary Overtures accompanying Broadway Musicals usually contain segments from the more popular songs in the musical. The overture usually is played before the musical starts. However, in the recent revival of Cole Porter's *Kiss Me, Kate*, the overture appears after the opening chorus of "Another Op'ning, another show", with the chorus remaining on stage. (In the original 1948 production, and all other productions of the show up to 1999, the overture to the show appeared in its usual place - before the first song.)

## Trivia

Musical overtures have also appeared in motion pictures, particularly early and science fiction movies. In the fashion of modern opera, these overtures appear before the opening credits and are accompanied by a black screen or occasionally a starfield. Notable examples include King Kong (1933 film), 2001: A Space Odyssey, Space Battleship Yamato (which had the distinction of a vocal overture instead of instrumental), Star Trek: The Motion Picture, and Disney's The Black Hole.

# Paisley Underground

**Stylistic origins:** 1960's [Folk rock](#), Psychedelic rock, [Garage rock](#), 1970's [Power pop](#), [Punk rock](#)

**Cultural origins:** mid 1980's, Los Angeles

**Typical instruments:** [Guitar](#) - [Bass](#) - [Drums](#)

**Mainstream popularity:** mid 1980s, Los Angeles

Los Angeles, Dunedin Sound

[Timeline of alternative rock](#)

**Paisley Underground** is a term used to describe a genre of [rock music](#), based primarily in Los Angeles, California, which was at its most popular in the mid-1980s. (The coinage -- a joke that stuck -- is usually ascribed to Michael Quercio of the band The Three O'Clock.)

Paisley Underground bands incorporated psychedelia, rich vocal harmonies and guitar interplay in a folk rock style that owed a particular debt to The Byrds, but more generally referenced the whole range of 1960s West Coast pop and garage rock, from the Seeds to the Beach Boys. (The Dream Syndicate channeled Crazy Horse and Creedence Clearwater Revival -- via The Velvet Underground -- while The Bangles recalled The Mamas and The Papas, Green on Red came on as a cousin to The Doors, The Long Ryders honored Gram Parsons and the Buffalo Springfield, and so on.) The 1970s Memphis cult band Big Star, whose "September Gurls" was covered by The Bangles, was also influential, as were Britain's Soft Boys. Although there were accomplished musicians among them, it was also rooted -- as was the [punk rock](#) that preceded it -- in an inspired amateurism.

Sometimes, bands more peripheral to the shared musical vision of the Paisley Underground but who were part of the same social circle, such as Redd Kross, then evolving from [punk rock](#) into power pop ; The Leaving Trains, who had many of the same influences as the above bands but who leaned more towards punk ; The Last, who predated the abovementioned bands although sharing their musical vision; and The Pandoras, who leaned more towards straightforward [garage rock](#) revivalism, are included as part of the Paisley Underground.

Paisley Underground bands frequently shared bills, socialized and collaborated. Members of Rain Parade, the Bangles, the Dream Syndicate and the Three O'Clock joined together to make *Rainy Day*, an album of cover versions of songs by the Velvet Underground, Buffalo Springfield, Bob Dylan, The Beach Boys, Big Star, Jimi Hendrix, and The Who. As "Danny and Dusty," Steve Wynn of the Dream Syndicate and Dan Stuart of Green on Red made the album *The Lost Weekend* (A&M, 1985) backed by members of each band along with most of The Long Ryders.

By far the most popular band to emerge from the movement was The Bangles, who have had massive mainstream success, although each of the best known groups released at least one album on a major label.

Penny Feathers on La Cienega Boulevard was a popular meeting point for paisley people.

By the end of the 1980s the movement had passed from public consciousness. However, later acts Mercury Rev and Granddaddy have acknowledged its influence.

The wider movement of which it is a part is named [jangle pop](#) after the ringing, light [guitar](#) sounds it often features. It was paralleled in other parts of the world by genres such as New Zealand's Dunedin Sound, whose chief exponents (such as The Chills and Sneaky Feelings) were often cited as directly comparable to Paisley Underground bands.

## Notable paisley underground bands

The Pandoras  
The Fuzztones  
The Gravedigger 5  
The Chesterfield Kings  
Dream Syndicate  
The Long Ryders  
The Eyes of Mind  
Green on Red  
Rain Parade  
Salvation Army, later called The Three O'Clock  
Game Theory and True West (based in Davis, California)  
28th Day (based in Chico, California)  
Lone Justice  
House of Freaks  
The Lost Patrol (based in San Francisco, California)

Not to be confused with Paisley, a type of punk, but ironically upbeat, and sung with lyrics that would normally be directed at children.

## Pan flute

The pipes comprising it are stopped at one end, so that the sound waves have to travel twice the length of the pipes, giving out a note nearly an octave lower than that produced by an open pipe of equal length. In the traditional South American style, pipes are fine-tuned to correct pitch by placing small pebbles or dry corn kernels into the bottom of the pipes. Contemporary makers of curved Romanian-style panpipes use wax (commonly beeswax) to tune new instruments. Special tools are used to place or remove the wax. Corks and rubber stoppers are also used, and are easier to quickly tune pipes.

The pan flute is played by blowing horizontally across the open end against the sharp inner edge of the pipes. This creates the regular series of pulses which generate the sound waves within the tubes. Each pipe is tuned to a note, called the **fundamental**. By overblowing, that is, increasing the pressure of breath and tension of lips, harmonics (notes whose frequencies are multiples of the fundamental) may also be produced. The Romanian panflute has the pipes arranged in a curved array, enabling the player to easily reach all the notes by simply swiveling their head. These instruments can also play all the sharps and flats, with a special technique of both tilting the pipes and jaw movement. An advanced player can play any scale and in any key. There are two styles of vibrato possible, hand vibrato and breath vibrato. In hand vibrato, the player applies a gentle motion to one end of the panflute (usually the high end) in much the same way as a violinist would wiggle their finger stopping the string to produce vibrato. Breath (or diaphragm) vibrato is the same technique used by players of the flute and other woodwinds.

The plural of *syrinx* is *syringes*, from which the modern word *syringe* is derived. (*Pan pipes* is both singular and plural.) Other names for the instrument include the Medieval ***fistula panis***.

The pan flute was most recently popularised by the Romanian [musician](#) Gheorghe Zamfir, who toured extensively and recorded many albums of pan flute music, and by several other artists who began recording at the same time. They are also very popular in Peruvian traditional groups and other Andean music.

This simple instrument was used in some songs by The Beatles, Simon and Garfunkel, Bee Gees, Agustín Lara, Luis Miguel and Céline Dion.

## Partner dance

**Partner dances** are the [dances](#) whose basic choreography involves coordinated dancing of two partners, as opposed to individuals dancing alone or individually in a non-coordinated manner, and as opposed to [groups of people](#) dancing simultaneously in a coordinated manner.

Dance partners stay together for the duration of the dance and, most often, dance independently of other couples dancing at the same time, if any.

Although this kind of dancing can be seen, for instance, in ballet, this term is usually applied to various forms of [social dance](#) and related forms: [ballroom dance](#), [folk dance](#), etc.

Partner dance may be a basis of a formation dance, a [round dance](#), a [square dance](#) or a sequence dance. These are kinds of [group dance](#) where the dancers form couples and dance either the same pre-choreographed or called routines or routines within a common choreography— routines that control both how each couple dances together and how each couple moves in accord with other couples. In square dance one will often change partners during the course of a dance, in which case one distinguishes between the "original partner" and a "situational partner".

In many partner dances, one, typically a man, is the **leader**; the other, typically a woman, is the **follower**. As a rule, they maintain connection with each other. In some dances the connection is loose and called dance handhold. In other dances the connection involves body contact. In the latter case the connection imposes significant restrictions on relative body positions during the dance and hence it is often called dance frame. It is also said that each partner has his own dance frame. Although the handhold connection poses almost no restriction on body positions, it is quite helpful that the partners are aware of their dance frames, since this is instrumental in leading and following.

In situations where the number of men and women are unequal, women tend to feel more comfortable than men when dancing with other members of the same gender. However, in real-world situations such as in salsa clubs, two men dancing together is practically never seen, and probably strongly frowned upon. It is believed that due to the macho Latin culture in salsa clubs, two men would never dance together and risk their "image." At partner dance events held at dance studios the situation may well be different as the context may make it clear that the two men are simply practicing the dance moves they're learning. Two women dancing together in salsa clubs is common, even cheered on by the male bystanders as some sort of entertainment.

In promenade-style partner dancing there is no leader or follower, and the couple dance side-by-side maintaining a connection with each other through a promenade handhold. The man dances traditionally to the left of the woman.

Some peoples have folk partner dances, where partners do not have any body contact at all, but there is still a kind of "call-response" interaction.

Nowadays, the most popular form of partner dancing among youth is "slow dancing" (for instance, dancing to ballads; see slow jam), and how close the partners get is up to them. In the "hug-and-sway" version of slow dancing, the man usually puts his arms around the female's waist, while the female puts her arm on the man's shoulders.

## Double partner dance

This kind of dance involves dancing of three persons together: one man with two women or one woman with two men. In [social dancing](#), double partnering is of choice when a significant demographic disproportion happens between the two sexes. For example, this happens during wars: in army there is lack of women, while among civilians able dancers are mostly women, especially during enormous wars such as WWII.

Today (1980-2004), double partner dance is often performed in Hustle, Salsa and [Swing](#) dance communities, experienced leaders leading two followers.

There are a number of folk dances that feature this setup. Among these are the Russian Troika and the Polish Trojak folk dances, where a man dances with two women. A Cajun dance with the name *Troika* is also known.

# Payola

In the [music industry](#), the illegal practice of record companies paying money for the broadcast of records on music radio is called **payola**, if the song is presented as being part of the normal day's broadcast.

Under United States law, a radio station has always had the ability to play a specific song in exchange for money; however, this must be disclosed on the air as being sponsored airtime, and that play of the song should not be reported as a "spin". Some radio stations report spins of the newest and most popular songs to industry publications, which are then published. The number of times the songs are played can influence other stations around the country to play or pass on a particular song. On influential stations (and particularly on television) payola can become so commonplace that it becomes difficult for artists to get their records/videos played without offering some sort of payment. The term gets its name as a take-off of the names of some early record-playing machines, such as Victrola. (These names in their turn stem from pianola, c.1896, the trademark name of a player piano, the ending perhaps abstracted from viola and meant as a diminutive suffix.)

Alan Freed—a [disc jockey](#) and early supporter of [rock and roll](#)—saw his career and reputation greatly harmed by a payola scandal. Another early disc jockey who was nearly derailed by the payola scandal was Dick Clark, but he avoided trouble by selling his stake in a record company and cooperating with authorities.

The practice was criticized in the chorus of the Dead Kennedys song "Pull My Strings," a parody of the song "My Sharona" sung to a crowd of music industry leaders during a music award ceremony.

The They Might Be Giants song "Hey, Mr. DJ, I Thought You Said We Had A Deal" is another song about the practice. It is narrated from the point of view of a naïve and inexperienced music artist who has been coerced by a [disc jockey](#) into paying for airplay -- the disc jockey then disappears and does not deliver on his promise.

## **Third-party Loophole**

Currently a different form of payola is used by the record industry through the loophole of being able to pay a third party or independent record promoters ("indies"; not to be confused with independent record labels), who will then go and "promote" those songs to radio stations. Offering the radio stations "promotion payments", the independents get the songs that their clients, record companies, want on the playlists of radio stations around the country.

Because of this, a very large majority of DJs are cut out of the song-picking decisions and are instead told what to play and when (for the most part) by music directors and/or "higher ups" at their radio stations.

This new type of payola sidesteps current FCC regulations requiring that, if a song is paid for by the record company, the radio station must state that it was paid for. Using independent intermediaries allows the record company to avoid directly paying the radio station, thus the radio station need not report it as a paid promotion.

New York State Attorney General Eliot Spitzer has been prosecuting payola-related crimes in his jurisdiction. His office settled out of court with Sony BMG Music Entertainment in July 2005, Warner Music Group in November 2005 and Universal Music Group in May 2006. The three conglomerates agreed to pay \$10, \$5 and \$12 million respectively for distribution by Rockefeller Philanthropy Advisors to New York State non-profit organizations that will fund music education and appreciation programs throughout the state. EMI remains under investigation.

## Percussion ensemble

A **percussion ensemble** is a [musical ensemble](#) consisting of only [percussion instruments](#). Although the term can be used to describe any such group, it commonly refers to groups of classically-trained percussionists performing primarily [classical music](#). Percussion ensembles are most commonly found at conservatories, though some professional groups, such as Nexus exist.

See also: [Drumline](#), [Indoor percussion ensemble](#)

Categories: [Percussion ensembles](#) | [Musical groups](#)

## Percussion instrument

**Percussion instruments** are music instruments played by being struck, shaken, rubbed or scraped, hence the "percussive" name. They are perhaps the oldest form of [musical instruments](#), rivaled only by vocal. Percussion instruments play not only [rhythm](#), but also [melody](#) and [harmony](#).

Music for pitched percussion instruments can be [notated](#) on a staff with the same treble and bass clefs used by many non-percussive instruments. Music for percussive instruments without a definite pitch is often notated with a specialist rhythm or percussion-clef; although sometimes a bass clef is simply substituted for rhythm clef.

## Classifications

Most percussion instruments have a distinct tone; even a [drum](#) can be tuned. However, a distinction is usually made based on whether the instrument can play a definite pitch or not.

The [timpani](#), [xylophone](#), marimba, balafon , [vibraphone](#), [bell](#), [tubular bells](#) (chimes in the U.S.A.), crotales and glockenspiel all play a definite pitch. (The [piano](#) is also often considered a percussion instrument because its sound is created by a hammer striking strings.) The snare drum, bass drum, afuche, various chimes (e.g. mark tree), [castanets](#), claves, cowbell, [cymbal](#), doyra, flexatone, güiro, maracas, mendoza, ratchet, spoons, [tambourine](#), temple blocks, tom-tom, timbales, [triangle](#), vibraslap, washboard, whip and wood block do not in general. However, some percussionists tune drum heads to specific pitches when recording albums or in preparation for specific composer requirements. [Gongs](#) and anvils can be tuned or untuned – the most familiar type of gong in the west, the *chau gong* (sometimes called a *tam-tam*), is untuned. Tuned cymbals exist but are rare. Often instruments will come in pairs (such as bongos) or larger groups (such as temple blocks); here, there will be a high-low distinction while still retaining indefinite (or unspecified) pitch.

The two major categories are [membranophones](#), which add [timbre](#) to the sound of being struck (such as drums), and [idiophones](#), which sound of themselves (such as the [triangle](#)). The [tambourine](#) is both membranophone and idiophone, having both a head and jingles.

Percussion can be broken down into more specific sub-categories as well, for a more specific understanding of the uses of the instruments and the styles of music in which those particular instruments are used. These are not formal distinctions, but some useful categories are: Tuned percussion, Untuned percussion, Auxiliary percussion, [Latin percussion](#) and [Drum Kit](#).

Drum kits are usually a combination of several or all categories, as some drum kit players (e.g. Neil Peart) use massive ensembles of snare drums, tom-toms, timpani, electronic xylophones, various pieces of auxiliary and latin percussion (cowbell racks, tambourines etc) along with enormous arrays of cymbals in all shapes, sizes and functions.

## Names for percussionists

The general term for a musician who plays percussion instruments is *percussionist*.

- drummer: someone who primarily plays drums including the drumset and [hand drums](#).
- timpanist: a [timpani](#) player
- marimbist, marimbero: a marimba player
- balafonist: a balafon player
- vibraphonist: a [vibraphone](#) player
- timbalero, timbero: someone who plays timbales
- congalero, conguero: someone who plays [congas](#)
- bongocerro: someone who plays bongos and usually cencerro, a cow bell, too

Percussionists are also called upon to play a variety of instruments which are not percussive or are not generally thought of as percussion instruments. These include the lion's roar, wind machines, [whistles](#) and duck calls, air raid sirens, doorbells, car horns, pistols, typewriters and the glass harmonica.

Because percussion covers such a diverse range of musical styles, rhythms, melodies and harmonies, percussion virtuosos are often some of the most widely skilled and accomplished musicians in the music industry.

One of the most prolific modern percussionists alive today is Emil Richards.

## Function

Percussion is commonly referred to as "the backbone" or "the heartbeat" of a musical ensemble, often working in close collaboration with bass instruments, when present. Though there are many classical, jazz and even rock ensembles that refrain from the use of percussion from time to time, it is extremely rare to have a truly impressive piece of music in any genre unless there is a strong percussive backing. Most classical pieces written for full orchestra since the time of Haydn and Mozart are orchestrated to place emphasis on the strings and woodwinds, but will almost always include at least one pair of timpani in the background, providing percussive drive and strengthening the bass line.

In almost every style of music, percussion plays a pivotal role. In military [marching bands](#) and pipes and drums, it is the beat of the bass drum that keeps the soldiers in step and at a regular speed, and it is the snare that provides that crisp, decisive air to the tune of a regiment. In classic jazz, one almost immediately thinks of the distinctive rhythm of the hi-hats or the ride cymbal when the word "swing" is spoken. In more recent popular music culture, it is almost impossible to name three or four rock, hip-hop, rap, funk or even soul charts or songs that do not have some sort of percussive beat keeping the tune in time.

Because of the diversity of percussive instruments, it is not uncommon to find large musical ensembles composed entirely of percussion. Rhythm, melody and harmony are all apparent and alive in these musical groups, and in live performance they are quite a sight to see.

[Music of the United States](#) - [Music of Canada](#)

**Peyote songs** are a form of [Native American music](#), now most often performed as part of the Native American Church. They are typically accompanied by a rattle and water drum, and are used in a ceremonial aspect during the sacramental taking of peyote. Peyote songs share characteristics of Apache music (Southern Athabaskan) and Plains-Pueblo music, having been promoted among the Plains by the Apache people. Vocal style, melodic contour, and rhythm in Peyote songs is closer to Apache than Plains, featuring only two durational values, predominating thirds and fifths of Apache music with the tile-type melodic contour, incomplete repetitions, and isorhythmic tendencies of Plains-Pueblo music. The cadential formula use is also probably of Apache origin. (Nettl 1956, p.114)

In recent years, modernized peyote songs have been popularized by Verdell Primeaux, a Sioux, and Johnny Mike, a Navajo.

## P-Funk

Parliament-Funkadelic, also called *P-Funk*, is a collective consisting of two primary bands, Parliament and Funkadelic, as well as a great many offshoot groups and solo musicians.

The etymology of the term "P Funk" is murky. It seems part abbreviation of "Parliament-Funkadelic", part abbreviation for "pure [funk](#)," a genre of music embodied by the Clinton bands; and part abbreviation of "Plainfield Funk", referring to Plainfield, New Jersey, Parliament's hometown. The breakout popularity of Parliament-Funkadelic elevated the status of "P Funk" to describe Funk of a quintessentially superior quality, a sort of *sui generis*.

"I want the bomb. I want the P-Funk. I want my funk uncut." ["P Funk (Wants To Get Funked Up)", Mothership Connection, 1976].

# History of P-Funk

## Early Development

The P Funk story begins in 1956, in Plainfield, New Jersey, 1956 - with a doo-wop group built around George Clinton, Ray "Stingray" Davis, Clarence "Fuzzy" Haskins, Calvin Simon and Helen Clark. These were The Parliaments, the name inspired by Parliament cigarettes. Their backing band was made up from the young Plainfield musical talent that came into Clinton's barbershop there. The band, composed of Billy "Bass" Nelson (bass), Eddie Hazel (lead guitarist), Tawl Ross (guitarist), Tiki Fulwood (drums) and Mickey Atkins (keys), called itself The Funkadelics.

## P-Funk Goes To Motown

But the 1960s brought little success for the prototype P Funk act. In his Family Series "Studio Memories", Clinton describes how he was so inspired by the success of Motown Records that he decided to move the band to Detroit and audition for the label. However, things didn't work out as planned and The Parliaments ended up recording only a handful on singles for the relatively minor label Revilot Records. These included a hard-won hit in 1967 with 'I Wanna Testify', but the band struggled to really take off. In the meantime George Clinton was writing songs for the established Motown acts, including The Jackson 5; and band members such as Eddie Hazel and Billy Nelson were recording on the occasional track in the Snakepit, on the quiet.

## Transition to Funkadelic

At the end of the 1960s, Revilot folded and took The Parliaments name with it. Things were looking bleak for the Funk Mob. But it was at this point that George Clinton decided to let The Funkadelics come to the fore. They became Funkadelic, and started taking over the show. The sound and the look of the band both became gradually less clean-cut. The sound hardened into a freaked-out blend of psychedelic Rock music/R&B music, and a purified, raw Funk music essence. Their experimentation with disorienting distortion effects and feedback, combined with an almost obnoxious attitude toward gigging, meant that early Funkadelic had a small and devoted cult

following. They recorded the underground classic album Funkadelic for Westbound Records in 1970, but they were still to find widespread commercial success elusive.

Funkadelic recorded two more albums in the following year, *Free Your Mind And Your Ass Will Follow* and *Maggot Brain*. The first saw the arrival of master keyboardist Bernie Worrell, another Plainfield youngster and classically trained musician, who opened up the band's sound into a whole new strange area of gothic funkiness. The second featured the incredible 'Maggot Brain', a showcase for the guitar talents of Eddie Hazel.

### **Arrival of the Collins Brothers**

Billy Nelson and Eddie Hazel temporarily left the group in 1972 due to financial disputes, and Tawl Ross left because of a bad LSD trip. William and Phelps Collins, two brothers who eventually became more widely known as Bootsy and Catfish, respectively, hopped aboard. Bootsy first met George when he was tripping out on acid, spouting jibberish. They had been playing with James Brown as part of the [JBs], but had tired of his tyrannical attitude. Bootsy described how he knew straight away that he wanted to work with Clinton because, as he describes, "he was tripping like a mug". Both brothers were influential in the development of the P-Funk sound, particularly the maverick Bootsy, and the result was *America Eats Its Young* (1972), a bizarre, distorted and brilliant work.

### **The Reemergence of Parliament**

But there were tensions behind the scenes. The arrival of the Collins brothers changed the tone of the Funkadelic sound, and not everybody was happy. Bootsy left briefly after that album, while Catfish was an on-and-off member who eventually wound up playing mostly for his brother's solo efforts.

By the time Bootsy came back in 1974, Clinton had decided to open up another front for The Funk. He had released a selection of the band's tripped out, experimental songs under the name Parliament in 1970, as the album *Osmium*. But the Parliament name languished for four years after that, until Clinton resurrected it in 1974 for *Up For The Downstroke*, which was basically recorded by Funkadelic, plus Bootsy.

The following year, Maceo Parker and Fred Wesley (also from the JB's) joined Parliament, enhancing the horns and added a new, [jazzy](#) dimension to the music. The same year, the incredible young light of Glen Goins joined too, a naturally talented singer from a hugely talented family, rooted strongly

in the gospel. And so too did Jerome "Big Foot" Brailey on drums. This was 1975, the year of Chocolate City.

And the year that followed, 1976, was the year of The Mothership Connection. "Tear the Roof Off the Sucker (Give Up The Funk)" became the first Top Ten single for the group, peaking at number five, and the album became the first gold P-Funk LP.

Two years later, 1977, Parliament won its first No. 1 hit with "Flashlight", off the album Funkentelechy vs. The Placebo Syndrome.

## **P-Funk On The Rise**

Clinton had signed Parliament to Casablanca Records. In 1977 he moved Funkadelic from Westbound to Warner Brothers, angering some of the original members.

But Funkadelic would go on with mounting confidence and popularity throughout the 1970s, recording a string of excellent albums - Cosmic Slop (1973), Standing On The Verge Of Getting It On (1974), Let's Take It To The Stage (1975), Tales of Kidd Funkadelic (1976), Hardcore Jollies (1976), One Nation Under A Groove (1978), Uncle Jam Wants You (1979), and The Electric Spanking Of War Babies (1981). In this period they had two No. 1 hits of their own: One Nation Under a Groove in 1978 and (Not Just) Knee Deep in 1979.

As the years went by, their strengths were boosted by the constant attraction of new talent - including Eddie Hazel-esque guitarist Michael Hampton, The Ohio Players genius Junie Morrison, and even Sly Stone.

Parliament went on through the 1970s with a series of successful albums: The Clones Of Dr. Funkenstein (1976), Funkentelechy vs. The Placebo Syndrome (1977), The Motor-Booty Affair (1978), Gloryhallastoopid (1979) and Trombipulation (1980). The band scored another No. 1 hit in 1978 with "Aqua Boogie", on The Motor-Booty Affair album.

The albums of the period had morphed into [concept albums](#), with bizarre, spacy themes that carried elaborate and pointed political and sociological messages, and were usually linked between albums (see P-Funk mythology). The two most notable additions to the group during this period were Junie Morrison and Rodney "Skeet" Curtis. Junie in particular played several instruments, wrote, produced and arranged many of the most-respected songs on two crucial albums, One Nation Under a Groove and Motor Booty Affair.

## **Bootsy's Rubber Band & The P-Funk Family**

With help from Clinton, Bootsy Collins formed Bootsy's Rubber Band, a wacky, bass-driven group, along with Catfish Collins, Mudbone Cooper, the Horny Horns and, at times, Bernie Worrell and Joel Johnson.

Bootsy's Rubber Band was the beginning of a burgeoning P-Funk family, which multiplied in the late seventies, with the building swarm of musicians recording albums released under a multitude of names - including The Brides of Funkenstein and Parlet, and most notably The Horny Horns with Fred Wesley. Bernie Worrell and Eddie Hazel also released excellent solo albums.

The changes that happened in 1977 with the move to Warner Brothers, and the string of No. 1 hits, saw the emergence of the lavish P-Funk tours that would eventually become legendary, involving huge elaborate props, costumes, routines and even a massive flying Mothership landing on stage, called in by Glen Goins. These tours became ever more and more elaborate and expensive, resulting in dire financial straits. In 1979, Funkadelic launched the Anti-Tour, scrapping much of the lavishness. This was where Dennis Chambers and Blackbyrd McKnight joined the group.

As the 1970s drew to a close, bad management had put the whole empire in jeopardy. George Clinton's tendency to neglect the very people who had helped him build the P-Funk sound also meant that many of the greatest musical talents turned against him. Glen Goins left to form renegade P Funk band Quazar; Jerome Brailey left to form the equally renegade Mutiny; and the original Parliaments formed a renegade Funkadelic of their own. The P Funk mob began to splinter, and their foundation started to crumble.

Parliament's final album - Trombipulation - came out in 1980, and Funkadelic's - The Electric Spanking Of War Babies in 1981.

## **End For The Funk?**

Casablanca Records folded in 1982. Like Revilot in the 1960s, it took the legal rights to the name Parliament with it. Meanwhile Warner Brothers seemed to have lost interest in Funkadelic, becoming prudish, fussy, negative and penny pinching, despite all the band's years of success. With the Funk Mob in chaos already, the end of the P seemed nigh.

## **P-Funk Lives!**

George Clinton battled with financial problems and some well publicised drug problems, and kept recording during the 1980s. The remaining Funk Mob recorded the 1982 hit album Computer Games, which included the

much-sampled, No. 1 single, "Atomic Dog". The following year, he formed The P Funk All Stars, who went on to record Urban Dancefloor Guerillas in 1983 and toured regularly throughout the rest of the 1980s.

Other P-Funk artists continued with their own projects, including Sweat Band and O.G. Funk. Clinton produced a series of solo rap albums too during this time, of mixed quality.

As the 1980s continued, with an industry hostile to it, The Funk began to slip out of the popular consciousness. But Hip Hop kept the flame alive, the growing genre of funk-sampling street music.

By 1993, most of the old Parliament and Funkadelic albums had been re-released. A new generation began to pick up on the power of The Funk. The same year saw the return of a reconstituted P-Funk All-Stars, with the re-release of Urban Dancefloor Guerillas as Hydraulic Funk, and a scandalous new Hip Hop influenced album Dope Dogs, including the excellent 'All Sons Of Bitches'. In 1994, the group toured with Lollapalooza.

P-Funk's fortunes seemed back on the rise. In 1996 they released T.A.P.O.A.F.O.M.. But legal problems flared up again, and it would be another ten years before another album would be released. In the intervening time, successive tours would slowly restore some of the broken ties between the original band members, together with an accumulation of new talent, slowly rebuilding that old confidence and audacity.

In 2002, Bootsy released Play With Bootsy.

And in 2005, Clinton released the latest P Funk All Stars album How Late Do You Have 2BB4UR Absent? in time for the 50th anniversary of the founding of the original Parliaments.

## **Key figures in the development of the P-Funk sound**

### **George Clinton**

George Clinton has been, since its inception, the driving force behind the development of the P-Funk sound. Though he may be remembered today more for his rainbow hair and outlandish costumes than his music, his influence on generations of musicians has been remarkable. Clinton's artistry encompassed more than mere entertainment. In an era of growing black awareness, political ferment, social protest and societal upheaval, Clinton, like scores of his contemporaries (Curtis Mayfield and The Impressions; the Temptations; Donny Hathaway; Marvin Gaye; Edwin Starr; Oscar Brown, Jr.; The Staples Singers/Swingers; The Voices of East Harlem; Nina Simone; etc.) took African-American popular music (long concerned with issues of social, political and economic justice) to new levels of political outspokenness, public visibility and artistic accomplishment, tackling such complex subjects as the Vietnam War and the War on Drugs with intelligence and awareness.

### **Bootsy Collins**

Bootsy is a versatile bassist, capable of playing many styles. He was adventurous and original in his playing, and has become known as a legendary virtuoso of the bass guitar. He also made a substantial impact as a songwriter and uncredited guitarist and drummer on several studio tracks. Like many of Clinton's bandmembers, he is also known for his outlandish stage wear, especially gaudy glasses. Bootsy also had a successful solo career, during which he often used the stage and production names "Boozilla" and "Casper".

### **Catfish Collins**

A strong rhythm guitarist, versatile like his brother, Catfish Collins's ability to lock onto a groove and keep it going through the epic live jamming the group is known for has made him one of the most influential rhythm guitarists in musical history. He was able to keep a stable rhythm, thereby allowing Worrell and others to go off on musical improvisatory excursions while keeping the music stable and grounded.

## **Eddie Hazel**

Eddie Hazel is considered one of the most influential guitarists in musical history. Though he was never as flashy as many others, his playing was always intense and unconventional. "Maggot Brain", a ten-minute solo, is widely cited as an emotional masterpiece of the guitar. He wrote many of the guitar riffs for the band, and did some singing as well. Along with childhood friend, Billy Bass Nelson, Hazel developed psychedelic funk rock, mixing blues, rock and roll, soul, Motown and [pop music](#).

## **Garry Shider**

Of all the Funksters, Shider is probably the greatest vocalist of the group. He performed leads on many of their most famous songs ("Cosmic Slop" being particularly notable).

## **Bernie Worrell**

Bernie Worrell, keyboardist, was added after the release of their first album. He deserves a special mention as an especially important influence in the early development of the P-Funk sound. Even before officially joining the group, he helped out on many of the recording sessions. Eventually, he became responsible for many of the musical arrangements, and produced most of the later albums.

## **Glen Goins**

Born and raised in Plainfield, New Jersey in a family of talented musicians, this master vocalist with the strong, haunting gospel voice is perhaps best known for calling in the Mothership in the P Funk live shows. Glen was one of the first to leave the group in reaction to Clinton's bad management, and poor treatment of musicians. He formed Quazar in 1978 to be a renegade Funk outfit, which also featured his younger brother Kevin Goins, now performing with PTheory. Glen died from Hodgkins Disease in the same year, aged only 24.

## Notable Songs

- "Atomic Dog" (George Clinton)
- "Do Fries Go With That Shake?" (George Clinton)
- "Flashlight" (Parliament)
- "(Not Just) Knee Deep" (Funkadelic)
- "Give Up The Funk (Tear The Roof Off The Sucker)" (Parliament)
- "Up For The Down Stroke" (Parliament)
- "Maggot Brain" (Funkadelic)
- "One Nation Under a Groove" (Funkadelic)
- "Chocolate City" (Parliament)
- "Can You Get to That" (Funkadelic)
- "Ride On" (Parliament)
- "Comin Round the Mountain" (Funkadelic)

## Philadelphia soul

**Philadelphia (or Philly) soul**, sometimes called the **Philadelphia Sound**, is a style of [soul music](#) characterized by lush instrumental arrangements often featuring sweeping strings and horns. The result is a much smoother sound compared to the more funky and gritty Southern and deep soul styles.

Due to the emphasis on sound and arrangement and the relative anonymity of many of the style's players, Philly soul is often considered a producers' genre. Philly soul songwriters and producers, including Thom Bell, Linda Creed, and teams of Gene McFadden and John Whitehead, and Kenny Gamble and Leon Huff (the latter pair of Philadelphia International Records) worked with a stable of studio musicians to develop the unique Philly sound used as backing for many different singing acts. Many of these musicians would record as the instrumental group MFSB which had a hit with the seminal Philly soul song "TSOP (The Sound of Philadelphia)" in 1974. A notable extension of the Philly Sound were producers bassist Ronald Baker, guitarist Norman Harris, and drummer/Trammps baritone Earl Young, (B-H-Y) who extended the sound once the original producers above went in a different musical direction. These three were the base rhythm section for MFSB, and branched off into a sub-label of Philadelphia International, called Golden Fleece, distributed by CBS (now Sony BMG). These three then created the Gold Mind label, distributed by SalSoul, that had First Choice, Loleatta Holloway, and Love Committee, all produced by them. Their hit by Double Exposure, Ten Percent, (1976) was one of the first commercial 12" records, and was a big seller. The Salsoul Orchestra was another extension of the MFSB orchestra, opting for an R/B-latin flavor, conducted by one time Mike Douglas TV show bandleader/vibraphonist Vincent Montana Jr., another founding MFSB member.

Philly soul was popular throughout the 1970s and it set the stage for the studio constructions of [disco](#) and urban contemporary music that emerged later in the decade.

Notable Philly soul artists include:

- The Delfonics
- The Intruders
- Harold Melvin & the Blue Notes
- MFSB
- The O'Jays
- Teddy Pendergrass
- The Spinners
- The Stylistics
- Patti LaBelle

## **Photoplay music**

**Photoplay music** is the term given to music written specifically for the accompaniment of silent films.

## Early years

Early films (c. 1890-1910) merely relied on classical and popular repertory, mixed usually with improvisation by whatever accompanist was playing (usually a pianist).

Around 1910, folios of Photoplay Music began being published by companies such as Sam Fox Music and Academic Music. These small bits of music were only a minute or so long and usually couldn't sustain an entire feature, but were enough to fill in scenes in which music wasn't popularly written (such as "misteriosos" for scenes of mystery, lurking, creeping, etc.)

## **Types of Scores**

When it comes to producing a score for a silent film, there were three types: improvised, compiled, and original.

### **Improvisational Scores**

Improvised scores were generally scores that were solely played out on organ or piano. The musical conductor found it fit to just play whatever he felt necessary to set the mood for the scene.

### **Compiled Scores/Cue Sheets**

According to Richard Koszarski's book "An Evening's Entertainment", a survey was sent out in the mid-1920s to 10,000 out of about 15,000 in America, but it is not known how many responded. Of those that did, approximately 50% used theater organs, 25% used piano only, and 25% used orchestras (2 or more players).

For that 25%, an improvisation would prove quite difficult. The usual process for such a compiled score would be for the studio to hire a company to produce a cue sheet; generally 3 to 4 pages of listings of Photoplay Music, classical or popular standards from their library. This concept of a "compilation score" was invented around 1910. The Edison Film Company was among the first to use this method of scoring film.

The Cue Sheet would list the Title and Author of a song, when to play it, roughly how long to play it for, and the publisher of the piece. Quite often, further notes were given of sound effects, tempo, etc so that every important factor could be supervised. The musical director of a theater would go through the theater's music collection (generally listed by tempo) and pick out the appropriate cue. If he did not have that particular cue, he could replace it with another suitable piece, or order it through the company that created the cue sheet.

Around 1923, the Cameo Thematic Music Co. was responsible for about 90% of Cue Sheets being written. Ernst Luz and James C. Bradford were the major compilers for Cameo. Belwin Inc. also printed cue sheets, generally compiled by Max Winkler.

Some conductors threw cue sheets out all together, and compiled their own scores; some followed the cue sheet, but used their own choices of music; many followed the cue sheet with what little time they had to produce

an opera's worth of music. Much of the time, musicians came in and sight-read their parts, with little to no time to rehearse or look over the score beforehand.

## **Original Scores**

Original scores were the minority. Scores published were generally the premiere score that was played in the New York theaters. These were often compiled scores with some original material, such as Joseph Carl Breil's score for *The Birth of a Nation*, the William Axt/David Mendoza scores for the 1925 film *Ben Hur* or the 1926 film *The Big Parade*. Even fewer were all-original scores, the most notable being those scores for Fritz Lang's *Nibelungen* films, composer Mortimer Wilson's for Douglas Fairbank's *The Thief of Baghdad* and German-born composer Gottfried Huppertz's for *Metropolis*.

## **Later years**

The last days of Photoplay music were of the era of 1927-1930, when sound films became popular. Films that were already shot silent generally were released with orchestral soundtracks that were compiled of Photoplay music with sound effects added. Some Photoplay music was used as incidental music in early sound films as well. Most theaters, however, threw out entire libraries of music. Publishers junked overstock or used it as scrap paper.

In recent years, Photoplay music has had a revitalization through home videos and live performances of silent films. Many videos of silent films have premiere or cue sheet scores recorded for posterity.

# Piano

A **piano** is a [musical instrument](#) that is classified as a [keyboard](#), [percussion](#), or [string](#) instrument, depending on the system of [classification](#) used. Playing the piano is wide-spread in western music for solo performance, [chamber music](#), and [accompaniment](#), and is also popular as an aid to [composing](#) and rehearsal.

The piano produces sound by striking steel strings with felt hammers. Vibrations are transmitted through the [bridges](#) to the soundboard.

The word *piano* is a shortened form of the word *pianoforte*, which is seldom used except in formal language and derived from the original Italian name for the instrument, *gravicèmbalo col piano e forte* (literally *harpsichord with soft and loud*). This refers to the ability of the piano to produce notes at different volumes depending on how hard the keys are pressed.

As a keyboard stringed instrument, the piano is similar to the clavichord and harpsichord. These three instruments differ in their mechanisms of sound production. In a harpsichord, strings are plucked by quills or something similar. In the clavichord, strings are struck by tangents, which remain in contact with the string. In a piano, the strings are struck by hammers which immediately rebound, leaving the string to vibrate freely.

## Early history

Bartolomeo Cristofori of Florence, Italy, invented the first pianoforte. He called it a *gravicembalo con piano e forte*. It is not entirely clear when he built this instrument, but an inventory made by Cristofori's employers, the Medici (pron. /'Mèdici/) family, indicates the existence of an early Cristofori instrument by the year 1701. Cristofori built only about twenty pianofortes before he died in 1731; the three that have survived until today date from the 1720s.

Like many other inventions, the pianoforte was founded on earlier technological innovations. In particular, it benefited from centuries of work on the harpsichord, which had shown the most effective ways to construct the case, soundboard, bridge, and keyboard. Cristofori, himself a harpsichord maker, was well acquainted with this body of knowledge.

Cristofori's great success was in solving, without any prior example, the fundamental mechanical problem of piano design: the hammers must strike the string, but not touch it once they have struck (which would damp the sound). Moreover, the hammers must return to their rest position without bouncing violently, and it must be possible to repeat a note rapidly. Cristofori's piano action served as a model for the many different approaches to piano actions that followed. Cristofori's early instruments were made with thin strings and were much quieter than the modern piano. Compared to the clavichord (the only previous keyboard instrument capable of dynamic nuance), however, they were considerably louder and had more sustaining power.

Cristofori's new instrument remained relatively unknown until an Italian writer, Scipione Maffei, wrote an enthusiastic article about it (1711), including a diagram of the mechanism. This article was widely distributed, and most of the next generation of piano builders started their work as a result of reading it. One of these builders was Gottfried Silbermann, better known as an [organ](#) builder. Silbermann's pianos were virtually direct copies of Cristofori's, with one important addition: Silbermann invented the forerunner of the modern damper pedal (also known as the sustaining pedal or loud pedal), which lifts all the dampers from the strings at once. Virtually all subsequent pianos incorporated some version of Silbermann's idea.

Silbermann showed Bach one of his early instruments in the 1730s, who did not like it at that time, claiming that the higher notes were too soft to allow a full dynamic range. Although this earned him some animosity from Silbermann, the criticism was apparently heeded. Bach did approve of a later

instrument he saw in 1747, and even served as an agent in selling Silbermann's pianos.

Piano-making flourished during the late 18th century in the Viennese school, which included Johann Andreas Stein (who worked in Augsburg, Germany) and the Viennese makers Nannette Stein (daughter of Johann Andreas) and Anton Walter. Viennese-style pianos were built with wooden frames, two strings per note, and had leather-covered hammers. It was for such instruments that Mozart composed his [concertos](#) and [sonatas](#), and replicas of them are built today for use in [authentic-instrument performance](#) of his music. The pianos of Mozart's day had a softer, clearer tone than today's pianos, with less sustaining power. The term *fortepiano* is nowadays often used to distinguish the 18th-century instrument from later pianos.

## Development of the modern piano

In the lengthy period lasting from about 1790 to 1890, the Mozart-era piano underwent tremendous changes which led to the modern form of the instrument. This evolution was in response to a consistent preference by composers and pianists for a more powerful, sustained piano sound. It was also a response to the ongoing Industrial Revolution, which made available technological resources like high-quality steel for strings (see piano wire) and precision casting for the production of iron frames.

Over time, piano playing became a more strenuous and muscle-taxing activity, as the force needed to depress the keys, as well as the length of key travel, was increased. The tonal range of the piano was also increased, from the five octaves of Mozart's day to the 7 1/3 (or even more) octaves found on modern pianos.

In the first part of this era, technological progress owed much to the English firm of Broadwood, which already had a strong reputation for the splendour and powerful tone of its harpsichords. Over time, the Broadwood instruments grew progressively larger, louder, and more robustly constructed. The Broadwood firm, which sent pianos to both Haydn and Beethoven, was the first to build pianos with a range of more than five octaves: five octaves and a fifth during the 1790s, six octaves by 1810 (in time for Beethoven to use the extra notes in his later works), and seven octaves by 1820. The Viennese makers followed these trends. The two schools, however, used different piano actions: the Broadwood one more robust, the Viennese more sensitive.

By the 1820s, the center of innovation had shifted to Paris, where the Érard firm manufactured pianos used by Chopin and Liszt. In 1821, Sébastien Érard invented the **double escapement** action, which permitted a note to be repeated even if the key had not yet risen to its maximum vertical position, a great benefit for rapid playing. As revised by Henri Herz about 1840, the double escapement action ultimately became the standard action for grand pianos, used by all manufacturers.

Some other important technical innovations of this era include the following:

- use of **three strings** rather than two for all but the lower notes
- the **iron frame**. The iron frame, also called the "plate", sits atop the soundboard, and serves as the primary bulwark against the force of string tension. The iron frame was the ultimate solution to the problem of structural integrity as the strings were gradually made thicker, tenser, and

more numerous (in a modern grand the total string tension can approach 20 tons). The single piece cast iron frame was patented in 1825 in Boston by Alpheus Babcock, culminating an earlier trend to use ever more iron parts to reinforce the piano. Babcock later worked for the Chickering & Mackays firm, where the first iron frame in grand pianos (1843) was developed.

- **felt hammers.** The harder, tauter steel strings required a softer hammer type to maintain good tone quality. Hammers covered with compressed felt were introduced by the Parisian maker Jean-Henri Pape in 1826, and are now universally used.
- the **sostenuto pedal** (see below), invented in 1844 by Jean Louis Boisselot and improved by the Steinway firm in 1874.
- the **overstrung scale**, also called "cross-stringing". The strings are placed in a vertically overlapping slanted arrangement, with two heights of bridges on the soundboard, rather than just one. This permits larger, but not necessarily longer, strings to fit within the case of the piano. Overstringing was invented by Jean-Henri Pape during the 1820s, and first patented for use in grand pianos in the United States by Henry Steinway Jr. in 1859.
  
- **duplexes** or aliquot scales. In 1872 Theodore Steinway patented a system to control different components of string vibrations by tuning their secondary parts in octave relationships with the sounding lengths. Similar systems developed by Blüthner (1872), as well as Taskin (1788), and Collard (1821) used more distinctly ringing undamped vibrations to modify tone.

Today's upright, grand, and concert grand pianos attained their present forms by the end of the 19th century. Improvements have been made in manufacturing processes, and many individual details of the instrument continue to receive attention .

Some early pianos had shapes and designs that are no longer in use.

The **square piano** had horizontal strings arranged diagonally across the rectangular case above the hammers and with the keyboard set in the long side, it is variously attributed to Silbermann and Frederici and was improved by Petzold and Babcock. Built in quantity through the 1890s (in the United States), Steinway's celebrated iron framed overstrung squares were more than two and a half times the size of Zumpe's wood framed instruments that were successful a century before, their overwhelming popularity was due to inexpensive construction and price, with performance and sonority frequently restricted by single actions and double stringing.

The tall vertically strung **upright grand** was arranged with the soundboard and bridges perpendicular to keys, and above them so that the strings did not extend to the floor. Diagonally strung **Giraffe**, **pyramid** and **lyre** pianos employed this principle in more evocatively shaped cases. The term was later revived by many manufacturers for advertising purposes.

The very tall **cabinet piano** introduced by Southwell in 1806 and built through the 1840s had strings arranged vertically on a continuous frame with bridges extended nearly to the floor, behind the keyboard and very large *sticker action*.

The short **cottage** upright or **pianino** with vertical stringing, credited to Robert Wornum about 1810 was built into the 20th century. They are informally called *birdcage pianos* because of their prominent damper mechanism. Pianinos were distinguished from the **oblique**, or diagonally strung upright made popular in France by Roller & Blanchet during the late 1820s.

The tiny overstrung **spinet** upright had a compact full iron frame and a so-called *drop action* arranged below the level of the keys. Spinet pianos were first manufactured in the mid-1930s. These smaller pianos are well-suited for people who live in smaller houses or apartments, and their lighter weight makes them easier to move. Spinet pianos, however, have their drawbacks. The drop-action and shorter keys make it harder for a pianist to have dynamic control while playing, and the shorter strings result in a less wide range of harmonics. A few piano technicians will not even service spinet pianos as their drop-action design makes them difficult to work on. Presently, very few companies are making spinet pianos.

## **Piano history and musical performance**

The huge changes in the evolution of the piano have somewhat vexing consequences for musical performance. The problem is that much of the most widely admired piano repertoire — for example, that of Haydn, Mozart, and Beethoven — was composed for a type of instrument that is rather different from the modern instruments on which this music is normally performed today. Even the music of the Romantics, including Chopin, Schumann, and Brahms, was written for pianos substantially different from ours. The interpretation of these works on modern pianos poses a variety of problems; for discussion, see [Piano history and musical performance](#).

# The modern piano

## Types

Modern pianos come in two basic configurations and several sizes: the [grand piano](#) and the upright piano.

**Grand pianos** have the frame and strings placed horizontally, with the strings extending away from the keyboard. This makes the grand piano a large instrument, for which the ideal setting is a spacious room with high ceilings for proper resonance. There are several sizes of grand piano. Manufacturers and models vary, but a rough generalisation distinguishes the "concert grand", (between about 2.2 m to 3 m long) from the "boudoir grand" (about 1.7 m to 2.2 m) and the smaller "baby grand" (which may be shorter than it is wide). All else being equal, longer pianos have better sound and lower inharmonicity of the strings (so that the strings can be tuned closer to equal temperament in relation to the standard pitch with less stretching), so that full-size grands are almost always used for public concerts, whereas baby grands are often chosen for domestic use where space and cost are considerations.

**Upright pianos**, also called **vertical pianos**, are more compact because the frame and strings are placed vertically, extending in both directions from the keyboard and hammers. It is considered harder to produce a sensitive piano action when the hammers move horizontally, rather than upward against gravity as in a grand piano; however, the very best upright pianos now approach the level of grand pianos of the same size in tone quality and responsiveness. However, one feature of the grand piano action always makes it superior to the vertical piano. All grand pianos have a special repetition lever in the playing action that is absent in all verticals. This repetition lever, a separate one for every key, catches the hammer close to the strings as long as the key remains depressed. In this position, with the hammer resting on the lever, a pianist can play repeated notes, staccato, and trills with much more speed and control than they could on a vertical piano. The action design of a vertical prevents it from having a repetition lever. Because of this, piano manufacturers claim that a skilled piano player can play as many as 14 trill (music) notes per second on grands but only 7 on uprights.

In 1863, Henri Fourneaux invented the [player piano](#), a kind of piano which "plays itself" from a piano roll without the need for a pianist. Also in the 19th century, toy pianos began to be manufactured.

A relatively recent development is the prepared piano, which is simply a standard grand piano which has had objects placed inside it before a performance in order to alter its sound, or which has had its mechanism changed in some way.

Since the 1980s, digital pianos have been available, which use digital sampling technology to reproduce the sound of each piano note. The best digital pianos are sophisticated, with features including working pedals, weighted keys, multiple voices, and MIDI interfaces. However, with current technology, it remains difficult to duplicate a crucial aspect of acoustic pianos, namely that when the damper pedal (see below) is depressed, the strings not struck vibrate sympathetically when other strings are struck. Since this sympathetic vibration is considered central to a beautiful piano tone, in many experts' estimation digital pianos still do not compete with the best acoustic pianos in tone quality. Progress is being made in this area by including physical models of sympathetic vibration in the synthesis software.

## **Keyboard**

For the arrangement of the keys on a piano keyboard, see Musical keyboard. This arrangement was inherited from the harpsichord without change, with the trivial exception of the colour scheme (white for notes in the C major scale and black for other notes) which became standard for pianos in the late 18th century.

Almost every modern piano has 88 keys (seven octaves plus a minor third, from A0 to C8). Many older pianos only have 85 keys (seven octaves from A0 to A7), while some manufacturers extend the range further in one or both directions. The most notable example of an extended range can be found on Bösendorfer pianos, two models which extend the normal range downwards to F0, with one other model going as far as a bottom C0, making a full eight octave range. Sometimes, these extra keys are hidden under a small hinged lid, which can be flipped down to cover the keys and avoid visual disorientation in a pianist unfamiliar with the extended keyboard; on others, the colours of the extra white keys are reversed (black instead of white). The extra keys are added primarily for increased resonance; that is, they vibrate sympathetically with other strings whenever the damper pedal is depressed and thus give a fuller tone. Only a very small number of works composed for piano actually use these notes. More recently, the Stuart and Sons company has also manufactured extended-range pianos. On their instruments, the range is extended both down the bass to F0 and up the treble to F8 for a full eight octaves. The extra keys are the same as the other keys in appearance.

## Pedals

Pianos have had *pedals*, or some close equivalent, since the earliest days. (In the 18th century, some pianos used levers pressed upward by the player's knee instead of pedals.) The three pedals that have become more or less standard on the modern piano are the following.

The **damper pedal** (also called the **sustaining pedal** or **loud pedal**) is often simply called "the pedal," since it is the most frequently used. It is placed as the rightmost pedal in the group. Every string on the piano, except the top two octaves, is equipped with a damper, which is a padded device that prevents the string from vibrating. The damper is raised off the string whenever the key for that note is pressed. When the damper pedal is pressed, all the dampers on the piano are lifted at once, so that every string can vibrate. This serves two purposes. First, it assists the pianist in producing a legato (playing smoothly connected notes) in passages where no fingering is available to make this otherwise possible. Second, raising the damper pedal causes all the strings to vibrate sympathetically with whichever notes are being played, which greatly enriches the piano's tone.

Sensitive pedaling is one of the techniques a pianist must master, since piano music from Chopin onwards tends to benefit from extensive use of the sustaining pedal, both as a means of achieving a singing tone and as an aid to legato. In contrast, the sustaining pedal was used only sparingly by the composers of the 18th century, including Haydn, Mozart and in early works by Beethoven; in that era, pedalling was considered primarily as a special coloristic effect.

The **soft pedal** or "una corda" pedal is placed leftmost in the row of pedals. On a grand piano, this pedal shifts the whole action including the keyboard slightly to the left, so that hammers that normally strike all three of the strings for a note strike only two of them. This softens the note and also modifies its tone quality. For notation of the soft pedal in printed music.

The soft pedal was invented by Cristofori and thus appeared on the very earliest pianos. In the 18th and early 19th centuries, the soft pedal was more effective than today, since it was possible at that time to use it to strike three, two or even just one string per note—this is the origin of the name "una corda", Italian for "one string". In modern pianos, the strings are spaced too closely to permit a true "una corda" effect — if shifted far enough to strike just one string on one note, the hammers would also hit the string of the next note.

On upright pianos, the soft pedal operates a mechanism which moves the hammers' resting position closer to the strings. Since the hammers have less distance to travel this reduces the speed at which they hit the strings,

and hence the volume is reduced, but this does not change tone quality in the way the "una corda" pedal does on a grand piano.

Digital pianos often use this pedal to alter the sound to that of another instrument such as the organ, guitar, or harmonica. Pitch bends, leslie speaker on/off, vibrato modulation, etc. increase the already-great versatility of such instruments.

The **sostenuto pedal** or "middle pedal" keeps raised any damper that was raised at the moment the pedal is depressed. This makes it possible to sustain some notes (by depressing the sostenuto pedal before notes to be sustained are released) while the player's hands are free to play other notes. This can be useful for musical passages with pedal points and other otherwise tricky or impossible situations. The sostenuto pedal was the last of the three pedals to be added to the standard piano, and to this day many pianos are not equipped with a sostenuto pedal. (Almost all modern grand pianos have a sostenuto pedal, while most upright pianos do not.) A number of twentieth-century works specifically call for the use of this pedal, for example Olivier Messiaen's *Catalogue d'oiseaux*.

Some upright pianos have a **practice pedal** or **celeste pedal** in place of the sostenuto. This pedal, which can usually be locked in place by depressing it and pushing it to one side, drops a strip of felt between the hammers and the keys so that all the notes are greatly muted — a handy feature for those who wish to practice in domestic surroundings without disturbing the neighbours. The practice pedal is rarely used in performance. Other uprights have a **bass sustain** as a middle pedal. It works like the **damper pedal**, but only lifts the dampers for the lowest notes.

The rare transposing piano, of which Irving Berlin possessed an example, uses the middle pedal as a clutch which disengages the keyboard from the mechanism, enabling the keyboard to be moved to left or right with a lever. The entire action of the piano is thus shifted to allow the pianist to play music written in one key so that it sounds in a different key.

## Materials

Many parts of a piano are made of materials selected for extreme sturdiness. In quality pianos, the outer **rim** of the piano is made of a hardwood, normally maple or beech. According to Harold A. Conklin, the purpose of a sturdy rim is so that "the vibrational energy will stay as much as possible in the soundboard instead of dissipating uselessly in the case parts, which are inefficient radiators of sound." The rim is normally made by laminating flexible strips of hardwood to the desired shape, a system that was developed by Theodore Steinway in 1880.

The thick wooden **braces** at the bottom (grands) or back (uprights) of the piano are not as acoustically important as the rim, and are often made of a softwood, even in top-quality pianos, in order to save weight.

The **pinblock**, which holds the tuning pins in place, is another area of the piano where toughness is important. It is made of hardwood, and generally is laminated (built of multiple layers) for additional strength and gripping power.

Piano **strings** (also called piano wire), which must endure years of extreme tension and hard blows, are made of high quality steel. They are manufactured to vary as little as possible in diameter, since all deviations from uniformity introduce tonal distortion. The bass strings of a piano are made of a steel core wrapped with copper wire, to increase their flexibility. For the acoustic reasons behind this.

The **plate**, or metal frame, of a piano is usually made of cast iron. It is advantageous for the plate to be quite massive. Since the strings are attached to the plate at one end, any vibrations transmitted to the plate will result in loss of energy to the desired (efficient) channel of sound transmission, namely the bridge and the soundboard. Some manufacturers now use cast steel in their plates, for greater strength. The casting of the plate is a delicate art, since the dimensions are crucial and the iron shrinks by about one percent during cooling. The inclusion in a piano of an extremely large piece of metal is potentially an aesthetic handicap. Piano makers overcome this handicap by polishing, painting, and decorating the plate; often plates include the manufacturer's ornamental medallion and can be strikingly attractive.

The numerous grand parts and upright parts of a piano **action** are generally hardwood (e.g. maple, beech, hornbeam). Since World War II, plastics have become available. Early plastics were incorporated into some pianos in the late 1940s and 1950s, but proved disastrous because they crystallized and lost their strength after only a few decades of use. The Steinway firm once incorporated Teflon, a synthetic material developed by DuPont, for some grand action parts in place of cloth, but ultimately abandoned the experiment due to an inherent "clicking" which invariably developed over time. More recently, the Kawai firm has built pianos with action parts made of more modern and effective plastics such as carbon fiber; these parts have held up better and have generally received the respect of piano technicians.

The part of the piano where materials probably matter more than anywhere else is the **soundboard**. In quality pianos this is made of solid spruce (that is, spruce boards glued together at their edges). Spruce is chosen for its high ratio of strength to weight. The best piano makers use close-grained, quarter-sawn, defect-free spruce, and make sure that it has been carefully dried over a long period of time before making it into soundboards. In cheap pianos, the soundboard is often made of plywood.

Piano **keys** are generally made of spruce or basswood, for lightness. Spruce is normally used in high-quality pianos. Traditionally, the black keys were made from ebony and the white keys were covered with strips of ivory, but since ivory-yielding species are now endangered and protected by treaty, plastics are now almost exclusively used. Legal ivory can still be obtained in limited quantities. At one time the Yamaha firm innovated a plastic called "Ivorine" or "Ivorite", since imitated by other makers, that mimics the look and feel of ivory.

The requirement of structural strength, fulfilled with stout hardwood and thick metal, makes a piano heavy; even a small upright can weigh 136 kg (300 lb), and the Steinway concert grand (Model D) weighs 480 kg (990 lb). The largest piano built, the Fazioli F308, weighs 691 kg (1520 lb).

### **Care and maintenance**

Pianos are regularly **tuned** to keep them up to pitch and produce a pleasing sound; by convention they are tuned to the internationally recognised standard concert pitch of A = 440 Hz.

The hammers of pianos are **voiced** to compensate for gradual hardening. Top-quality but aged pianos can be **restored** or **reconditioned**, by replacing a great number of their parts to produce an instrument closely similar to a new one.

## The role of the piano

The piano is a crucial instrument in Western [classical music](#), [jazz](#), [film](#), [television and electronic game music](#), and most other complex western musical genres. A large number of [composers](#) being proficient pianists, the piano is often used as a tool for composition.

Pianos were, and are, popular instruments for private household ownership, especially among the middle and upper classes. Hence pianos have gained a place in the popular consciousness, and are sometimes referred to by nicknames, including: "the ivories", "the joanna", "the eighty-eight", and "the black(s) and white(s)." Playing the piano is sometimes referred to as "tickling the ivories".

## Piano bar

A **piano bar** (also known as a **piano lounge**) consists of a [piano](#) or electronic keyboard played by a professional [musician](#), located in a cocktail lounge or bar . Some piano bars feature a baby grand or [grand piano](#) surrounded by stools for patrons. Others have a bar surrounding the piano or keyboard.

There are different types of piano bars:

- **"instrumental only"**: the professional piano/keyboard player plays strictly instrumental music, which is usually [classical](#), semi-classical, or "easy listening"; this type of piano bar is often found in hotel lobby lounges or "fine dining" restaurants
- **"only the musician sings"**: the professional piano/keyboard player sings to his/her accompaniment, usually on microphone, but no other singers are allowed
- **"sing-along"**: patrons surrounding the piano/keyboard sing as a group, usually without any microphones
- **"dueling pianos"**: usually on stage with two grand pianos, each played by a professional player who sings and entertains; humor and audience participation are prevalent; usually these types of piano bars have substantial sound systems, and most of the songs performed are rock'n'roll, "classic rock", blues, R&B, or country, played at very high volume; **Howl at the Moon Piano Bar** is a popular chain of this type of piano bar
- **"open mic"**: individual patrons sing (on microphone) to the accompaniment of the professional musician; in some ways, this type of piano bar is like [karaoke](#), except that the music is live and dynamic, and there are usually no [lyrics](#) available (although some piano bar players do supply some lyrics); like karaoke, the songs performed may cover a wide, eclectic range ("*show tunes*", "*standards*" from the 1920's forward, jazz, country, R&B, rock'n'roll, blues, folk, soul, disco, hip-hop, etc.); the patron singers are usually called to the microphone in a rotating order; often, each singer is allowed 2 or 3 songs each time he/she is called to perform.

Before becoming famous, Billy Joel sometimes worked as a piano bar performer. His classic hit, "**Piano Man**" is based on his experiences as a piano bar player.

## Piano concerto

A **piano concerto** is a [concerto](#) for solo [piano](#) and [orchestra](#). It may be divided into several [movements](#).

## History

Concerti for the harpsichord were written throughout the [Baroque](#) era, notably by Johann Sebastian Bach. Today these harpsichord concerti are often performed with a piano as the solo instrument.

As the piano developed and became accepted, [composers](#) naturally started writing concerti for it. This happened in the 18th century, and so corresponded to the [Classical music era](#). The most important composer in the development of the form in these early stages was Wolfgang Amadeus Mozart.

Mozart wrote many of his 27 piano concerti for himself to perform. Mozart's large body of piano concerti, being written by such a great composer during a time of musical change when other composers during the era such as Joseph Haydn largely ignored the genre, put Mozart's stamp firmly on that genre well into the Romantic era. With the development of the piano virtuoso many composer-pianists did likewise, notably Ludwig van Beethoven, Frédéric Chopin, Franz Liszt, Sergei Rachmaninoff and Sergei Prokofiev, and also the somewhat lesser-known Johann Nepomuk Hummel and John Field. Many other Romantic composers wrote pieces in the form, well known examples being those by Robert Schumann, Edward Grieg, Johannes Brahms and Pyotr Ilyich Tchaikovsky.

The few well-known piano concerti which dominate today's concert programs and discographies account for only a minority of the repertoire which proliferated on the European music scene during the 19th century. Critical opinion has often dismissed the bulk of the Romantic piano concerto repertoire for its vapid mediocrity (many pieces were slavish variations on [opera](#) tunes). However, many of these compositions were more than just flashy calling-cards churned out by composer-virtuosi for their sensational tours of Europe and America. These "showpieces" were also a formative influence on the training and styles of the composers whose concerti managed to secure a place in the canon of "greatness" .

The piano concerto form survived through the 20th century into the 21st, with examples being written by Béla Bartók, Sergei Prokofiev, Igor Stravinsky, Dmitri Shostakovich, Samuel Barber, Michael Tippett, Witold Lutosławski, György Ligeti, Einojuhani Rautavaara, Leroy Anderson, Philip Glass, George Gershwin and others.

There are examples of piano concerti written to commissions by pianists. Paul Wittgenstein, who lost his right arm during World War I, on resuming his musical career asked a number of composers to write pieces for him which required the pianist to use his left hand only. The results of these

commissions include the concertante pieces for orchestra and piano left hand by Benjamin Britten, Franz Schmidt, Maurice Ravel, Sergei Prokofiev (Piano Concerto No. 4) and Erich Wolfgang Korngold.

## Form

A classical piano concerto is often in three movements.

1. A quick opening movement in [sonata form](#) including a [cadenza](#) (which may be [improvised](#) by the soloist).
2. A slow expressive movement
3. A faster rondo

Examples by Mozart and Beethoven follow this model, but examples abound which do not. Many composers have introduced innovations - for example Liszt's single-movement concerti.

## Other compositions for piano and orchestra

Concerti have been written where the piano is not the only solo instrument. A famous example is the *Triple concerto* (for [piano trio](#) and orchestra) by Beethoven.

There also exist a number of compositions for piano and orchestra which treat the piano as a solo instrument while not being piano concerti. Examples of such works include George Gershwin's Rhapsody in Blue, Rachmaninov's Rhapsody on a Theme of Paganini and Liszt's Totentanz. The last two of these works are each in variation form, based on the 24th Caprice for solo violin by Niccolò Paganini and the ancient Gregorian Dies Irae chant respectively.

There are also works written for orchestra or large [ensemble](#) requiring a solo pianist, such as Olivier Messiaen's Des canyons aux étoiles... and Turangalîla-Symphonie, and Karol Szymanowski's 4th Symphony.

Composers also occasionally bring orchestral pianists into the limelight, as for example Igor Stravinsky does in episodes of his [ballet](#) *Petrushka*.

## **Piano history and musical performance**

The [piano](#) has evolved technologically more than any other musical instrument, giving rise to difficult issues involving the performance of music written for earlier pianos.

## Background

The earliest pianos by Cristofori (ca. 1700) were lightweight objects, hardly sturdier in framing than a contemporary harpsichord, with thin strings of wrought iron and brass and tiny hammers covered with leather. During the [Classical](#) era, when pianos first became used widely by important composers, the piano was only somewhat more robust than in Cristofori's time; see fortepiano. It was during the period from about 1790 to 1870 that most of the important changes were made that created the modern piano:

- **iron framing**, culminating in the single-piece cast iron frame
- ultra-tough **steel strings**, with three strings per note in the upper 2/3 of the instrument's range
- **felt hammers**
- **cross-stringing**
- the **repetition action**
- in general, an enormous increase in **weight and robustness**. A modern Steinway Model D weighs 480 kg (990 lb), about six times the weight of a late 18th century Stein piano.
- The hammers and action became much heavier, so that the **touch** (keyweight) of a modern piano is several times heavier than that of an 18th century piano.

The prototype of the modern piano, with all of these changes in place, was exhibited to general acclaim by Steinway at the Paris exhibition of 1867; by about 1900, most leading piano manufacturers had incorporated most of these changes.

These huge changes in the piano have somewhat vexing consequences for musical performance. The problem is that much of the most widely admired piano repertoire was composed for a type of instrument that is very different from the modern instruments on which this music is normally performed today. The greatest difference is in the pianos used by the composers of the [Classical era](#); for example, Haydn, Mozart, and Beethoven. But lesser difference are found for later composers as well. The music of the early Romantics, such as Chopin and Schumann--and even of still later composers (see below)--was written for pianos substantially different from ours.

One view that is sometimes taken is that these composers were dissatisfied with their pianos, and in fact were writing visionary "music of the future" with a more robust sound in mind. This view is perhaps plausible in

the case of Beethoven, who composed at the beginning of the era of piano growth. However, many aspects of earlier music can be mentioned suggesting that it was composed very much with contemporary instruments in mind. It is these aspects that raise the greatest difficulties when a performer attempts to render earlier works on a modern instrument.

## **Sources of difficulty**

### **Sustain time**

The modern piano has a considerably greater sustain time than the classical-era piano. Thus, notes played in accompaniment lines will stay loud longer, and thus cover up any subsequent melodic notes more than they would have on the instrument that the composer had used. This is felt to be a particular impediment to realizing the characteristic textural clarity of Classical-era works. As an anonymous commentator (see References below) writes, "[the] earlier instruments all demonstrate a lighter and clearer sound than their modern counterparts. Lines can emerge more clearly; rapid passages and ornaments are more easily enunciated by instruments whose main purpose is not volume and power."

### **Pedal marks in Classical-era works**

During the Classical era, the damper pedal was generally not used as it is in later music; that is, as a more or less constant application and modulation of the basic piano sound. Instead, pedaling was employed as a particular expressive effect, applied to certain individual musical passages.

Classical composers sometimes wrote long passages in which the player is directed to keep the damper pedal down throughout. One example occurs in Haydn's Piano Sonata H. XVI/50, from 1794-1795; and two later well-known instances occur in Beethoven's work: in the last movement of the "Waldstein" sonata, Op. 53; and the entire first movement of the "Moonlight" sonata, Op. 27 No. 2. Because of the great sustain time of a modern piano, these passages sound very blurred and dissonant if the performer respects the composer's directions literally. Thus, modern pianists typically modify their playing style to help compensate for the difference in instruments, for example by lifting the pedal discretely (and often partially), thus deviating from the composer's directions. For further discussion of such modifications, see Piano Sonata No. 14 (Beethoven).

### **Ensemble issues**

Pianos are often played in chamber ensembles with string instruments, which also evolved considerably during the 19th century. Charles Rosen, in

*The Classical Style* (p. 353) offers a clear characterization of the problems that arise in Classical-era works:

"Instrumental changes since the eighteenth century have made a problem out of the balance of sound in ... all chamber music with piano. Violin necks (including, of course, even those of the Stradivariuses and Guarneris) have been lengthened, making the strings tauter; the bows are used today with hairs considerably more tight as well. The sound is a good deal more brilliant, fatter, and more penetrating. ... The piano, in turn, has become louder, richer, even mushier in sound, and, above all, less wiry and metallic. This change makes nonsense out of all those passages in eighteenth-century music where the violin and the piano play the same melody in thirds, with the violin *below* the piano. Both the piano and the violin are now louder, but the piano is less piercing, the violin more. Violinists today have to make an effort of self-sacrifice to allow the piano to sing out softly ... The thinner sound of the violin in Haydn's day blended more easily with the metallic sonority of the contemporary piano and made it possible for each to accompany the other without strain."

### **The *una corda* pedal**

The *una corda* pedal is also called the "soft pedal". On grand pianos (both modern and historical), it shifts the action sideways, so that the hammers do not strike every string of a note. (There are normally three strings, except in the lower range.)

On the modern piano, the soft pedal can only reduce the number of strings struck from three to two, whereas the pianos of the classical era were more flexible, permitting the player to select whether the hammers would strike three strings, two, or just one. The very term "una corda", Italian for "one string", is thus an anachronism as applied to modern pianos.

In his piano music Beethoven made use of the true "una corda" stop. In the Piano Sonata, Op. 101 (1816), he marks the beginning of the third movement with the words "Mit einer Saite", meaning "on one string". At the end of this movement, there is a passage that forms a continuous transition to the following movement. Here, Beethoven writes "Nach und nach mehrere Saite", "gradually more strings", thus making full expressive use of the soft pedal of his day.

## The authenticity solution

Not all performers attempt to adapt the older music to the modern instruments: participants in the [authentic performance](#) movement have constructed new copies of the old instruments and used them (or occasionally, restored originals) in performance. This form of musical exploration, which has been widely pursued for the music of the Classical era, has provided important new insights and interpretations of the music. It has also made it possible to get a clearer idea of what a Classical composer meant in specifying particular pedaling directions; thus, performances of Beethoven's works on historical pianos can and typically do respect the composer's own pedal marks.

## How far forward in piano history was the piano substantially different?

Although most of the scholarly focus on differences in pianos covers the Classical era, it is also true that even in the Romantic era--and even later--the pianos for which the great composers wrote were not the same as the pianos that are generally used today in performing their music.

### Brahms

One example is the last piano owned by Johannes Brahms. This instrument was made in 1868 by the Streicher firm, which was run by the descendants of the great pioneer 18th century maker Johann Andreas Stein. It was given by the Streicher company to Brahms in 1873 and was kept and used by him for composition until his death in 1897. The piano was evidently destroyed during the Second World War. Piano scholar Edwin Good (1986; see References below) has examined a very similar Streicher piano made in 1870, with the goal of finding out more about Brahms's instrument. This 1870 Streicher has leather (not felt) hammers, a rather light metal frame (with just two tension bars), a range of just seven octaves (four notes short of the modern range), straight (rather than cross-) stringing, and a rather light Viennese action, a more robust version of the kind created a century earlier by Stein.

Good observes (p. 201): "the tone, especially in the bass, is open, has relatively strong higher partials than a Steinway would have, and gives a somewhat distinct, though not hard, sound." He goes on to note the implications of these differences for the performance of Brahms's music:

"to hear Brahms's music on an instrument like the Streicher is to realize that the thick textures we associate with his work, the sometimes muddy chords in the bass and the occasionally woolly sonorities, come cleaner and clearer on a lighter, straight-strung piano. Those textures, then, are not a fault of Brahms's piano composition. To be sure, any sensitive pianist can avoid making Brahms sound murky on a modern piano. The point is that the modern pianist must strive to avoid that effect, must work at lightening the dark colors, where Brahms himself, playing his Streicher, did not have to work at it."

Although the revival of later such 19th century pianos has not been pursued to anywhere near the extent seen in the Classical fortepiano, the

effort has from time to time been made; for instance, the pianist Jörg Demus has issued a recording of Brahms's works as performed on pianos of his day.

## **Ravel**

Good (1986) also describes an 1894 piano made by the Erard company of Paris. This instrument is straight- (not cross-) strung, has only seven octaves, and uses iron bracing but not a full frame. According to Good (p. 216) "[while] some Erards were the equal in volume and richness of Steinways and Bechsteins ..., the "typical" Erard sound was lighter than that of its competitors." He goes on to say "though Claude Debussy preferred the Bechstein, Maurice Ravel liked the glassy sound of the Erard."

Thus, even for major composers of the first part of the 20th century, the possibility exists that performers might profitably experiment with what would count as "authentic" pianos, in light of the particular composer's own musical preferences. To this end the pianist Gwendolyn Mok has recently made commercial recordings of Ravel's music on an 1875 Erard piano; see External Links below.

## Piano quartet

A **piano quartet** is a [musical ensemble](#) consisting of a [piano](#) and three other instruments, or a piece written for such a group. In [classical music](#), those other instruments are usually a [string trio](#), that is a [violin](#), [viola](#) and [cello](#).

Piano quartets for that standard lineup were written by Wolfgang Amadeus Mozart, Robert Schumann, Johannes Brahms, Antonín Dvořák and Gabriel Fauré among others. In the [20th century](#), composers have also written for more varied groups, with Anton Webern's Quartet, opus 22 (1930), for example, being for piano, violin, [clarinet](#) and tenor [saxophone](#), and Olivier Messiaen's Quatuor pour la fin du temps (1940) for piano, violin, cello and clarinet. An early example of this can be found in Franz Berwald's quartet for piano, horn, clarinet and bassoon (1819), his opus 1.

Categories: [Piano](#) | [Chamber music](#) | [Musical groups](#)

## Piano quintet

A **piano quintet** is a [chamber musical ensemble](#) made up of one [piano](#) and four other instruments, or the name of a piece written for such a group.

The most common grouping is one piano, two [violins](#), a [viola](#), and a [cello](#)—that is, a piano with a [string quartet](#). This combination of instruments is sufficiently prevalent in [classical music](#) that when the phrase *piano quintet* is used without qualification, it usually refers to this particular group.

Several composers have written piano quintets, although few have written more than one, a rare exception being Gabriel Fauré, who wrote two. Other composers to have written for the usual grouping of a string quartet plus piano include Robert Schumann, Johannes Brahms, Antonin Dvorak (who also wrote more than one, though only one is played with any regularity), and Dmitri Shostakovich. Franz Schubert's famous Trout Quintet is written for the less usual combination of piano, violin, viola, cello, and double bass.

Wolfgang Amadeus Mozart and Ludwig van Beethoven both wrote pieces for a piano and four [wind instruments](#) ([oboe](#), [clarinet](#), [horn](#), and [bassoon](#) in both cases). Although these pieces could be called piano quintets, they are more often referred to as "quintets for piano and wind" so as to distinguish them from pieces with the more usual instrumentation.

## List of works

The following is a partial list of piano quintets by famous composers. All works are for piano and string quartet unless otherwise noted.

Amy Beach - Piano Quintet

Ludwig van Beethoven - Piano Quintet (for piano, oboe, clarinet, horn, and bassoon; 1796)

Johannes Brahms - Piano Quintet (1864)

Ernö Dohnányi - Piano Quintet No. 1 (1895) Piano Quintet No. 2 (1914)

Antonin Dvorak - Piano Quintet No. 1 (1875) Piano Quintet No. 2 (1889)

Edward Elgar - Piano Quintet (1918)

Gabriel Fauré - Piano Quintet No. 1 (completed 1905) Piano Quintet No. 2 (completed 1921)

César Franck - Piano Quintet (1879)

Sofia Gubaidulina - Piano Quintet (1957)

Johann Nepomuk Hummel - Piano Quintet (for piano, violin, viola, cello, and double bass)

Wolfgang Amadeus Mozart - Piano Quintet, K. 452 (for piano, oboe, clarinet, horn and, bassoon; 1784)

Leo Ornstein - Piano Quintet (1927)

Camille Saint-Saëns - Piano Quintet in A minor, op. 14 (1855)

Alfred Schnittke - Piano Quintet (1976)

Franz Schubert - Trout Quintet (for piano, violin, viola, cello, and double bass; 1819)

Robert Schumann - Piano Quintet (1842)

Dmitri Shostakovich - Piano Quintet (1940)

Anton Webern - Piano Quintet (1907)

Categories: [Piano](#) | [Chamber music](#) | [Musical groups](#)

## Piano rock

**Piano rock**, sometimes referred to as **piano pop**, is a term for a style of [music](#) that is based around the [piano](#), and sometimes around piano-related instruments, such as the Fender Rhodes, the Wurlitzer electric piano, and keyboard-based [synthesizers](#). Unlike the classic rock combination of lead guitar, bass guitar, drums, and vocals, piano rock puts the pianist front and center. Traditionally, piano rock has not been as prevalent as classic [rock](#). However, modern bands such as Ben Folds Five, Coldplay, Super Sleuth and the Septagons, and The Whitlams, and solo artists such as Tori Amos and Rufus Wainwright, have heavily featured keyboard instruments in their songs.

The roots of piano rock can be traced to 1950s rock-and-roll pioneers Little Richard and Jerry Lee Lewis. Many of their frantic performance styles, such as kicking the piano bench out of the way to play standing, raking their hands up and down the keyboard for dramatic effect, and even sitting on the keyboard are now commonplace in modern piano rock and often seen in the performances of Elton John and Ben Folds.

Elton John can be considered the modern-day groundbreaker in the genre, with hits throughout the '70s and '80s merging the [Rhythm and blues](#) sounds of pianists Ray Charles and Stevie Wonder with Jerry Lee Lewis-inspired [Rock](#) and [Pop](#) idioms.

Artists such as Tori Amos and Ben Folds have kept piano rock in the public consciousness throughout the '90s and into the 2000s.

## **Notable Piano Rockers and Albums**

Little Richard - Here's Little Richard (1957)  
Jerry Lee Lewis - Jerry Lee's Greatest (1961)  
Billy Joel - Piano Man (1973), The Stranger (1977)  
Elton John - Goodbye Yellow Brick Road (1973), Honky Chateau (1972), Captain Fantastic and the Brown Dirt Cowboy (1975)  
Tori Amos - Little Earthquakes (1992)  
Ben Folds Five - Ben Folds Five (1995)  
Rufus Wainwright - Rufus Wainwright (1998)  
The Whitlams - Eternal Nightcap (1998)  
Ben Folds - Rockin' the Suburbs (2001)  
Coldplay - A Rush of Blood to the Head (2002)  
Keane - Hopes and Fears (2004)  
Missy Higgins - The Sound of White (2005)  
Something Corporate - North (2003)  
Delta Goodrem - Innocent Eyes (2003)  
The Dresden Dolls - The Dresden Dolls (2004)  
Jack's Mannequin - Everything in Transit (2005)  
Something Corporate - Ready... Break (2000)  
Vanessa Carlton - Be Not Nobody (2002), Harmonium (2005)

## **Notable Recent Piano Rock Achievements**

### **Juno Awards**

Sarah McLachlan - Surfacing (Album of the Year) (1998)  
Sarah McLachlan - "Building a Mystery" (Single of the Year) (1998)  
Rufus Wainwright - Rufus Wainwright (Alternative Album of the Year) (1999)  
Rufus Wainwright - Poses (Alternative Album of the Year) (2002)

### **Grammys**

Sarah McLachlan - "Last Dance" (Best Pop Instrumental Performance) (1998)  
Sarah McLachlan - "Building a Mystery" (Best Female Pop Vocal Performance) (1998)  
Train - "Drops of Jupiter (Tell Me)" (Best Rock Song) (2002)

### **ARIA Music Awards**

Delta Goodrem - "Born to Try" (Best Single) (Highest Selling Single) (2003)  
Delta Goodrem - Innocent Eyes (Best Pop Release) (2003)  
(Highest Selling Album) (2004)  
Missy Higgins - The Sound of White (Album of the Year) (Highest Selling Album) (2005)

### **Triple J Hottest 100**

Missy Higgins finished at numbers 31, 47 and 74 in the Triple J Hottest 100, 2005 with "The Special Two", "Stuff and Nonsense" and "The Sound of White"  
Ben Folds finished at numbers 55 and 89 in the Triple J Hottest 100, 2005 with "Landed" and "Bastard"  
Missy Higgins's "Scar" finished number two in the Triple J Hottest 100, 2004  
The Dresden Dolls came in at number twelve in Triple J Hottest

100, 2004 with "Coin-Operated Boy"  
The Whitlams's "No Aphrodisiac" finished number one in the  
Triple J Hottest 100, 1997

## Piano sextet

A **piano sextet** is a composition for [piano](#) and five other musical instruments, or a group of six musicians who perform such works. There is no standard grouping of instruments with that name, and compared to the [string quartet](#) or [piano quintet](#) literature, relatively few such compositions exist. The best-known piano sextet is probably Chausson's *Concert*, widely regarded as one of the masterpieces of the French chamber music literature (for example, the critic Jean Gallois describes it as "superb").

The following is an incomplete list of piano sextet composers and their works in this genre:

Ernest Chausson (1855 - 1899), Concert in D major, Op. 21, composed 1891, for piano, violin, and string quartet

Mikhail Glinka (1804 - 1857)

Grand Sextet (Sestetto originale) in E-flat major, composed 1832, for piano, string quartet, and double bass

Serenade (Divertimento brillante) on Themes from Bellini's La Sonnambula in A-flat major, composed 1832, for piano, string quartet, and double bass

Gordon Jacob (1895 - 1984), Sextet in B-flat major, composed 1956, for piano and wind quintet

Bohuslav Martinu (1890 - 1959)

ballet, La Revue de cuisine, composed 1927, for piano, violin, cello, clarinet, bassoon, and trumpet

Piano Sextet, composed 1829, for piano, flute, oboe, clarinet, and two bassoons

Felix Mendelssohn (1809 - 1847), Piano Sextet in D major, Op. 110, composed 1824, for piano, violin, two violas, cello, and double bass

Francis Poulenc (1899 - 1963), Sextet, composed 1939, for piano and wind quintet

Sergei Prokofiev (1891 - 1953), Overture on Hebrew Themes in C minor, Op. 34, for piano, clarinet, and string quartet

Ludwig Thuille (1861-1907), Sextet in Bb, Op. 6, for piano and wind quintet

Closely related forms of chamber music include the [piano trio](#), the [piano quartet](#) and the [piano quintet](#).

Categories: [Piano](#) | [Musical groups](#)

## Piano sonata

A **piano sonata** is a [sonata](#) written for unaccompanied [piano](#). Piano sonatas are usually written in several movements, usually three or four, occasionally just one or two. The first movement is usually composed in [sonata form](#).

## The Baroque keyboard sonata

In the [Baroque](#) era, the use of the term "sonata" generally referred to either the sonata da chiesa (church sonata) or sonata da camera ("ordinary" sonata), both of which were sonatas for various instruments (usually one or more [violins](#) plus basso continuo). The keyboard sonata was relatively neglected by most composers.

It was the over 500 sonatas of Domenico Scarlatti that were the hallmark of the Baroque keyboard sonata, though they were for the most part unpublished during his lifetime. The majority of these sonatas are in one-movement [binary](#) form, both sections being in the same tempo and utilizing the same thematic material. These sonatas are prized both for their technical difficulty (which has also led to some to criticise them as being nothing more than pedagogical compositions to develop technique) and musical and formal ingenuity. Much of the Spanish folk music's influence on Scarlatti is evident in these sonatas.

Other composers of keyboard sonatas (most in two or three movements) include Marcello, Giustini, Durante and Platti.

## Piano sonatas in the Classical era

Although various composers in the 17th century had written keyboard pieces which they entitled "Sonata", it was only in the [classical era](#), when the piano displaced the earlier harpsichord and sonata form rose to prominence as a principle of musical composition, that the term "piano sonata" acquired a definite meaning and a characteristic form.

All three of the great Classical era composers, Joseph Haydn, Wolfgang Amadeus Mozart, and Ludwig van Beethoven (also Romantic) wrote many piano sonatas, as did the much younger Franz Schubert.

The 32 sonatas of Beethoven, including the well-known Pathétique Sonata and the Moonlight Sonata, are often considered the pinnacle of piano sonata composition.

## Piano sonatas in the Romantic era

As the [Romantic](#) era progressed after Beethoven and Schubert, piano sonatas continued to be composed, but in smaller numbers as the form took on a somewhat academic tinge and competed with shorter genres more compatible with Romantic compositional style. Franz Liszt's comprehensive "four-movements-in-one" Sonata in B minor draws on the concept of thematic transformation first introduced by Schubert in his Wanderer Fantasie of 1822. Piano sonatas have been written throughout the 19th and 20th centuries and up to the present day.

# Famous Piano Sonatas

## Classical

- Mozart, Wolfgang Amadeus
  - Piano Sonata in E-flat major (K. 281/189f - see Köchel-Verzeichnis)
  - Piano Sonata in A Major (K. 331/300i)
  - Piano Sonata in B-flat major (K.333/315c)
  - Piano Sonata in C Major (K.545)
  - Piano Sonata in B-Flat Major (K.570)
- Haydn, Franz Joseph (ca 1732-ca 1809)
  - Piano Sonata in E flat major, H. 16/52
- Beethoven, Ludwig Van
  - Piano Sonata No. 1 in F minor, Op.2/1
  - Piano Sonata No. 8 in C minor, Op.13 "Pathétique"
  - Piano Sonata No. 14 in C-sharp minor, Op.27/2 "Moonlight"
  - Piano Sonata No. 15 in D Major, Op. 28 "Pastoral"
  - Piano Sonata No. 17 in D minor, Op. 31/2 "Tempest"

## Romantic

- Beethoven, Ludwig Van
  - Piano Sonata No. 21 in C Major, Op.53 "Waldstein"
  - Piano Sonata No. 23 in F minor, Op.57 "Appassionata"
  - Piano Sonata No. 26 in E-flat Major, Op. 81a "Les adieux"
  - Piano Sonata No. 29 in B-flat Major, Op.106 "Hammerklavier"
  - Piano Sonata No. 32 in C minor, Op.111
- Chopin, Frédéric
  - Piano Sonata No. 2 in B flat minor, Op. 35, "Funeral March"
  - Piano Sonata No. 3 in B minor, Op.58
- Grieg, Edvard
  - Piano Sonata, Op.7
- Franz Liszt
  - Sonata after a Reading of Dante (*Fantasia Quasi Sonata*)
  - Sonata in B minor
- Mendelssohn, Felix
  - Piano Sonata in E major, Op.6
  - Piano Sonata in G minor, Op.105

- Piano Sonata in B-flat major, Op.106
- Rachmaninoff, Sergei
  - Piano Sonata No. 2 in B flat minor, Op.36
- Schubert, Franz
  - Piano Sonata No. 20 in A major, D.959
  - Piano Sonata No. 21 in B-flat major, D.960
- Schumann, Robert
  - Piano Sonata No. 1 in F minor, Op.11 "Grosse Sonate"
  - Piano Sonata No 2 in G minor, Op.22
  - Piano Sonata No. 3 in F minor, Op.14 "Concerto without Orchestra"

## **20th Century (Including Modern)**

- Barber, Samuel
  - Sonata for Piano, Op.26
- Bartók, Béla
  - Piano Sonata, Sz.80
- Berg, Alban
  - Piano Sonata, Op.1
- Boulez, Pierre
  - Piano Sonata No. 1
  - Piano Sonata No. 2
  - Piano Sonata No. 3 (Unfinished: only two of the five movements have been published.)
- Copland, Aaron
  - Piano Sonata
- Dutilleux, Henri
  - Sonata for Piano
- Hindemith, Paul
  - Piano Sonata No. 1 in A Major "Der Main"
  - Piano Sonata No. 2 in G Major
  - Piano Sonata No. 3 in B flat Major
- Ives, Charles
  - Piano Sonata No.2, Concord, Mass., 1840-60
- Janáček, Leoš
  - Piano Sonata "1.X.1905"
- Prokofiev, Sergei
  - Piano Sonata No. 3 in A minor, Op.28 ("From Old Notebooks")
  - Piano Sonata No. 6 in A Major, Op.82 ("War Sonata 1")
  - Piano Sonata No. 7 in B flat Major, Op.83 ("War Sonata 2/Stalingrad")

- Piano Sonata No. 8 in B flat Major, Op.84 ("War Sonata 3")
- Scriabin, Alexander
  - Piano Sonata No. 5
  - Piano Sonata No. 7 "White Mass"
  - Piano Sonata No. 9 "Black Mass"
- Stravinsky, Igor
  - Sonata for Piano

## Piano trio

A **piano trio** is a group of [piano](#) and two other instruments, almost always a [violin](#) and a [cello](#), or a piece of [music](#) written for such a group. It is one of the most common forms found in [classical chamber music](#).

The term can also refer to a group of musicians who regularly play together. Among the best known such groups were the one consisting of Alfred Cortot, Jacques Thibaud and Pablo Casals, earlier in the 20th century, and the American-based Beaux Arts Trio whose commitment to using the same players in every concert pioneered a new generation of similarly committed groups. A more recent well-known trio in the United States consists of Emanuel Ax, Young Uck Kim, and Yo-Yo Ma. In Europe, leading trios include the Florestan Trio in the United Kingdom, the Trio Wanderer in France, the Trio Fontenay, the Trio Parnassus and the Trio Jean Paul in Germany, the Vienna Piano Trio in Austria and the Guarneri Trio of Prague in the Czech Republic.

## Form

Traditionally, piano trios tend to be in the same overall form as a [sonata](#), which can be roughly said to be as follows:

- First movement - a quick movement in [sonata form](#)
- Second movement - a slow movement
- Third movement - a minuet and trio or a scherzo in ternary form
- Fourth movement - another quick movement, often in rondo form or [sonata-rondo form](#)

However, many variations on this form exist, and there are piano trios which bear no resemblance to this formal plan.

## The role of the three instruments

The piano trios of the Classical era, notably those of Haydn, are dominated by the piano part. The violin only plays the melody a certain amount of the time, and is often doubled by the piano when it does. The cello part is very much subordinated, usually just doubling the bass line in the piano. It is thought that this practice was quite intentional on Haydn's part and was related to the sonority of the instruments of Haydn's day: the piano was fairly weak and "tinkling" in tone, and benefited from the tonal strengthening of other instruments. Mozart's earlier trios are also rather dominated by the piano part.

With time, a new ideal of piano trio composition arose, in which each of the three instruments was supposed to contribute equally to the music. This is seen, for instance, in Beethoven's trios, and was likely in part the result of the increase in the power and sonority of the piano that took place during Beethoven's career, making it more feasible for the piano to play independently in an ensemble. The new idea of equality was never implemented completely; the extent to which it is realized varies from one composition to the next, as well as among movements within a single composition. Certainly by the mid nineteenth century, all three instruments had been modified to have a very powerful sound, and each can hold its own in a modern ensemble.

The earlier trios are now frequently performed and recorded using [authentic instruments](#), of the kind for which they were originally written. Such performances restore the sonic balance the composer would have expected, and have proven popular.

## Playing piano trios

Among the piano trios, works by Haydn and Mozart are considered the best starting point for pianists new to chamber music. Unlike string and wind players, who usually learn to play in an orchestra as students, most pianists have little ensemble experience and face a more difficult transition.

Most pianists find that they must practice the trios alone before playing with others, because the repertoire is difficult to sightread.

The extensive repertoire of [violin sonatas](#) generally contains less difficult piano parts, and is excellent preparation for pianists who wish to play the piano trios. Though fewer in number, there are chamber compositions for other string or wind instruments plus piano.

The Amateur Chamber Music Players publishes a contact list of musicians worldwide who play chamber music for their own enjoyment. They also publish lists of repertoire.

## Piano trio repertoire

Among the fairly large repertoire for the standard piano trio (violin, cello, and piano) are the following works:

- Anton Arensky (1861-1906)
  - Piano Trio #1 in d minor, op. 32
  - Piano Trio #2 in f minor, op.73
- Ludwig van Beethoven (1770-1827)
  - 3 Piano Trios (E-flat major, G major, c minor), op. 1
  - Piano Trio #4 (arrangement of Septet in E-flat major, op. 20), op. 38
  - Variations for Piano Trio in E-flat major, op. 44
  - Piano Trio (arrangement of string quartet in E-flat major, op.4), op. 63
  - 2 Piano Trios (D major "Ghost", E-flat major), op. 70
  - Piano Trio in B-flat major "Archduke", op. 97
  - Variations for Piano Trio in G major, op. 121a
- Leonard Bernstein (1918-1990)
  - Piano Trio (1937)
- Ernest Bloch (1880-1959)
  - Piano Trio (1925)
- Johannes Brahms (1833-1897)
  - Piano Trio #1 in B major, op. 8
  - Piano Trio #2 in C major, op. 87
  - Piano Trio #3 in c minor, op. 101
- Ernest Chausson (1855-1899)
  - Piano Trio in g minor, op. 3
- Frédéric Chopin (1810-1849)
  - Piano Trio in g minor, op. 8
- Aaron Copland (1900-1990)
  - *Vitebsk*: Study on a Jewish Theme for Piano Trio (1928)
- Claude Debussy (1862-1918)
  - Piano Trio in g minor, L. 3 (1880)
- Antonín Dvořák (1841-1904)
  - Piano Trio #1 in B flat major, B. 51
  - Piano Trio #2 in g minor, B. 56
  - Piano Trio #3 in f minor (once listed as Op. 64), B. 130
  - Piano Trio #4 in e minor ("Dumky"), B. 166
- Gabriel Fauré (1845-1924)

- Piano Trio in d minor, op. 120
- Enrique Granados (1867-1916)
  - Piano Trio, H. 140
- Joseph Haydn (1732-1809)
  - Piano Trios, H XV 1-40
- Johann Nepomuk Hummel (1778-1837)
  - Piano Trio #1 in E flat major, op. 12
  - Piano Trio #2 in F major, op. 22
  - Piano Trio #3 in G major, op. 35
  - Piano Trio #4 in G major, op. 65
  - Piano Trio #5 in E major, op. 83
  - Piano Trio #6 in E flat major, op. 93
  - Piano Trio #7 in E flat major, op. 96
- Charles Ives (1874-1954)
  - Piano Trio, S. 86 (1904-11)
- Édouard Lalo (1823-1892)
  - Piano Trio #1 in c minor, Op. 7
  - Piano Trio #2 in b minor (Ode on Music "Descend, ye Nine?")
  - Piano Trio #3 in a minor, Op. 26
- Franz Liszt (1811-1886)
  - Piano Trio *La Lugubre Gondola* (1882), also arranged for piano solo
- Frank Martin (1890-1974)
  - Trio sur des mélodies polulaires irlandaises (1925)
- Bohuslav Martino (1890-1959)
  - Piano Trio #1 ("Cinq pièces brèves"), H. 193
  - Piano Trio #2 in d minor, H. 327
  - Piano Trio #3 in C major, H. 332
  - Bergerettes (5) for piano trio, H. 275
- Felix Mendelssohn (1809-1847)
  - Piano Trio No. 1 in D minor, Op. 49 (1839)
  - Piano Trio No. 2 in C minor, Op. 66 (1845)
- Darius Milhaud (1892-1974)
  - Piano Trio, op.428 (1969)
- Wolfgang Amadeus Mozart (1756-1791)
  - Piano Trio #1 in B flat major, K. 254
  - Piano Trio #2 in G major, K. 496
  - Piano Trio #3 in B flat major, K. 502
  - Piano Trio #4 in E major, K. 542
  - Piano Trio #5 in C major, K. 548
  - Piano Trio #6 in G major, K. 564
- Vítězslav Novák (1870-1949)
  - Piano trio in g minor, Op 1
  - Piano trio in d minor "Quasi una ballata", Op 27

- Arvo Pärt (1935-)
  - Mozart - Adagio for piano trio
- Sergei Rachmaninoff (1873-1943)
  - Trio élégiaque No.1 in G minor, Op. posth. (1892)
  - Trio élégiaque No.2 in D minor, Op.9 (1893)
- Maurice Ravel (1875-1937)
  - Piano Trio in A minor (1914)
- Albert Roussel (1869-1937)
  - Piano Trio in E flat major, op. 2
- Camille Saint-Saëns (1835-1921)
  - Piano Trio No. 1 in F major, Op. 18 (1863)
  - Piano Trio No. 2 in E minor, Op. 92 (1892)
- Alfred Schnittke (1934-1998)
  - Piano Trio (arrangement of string trio)
- Franz Schubert (1797-1828)
  - Piano Trio #1 in B flat major, D. 898
  - Piano Trio #2 in E flat major, D. 929
  - Piano Trio in B flat major "Sonatensatz", D. 28
  - Piano Trio in E flat major "Nocturne" (Adagio only), D. 897
- Clara Schumann (1819-1896)
  - Trio for piano, violin & cello in G Minor, Op 17
- Robert Schumann (1810-1856)
  - Piano Trio # 1 in d minor, op. 63
  - Piano Trio # 2 in F major, op. 80
  - Piano Trio # 3 in g minor, op. 110
- Dmitri Shostakovich (1906-1975)
  - Piano Trio #1 in c minor, Op. 8
  - Piano Trio #2 in e minor, Op. 67
- Bedřich Smetana (1824-1884)
  - Piano Trio in g minor, JB 1:64 (Op. 15)
- Josef Suk (1874-1935)
  - Piano Trio in c minor, Op 2
  - Elegie for Piano Trio, Op 23
- Pyotr Ilyich Tchaikovsky (1840-1893)
  - Piano Trio in a minor, op. 50
- Joaquín Turina (1882-1949)
  - Piano Trio #1, op. 35
  - Piano Trio #2 in B minor, op. 76
  - Circulo, for piano trio, op. 91
- Ellen Zwilich (1939- )
  - Piano Trio

Many works also exist for less conventional groupings of instruments, but can still be classified as piano trios. Among these:

- Béla Bartók (1881-1945)
  - Contrasts (1938) for violin, clarinet, and piano
- Ludwig van Beethoven (1770-1827)
  - Trio for clarinet, cello, piano in B-flat, op. 11
- Alban Berg (1885-1935)
  - Adagio (arrangement of Chamber Concerto 2nd Mov't) for violin, clarinet, piano, op. 7
- Johannes Brahms (1833-1897)
  - Trio for violin, horn (or viola), piano in E-flat major, op. 40
  - Trio for clarinet (or viola), cello, piano in a minor, op. 114
- Mikhail Glinka (1804-1857)
  - Trio pathétique, for clarinet (or violin), bassoon (or cello), piano in d minor, G. iv173
- Aram Khachaturian (1903-1978)
  - Trio for B-flat clarinet, violin, and piano in C minor, Op. 30 (1932)
- Wolfgang Amadeus Mozart (1756-1791)
  - Trio for clarinet (or violin), viola, piano in E flat major "Kegelstatt", K. 498
- Francis Poulenc (1899-1963)
  - Trio for oboe, bassoon, piano, FP 43
- Albert Roussel (1869-1937)
  - Trio for flute, viola, piano, op. 40

## Piccolo

The **piccolo** is a small [flute](#). Its name in Italian, "flauto piccolo" means "small flute". Like the flute, the piccolo is normally pitched in the [key](#) of C, about one octave above the concert flute (making it, effectively, a sopranino flute). Music for the piccolo is written one octave lower than the sounds desired in order to avoid too many ledger lines above the staff. Fingerings on the piccolo correspond to fingerings on the flute, but sound an octave higher. Also, many alternate fingerings may be used to tune the individual pitches, as many are consistently out of tune.

In addition to the standard C piccolo, there is a piccolo pitched in D flat that is sometimes used in bands and a piccolo pitched in A flat rarely used outside Italian [marching bands](#).

## Timbre and construction

Because the piccolo sounds in a very high register, it has a potential to be strident or shrill. Thus, it is often used only as an ornamental, "flavor" or "garnish" instrument. A typical flute section may include only one or two piccolos, and since piccolo players usually also play flute, they may alternate between the two, according to what is appropriate for the music. Not all flute players play piccolo. Though the fingerings are the same, the embouchure and other differences do require a separate effort to learn.

The piccolo is somewhat notorious for being difficult to play in tune, as evidenced by the joke circulating among musicians that defines a minor second as "two piccolos playing in unison". Besides being generally sensitive to tuning, the piccolo does require a great deal of breath support and is quite conspicuous when out of tune.

Piccolos may be constructed out of wood, metal, plastic, or a combination. Many piccolo players find that wooden piccolos offer a more mellow [timbre](#) than metal ones. A popular compromise combines a metal head joint with a body made from wood. In more recent years the piccolo has also been made out of a plastic composite material. The composite piccolo is durable enough for marching and produces a fair quality sound. Most professionals agree that it should be made out of one material as two separate ones rise to separate temperatures, leading to tuning inconsistencies.

## Traditional use

The piccolo, historically with no keys, today with keys different from those of the classical piccolo, is also used in conjunction with marching drums in traditional formations at the carnival of Basel, Switzerland.

The first symphonic composition in which a piccolo was used was Ludwig van Beethoven's Symphony No. 5, also the first symphonic work to use a [trombone](#).

# Pieces

## Piedmont blues

The **Piedmont blues** is a type of [blues](#) music characterized by a unique fingerpicking method on the [guitar](#) in which a regular, alternating-thumb bass pattern supports a melody using treble strings. The Piedmont blues typically refers to a greater area than Piedmont, which refers to the East Coast of the United States from about Richmond, Virginia to Atlanta, Georgia. Piedmont blues musicians come from this area, as well as Maryland, Delaware, West Virginia, Pennsylvania and Florida.

Prominent musicians of the type include:

- Pink Anderson
- Scrapper Blackwell
- Blind Blake
- Bumble Bee Slim
- Reverend Gary Davis
- Blind Boy Fuller
- "Mississippi" John Hurt
- Skip James
- Lonnie Johnson
- Furry Lewis
- Mance Lipscomb
- Brownie McGhee
- Blind Willie McTell
- Sonny Terry
- Curley Weaver

## Pinpeat

The **pinpeat** [orchestra](#) or [musical ensemble](#) performs the ceremonial music of the former courts and temples of Cambodia. The [orchestra](#) consists of approximately nine or ten instruments, mainly [wind](#) and [percussion](#) (including several varieties of [xylophone](#) and [drums](#)), and accompanies court dances, masked plays, shadow plays, and religious ceremonies.

It is one of the most ancient Cambodian musical ensembles and is closely associated with the Angkor period. In fact, its history is carved into the walls of Angkor Wat in the shapes of the instruments held by celestial dancers, such as the [gong](#) called *korng* and the small [cymbals](#) called *chhing*, both of which have been essential to the pinpeat ensemble for centuries.

Categories: [Orchestras](#)

## Pipe

**Pipe** describes a number of musical instruments, historically referring to perforated wind instruments. The word is an onomatopoeia, and comes from the tone which can resemble that of a bird chirping.

## **Folk Pipe**

Fipple flutes are found in many cultures around the world. Often with six holes, the shepherd's pipe is a common pastoral image. Shepherds often piped both to soothe the sheep and to amuse themselves. Modern manufactured six-hole folk pipes are referred to as pennywhistle or tin whistle. The recorder is a form of pipe, often used as a rudimentary instructional musical instrument at schools, but so versatile that it is also used in orchestral music, but it has seven finger holes and a thumb hole.

## Tabor Pipe

The three-holed pipe is a form of the folk pipe which is usually played with one hand, while the other hand plays a tabor or other drone instrument, such as a [bell](#) or a psalterium (string-drum).

In English this instrument is properly called simply a *pipe*, but is often referred to as a *tabor pipe* to distinguish it from other instruments.

The tabor pipe has two finger holes and one thumb hole. In the English tradition, these three holes play the same notes as the bottom three holes of a tin whistle, or tone, tone, semitone. Other tabor pipes, such as the French galoubet, the Basque txistu, the Aragonese chiflo or the Andalusian pito rociero, are tuned differently.

The pipe and tabor was a common combination throughout Europe, during the mediæval period, and remains popular in some parts of Europe and the Americas today.

The English pipe and tabor had waned in popularity, but had not died out before a revival by Morris dance musicians in the early 20th century.

Traditionally made of cane or of wood, today pipes are also available made of metal and of plastic.

## Flageolet

The flageolet was developed from the tabor pipe, in France, and became an orchestral instrument. Its lower three holes were configured the same as a tabor pipe, with two on front and one on back. A second set of three holes was added above this. The mouthpiece had a unique configuration with a sponge inside.

Used as orchestral instruments into the 19th Century, the flageolet was given keys, like in the orchestral [flute](#).

## Reed Pipe

A reed pipe is an instrument which is similar in construction to the fipple flutes but instead of a whistle mouthpiece, has a (usually) double reed, like the [oboe](#).

## **Hornpipe**

A hornpipe is an instrument of the British Isles, made of animal horn, and has a free reed inside it.

## Pipe organ

A **pipe organ** is a [keyboard instrument](#) that produces its sound by admitting air under pressure through pipes. Pipe organs range in size from portable instruments having only a few dozen pipes to very large symphonic organs with tens of thousands of pipes. All but the smallest have more than one keyboard (manual), with the most common configuration being two manuals and a pedalboard. Three, four or five manuals and pedals is not uncommon for larger instruments.

Pipe organs are most commonly found in churches, and in some Reform synagogues. They are also found in town halls, and in arts centres intended for the performance of [classical music](#). In the era of silent films, large theater organs were installed in many cinemas.

## History

As one of the oldest instruments still in use, the organ has a long and rich history.

### The first organs

The word *organ* originates from the Latin word "organum", the earliest predecessor of the instrument used in ancient Roman circus games and similar to a modern portative.

The organ dates back to classical antiquity. The earliest organs were hydraulic. The inventor most often credited is Ctesibius of Alexandria, an engineer of the 3rd century BC, who created an instrument called the hydraulis. The hydraulis was common in the Roman Empire, where its immensely loud tone was heard during games and circuses in amphitheatres and processions. Characteristics of this instrument have been inferred from mosaics, paintings, literary references and partial remains, but knowledge of details of its construction remain sparse, and almost nothing is known of the actual music it played.

Organs were also known to exist in the Byzantine Empire as well as in Islamic Spain, though there is no evidence that the European organ came by way of Spain. In medieval times, the portable instruments (the **portatif** or **portative organ** and the **positive organ**) were invented. Because of their portability, they were used for the accompaniment of both sacred and secular music in a variety of settings.

### Blockwerk

As the instruments became larger, they were installed permanently in a fashion similar to the church organs of today. At this time, organs did not have sophisticated stop controls: the organist would usually have the choice of playing on a single 8' Principal stop or what was called the Blockwerk. The **Blockwerk** consisted of the entire tonal resources of the organ, which in some cases meant a very large number of ranks ranging from 16' pitch all the way through 1' pitch and higher.

Eventually, separate controls were built to allow the organist to control whether or not each rank in the Blockwerk would sound, effectively dividing the Blockwerk into separate stops. Some of the higher-pitched ranks were

still grouped together under a single stop control; these stops were the forerunner of mixtures that would be found in later organs.

## **The Renaissance and Baroque eras**

During the Renaissance and Baroque eras the organ became an instrument capable of creating numerous tonal colors, both unique and imitative. In northern Europe, the organ developed into a large instrument with several divisions, including an independent pedal. These divisions were readily discernible by the case design. This style was labeled the **Werkprinzip** by 20th-century organ scholars. In France, the French classical organ came into fashion, a style of building articulated most completely by Dom Bedos de Celles in his magnum opus, *L'art de facteur d'orgues*.

## **Romantic era**

In the Romantic era the organ transitioned from a polyphonic to a symphonic instrument, capable of creating a massive layered crescendo from the softest stops alone to the full organ. Through the developments of the French organ builder Aristide Cavallé-Coll, the romantic organ inspired generations of composers, beginning with César Franck and continuing through the 20th century. In the Romantic era organs began to be built in concert halls, and the organ began to be called for in large symphonic works by such composers as Camille Saint-Saëns and Gustav Mahler.

## **20th century**

A major revolution in pipe organ design took place in the late-19th century when the development of electric and electro-pneumatic key actions made it technically feasible to locate the console independently of the pipes. Up until the historical organ revival in the mid-20th century, electric key action reigned supreme. When organ builders began building historically-inspired instruments, they returned to mechanical key action. Due to the benefits of modern technology, modern mechanical actions are much lighter and require less effort to play than do historical mechanical actions. During the 20th century, electrically-controlled stop actions allowed for the development of sophisticated combination actions.

## **Pipeless organs**

In the mid-20th century, churches and other institutions began increasingly substituting electronic pipeless organs such as the Hammond organ(see [organ \(music\)](#)) for pipe organs, because pipe organs are more expensive and harder to maintain. In the later 20th century, digital pipeless instruments were developed that emulate the sound of a real organ. Both Hammond organs and modern digital organs have to be amplified using an electronic [instrument amplifier](#) and speakers that are designed to reproduce the full range of tones that an organ produces. Modern digital sampling organs are by far the most realistic imitation of the true pipe organ sound (though still merely an imitation). Major builders of such instruments include the firms of Allen, Rodgers, Johannus and Phoenix. It is increasingly common for even builders of real pipe organs today to use digital stops for the very lowest pedal ranks.

Despite the lower cost of electric and digital pipeless organs (as compared with the cost of a pipe organ), interest in pipe organs and mechanical actions for pipe organs has continued. Historic organs are still being rebuilt and refurbished, and new instruments with both mechanical and electric actions are being built.

## Construction

The main elements of an organ are the **pipes**, the **console** (or **keydesk**), the **wind** system, and the **stop** mechanism.

### Pipes

Organ pipes are arranged in **ranks**. A rank is a complete set of pipes of similar timbre tuned to a [chromatic scale](#). The great majority of ranks are mounted vertically, but some ranks may be mounted horizontally, as is the case with *trompettes en chamade*. At the base of the pipes is a **windchest** which supplies air (known in the organ world as "wind") to the pipes. The manner in which the wind is admitted to the pipes varies depending on the type of **action**, but in any case several ranks of pipes may be supplied by a single windchest. A few of the larger pipes may be "off chest" in order to better fit them into the available space or in order to feature them in the façade.

Pipes may be classified in several ways, each of which results in a different timbre:

- by the material they are made of (wood or metal)
- by the mechanism of sound production (*flue* pipes vs. *reed* pipes, also called *labial* and *lingual*)
- by the shape of the pipe (cylindrical, conical, or irregular)
- by the construction of the ends (open or closed).

Because a pipe produces only one pitch at a time, ideally there is at least one pipe for each controlling key or pedal. (Occasionally some pipes, especially in the bass, to save space or material, are rigged to provide multiple pitches like big recorders: this method was employed especially by a few builders in the early 20th century.) Thus, a keyboard with 61 notes would have 61 pipes per rank.

### Pitch

The pitch produced by a pipe is a function of its length. A stop may be tuned to sound (or *speak at*) the pitch normally associated with the key that is pressed (the *written pitch* or *unison pitch*), or it may speak at a fixed

interval above or below this pitch. These intervals are denoted by numbers on the stop knob. A stop tuned to unison pitch is known as an **8'** stop (pronounced "eight foot"). This refers to the approximate speaking length of an open flue pipe of that stop sounding CC (the C two octaves below middle C). A 4' stop (so called because its CC pipe is approximately four feet long) speaks an octave above unison pitch. Thus, the pitches which sound the octaves above and below unison pitch correspond to the powers of two: 1' is three octaves above unison pitch, 2' two octaves above, 4' one octave above, 8' unison pitch, 16' one octave below, 32' two octaves below, and 64' (extraordinarily rare) three octaves below. When considering the labeled lengths of ranks of pipes, the length of a foot is 328 mm when the speed of sound is 343 m/s.

Ranks pitched at some interval that is not a power of two (such as 2 2/3' or 1 3/5') are also common. These **mutations** reinforce certain partials of the overtone series of a fundamental. A stop at 2 2/3' pitch (called a "Nasard" or a "Quint") sounds at an interval of a twelfth above unison pitch, and a stop at 1 3/5' pitch (called a "Tierce") sounds at an interval of a seventeenth above unison pitch. (In some historical organs a stop at 2 2/3' pitch is labeled as 3'; this is purely a representation of historical convention and does not indicate that the stop is any different from one labeled 2 2/3'.) Normally, mutation stops are not played by themselves, they are combined with fundamental stops. They are most often used to add unique color to solo combinations.

Certain stops called **mixtures** contain multiple ranks of pipes. The number of ranks in a mixture is denoted by a Roman numeral in the stop name: a stop labeled "Mixture V" on a 61-note keyboard would contain  $5 \times 61 = 305$  pipes. The multiple ranks in a mixture (usually pitched at intervals of octaves and fifths, though mixtures containing thirds also exist) reinforce certain partials of a fundamental, like mutations; however, mixtures are generally used to color the plenum as opposed to solo combinations.

## Flue pipes

**Flue pipes** produce sound the same way as a recorder: they are actuated by a whistle or fipple. The majority of organ pipes are flue pipes. They are used in single-rank foundation and mutation stops as well as mixtures.

Most, but not all, flue pipes belong to one of three tonal families:

- **Flutes** have the purest waveforms, but have less-defined pitch than diapasons.

- **Diapasons** or principals have the most well-defined pitches and have a tone midway between flutes and strings.
- **Strings** have the richest harmonics and the narrowest pipe scales.

Ranks of all three tonal families may have either open ends or closed ("stopped") ends. The cross-section of a metal pipes is normally circular, while the cross-section of a wooden pipe is most often square or rectangular.

Flue pipes can be made of wood or metal. Metal flues are made of varying mixtures of lead and tin, according to the sound sought for that particular pipe (lead darkens the tone, tin brightens it). The exception is the very lowest pipes in a rank, which are sometimes made of rolled zinc. Wood flues will always have the foot, cap, block and mouthpiece made of hardwood, whereas the walls of the pipe may be made of hardwood or (commonly in very large pipes) of conifer.

## Reed pipes

**Reed pipes** are actuated by a beating reed. They are used almost exclusively as single-rank foundation stops. Because they contain moving parts, their construction is more complicated. Reed stops feature several different shapes of resonators and a great variety in tone color. Many reed stops imitate other historical musical instruments, such as the [trumpet](#), the [bassoon](#), the krummhorn, and the regal.

The reed in a reed pipe is made of brass. The pipe's sound is created entirely inside the pipe foot (or "boot"), but is amplified and given its respective color by the *resonator*, which projects upward from the boot. Resonators can be shorter than the corresponding pipe of a flue rank of the same pitch (called "fractional length"), of unison length, or twice as long (called "double length"), depending on the tone desired. They can be cylindrical and high in lead content (as in the Krummhorn) or conical and high in tin content (as in the Trompette). In addition, they can be narrowly flared, broadly flared, capped, semi-capped or open. All these variations have an effect on the tone produced.

## Accessories

In addition to pipes, some organs will have any of several accessories. The zimbelstern is quite common, especially on German Baroque-inspired instruments. The chimes and the celesta are normally found on American instruments, while the [harp](#), the [drum](#), and other percussion stops are rather rare. French romantic instruments sometimes feature the *éffet*

d'orage (the "thunder pedal") and the avalanche, used in the performance of storm compositions and improvisations.

## Stop nomenclature

Many stops have more than one name. The choice of the name reflects not only the timbre and construction of the stop, but also the style of the organ in which the stop resides. For example, the stop names on a German [Baroque](#) organ will generally be derived from the German nomenclature, while the names of similar stops on an English romantic organ will be derived from the English tradition.

A traditional stop label includes three parts:

- the name of the stop (Rohrflöte, Cornet, Trompette, etc.)
- the pitch (8', 4', etc.)
- the number of ranks controlled by the stop (III, VI–VIII, etc.)

Thus, a stop labeled *8' Cornet V* is a five-rank Cornet whose lowest pitched rank sounds at unison pitch. If—as in most cases—the stop controls only one rank, the "I" is normally omitted (i.e., *8' Principal*, not *8' Principal I*). Conventionally, a *resultant bass* (or *resultant*) stop, which plays two or more ranks in a harmonic series in order to create the illusion of a lower pitch, is labeled only with the resultant tone. For example, the relatively common combination of a 16' rank and a 10 2/3' rank, producing the impression of 32' tone, would be labelled *Resultant 32'*. Stop nomenclature was more strictly observed in classic organ building than it is today, in some ways. Classically, a "twelfth" and a "nasard" were essentially similar stops, but the term "twelfth" was used if the pipes were made as diapasons, and the term "nasard" was used if the pipes were made as flutes. Today, the term "twelfth" is little used, and "nasard" pipes may be either diapasons or flutes in design.

## Unification and extension

When a rank of pipes is available as part of more than one stop, the rank is said to be **unified**, or **borrowed**. Ranks can be borrowed within a single division or between manuals. For example, an 8' Diapason rank may also be made available as a 4' Octave. When both of these stops are selected and a key (for example, middle C) is pressed, two pipes of the same rank will sound: the middle C pipe and the pipe one octave higher.

Furthermore, if both the middle C key and the C an octave higher are pressed simultaneously, only three pipes will sound. This is because one pipe has been selected twice: once as the 4' Octave of middle C and once as the 8' Diapason of the key an octave higher. This is known as a "borrowing collision", and is one reason that borrowing from a rank is generally regarded as inferior to including a separate rank. Moreover, a dedicated 4' stop would be voiced and scaled slightly differently than the 8' stop; there is no opportunity to do this with a borrowed rank.

Due to the necessities of the technique, unification is difficult to accomplish without electric stop action. It is generally used when funds are scarce, as unifying one rank with another is much cheaper than building two separate ranks. Some organ builders, such as Schoenstien, have been successful (i.e., they have not compromised the unity or the quality of the instrument) in making extensive use of unification in order to allow for unique registrational effects.

When a rank is borrowed, the organist may run out of pipes at one end of the keyboard or the other. In the above example, there are no pipes in the original rank to sound the top octave of the keyboard at 4'. The neatest and most common solution to this is to provide an extra octave of pipes used only for the borrowed 4' stop. The full rank of pipes is now an octave longer than the keyboard, and is called an **extended rank** or an **extension rank**. An organ that relies heavily on extension is called an extension organ.

## Console

The organ is played from an area called the **console** (if it is separate from the rest of the case) or **keydesk** (if it is integrated into the case), which holds the manuals, pedals, and stop controls. Some very large organs, such as the Van Den Heuvel organ at the Church of St. Eustache in France, have more than one console, enabling the organ to be played from several locations depending on the nature of the performance.

Controls at the console called **stops** select which ranks are used. These controls are generally either **stop knobs**, which move in and out of the console, or **stop tabs**, which rock back and forth. Other stop controls include sliding rods and light-up digital buttons, though these styles are much less common than knobs and tabs.

Different combinations of stops change the timbre of the instrument considerably. The selection of stops is called the **registration**. On modern organs, the registration can be changed instantaneously with the aid of a combination action, usually featuring pistons. **Pistons** are buttons that can be pressed by the organist to change registrations; they are generally

found between the manuals or above the pedalboard (in the latter case they are called **toe studs**). Most large organs have both preset and programmable pistons, with some of the couplers repeated for convenience as pistons and toe studs. Programmable pistons allow comprehensive control over changes in registration.

In organs that use electronic action, the console is sometimes moveable. This allows for greater flexibility in placement of the console for various activities. For example, the console at St. Raphael's Cathedral, in Dubuque, Iowa is moveable. The electric-action console is located near the front of the church, while most of the organ pipes are located in the former choir loft, with a few at the front of church along the southern wall. Normally, the console is positioned so that it is next to the wall, with the organist seated so his back is to the wall. For recitals, the console is often moved into better view of the audience.

## Keyboards

The organ is played at least one keyboard, with configurations featuring from two to five keyboards being the most common. A keyboard to be played by the hands is called a **manual** (because it is played with the hands); an organ with four keyboards is said to have four manuals. Most organs also have a pedalboard, a large keyboard to be played by the feet.

The collection of ranks controlled by a particular manual is called a **division**. The names of the divisions of the organ vary geographically and stylistically. Common names for divisions are:

- Great, Swell, Choir, Solo, Orchestral, Echo, Antiphonal (America)
- Hauptwerk, Rückpositiv, Oberwerk, Brustwerk, Schwellwerk (Germany)
- Grand Choeur, Grand Orgue, Récit, Positif, Bombarde (France)

In English, the main manual (the bottom manual on two-manual instruments or the middle manual on three-manual instruments) is traditionally called the Great, and the upper manual is called the Swell. If there is a third manual, it is called the Choir and placed below the Great. If it is included, the Solo manual is usually placed above the Swell. Some larger organs contain an Echo or Antiphonal division, usually controlled by a manual placed above the Solo. German and English organs generally use the same configuration of manuals as American organs. On French instruments, the main manual (the Grand Orgue) is at the bottom, with the Positif and the Récit above it. If there are more manuals, the Bombarde is usually above the Récit and the Grand Choeur is below the Grand Orgue.

In some cases, an organ contains more divisions than it does manuals. In these cases, the extra divisions are called **floating** divisions and are played by coupling them to another manual. Usually this is the case with Echo/Antiphonal and Orchestral divisions, and sometimes it is seen with Solo and Bombarde divisions.

## Couplers

A device called a **coupler** allows the pipes of one division to be played by a manual. For example, a coupler labeled "Swell to Great" allows the stops of the Swell division to be played by the Great manual. It is unnecessary to couple the pipes of a division to the manual of the same name (for example, coupling the Great division to the Great manual), because those stops play by default on that manual (though this is done with super- and sub-couplers, see below). By using the couplers, the entire resources of an organ can be played simultaneously from one manual. On a mechanical-action organ, a coupler may connect one division's manual directly to the other, actually moving the keys of the first manual when the second is played.

Some organs feature **super-couplers** and **sub-couplers**, which shift the connection of the coupler respectively up or down by an octave. Super-couplers are usually labeled with the suffix "4'", as in "Swell to Great 4'", and sub-couplers with the suffix "16'", as in "Swell to Great 16'". The inclusion of these couplers allows for greater registrational flexibility and color. Some literature (particularly romantic literature from France) calls explicitly for *octaves aigues* (super-couplers) to add brightness, or *octaves graves* (sub-couplers) to add gravity. Some organs feature extended ranks to accommodate the top and bottom octaves when the super- and sub-couplers are engaged (see the discussion under "Unification and extension").

Some organs also have **unison off** couplers, which act to "turn off" the stops of a division on its own keyboard. For example, a coupler labeled "Great unison off" would keep the stops of the Great division from sounding, even if they were pulled. Unison off couplers can be used in combination with super- and sub-couplers to create complex registrations that would otherwise be possible. In addition, the unison off couplers can be used with the standard couplers to change the order of the manuals at the console: engaging the Great to Choir and Choir to Great couplers along with the Great unison off and Choir unison off couplers would have the effect of moving the Great to the bottom manual and the Choir to the middle manual.

## Wind system

*For more information, see the article at [Organ wind systems](#).*

In order for an organ to sound, it is necessary for air to be directed through the pipes. The air, referred to as **wind** in the organ trade, comes from one of two sources:

- When signalled by the organist (often using a bell called a **calcant** ), a person pumps the bellows of the organ by any of several mechanisms, supplying them with air. Before the advent of electricity, this is how all organs were provided with wind. Playing the organ in these days required at least one person to work the bellows, if not several, who had to be compensated for time and labor, making it an expensive instrument to play. Thus, practicing was usually done not on the organ, but on smaller instruments such as the clavichord or harpsichord. A few organs that can be pumped by hand still exist.
- An electric blower fills the bellows with air. Once electricity made the electric blower a reality, every new organ made use of it and virtually every old organ was outfitted with one. Suddenly, it became possible for organists to practice regularly on the organ.

Once the wind is produced through one of these two means, it is stored in one or more **bellows** of varying designs. The bellows are weighted to produce a constant wind pressure, which differs with the design of the organ and the division the wind supplies. An Italian organ from the [Renaissance](#) may feature a wind pressure of only 1 1/2 inches, while an orchestral organ from the early 20th century may have wind pressures as high as 25 inches in some divisions.

The wind flows from the bellows through one or more large pipes known as **wind trunks** to the separate divisions of the organ. There, the wind is fed into the **windchest**, which is directly under the pipes. Then, through the key action, the wind flows into the pipes, and the pipes speak.

## Stop mechanism

The organ's separate ranks are called into play by the organist through the stop mechanism. There are many different varieties of stop mechanisms, some proprietary, but the principal distinction is between mechanical and electric mechanisms. Mechanical stop mechanisms connect the stop controls directly to the windchests through a series of wooden or metal rods. When the organist moves the stop control, the rods move. This actuates the mechanism at the windchest that allows or denies

wind to the stop. Electric stop mechanisms control the mechanism at the windchest through electronics, which are activated when the organist moves a stop control at the console.

The choice of stop mechanism depends on the design of the organ and the console. If the console is located farther away from the rest of the organ, a mechanical stop action is harder to implement than when the console and the organ are in closer proximity. Furthermore, a sophisticated combination action requires an electric stop action. A rudimentary system of combination pedals can be employed with a mechanical stop action, but it offers less registrational flexibility than an electric stop mechanism with a combination action.

## **Enclosure**

The above elements of most organs are housed in a free-standing **organ case** or a dedicated room called an **organ chamber**. In either situation, the pipes are separated from the listeners by a grill that often contains decorative pipes known as a **façade**. Some organs do not have any discernable pipe façade (this is, in fact, a type of case design in itself), or they may have a screen behind which all of the organ's pipes are hidden.

In some organs with façade pipes, especially those which are based on historical styles from the time before the 20th century, the façade pipes are genuine, speaking pipes. They usually form part of an open flue rank from the Pedal or Great division. In other organs, the façade pipes are purely decorative and non-speaking.

Even with non-speaking pipes, the façade is considered an important part of an organ, much as the scroll of a violin is considered a part of that instrument. The façade also serves an acoustic function, changing the tone of the organ as the sound waves travel through it, as well as a means of masking swell boxes located behind it.

## Organ music

There is a large repertoire of religious music for the pipe organ, dating from the [Renaissance](#) to the present day; in the 19th century and later compositions that were effectively secular also became common, many in symphonic style. Some of the leading composers for the pipe organ, such as Cesar Franck and Charles-Marie Widor, are relatively little-known outside the organ world; probably the two composers who both enjoy a stellar reputation in the broader musical world and composed extensively for the pipe organ are the Baroque composer Johann Sebastian Bach and the 20th-century composer Olivier Messiaen.

Although most countries whose music falls into the Western tradition have contributed works to the pipe organ's repertoire, France and North Germany are particularly notable for having produced many composers for the instrument. There is also extensive repertoire from the Low Countries, England and the United States.

The development of the repertoire has gone hand in hand with the development of the instrument, leading to distinctive national styles of composition; in the opposite direction, the dominance of certain countries in providing the repertoire has influenced the emergence of an international mainstream of organ design. Thus the repertoire of Spain, Portugal and Italy is rarely heard outside those countries, because the tonal styles of their organs are quite distinct from the German-French-British-American mainstream. Likewise, there is little Russian or Greek organ music because those nations' Orthodox churches do not use the organ in worship.

Church-style pipe organs are very rarely used in [popular music](#). In some cases, groups have sought out the sound of the pipe organ, such as Tangerine Dream, which combined the distinctive sounds of [electronic synthesizers](#) and pipe organs when it recorded both music [albums](#) and videos in several cathedrals in Europe. Rick Wakeman of British [progressive rock](#) group Yes also used pipe organ to excellent effect in a number of the groups albums (including "Close To The Edge" and "Going For The One"). Wakeman has also used pipe organ in his solo pieces such as "Jane Seymour" from "The Six Wives Of Henry VIII" and "Judas Iscariot" from "Criminal Record". Even more recently, he has recorded an entire album of organ pieces - "Rick Wakeman at Lincoln Cathedral"

On the other hand, [electronic organs](#) and electromechanical organs such as the Hammond organ have an established role in a number of non-"Classical" genres, such as blues, jazz, gospel, and 1960s and 1970s rock music. Electronic and electromechanical organs were originally designed

as lower-cost substitutes for pipe organs. Despite this intended role as a sacred music instrument, electronic and electromechanical organs' distinctive tone-often modified with electronic effects such as vibrato, rotating Leslie speakers, and overdrive-became an important part of the sound of popular music. Billy Preston and Iron Butterfly's Doug Ingle have featured organ on popular recordings such as "Let it Be" and "In-A-Gadda-Da-Vida", respectively. Well-known rock bands using the Hammond organ include Pink Floyd and Deep Purple.

## Some notable pipe organs

The world's oldest playable pipe organ is located in the Basilica of Valère in Sion, Switzerland. Built around 1390, it still contains many of its original pipes.

The largest pipe organ ever built, containing more than 32,000 pipes, is the Main Auditorium Organ in Boardwalk Hall in Atlantic City, New Jersey, built by the Midmer-Losh Organ Company between 1929 and 1932. Today, the instrument is only partially assembled but unplayable, and indeed, was only fully assembled and operative for a short portion of its life - the space in the hall that some of the organ chambers took up being needed for other purposes.

The largest functioning pipe organ, with over 28,000 pipes, is the Grand Court Organ at Wanamaker's department store (now Lord and Taylor) in Philadelphia. It is also the second largest organ yet built.

The world's largest all pipe church organ, with about 21,800 pipes and some 355 ranks, is at the Cadet Chapel, United States Military Academy, West Point, New York. (Details: 355+ ranks, 874 stops, 293 voices, 24 divisions, 23,500 pipes. ) The world's next largest church pipe organ, with 20,000 pipes and 345 ranks, is at First Congregational Church, Los Angeles. Details: Stolist:

One of the most recognizable pipe organs, also one of the largest, is in the Tabernacle on Temple Square in Salt Lake City, UT. It is also of note that the largest pipes in the façade, which typically are made of metal, are made of a series of wood strips glued together in barrel-stave fashion. The lumber for these pipes as well as other wood portions of the organ and the structure of the building itself were hauled to the site by oxen from from the Parowan and Pine Valley mountains nearly 300 miles away.

## Pipes and drums

**Pipes and Drums** is the military designation for a band consisting of bagpipes and drums; the term **Pipe Band** is also used, both colloquially to refer to military bands, but has also come into common use as an official designation, primarily in civilian bands. Both terms commonly refer to bands comprised of musicians who play the Scottish and Irish [bagpipes](#) and drums.

## Military Pipes and Drums

While the term "pipe band" usually refers to bagpipe bands of civilian origin (for example Hong Kong Pipe Band), "pipes and drums" is a term used for bands of military and para-military origins (for example Pipes and Drums of The Black Watch (Royal Highland Regiment) or Pipes and Drums of the Hong Kong Police Force etc.).

There are regiments in the British Army (for example the Irish Guards) that vary the exact nomenclature, but this is all a matter of regimental tradition and custom. In the Scots Guards, for example, it is customary to call the regiment's pipes and drums simply "the Drums." This is because historically drummers have come to be recognized as an official part of that regiment's musical establishment before pipers, and as a result the pipes and drums are still being called "the Drums." Before their amalgamation into the Queen's Own Highlanders, the Gordon Highlanders were the only regiment to recognise the seniority of the drum corps by calling the band the 'Drums and Pipes'.

Nowadays musicians in British Army bands are normally required to take on a secondary role in the battlefield as medics. On the contrary, in most cases the pipes and drums in a Scottish or Irish infantry regiment constitute a machine gun platoon (as does the Corps of Drums in an English or Welsh infantry regiment). Therefore, apart from being musicians, members of the pipes and drums must also be qualified fighting soldiers. Unlike musicians, who belong to the Corps of Army Music, they belong to the regiment in which they serve and are infantrymen first and foremost.

The British Army runs its own pipes and drums training facility, the Army School of Bagpipe Music and Highland Drumming, in Edinburgh, Scotland. To be qualified as a Pipe Major or [Drum Major](#) in a British Army pipes and drums, candidates must successfully pass a series of courses at the school.

In the British Army, only Scottish Highland regiments were originally authorised separate pipers. Lowland regiments, the Scots Guards, and Irish regiments were only authorised them from 1922, after the partition of Ireland, although regimental colonels had long appointed them unofficially from men carrying out other duties.

## Pipe Bands

During the 20th Century, civilian pipe bands gained in popularity and today outnumber military bands by a large margin.

The most common form of pipe band, the Scottish pipe band, consists of a section of pipers, a section of side drummers known as a [drum corps](#), several tenor drummers and a single bass drummer. The tenor drummers and bass drummer are often referred to collectively as the midsection.

Standard instrumentation for a pipe band is from 6 to 25 pipers, 3 to 10 side drummers, 1 to 4 tenor drummers and 1 bass drummer. Occasionally this instrumentation is augmented to include additional instruments (such as additional percussion instruments or keyboard instruments), however this is typically done only in concert settings.

### History of the Pipe Band

The pipe band began life in the military, but its origins are obscure, and historical records exist mostly in hints gleaned from contemporary regimental records that had no direct interest in pipes. We do know that pipers served in regiments from the earliest times; the Royal Scots have records referring to pipers dating back to the early seventeenth century. Where pipers were employed as pipers (rather than just happening to be a soldier that also was able to play), they were employed by the officers of the regiments as private pipers. This situation continued until the 1840s, when Queen Victoria's enthusiasm for all things Highland was instrumental in the War Office's decision that each regiment be allowed five pipers and a Pipe Major, which continues to be all that the British Army provides funds for to this day. By this time, pipers were already playing together with drummers, probably modeling themselves on the fife and drum bands which had existed in Switzerland since the fifteenth century.

Drumming is, of course, as ancient as the Army itself, and to be a drummer in the Army even today carries a cachet unlike any other Army musician.

By the time of the Crimean War, pipe bands were well established. The first civilian outfits to take up the pipe band idea were police and fire brigade bands; even today, several forces maintain bands that play to a very high standard. By the time World War I broke out, the pipe band was a popular image of Scotland, both internally and externally.

WWI was both a tragedy and a boost for piping: during the early years of the conflict, pipers played over the top of the trenches as they had done since the time of the Jacobite Risings. Three thousand died before the War Office banned the practice in 1915. Although that ban still stands today, pipes have occasionally played into battle, notably on the Normandy beaches and the crossing of the Rhine.

The Royal Scots played them going into battle in the 1970s, and the Black Watch played into battle during the second Gulf War. However, WWI also created a huge demand for pipers, and huge numbers had been taught to play by the end of the war. This and the similar effort which went on during WWII ensured that there was a critical mass of people able to play and create a thriving pipe band scene from the 1950s onwards.

## **Pipe Band Music**

The music played by pipe bands generally consists of music from the Scottish tradition, either in the form of traditional folk tunes and dances or music from the Western tradition that has been adapted for pipes. Examples of typical pipe bands forms include marches, slow airs, up-tempo jigs and reels, and strathspeys. In recent years there has been a great deal of emphasis placed on new forms, especially the [suite](#). A good example of a suite for pipe band is Don Thompson's composition *Journey to Skye* (1987).

In conventional pipe band music, each section of instruments has a different role in the music. Generally speaking, the pipers deliver the melodic and harmonic material, while the side drummers provide a rhythmically interactive accompaniment part. The tenor drummers provide the fundamental rhythmic pulse with the bass drummer anchoring the rhythms and providing a strong and steady beat. The roles of each section are broken down further below.

### **The Pipe Section**

Since the bagpipe is the only one of the pipe band instruments that is capable of producing distinct pitches, the pipers in a pipe band are responsible for providing all of the melodic and harmonic material in the music. Generally speaking, all of the pipers play a unison melody on their chanters, with their drones providing the harmonic support and filling out the sound. These unison melodies are often quite complex and demanding. It is this complexity that provides much of the musical interest.

When [harmony](#) is written within the pipe section, it is usually only two-part harmony, and is usually scored in a 2:1 ratio (with two thirds of the players on the melody, one third of the players on the harmony part). Because of the limited range of the chanter, the harmonic possibilities are

somewhat limited, but well-written harmony in a pipe band setting can be quite effective. Pipe band harmony is sometimes referred to as "seconds", however this simply refers to a second part and not to the [interval](#) of a second. In fact, intervals of a second are rarely found in pipe band harmony parts, except in passing. Instead, it is the consonant intervals which are stressed, perfect fourths and fifths, and even more commonly, parallel thirds and sixths.

### **The Drum Corps**

The drum corps of a pipe band consists of a section of drummers playing [Highland snare drums](#). In the early days of pipe bands, rope tension snare drums were common, but as the technology evolved, so did the music. Pipe band drummers now play on drums with very tight heads, to create a very crisp and strident sound. Due to technological innovations and changing aesthetics, this crispness has become an integral part to the pipe band sound. Since today's drum is so facile as a result of its design, players are often able to execute extremely complicated and technically demanding rudimental patterns.

The pipe band drum corps is responsible for both supporting the piping with a solid rhythmic foundation and sense of pulse, and creating an interesting [contrapuntal](#) line unto itself. The line played by the drum corps (referred to as the "drum score") is usually based on rudimental patterns and can often be quite involved, with solo, unison and contrapuntal passages throughout. A popular pattern in many scores is for the lead drummer to play a phrase, and the section to play in response. This technique is known as "the chips".

While standard practice in pipe bands is for the pipe section to perform the traditional or standard arrangements of the melodies, including even the gracenotes, drum scores are very often composed by the lead drummer of the band. In competition, drumming adjudicators grade bands on how creative their scores are and how well they fit the piping.

### **The Midsection**

The midsection usually consists of a section of tenor drummers and a bass drummer. Their role is to provide rhythmic support to the entire ensemble. In this respect, the midsection allows the drum corps to delegate their timekeeping responsibilities and allows more freedom in the drum scores.

Generally, the bass drum provides a steady pulse, playing on the downbeat and on the strong beats of the bar, and the tenors support that pulse, often adding supporting beats, accents and dynamic support.

Tenor drums in their modern form are a relatively new addition to the pipe band. While pipe bands of yesteryear would often include tenor drummers, they would usually be "swinging tenors", players who would swing their sticks for elaborate visual effect but who would rarely play.

Today's tenor drummers play pitched drums, and careful thought is given as to which pitches to use and at which times. In some cases, five or six tenor drummers have been used, providing a palette of individual pitches for use in a variety of musical situations.

## **Competition & The World Pipe Band Championships**

While a great number of pipe bands exist purely for the enjoyment and performance of the music, playing on parade and in festivals and tattoos, the primary focus for most bands today is competition. Since 1930, when the Scottish Pipe Band Association (Now the Royal SPBA) was formed, there has been an event known as the World Pipe Band Championships held in Glasgow every August. For competitive bands, the title of World Champion is highly coveted, and this event is seen as the culmination of a year's worth of preparation, rehearsal and practice. Until 1987, when the Canadian 78th Fraser Highlanders band was awarded the Grade One title, every band that had won had been Scottish. In recent years however, this has changed and several non-Scottish bands have had success, most notably the Simon Fraser University Pipe Band (pictured above), and the Field Marshal Montgomery Pipe Band of Northern Ireland.

Prizes at the World's are awarded in the following six categories:

- Grade One
- Grade Two
- Grade Three
- Grade Four
- Novice
- Juvenile

In the Juvenile category, band members must be under the age of eighteen, with the exception of the Pipe Major. The remaining categories have no age restriction, but are based on proficiency. Grade One is the highest of these categories, and Novice is the lowest. Grading and eligibility are overseen by the RSPBA, and bands must apply for downgrading or upgrading.

The entirety of the World Championships takes place on one day in August, on Glasgow Green. Typically several hundred bands attend, travelling from all over the world. Bands arrive early and are required to perform in a qualifying round which takes place in the morning. The top bands at the end of the qualifying round play in a second event in the afternoon to determine an aggregate winner. To win, bands must perform in two events, a March, Strathspey & Reel event (known as a "set" or "MSR")

which consists of three pre-arranged tunes, and a Medley event, which consists of a short selection of music chosen and arranged by the band.

In addition to performing at the World's, most competitive bands participate in a season of competitive events held during the summer months. Events of this type are usually held at Highland Games and are administered by the governing Pipe Band Association. The grading and organization of these events is generally consistent with the World Championships.

## **Progressive Pipe Bands?**

The future for pipe bands is unclear. Some bands are starting to find the competitive system musically stifling, although it does demand high standards. Some advocate making the transition to a Breton model, where competitions are more flexible and with fewer restrictions.

Instead of giving up on the competitive model, a number of bands have instead turned to alternate types of band activities.

- **Concerts.** Performing in this setting allows a greater degree of musical flexibility and creativity, and encourages the inclusion of additional instruments and performers, to expand the musical possibilities. Notable examples of these endeavours include the Simon Fraser University Pipe Band's Carnegie Hall concert of 1997, and the recent recordings by the 78th Fraser Highlanders. Their albums *The Immigrant's Suite* (1989), *Live in Canada - The Megantic Outlaw Concert* (1991), *Flame of Wrath* (1998), and most recently, *Cascade* (2003), showcase both their attachment to traditional pipe band music and their desire to break out of the compositional mould and venture into undiscovered territory.
- **Parades.** Some pipe bands (sometimes referred to as "street bands") perform in parades and other public events as a primary activity. Some military bands fall into this category as well, playing for regimental functions in lieu of, or supplemented by, competitions and/or concerts.

## **The Bagad**

A lesser-known type of pipe band that has already expanded the pipe band genre is the bagad, a French invention modelled on the Scottish pipe band. Bagads began in the thirties, to counter the widespread decay of the living Breton folk tradition. A popular bagad, *Bagad Brieg*, recently performed with the *Shotts & Dykehead Caledonia Pipe Band* and released a recording in 2002 entitled *La Boum Ecosse*, in which both the traditional pipe band and the bagad perform together.

A modern-day bagad consists of a biniou braz (bagpipe), a bombarde section, a [drum corps](#), perhaps more accurately described nowadays as a 'large and varied [percussion](#) section' (one band's percussionists lug around a huge metal model elephant), and any additional musical instruments the band wishes to add. Common additions are small [jazz orchestras](#), [guitars](#), and other forms of binious.

# Pitch

In [music](#), **pitch** is the psychological correlate of the fundamental frequency of a [note](#).

## Perception of pitch

Like other senses, the relative perception of pitch can be fooled, resulting in "audio illusions". There are several of these, such as the tritone paradox, but most notably the Shepard scale, where a continuous or discrete sequence of specially formed tones can be made to sound like this sequence continues ascending *forever*, when this in fact is an audio illusion.

## Examples

The note A above middle C played on any instrument is perceived to be of the same pitch as a pure tone of 440 Hz, but does not necessarily contain a partial having that frequency. Furthermore, a slight change in frequency need not lead to a perceived change in pitch, but a change in pitch implies a change in frequency. In fact, the just noticeable difference (the threshold at which a change in pitch is perceived) is about five cents, but varies over the range of hearing and is more precise when the two pitches are played simultaneously. Like other human stimuli, the perception of pitch also can be explained by the Weber-Fechner law. Pitch also depends on the amplitude of the sound, especially at low frequencies. For instance, a low bass note will sound lower in pitch if it is louder. Like other senses, the relative perception of pitch can be fooled, resulting in "audio illusions". There are several of these, such as the tritone paradox, but most notably the Shepard scale, where a continuous or discrete sequence of specially formed tones can be made to sound like this sequence continues ascending *forever*, when this in fact is an audio

## Concert pitch

The **A** above middle C is nowadays set at 440 Hz (often written as "A = 440 Hz" or sometimes "A440", and known as **concert pitch**), although this has not always been the case (see "Historical pitch standards"). Pitch is often cited as one of the fundamental aspects of music.

## Labeling pitches

Pitches are often labeled using scientific pitch notation or some combination of a letter and a number representing a fundamental frequency. For example, one might refer to the A above middle C as "A4" or "A440." However, there are two problems with this practice. First, in standard Western equal-temperament, the notion of pitch is insensitive to spelling: the description "G##4" refers to the same pitch as "A4." Second, human pitch perception is logarithmic with respect to fundamental frequency: the perceived distance between the pitches "A220" and "A440" is the same as the perceived distance between the pitches "A440" and "A880."

To avoid these problems, music theorists sometimes represent pitches using a numerical scale based on the logarithm of fundamental frequency. For example, one can adopt the widely-used MIDI standard to map fundamental frequency  $f$  to a real number  $p$  as follows

$$p = 69 + 12 * \log_2(f / 440)$$

This creates a linear pitch space in which octaves have size 12, semitones (the distance between adjacent keys on the piano keyboard) have size 1, and middle C is assigned the number 60. Distance in this space corresponds to musical distance as measured in psychological experiments and understood by musicians. The system is flexible enough to include "microtones" not found on standard piano keyboards. For example, the pitch halfway between C (60) and C# (61) can be labeled 60.5.

## Varying pitch

Pitches may be described in various ways, including high or low, as discrete or indiscrete, pitch that changes with time (chirping) and the manner in which this change with time occurs: gliding; portamento; or vibrato, and as determinate or indeterminate. Musically the frequency of specific pitches is not as important as their relationships to other frequencies - the difference between two pitches can be expressed by a ratio or measured in cents. People with a sense of these relationships are said to have relative pitch while people who have a sense of the actual frequencies independent of other pitches are said to have absolute pitch, less accurately called perfect pitch.

## Scales

The relative pitches of individual notes in a [scale](#) may be determined by one of a number of [tuning](#) systems. In the west, the twelve-note [chromatic scale](#) is the most common method of organization, with equal temperament now the most widely used method of tuning that scale. In it, the pitch ratio between any two successive notes of the scale is exactly the twelfth root of two (or about 1.05946). In well-tempered systems (as used in the time of Johann Sebastian Bach, for example), different methods of musical tuning were used. Almost all of these systems have one interval in common, the octave, where the pitch of one note is double the frequency of another. For example, if the A above middle C is 440 Hz, the A an octave above that will be 880 Hz.

## Other musical meanings of pitch

In atonal, twelve tone, or musical set theory a "pitch" is a specific frequency while a pitch class is all the octaves of a frequency. Pitches are named with integers because of octave and enharmonic equivalency (for example, C# and Db are the same pitch while C4 and C5 are functionally the same, one octave apart).

Discrete pitches, rather than continuously variable pitches, are virtually universal, with exceptions including "tumbling strains" (Sachs & Kunst, 1962) and "indeterminate-pitch chants" (Malm, 1967). Gliding pitches are used in most cultures, but are related to the discrete pitches they reference or embellish. (Burns, 1999)

## Historical pitch standards

Historically, various standards have been used to fix the pitch of notes at certain frequencies. Various systems of [musical tuning](#) have also been used to determine the relative frequency of notes in a scale. In 1955, the International Organization for Standardization fixed the frequency of the A above middle C at 440 Hz, but in the past, various frequencies have been used.

Until the 19th century, there was no concerted effort to standardize musical pitch and the levels across Europe varied widely. Even within one church, the pitch used could vary over time because of the way [organs](#) were tuned. Generally, the end of an organ pipe would be hammered inwards to a cone, or flared outwards to raise or lower the pitch. When the pipe ends became frayed by this constant process, they were all trimmed down, thus raising the overall pitch of the organ.

Some idea of the variance in pitches can be gained by examining old tuning forks, organ pipes and other sources. For example, an English pitchpipe from 1720 plays the A above middle C at 380 Hz, while the [organs](#) played by Johann Sebastian Bach in Hamburg, Leipzig and Weimar were pitched at A = 480 Hz, a difference of around four semitones. In other words, the A produced by the 1720 pitchpipe would have been at the same frequency as the F on one of Bach's organs.

Pitch levels did not just vary from place to place, or over time - pitch levels could vary even within the same city. The pitch used for an English cathedral organ in the 17th century for example, could be as much as five semitones lower than that used for a domestic [keyboard instrument](#) in the same city.

## Need to standardize pitch

The need to standardize pitch levels, at least within one city or country, rose as performance of music which combined the [organ](#) with instrumental [ensembles](#) became more popular. One way in which pitch could be controlled was with the use of tuning forks, although even here there was variation - a tuning fork associated with Handel, dating from 1740, is pitched at A = 422.5 Hz, while a later one from 1780 is pitched at A = 409 Hz, almost a semitone lower. Nonetheless, there was a tendency towards the end of the 18th century for the frequency of the A above middle C to be in the range of 400 to 450 Hz.

Throughout the first half of the 19th century, there was a tendency for the pitch used by [orchestras](#) to rise. This was probably largely due to orchestras competing with each other, each attempting to fill increasingly large concert halls with a brighter, more "brilliant", sound than that of their rivals. They were helped in this endeavour by the improved durability of the [violins'](#) E-strings - in the 16th century, Michael Praetorius had rejected various high pitch standards as leading to snapped strings, but the new strings could take the higher tension without breaking.

The rise in pitch at this time can be seen reflected in tuning forks. An 1815 tuning fork from the Dresden [opera](#) house gives A = 423.2 Hz, while one of eleven years later from the same opera house gives A = 435 Hz. At La Scala in Milan, the A above middle C rose as high as 451 Hz.

The most vocal opponents of the upward tendency in pitch were singers, who complained that it was putting a strain on their voices. Largely due to their protests, the French government passed a law on February 16, 1859 which set the A above middle C at 435 Hz. This was the first attempt to standardize pitch on such a scale, and was known as the *diapason normal*. It became quite a popular pitch standard outside of France as well.

There were still variations, however. The *diapason normal* resulted in middle C being tuned at approximately 258.65 Hz. An alternative pitch standard known as philosophical or scientific pitch, which fixed middle C at exactly 256 Hz (that is, 28 Hz), and resulted in the A above it being tuned to approximately 430.54 Hz, gained some popularity due to its mathematical convenience (the frequencies of all the Cs being a power of two). This never received the same official recognition as A = 435, however, and was not as widely used.

In 1939, an international conference recommended that the A above middle C be tuned to 440 Hz. This standard was taken up by the International Organization for Standardization in 1955 (and was reaffirmed

by them in 1975) as ISO 16. The difference between this and the diapason normal is due to confusion over which temperature the French standard should be measured at. The initial standard was  $A = 439$  Hz, but this was superseded by  $A = 440$  Hz after complaints that 439 Hz was difficult to reproduce in a laboratory owing to 439 being a prime number.

Despite such confusion,  $A = 440$  Hz is arguably the most common tuning used around the world. Orchestras in the United States and United Kingdom tend to adhere to this standard as concert pitch. In other countries, however, higher pitches have become the norm:  $A = 442$  Hz is common in continental European orchestras, while  $A = 445$  is heard in Germany, Austria, and China.

In practice, as orchestras still tune to a note given out by the [oboe](#), rather than to an electronic tuning device (which would be more reliable), and as the oboist may not have used such a device to tune in the first place, there is still some variance in the exact pitch used. Solo instruments such as the piano (which an orchestra may tune to if they are playing together) are also not universally tuned to  $A = 440$  Hz. Overall, it is thought that the general trend since the middle of the 20th century has been for standard pitch to rise, though it has certainly been rising far more slowly than it has in the past...

Readers should also consult Helmholtz: 'On the sensations of tone'.

## Changing the pitch of a vibrating string

There are three ways to change the pitch of a vibrating string. [String instruments](#) are tuned by varying the strings' tension because adjusting length or mass per unit length is impractical.

### Length

Pitch can be adjusted by varying the length of the string. A longer string will result in a lower pitch, while a shorter string will result in a higher pitch. The change in frequency is inversely proportional to the change in length, and a geometric change in length corresponds to an arithmetic change in frequency:

A string twice as long will produce a tone an octave lower.

### Tension

Pitch can be adjusted by varying the tension of the string. A string with less tension (looser) will result in a lower pitch, while a string with greater tension (tighter) will result in a higher pitch. The change in frequency is proportional to the square root of the change in tension:

### Density

The pitch of a string can also be varied by changing the density of the string. The change in frequency is inversely proportional to the square root of the change in density:

## Pitch of brass instruments

The following is a comparison table of the **pitch of the common brass instruments** in descending order of pitch. Whereas it is usually quite easy to determine whether an instrument is pitched in, say, F or Bb or Eb, it is not always obvious which octave of F or Bb is being referred to. As a reference point, the second harmonic (the lowest normally playable open note, written as middle C) of a Bb trumpet or cornet is Bb below middle C.

|         |  |
|---------|--|
| Bb or A | piccolo <a href="#">trumpet</a>  |
| Eb      | soprano <a href="#">trumpet</a> or <a href="#">cornet</a>                        |
| Bb      | <a href="#">trumpet</a> , <a href="#">cornet</a> , flugelhorn                    |
| Eb      | alto horn, alto trombone, contralto trumpet                                      |
| Bb      | tenor <a href="#">trombone</a> , baritone horn, euphonium, Bb horn, bass trumpet |
| F       | <a href="#">F horn</a>   |
| Eb      | bass <a href="#">tuba</a>  |
| Bb      | contrabass <a href="#">tuba</a> , sousaphone                                     |

### Notes:

For transposing brass instruments, the second harmonic (of the instrument, unlengthened by valves or slides) is usually written as middle C. (The exception is the horn - see below - and older trumpet pitches, which are beyond the scope of the present article.)

The 'normal' range of a brass instrument is from three tones below the 2nd harmonic to the 10th harmonic. For transposing instruments this is from written F# below middle C, to E two octaves and a third above middle C.

The euphonium differs from the baritone in that it has a wider bore and appears a much larger instrument: the euphonium is a true tenor tuba whereas the baritone is a saxhorn. Note though that this distinction is not always observed in the US, where true baritones are rare and the term is sometimes used to refer to a small euphonium, or perhaps one with three valves rather than four.

A bass trombone is like a tenor trombone but has an F, sometimes also an E valve extending the lower range down to the fundamental, and a wider bore and mouthpiece to facilitate the production of these notes. A true bass trombone would require the player to have the arm of a gibbon, although old instruments in G were used where this particular requirement was avoided by the use of an extension handle to push the slide out.

Classifying the orchestral horn as pitched in Bb is somewhat controversial. Its fundamental pitch is F near that of the bass tuba, but it is

normally played much higher in its register. This is aided by the narrower bore and much smaller mouthpiece. What is written as middle C for a horn is in fact the fourth harmonic, not the second. However, most horns are fitted with a fourth valve which puts the horn into Bb a fourth higher, which alleviates the problem in the higher register of the harmonics being uncomfortably close together. In fact, much of the time the horn is played in Bb, and its range corresponds more with an instrument of that pitch.

The bass tuba is also available in F, and contrabass tubas in C. The Bb tuba is found in brass bands, while the C tuba is more common in [orchestras](#).

Baritones, euphoniums and tubas often have a fourth valve to extend the lower range down to the fundamental.

Category: [Brass instruments](#)

# Plainsong

Broadly speaking, **plainsong** (also known as **plainchant**) is the name given to the body of traditional songs used in the liturgies of the Catholic Church. The liturgies of the Orthodox Church, though in many ways similar, are generally not classified as plainsong, though the musical form is nearly as old as Christendom itself.

Plainsong is [monophonic](#), and is in free rather than measured rhythm. [Gregorian chant](#) is a variety of plainsong that is named after Pope Gregory I (6th century AD). However, it is a myth that Gregory invented the chant, or that he ordered the suppression of previous chant styles, such as the [Ambrosian](#) or [Mozarabic](#). For several centuries, different plainchant styles existed concurrently, and standardization on Gregorian chant was not completed, even in Italy until the 12th century. Plainchant represents the first revival of musical [notation](#) after knowledge of the ancient Greek system was lost. Plainsong notation differs from the modern system in having only four lines to the staff and a system of note-shapes called **neumes**.

There was a significant plainsong revival in the 19th century AD when much work was done to restore the correct notation and performance-style of the old plainsong collections, notably by the monks of the Abbaye de Solesmes in Northern France. The use of plainsong is now mostly confined to the Monastic Orders. In the late 1980s, plainchant achieved a certain vogue as music for relaxation, and several recordings of plainchant became "classical chart hits".

## Player piano

The **player piano** is a type of [piano](#) that plays [music](#) automatically without the need for a human pianist. Instead, these are moved by mechanical, pneumatic or electrical means. The player piano was most popular in the first half of the 20th century, roughly at the same time as the acoustic gramophone.

## History of the Player Piano

One cannot say that this [musical instrument](#) was invented by any one person, since its many distinguishing features were developed over a long period of time, principally during the second half of the 19th century. An early example was the **Pianista**, developed by Henri Fourneaux in 1863, though ultimately the best known was the **Pianola**, originally created by Edwin Scott Votey in 1897 at his home workshop in Detroit. It was Votey's invention that initiated mass production of the instrument.

John McTammany, an American Civil War veteran, also deserves much credit in the invention and development of the instrument, having patented several devices that were important to the development of the player piano from 1881 onwards.

## Types of Player Piano

The most commonly found older player pianos are pneumatic, powered by vacuum (via foot pedals or electric motors). There are two main types: one fully automatic which faithfully reproduces a pianist's interpretation of the music, and one which lacks the nuance of live performance. Nowadays, these are usually known as the **reproducing piano** and the **pianola** respectively, though there are also instruments that cross this exact division. Originally, the **Pianola** (with a capital 'P') was a registered tradename of the **Aeolian Company**, but became a generic name associated with the player piano. Many companies marketed the player piano with different names, most commonly with the suffix OLA or with the word TONE incorporated into it, but Pianola was the name that stuck.

The most familiar type of pneumatic player piano looks like a normal upright piano, but has a mechanism controlled by a paper **music roll** contained within the cabinet of the piano itself. However, the original pneumatic players were constructed in a separate cabinet, which was placed in front of the keyboard of an ordinary piano, in such a way that a series of felt-covered wooden or metal "fingers" were located above each key of the piano and struck the corresponding note as indicated by the music roll. Most include one or more moving "feet" to control the piano's pedals as well. Not surprisingly, these early instruments came to be known as **cabinet players** or **vorsetzers**. From around 1908, the roll mechanisms were also built into grand pianos.

Ampico (American Piano Company), Welte-Mignon (M. Welte & Sons, Inc.), Duo-Art (Aeolian Company, New York) are a few of the popular brands of (now antique) reproducing piano mechanisms. Each uses a different encoding method for the paper music roll and different internal systems to control the piano during playback. These mechanisms were retro-fitted into many different piano brands (Steinway, Marshall and Wendall, Kimball, etc.)

Player pianos were sometimes built with combinations of string and wind [music boxes](#) built into them. This kind of instruments was called an Orchestrion, built since about 1840. One of the leading companies in this business were the German-American company M. Welte & Sons, the later producers of the Welte-Mignon reproducing pianos and the Wurlitzer-Company, founded by German Immigrants from Bavaria. These massive devices were the most complicated mechanical musical instruments ever built, with the exception of a few [organs](#).

## **Music Rolls**

Music rolls for pneumatic player pianos, often known as piano rolls, consist of continuous sheets of paper, about 11 1/4 inches wide and generally no more than 100 feet in length, rolled on to a protective spool, rather like a large cotton reel. The paper is perforated with small holes according to the pattern of the notes to be played. On reproducing rolls, additional holes control the volume level, accents, pedals, etc., to faithfully recreate the original performance.

## Modern Player Pianos

Later developments of the **reproducing piano** include the use of magnetic tape rather than piano rolls to record and play back the music, and, in the case of one instrument made by Bösendorfer, computer assisted playback. Almost all modern player pianos use MIDI to interface with computer equipment. Live performance or computer generated music can be recorded in MIDI file format for accurate reproduction later on such instruments.

As of 2006, several player piano conversion kits are available (PianoDisc, Pianomation, etc.), allowing the owners of normal pianos to convert them into computer controlled instruments. The conversion process usually involve cutting open the bottom of the piano to install mechanical parts under the keyboard. Most modern player pianos come with an electronic device that can record and playback MIDI files on floppy disks and/or CD ROMs, and a MIDI interface that enables computers to drive the piano directly for more advanced operations.

Yamaha produces the Disklavier, a reproducing piano that is controlled by solenoids and optical sensors for each key. The optical sensors record the notes and key velocity played by the performer, without needing any physical contact with the keys. This contact-less design allows accurate recording without affecting the movement of the keys in any way. The solenoids move the keys in response to the recorded MIDI events during playback. One minor limitation of the Disklavier, up through the Mark III series, is that it has been restricted to playing sixteen notes at any one time, meaning that for any complex music (such as the piano rolls of George Gershwin's 'An American in Paris',) two synchronized instruments have to be used. {The Mark IV Pro series now allows double the polyphony of the Mark III series.} The Mark III series of the Disklavier is integrated with a CD drive that can play any of several variations of Yamaha's software. Since the Mark III Disklavier is equipped with a full synthesizer, a CD player, and a stereo audio system, it can playback acoustic piano part with synthesized music and voice recording on the CD. The Mark III also supports a silent mode where all the piano strings are muted and the piano sound is played by the synthesizer through the head phones. The feature allows late night piano practice without waking up the neighbors. Yamaha also produces piano accompaniment software on floppy disc that goes with off-the-shelf popular music. The listener is able to play their favorite artist's regular CD on a Stereo system and at the same time play a special floppy on the piano that would synchronize the piano part with the rest of the

music. Beginner piano player can also plays a special software called SmartKey on the Disklavier. The piano would pause and prompt the player to press the next key. As the beginner plays his part, the piano would play the more complex part to follow.

Another company, QRS Inc. of the USA, make the most sophisticated type of reproducing piano system, called Pianomation, which does not have the limitations of the other manufacturers products. It can play 80 notes at a time, plus fully orchestrated backing with vocals from original artists from the internal hi-fi system built in. QRS also have the largest software catalogue of 7000 titles (to date).

In 2005, the Yamaha Disklavier Mark IV was released in Grand Piano form. This technologically advanced piano features a wireless touch screen controller to control all aspects of the piano's functions. It introduced a new 'greyscale' optical sensing system which senses the position of the key without having contact with the key, and thus does not interfere with the touch of the piano. It is equipped with an XG tone generator and a Yamaha hi-fi system mounted under the piano. It has an 80Gb hard drive where the user can store many hours of performances, including data for playing the piano, audio files, and data files for the XG tone generator, or a combination of all. The Disklavier can be controlled by a computer, and data generated from the Disklavier can be recorded by the Disklavier, or sent to a computer. The Disklavier is a centre-piece for the International Piano e-competition, where performers from all over the world perform on Yamaha CFIIIS concert grands equipped with Disklavier technology connected to the internet. This competition means that performers regardless of location can perform at other locations without the limitations and variations of audio recording, and playback for a level playing field in the competition.

## **Player Pianos versus other types of piano**

A player piano is neither an electric piano, electronic piano, nor a digital piano. The distinction between these instruments lies in the way sounds are produced. A player piano is a real, acoustic piano where the sound is produced by moving the keys, which in turn cause the hammers to strike the piano strings.

## Playground song

A **playground song** is a [song](#) sung by children, usually on a playground or other children's gathering place, that describes or comments on the social scene of a playground. Playground songs can, of course, be sung anywhere, and presumably customs like playground songs exist globally. They are distinct from nursery rhymes in that they usually do not have characters (such as Mary, Georgie Porgie, Jack & Jill, and Humpty Dumpty), but playground songs are related to counting-out games. If a playground song does have a character, it is usually a child present at the time of the song's performance. The inexplicable and extreme awkwardness of relations between young boys and young girls is a common [motif](#).

### Examples

Some examples of playground songs:

Circle circle, dot dot

K-I-S-S-I-N-G

# Political hip hop

**Political hip hop** is a subgenre of [hip hop music](#). Though mainstream and crossover acceptance has been generally limited to [gangsta rap](#) and pop rap, some artists with a socially aware and positive or optimistic tone or a more avantgarde approach have achieved some success. They are often referred to in mainstream musical circles as **conscious hip hop** due to their focus on political issues surrounding the black community, which differentiates them from gangsta rappers. Fans of such rappers tend to view this subgenre as more authentic hip hop, claiming that they harken back to hip hop's early days where several artists rapped about "socially conscious" issues and gangsta rap had not yet gained mainstream acceptance.

## History

In 1988 and 1989, albums from the Native Tongues collective like De La Soul's *Three Feet High and Rising*, A Tribe Called Quest's *People's Instinctive Travels and the Paths of Rhythm* and the Jungle Brothers' *Straight Out the Jungle* are usually considered the first conscious rap albums, with [jazz](#)-based samples and quirky, insightful lyrics covering a diverse range of topics (see [jazz rap](#)) and strongly influenced by the Afrocentric messages of Bambaataa's Zulu Nation. This period, between 1988 and 1992, when the Native Tongues (together with other crews such as Pete Rock and CL Smooth) were at their creative peak, is considered the [golden age of hip hop](#).

## **Public Enemy**

Public Enemy is one of the definitive voices of "conscious hip hop," verbally confronting institutional racism, police corruption, and the legacy of slavery in the United States. They attracted youth because of their ability to boldly criticize and reveal serious contradictions in American democracy. Since then, other rappers have promoted positive messages. For example, with songs like "Stop the Violence" and "Self-Destruction," KRS-One has dedicated his talent to opening the ears of a world that often seems cruel and drenched in hate. Eric B and Rakim, EPMD, Schoolly D, Slick Rick, Poor Righteous Teachers, and Ice Cube all helped to build this movement.

## Lyrical content

With conscious hip hop lyrics become more poignant as the rhythm continued to capture the attention of young audiences. The following excerpt from Grandmaster Flash and the Furious Five's "The Message" demonstrates how the lyrics and rhythm come together: "Got a bum education, double-digit inflation/ Can't take the train to the job, there's a strike at the station/ Don't push me cause I'm close to the edge/ I'm tryin' not to lose my head/ It's like a jungle sometime it makes me wonder/ How I keep from going under." Because of the beat and the rhythm of the music this particular song appealed to a large audience and the message against the oppression of Afrikan Americans spread with it.

# Polka

[Chicken scratch](#) | [Norteno](#) | [Polka-mazurka](#) | [Slovenian-style polka](#)

**Polka** is a type of [dance](#) and [genre](#) of [dance music](#); it originated in the middle of the 19th century in Bohemia, and is still a common genre of Czech [folk music](#); it is also common both in Europe and in the Americas. In classical music, many polkas were composed by both Johann Strauss I and his son Johann Strauss II; a couple of well-known ones were composed by Bedřich Smetana and Jaromír Vejvoda, the author of *Škoda lásky* ("Roll Out the Barrel").

The polka (a 2/4-beat [dance](#) of Czech origin) should not be confused with the polska (a Swedish 3/4-beat dance with Polish roots); cf. also [polka-mazurka](#). A related dance is the redowa.

Polkas are played in Hungary as well; in Hungarian they're called *porkák* (plural).

## Styles

There are various styles of contemporary polka. Of the US types, the North American "Polish-style polka" has roots in Chicago, Illinois, and can be identified as 'Chicago honky' and 'Chicago push' styles. This 'push' version or style of Polka features accordion, concertina, bass, drums, and (almost always) two trumpets. The 'honky' variation of this style uses clarinet and one trumpet; accordion is almost never used in this setting. North American "Slovenian-style polka" is fast and features piano accordion, and is associated with Cleveland. North American "Dutchman-style" features an oom-pah sound, often with a tuba, and has roots in the American Midwest. "Conjunto-style" has roots in Northern Mexico and Texas, and is also called Norteño. In the 1980s and 1990s several bands began to combine polka with various rock styles, sometimes referred to as "punk polka", "alternative polka" or "San Francisco-style".

In the pampas, there is another kind of polka (that is called polca). It is a very very fast beat, with a 3/4 compass. Instruments used: acoustic guitar (usually six strings, but sometimes seven strings), electric or acoustic bass (sometimes fretless), accordion (sometimes piano accordion, sometimes button accordion), and sometimes some percussion is used. The lyrics always praise the gaucho warriors from the past or tell about the life of the gaucho campeiros (provincial gauchos who keep the traditions).

## **Organisations**

The International Polka Association based in Chicago, Illinois works to preserve the cultural heritage of polka music and to honor its musicians through the Polka Hall of Fame.

## Some polka artists

Slavko Avsenik

Big Lou and her Polka Casserole

Eddie Blazonczyk, Chicago push

Brave Combo, alternative, two-time Grammy Award winner

The Dynatonas

The Polish Muslims, Detroit polka rock band

- [polka-mazurka](#) - 3/4-beat dance, musically similar to the [mazurka](#)

## Polka-mazurka

The **polka-mazurka** is a [dance](#), musically similar to the [mazurka](#), but danced much like the [polka](#). Many polka-mazurkas were composed by Johann Strauss II and his family. Johann Strauss I did not compose any of this type of music; the first polka-mazurka example written by the Strauss family was in the year 1854 by Johann Strauss II entitled La Viennoise op. 144.

Its tempo of 3 beats to the bar which is in 3/4 time meant that it was similar to the [waltz](#), but the emphasis of the polka-mazurka was on the first beat of the bar as opposed to the waltz which places its beats on the last two as epitomised by the Viennese waltz with its heavily accentuated final two beats to the bar.

The polka-mazurka was not credited to the Strauss family alone as many Viennese composers on the 1850s era also wrote many examples. This variant of the [polka](#) was seen as cross-cultural, as many of its influences can be seen in the French-polka with its feminine and deliberate steps as well as the exciting schnell-polka where Eduard Strauss composed many famous pieces of this type.

The polka-mazurka does possess a similar structure to the polka, with a main theme quickly proceeding to its subsidiary theme which is usually brash and loudly played. The 'trio' section is free-style and does not need to associate with the main theme although the Strauss family, Josef Strauss in particular, attempted in most of his famous polka-mazurkas to blend in sensitivity and romanticism as can be heard in his pieces Sympathie op. 73 and Frauenherz op. 166 which was inspired by his concern for social issues faced by women in that by-gone era.

# Polyphonic Era

During the **Polyphonic Era** (1200-1650), most music consisted of the simultaneous flow of several different melodies, all independent and equally important. Usually made of four or five different choral parts, the music was originally for unaccompanied voices and was used mostly in the mass and [motet](#) of church music and the [madrigal](#) in secular music.

## Gothic Period (1200-1550)

First forms of polyphonic music are developed known as *Ars Antiqua*-Ancient Art

## Ars Nova (14th Century)

New techniques of rhythm and melody brought more feeling to the music, paving the way for the first important polyphonic music schools. *Ars Nova* means New Art

## Important Polyphonic Schools (15th-16th century)

Netherland (Flemish) School: Dufay (1400-1474), Josquin des Prés (c. 1445-1521), and Orlando di Lasso (1532-1594)

Venetian School: Willaert (c. 1488-1562), and Giovanni Gabrieli (c. 1557-c.1612)

Roman School: Palestrina (c. 1525-1594), and Victoria (c. 1548-1611)

## Secular Polyphonic Music (16th Century)

Claudio Monteverdi (1567-1643) William Byrd (1543-1623) Morley (1557-1603) Orlando Gibbons (1583-1625)

## Baroque Period

Forms become more elaborate, attention paid to dramatic effect, choruses combined with arias, duets and quartets with choral music accompanied by instruments. New church forms developed such as the

[oratorio](#), the passion, and the [cantata](#). -Carissimi (1605-1674) - J.S. Bach (1685-1750) -Heinrich Schütz (1585-1672) - Handel (1685-1759)

## **Pop albums that have consistently appeared in top lists**

While it is impossible to name the greatest [album](#) ever made, it is possible to discuss albums that have been named as candidates. The criteria usually consist of critical and commercial reception, sales, and awards, even though awards usually go to the best-selling artists and using sales as a criterion to judge music is considered quite dubious.

## Albums acclaimed by critics

- The Rolling Stones' ***Exile on Main Street*** was named the greatest in the December 1997 German edition of Rolling Stone magazine, and appears frequently on other critics lists. The album is often cited as the definitive Stones record in its sprawling synthesis of [hard rock](#), soul, gospel, and various American roots music. The album's rise to critical acclaim is particularly impressive given its initially lukewarm critical reception and the absence of any major singles.
- Bob Dylan's ***Highway 61 Revisited*** has consistently appeared on greatest album lists. Released in 1965, it expanded upon and perfected the sound and style of his previous album, Bringing It All Back Home (see below). It is best remembered for the opening track and single Like a Rolling Stone, recently named the greatest song ever by Rolling Stone. It is widely considered to be Dylan's greatest work.
- Public Enemy's ***It Takes a Nation of Millions to Hold Us Back***, garnered critical acclaim upon its release, due to its radical and militant content railing against corporate control, structural racism, and police brutality. The album's popularity among aficionados and mainstream listeners laid the foundation for other rap groups such as X-Clan, Native Tongues Posse, and Brand Nubian; who abandoned [hip hop](#)'s early themes of exuberant partying and *braggadocio*, and embraced more socially aware issues such as drug abuse, poverty, and African American empowerment. In 2003 the VH1 named It Takes a Nation of Millions the 20th greatest album of all time. It was also named the second greatest album in Spin Magazine's "Top 100 from 1985-2005". Furthermore, It was the top ranked hip-hop album in the List of Rolling Stone's 500 Greatest Albums of All Time; number 48. The album was voted as the best album of the year in The Village Voice Pazz & Jop critics poll.
- Miles Davis' ***Kind of Blue*** is considered by many to be the greatest [jazz](#) album of all time. It represented a major step away from traditional [bebop](#) jazz of the 50's and is widely acclaimed for its new interpretation

of jazz. It is questionable whether Kind of Blue has sold the most copies of all jazz albums, or another Davis album, Bitches Brew, has done so. Exact statistics vary between different sources.

- Metallica's ***Master Of Puppets*** is widely regarded among heavy metal fans as one of the greatest metal releases of all time. The seminal album is held in high esteem among fans and non-fans of the band, and countless metal and hard rock artists have cited Master of Puppets as a major influence in their music. A loose concept album on the theme of control and power, Master of Puppets surged the popularity of thrash metal as a more complex and thought-provoking alternative to the commercial pop-metal of the 80s. In 2006, Guitar World dedicated an issue to the 20th anniversary of the album's release.
- Radiohead's ***OK Computer*** is consistently featured on many critics' "best albums" lists, including a top placing in a 1998 and 2005 Q magazine readers' poll as well as the number one spot on Channel 4's 2005 list. It was recorded at St Catherine's Court, the country house of Jane Seymour near Bath, mixed at Abbey Road Studios and released on June 16, 1997 in the United Kingdom and on July 1 in the United States. The album met with wide critical acclaim and commercial success, putting the British group at the forefront of modern rock. *OK Computer* won a [Grammy Award](#) in 1998 in the category of "Best Alternative Music Performance". The album is arguably Radiohead's most significant work to date.
- The Beach Boys' ***Pet Sounds*** was named the greatest by MOJO magazine. Released in 1966, it showcased a maturer, more artistic Beach Boys that had moved away from the surf rock of their early days. The songs on Pet Sounds are contextually linked and highlight the troubles and feelings of teenagers in almost symphonic complexity and harmony. It was also something of an answer album to The Beatles' 1965 record Rubber Soul and was a major influence on The Beatles' *Sgt. Pepper's Lonely Hearts Club Band*.
- The Beatles' ***Revolver*** has been named by many critics and performers (including Ozzy Osbourne) as the greatest album ever made. Released in 1966, it marked a change in The Beatles' sound. They began pulling away from the love songs of the early-1960s and instead moved to

seemingly complex political anthems, satirical songs, modern poetry and psychedelic rock. They started to rely more heavily on unusual instruments, especially the sitar that had been introduced in the earlier song "Norwegian Wood (This Bird Has Flown)."

- The Beatles' ***Sgt. Pepper's Lonely Hearts Club Band*** has also been named by many critics as the greatest album ever made. Released in the Summer of Love in 1967, it was a culmination of psychedelic, folk, progressive, and classic rock. Not the first [concept album](#) ever, it was still hailed by critics with its elaborate structure, complex sound textures and lyrics, inventive intros and fade-outs and other experimental devices that went much further than anything previously heard, but other sources indicate that the Beatles had heard The Byrds' *Younger Than Yesterday*, which had several of the "innovations" of the album. It was ranked as number one on Rolling Stone's List of the 500 Greatest Albums of All Time.
- Michael Jackson's ***Thriller*** (1982) won eight Grammy Awards and has appeared on numerous "best albums" lists. It is the best-selling album worldwide and yielded several hit singles, among them "Billie Jean" and "Beat It". It was influenced by various genres, including disco, rhythm and blues, rock and roll and punk, soul, power pop, ballad, and experimental pop.
- Captain Beefheart's ***Trout Mask Replica***, a 28 song album full of bewildering poetry, studio chatter, avant-garde techniques, [delta blues](#) and Beefheart's distinctive four and a half octave voice, which seemed to take on a different character in each song. There is likely not a single album like it in the history of music. The heralded critic John Peel said of the album, "If there has been anything in the history of popular music which could be described as a work of art in a way that people who are involved in other areas of art would understand, then Trout Mask Replica is probably that work. " The music was largely ignored until the [New Wave music](#) movement.
- The Velvet Underground's ***The Velvet Underground & Nico*** has long been a favorite of underground and alternative music. Unlike other albums on most top album lists, it attained little commercial success and no acclaim for a long time. Under the guiding hand of Andy Warhol

and the skills of musicians like John Cale, who worked with LaMonte Young, and singer Lou Reed, they crafted an album that some said invented most of the key genres of [Rock](#), and at least hinting at several more. Many claim it to be one of the first [punk](#) albums of all time, some say it was the first [alternative rock](#) album of all time, some say it has its own genre. While bands like The Beatles were tip-toeing around the counter-culture, Reed sang about heroin, Sacher-Masoch, beat-poetry, S&M and other radical subjects.

- Marvin Gaye's ***What's Going On*** has been named by The Guardian as the best album ever made. With his especially masterful adagios, Gaye helped codify modern, smooth R&B music and distinguish it from the earlier generation's bluesier "Rhythm and Blues" music. Released in 1971, it influenced countless artists -- particularly African-American ones -- such as Stevie Wonder, Al Green and Curtis Mayfield. *What's Going On* included the hits "Inner City Blues", "Mercy Mercy Me" and the title track.

## Best selling albums

- Michael Jackson's ***Thriller*** is the best selling album worldwide, with sales of over 51 million copies . The album included the popular singles "Billie Jean", "Beat It", "Thriller", "Wanna Be Startin' Somethin'", "P.Y.T.", "Human Nature" and "The Girl Is Mine." *Thriller* spent 37 weeks at #1 and won eight Grammy Awards.
- AC/DC's ***Back in Black*** is the second best-selling album worldwide, with sales of 42 million copies. The album was the first with new lead singer Brian Johnson, after the death of their former-lead singer Bon Scott. The album included the popular singles "Hell's Bells", "You Shook Me All Night Long", "Shoot to Thrill" and the title track.
- The Eagles' ***Their Greatest Hits (1971-1975)*** is the best-selling album in the United States, with over 28,000,000 copies sold. Its greatest album status is questionable because it is an anthology rather than new material.
- Michael Jackson's ***HIStory*** is the best-selling multiple-disc album of all-time, with sales of 18 million worldwide. Disc one of the album includes 15 greatest hits, while disc two includes 15 original songs. Because it is sometimes regarded as an anthology, rather than a full studio album, its greatest album status is questionable.
- Pink Floyd's ***Dark Side of the Moon*** is the tenth best-selling album of all-time, with 34 million copies sold. It spent 591 consecutive weeks on the Billboard magazine music charts, eventually reaching a total of 741 weeks. In 2003 alone it sold 250,000 copies, and in 2004 8,000 copies a week were being sold.

## Genre-creating albums

In addition to critical acclaim and popular appeal, some albums are recognized for the creation (or codification) of entire genres or sub-genres of music. These albums have been uniquely influential within their own musical tableaux even if they copied or "borrowed" from other sources that did not happen to achieve mainstream success. These albums are generally recognized as having had an effect on many types of music by the critics.

- Nirvana's album ***Nevermind*** symbolically signaled the end of the hair metal ballads and bombastic anthems of the 1980s and the rise of grunge rock and [alternative rock](#) as the dominant form of rock music in the 1990s. The opening track, "Smells Like Teen Spirit," and its accompanying music video that depicted a high school pep rally gone awry, received massive airplay in late 1991. .
- De La Soul's release of the landmark album, ***3 Feet High and Rising***, is often viewed as the stylistic birth of [alternative hip hop](#) (and especially [jazz rap](#)) —mixing unique sampling sources (such as The Turtles, Hall & Oates, Steely Dan's "Peg", and Johnny Cash) with hippie-ish lyrics and a lighthearted sense of humor. With its inclusion of pre-recorded bits from outlandish sources, the album foreshadowed the self-referential sampling kaleidoscope that would soon envelope hip hop (and pop music in general). It received unanimous acclaim from all quarters for its innovation, including NME (One of the greatest albums ever made), Village Voice (the Sgt. Pepper of hip hop), and Spex (also #5 on the top 100 Albums of the Century). The album was also included in Rolling Stones' 200 Essential Rock Records. When Village Voice held its annual Pazz & Jop Critics Poll for 1989, 3 Feet High and Rising was ranked at #1, outdistancing its nearest opponent (Neil Young's Freedom) by 21 votes and 260 points.
- Dr. Dre's 1992 debut album ***The Chronic***, is widely recognized as being the apotheosis of [West Coast Gangsta Rap](#), and having popularized such modern [hip hop production](#) staples such as sampling, melodic accompaniment, and background vocals. The album brought the genre

now known as [G-funk](#) to the mainstream — a genre defined by slow bass beats and melodic synthesizers, topped by [P-Funk](#) samples, female vocals, and a slurring lyrical delivery referred to as a “*lazy drawl*”. The Chronic is also responsible for launching the careers of several legendary figures within the hip-hop community, including Snoop Dogg. The Chronic’s success established Death Row Records as the dominant hip hop record label of mid-1990s, and established G-funk as the most popular sound in hip hop for several years following its release (with Dre himself producing several major albums that drew heavily on his production style). The Chronic was included in Vibe's "100 Essential Albums of the 20th Century Vibe", listed in Rolling Stone's "Essential Recordings of the 90's", and ranked #8 in Spin Magazine's "*90 Greatest Albums of the '90s*".

- Bob Dylan's 1965 album ***Bringing It All Back Home*** has been called the world's first [folk-rock](#) album, and is the first album ever to combine a folk music sensibility with an electrified band. It contains some supremely influential songs, including "Subterranean Homesick Blues" and "Mr. Tambourine Man," and it went on to shape the work not only of musicians such as The Beatles and Paul Simon, but also of Dylan himself.
- Black Sabbath's eponymous debut album is widely considered to be the first heavy metal album. While bands like Led Zeppelin and Blue Cheer are known for developing on heavy rock, *Black Sabbath* is agreed upon to be the first truly heavy metal album. The eponymous song that opens the album is also regarded as the birth of heavy metal.
- ***London Calling*** by The Clash, while certainly not a genre-creator in its own right, is generally held to be responsible for the mainstream popularity of [punk rock](#) and therefore the ancillary popularization of such bands as The Sex Pistols and Buzzcocks among many others. It contains several highly influential punk sounds, including the (in)famous "wall of noise" borrowed from the Sex Pistols, and samples from classic radio programming. It is perhaps the most widely covered punk rock album of all time, containing such perennially popular tracks as "Train in Vain (Stand By Me)," "The Guns of Brixton" and the title track. *London Calling* also has one of the most famous album covers of all time, a photo by Pennie Smith of bassist Paul Simonon smashing his bass

guitar against the stage - an act that would become synonymous with punk and rock music in general.

- **Elvis Presley's** self-titled album is perhaps the most influential pop record in history, responsible for the popularization and acceptance of rock and roll music as a genre. It helped launch Presley as one of the most influential musicians of all time, and was partially responsible for a huge shift in the culture and practices of American youth and, indeed, youth worldwide. As John Lennon put it: "Before Elvis, there was nothing."
- The **soundtrack** to the film Saturday Night Fever, released in 1977 is responsible for bringing the nascent disco scene into the mainstream. Songs on the album were recorded by various artists, including KC & the Sunshine Band ("Boogie Shoes"), Walter Murphy ("A Fifth of Beethoven"), and David Shire ("Manhattan Skyline," et al.). However, the most significant singles were performed by The Bee Gees, including "How Deep Is Your Love?," "Night Fever," "More Than A Woman," "Jive Talkin'," "You Should Be Dancing," and perhaps the most famous and beloved disco song of all time: "Stayin' Alive." The soundtrack remains the quintessential disco record, and is one of the few works of disco music that continues to be influential (and commercially viable) today.

## Fusion genres

[Pop punk](#) - [Pop rap](#) - [Power pop](#)

## Regional scenes

Asia: Cantopop, Mandarin pop, Indian pop, J-pop, K-pop, String (Thai pop) - Europe: Euro pop, [Britpop](#), Nederpop - Americas: United States, [Música Popular Brasileira](#)

## Other topics

[Boy band](#) - [Girl group](#)

**Pop music** is an important genre of [popular music](#) distinguished from [classical](#) or art music and from [folk music](#) . The term indicates specific stylistic traits but the genre also includes artists working in many styles ([rock](#), [hip hop](#), [rhythm and blues](#) (R&B), and [country](#)), and it is reasonable to say that "pop music" is a flexible category. It may also be referred to as [soft rock](#) or [pop/rock](#).

## Characteristics as a subgenre

Pop music is often defined as music produced commercially, for profit, or "as a matter of enterprise not art" though it may more usefully be defined by market, ideology, production, and aesthetics. Pop "is designed to appeal to everyone" and "doesn't come from any particular place or mark off any particular taste." It is "not driven by any significant ambition except profit and commercial reward...and, in musical terms, it is essentially conservative." It is "provided from on high (by record companies, radio programmers and concert promoters) rather than being made from below...Pop is not a do-it-yourself music but is professionally produced and packaged." Frith 2001, p.95-96)

While Pop and Rock music each appeal to mass culture, often aim for (and achieve) commercial success, feature catchy tunes and melodies, and emphasize rhythm, Rock music has a much more direct connection to the blues and folk from which it originated, while Pop can be thought of as the current incarnation of [Popular music](#), which has existed for centuries.

# History of pop music

## 1930s and 1940s

Styles influencing the later development of pop include the [Blues](#) (Chicago), and [Country](#) (Tennessee).

## 1950s

Early Pop music artists include Frank Sinatra, Bobby Darin, and Peggy Lee.

## 1960s

Pop explodes with The Beatles, Carole King, Neil Diamond, Burt Bacharach, Aretha Franklin, Isley Brothers, Ray Charles, Stevie Wonder, the Supremes, Marvin Gaye, Beach Boys, Bob Dylan, Simon and Garfunkel, The Byrds.

## 1970s

A proliferation of new sounds from the [disco](#) of the BeeGees, the piano sounds of Billy Joel and Elton John, the country of the Eagles, the rock-influenced pop of artists like Rod Stewart, Steely Dan, and Fleetwood Mac.

## 1980s

One of the biggest highlights for pop music in the 1980's was Michael Jackson's second solo album, Thriller, which went on to become the best-selling album of all time. Thriller earned Mr. Jackson the nickname "King Of Pop". Other artists included Madonna, Duran Duran, the Police, Abba, Phil Collins, and Culture Club.

## 1990s

Resurgence of [boy band](#) and girl band trends. From the UK came the likes of Take That, Blue, the Spice Girls, a highly successful formula. Irish boy bands of the time include Boyzone and Westlife. The US had New Kids On The Block followed by the Backstreet Boys, Hanson and then 'N Sync and Britney Spears.

## **Sound and themes**

Pop music, in whatever musical influence form that it derives from, may be produced by a more basic songwriting approach and arrangement. The emphasis is often on a simpler melody, which makes the songs more memorable, and may use stripped-down rhythms. The combination of the melody and the rhythm allows for harmony to be a driving force of the song, which can make it more pleasing to the listener's ear. Themes range from personal songs, to vivacious party jams. However, the most common theme deals with the wide range of emotions which stems from physical or emotional love.

Music videos and live performances are often used for exposure in the media, and artists may have extravagant stage shows and use choreographed dancing. Many pop tunes are used in both Dance clubs and Sport clubs

## **Effects beyond music**

The friendliness and the appeal of pop music makes the subgenre prized by record companies, radio stations, and music television stations thanks to sales and ratings. The relative ease of the draw generates billions and billions of dollars into the entertainment industry. The wide canvas of artists benefit from sales, airplay, shows, and endorsements.

**Pop punk** is a term applied to a style of [punk rock](#) music, most popular in the 2000s but beginning in the late 1970s. The sound broke into the mainstream with the popularity of Green Day and The Offspring's respective albums Dookie and Smash. The style of music is usually more melodic than other punk rock.

# History

## Origins

Pop Punk is a musical style which emerged at the on-set of punk rock in 1974 with America's counterpart of England's Sex Pistols and the Clash - The Ramones (who actually formed before the Sex Pistols or the Clash). The Ramones were trying to bring about a rock and roll revival and were huge fans of The Beatles and of 1960s [Bubblegum pop](#). During 1975 their sped-up buzz saw, loud and fast, minimalistic melodic rock differentiated them from other groups who were lumped in with punk's early artists such as Television, Patti Smith, Iggy Pop, Talking Heads etc. Though The Ramones themselves would never have a number 1 hit, and never crossed over completely to mainstream culture, they would set the stage for the pop punk genre.

Power-pop bands like The Raspberries, Pezband, The Records, and especially The Nerves showed elements that laid the groundwork for pop-punk.

In Britain, the best-known examples of Pop-punk were likely The Undertones and The Buzzcocks. Both bands featured catchy hooks and lyrics centered around teenage romantic issues. The Undertones are a particularly good example of the genre. The Rezillos The Boys, and the Only Ones are also excellent examples of early Pop-punk. On the somewhat harder-edged side of things, there were bands like 999, The Vibrators, The Adicts, and The Lurkers. Many [Mod Revival](#) bands also displayed Pop-punk elements, particularly The Chords and The Purple Hearts.

The early 1980s was a time of reaction against the images offered up by the mass media about punks. Hardcore developed in response which claimed greater authority over what was actually punk. Black Flag and Minor Threat on the Pacific and Atlantic coasts are just two prime examples of this phenomenon. The music nabbed the aggression and violence of the Sex Pistols, ran away from the pop conscious sounds of The Ramones, and incorporated politics from the Clash into their music to an even greater degree. This sound was predominant through much of the 1980s. Despite this dominance, several bands instilled into their hardcore influenced songs a tunefulness and love of pop melody. These bands were The Descendents, Hüsker Dü, the Replacements and the Misfits.

As Hardcore became more standard other groups began to respond by embracing pop hooks again and catchy melodies as an alternative to the hard speed sounds of hardcore. By this point punk in America, which had been confined to urban environments in the late 1970s and 80s, was really permeating all across the country. MTV which had begun in the 80s was still rather young and had yet to embrace much punk music either. By the 1990s many of the bands that had started in the late 80s and 90s were getting better and more experienced.

### **The influence of college rock and Lookout! Records**

By the middle of 1980s hardcore was beginning to slow down, with Black Flag, Minor Threat and Dead Kennedys all splitting up within a few years of each other. Many other bands who did manage to stay together either outgrew the style as they became more technically proficient musicians and better songwriters, with many moving into [thrash metal](#) territory, or forming entirely new bands to play music that didn't adhere to hardcore's strict "Loud Fast Rules" philosophy.

At a similar time college rock became more popular due to its reliance on poppy, catchy melodies rather than noise, aggression and violence as had been the case with hardcore. Bands like R.E.M., Camper Van Beethoven, Beat Happening, Dinosaur Jr and the Pixies led the way alongside bands such as Hüsker Dü and The Replacements who had evolved out of the hardcore scene into the more accessible sound of alternative rock. Inspired by this new, but less well known bands were formed such as The Donner Party and Dead Milkmen. Something similar happened in post punk Britain with the rise of Twee pop, a style of music strongly influenced by jangly guitar pop bands like The Byrds and The Smiths as well as early R.E.M. and Pacific Northwest indie institution Beat Happening.

In 1988, Larry Livermore started a record label called Lookout! Records. Based in California, the label initially specialised entirely in a sunny, upbeat take on punk rock that both strongly recalled the thrashy bubblegum pop of The Ramones and stood in opposition to the Hardcore punk movement that had ruled the North American punk scene in the early-mid '80s. In this way it was similar to college rock in America and twee pop in Britain but it was different enough to establish an audience outside of both these scenes whilst possessing a similar spirit.

Lookout! Records were in an enviable position as they arrived at the right time to capitalize on this desire for rock music that was catchy and accessible but with an underground cool about it. Some of the Lookout! bands broke through into the mainstream in the 1990s after the release of

Nirvana's major label debut Nevermind in 1991 proved that punk rock bands could shift millions of units and get onto commercial radio and MTV.

### **Green Day and the first wave of California pop punk**

It wasn't until 1994 that the melodic strand of punk inspired by the Ramones broke through on par with Nirvana's success. Green Day's album Dookie was the record which put pop punk on the map. The record was a huge commercial success, both in terms of sales and exposure on commercial radio and MTV. The Offspring's breakthrough album Smash arrived a couple of months later, selling more than 11 million copies and becoming the biggest selling release of all time on an independent record label.

Other bands like Rancid and NOFX were pulling their weight and selling out huge concert halls. In addition many of the bands of the late '80s and early '90s who championed this style such as Crimpshrine, Jawbreaker, Screeching Weasel, the Queers, Squirtgun and The Descendents just to name a few found a public much more ready for their sound. Lookout! Records was one of the main labels behind Green Day and others. Fat Wreck Chords (owned by Fat Mike of NOFX) and Epitaph Records (owned by Brett Gurewitz of Bad Religion) also hosted pop punk artists, though they had a reputation for a more aggressive and diverse roster.

The overnight success and [sell-out](#) status controversy of Green Day created a media whirlwind which reached all corners of the country. In response, teens all over picked up guitars and started bands, many hoping to achieve what Green Day and The Offspring had done. Green Day was formed in the late '80s and was caustically anti-major label, turning down offers from the majors for years, as did The Offspring, who formed in 1984. Maximum RocknRoll, which, apart from being a magazine, was anti-major labels and anti-corporate advertising, had supported Green Day and many other bands which eventually went on to sign with majors. However, it was necessary for them to sign with major labels in order for their music to be heard.

### **Blink-182 and the second wave of Southern Californian pop punk**

In 1999, blink-182 released their breakthrough album Enema of the State. Whereas Green Day and their contemporaries had not really altered their sound during the move from indie to major label, blink-182's breakthrough record boasted a radio friendly sound and slick production when compared to the more trashy sound of their independently released

recordings. The album disappointed some fans who accused them of [selling out](#), blatantly softening their sound in pursuit of major success and playing the major label game by the book. However with the Internet full steam ahead, the accessibility of music and the impending dot com bubble and burst on the horizon, more and more kids were downloading songs and listening to music which would have previously been outside their "domain." The result was that all subcultures became much more accessible and as such also lost their potency. The listeners of music now were also probably listening to hundreds of other bands probably overlapping several genres.

Despite, or perhaps because of this, *Enema of the State* became the band's most commercially successful release to date, garnering much radio airplay and widespread airing of the band's pop-parody [music video](#) for "All the Small Things". Their next album, *Take off Your Pants and Jacket* continued their commercial success and was similar in style to *Enema of the State*, alternating thrashy choruses with chuggy verses and combining the catchy melodies and anthemic choruses of Green Day with American Pie-style humour. Following the success of the album, major recording labels began heavily recruiting and promoting pop punk acts.

Bands such as Good Charlotte and Sum 41 had hits on both sides of the Atlantic following this mass signing of punk bands by major labels. These, as well as lesser known bands such as Bowling for Soup (despite forming in 1994), became prime targets for criticism. They were perceived as adding little-to-nothing to the pop punk sound that already existed and were criticised from certain quarters that viewed them as pure careerists, apeing a sound that had reached its conclusion years ago, purely to become rich and famous.

This style has spread worldwide even to countries like Argentina, where the local band Smile is a national success.

## **The new millennium**

The new millennium brought on a host of major label pop punk groups which pushed catchy singalong melodies and simple sugar-coated guitar solos. The emo strain had also crossed back into the punk genre. New Found Glory mocked and embraced the "boy band" culture surrounding Britney Spears, N'Sync, and Backstreet Boys. Allister, The Ataris, Midtown, Fall Out Boy, The All-American Rejects, Simple Plan, and Good Charlotte are some of the bands achieving widespread notoriety. Bowling For Soup also clocked in with some nerd tunes with almost a nod to parody artist Weird Al Yankovic.

On the other end of the commercial spectacle, pop-punk is still thriving, and generally getting its cues from the Ramones or melodic hardcore as opposed to emocore. A term that has arisen to define this non-commercial vein of modern pop-punk has been buzzpop, with punk rock and pop-punk commentator Mitch Clem advocating the term.

blink-182 released their first untitled album, a top-seller which was more introspective with not a single joke song, marking a progression from their previous *American Pie*-records. The album was much acclaimed but didn't outsell their *Enema of the State*. Soon after, the band entered into a hiatus, with bandmembers devoting to solo projects.

Bassist Mark Hoppus and drummer Travis Barker aligned with the female singer Carol Heller, formerly of Get The Girl, to release a new album by the name of Plus 44, scheduled for projected release in the summer of 2006. Guitarist and vocalist Tom DeLonge formed new band Angels and Airwaves - including The Offspring drummer Atom Willard, Box Car Racer guitarist David Kennedy and The Distillers bassist Ryan Sinn - with debut album *We Don't Need to Whisper* to be released in May 23, 2006.

In early 2001, one of the pioneers of the pop-punk genre, the Chicago-based band Screeching Weasel disbanded a few months after playing a sold-out show with Yesterday's Kids and The Queers at the House of Blues in Chicago. Following the break-up, Screeching Weasel guitarist John Jughead formed an acoustic pop-punk band, which he christened Even in Blackouts in reference to the band's capability to perform sans electrification. EiB, as the band is sometimes known, has toured extensively and put out two full-lengths and an EP. The band has won praise from critics and fans alike for their musicianship and for the new twist that have put on the pop-punk genre. Although plans were announced for a Screeching Weasel reunion tour in the fall of 2004, these failed to come to fruition. The band's frontman, Ben Weasel is currently beginning work on an eponymous solo project.

## Common misconceptions about pop punk

Pop punk is sometimes associated with the label [emo](#). Emo is a form of [hardcore punk](#) that places emphasis on emotion in the music, lyrics, and voice. True emo has no relation to the current "emo" trend – pop punk is associated with emo in recent years because of bands like Jimmy Eat World & Get Up Kids who borrowed many post-emo ideas earlier in their careers, but have since been heavily affected by their respective major label deals in a way that means their music presently bears only slight similarities to post-emo. Post-emo is an offshoot of the emo genre that took the emphasis on emotion in the music, lyrics, and vocals and combined it with the mellower sound of indie music. Detractors of pop-punk consider it actually what punk was originally intended to rebel against, the stereotyped ideal pop culture – leaving the term a whole oxymoron. Some claim that pop punk is still a subculture of punk. Pop punk has expanded so much in recent years that it is difficult for teens to well understand the culture. Bands such as Busted and Mcfly exemplify this increased expansion and popularity of the genre by further blurring the line between 'punk' and 'pop'. Although labelled as 'boy-bands' by sceptical pop-punkers, the fast, trashy, cheesy and guitar driven catchiness of Busted in particular, and more recently, Son of Dork, resonates strongly with the pop-punk sound however sugar coated it has become. It could be said these British bands, Freefaller being another example, epitomise 'Punk-pop' as opposed to 'Pop-punk'.

The term pop punk began as a term describing "poppier" punk. It has now come to also mean (depending on usage) "popular" punk.

## Underground pop punk

Parallel to the influx of mainstream pop punk bands, there are still a number that remain underground. Bands like Groovie Ghoulies from California, Screeching Weasel from Chicago, The Zatopeks from England, Some Garage Band from Defiance, Ohio, and Moral Crux from Washington have obtained a large fanbase without following the mainstream. Redscare Records is also emerging as a new label dedicated only to pop punk acts (For a partial listing of current underground bands see the Independent Pop Punk section below).

In the [punk](#) community, listening to underground pop punk does not always have the stigma attached to listening to their mainstream counterparts.

# Pop rock

**Pop rock** is a genre of music that combines elements of both [pop](#) and [rock](#). Songs are identified by their simple song structure, catchy melodies, and repetition of musical passages (the pop part), and by their use of [electric guitar](#)- and [drums](#)-based instrumentation and a somewhat aggressive attitude (the rock part). The term was first used to describe the early hits of The Beatles, along with acts that followed them, such as The Grass Roots, Gary Puckett & The Union Gap, and The Buckingham. [Surf rock](#) is sometimes included as a type of pop rock; this is an anachronism, as [surf music](#) and [rock music](#) were considered distinct musical genres in the 1960s.

Pop rock largely gave way to [soft rock](#) in the 1970s. Although there were few acts in the 1970s and 1980s that could strictly be called pop rock, the genre continued in the form of [power ballads](#) from [hard rock](#) and [heavy metal](#) acts, along with the more up-tempo songs from soft rock acts.

The latest wave of pop rock originated in the mid-1990s with such acts as Alanis Morissette and possibly Melissa Etheridge. The genre has enjoyed a resurgence in recent years as hard rock acts are knocked off the charts in favour of rap, R&B and hip hop artists. A feature of some modern pop rock songs is the alternation of soft verses and loud choruses, influenced by the arrangements of alternative rock artists. Other modern pop rock artists include Michelle Branch, the All-American Rejects, Kelly Clarkson, Vanessa Carlton, Catalina Velez, Ashlee Simpson, t.A.T.u., and The Veronicas. These acts are commonly classified as Hot AC (after the radio format) or Adult Top 40 (after the Billboard chart).

There is much debate over whether certain artists are defined as rock or pop rock, and this generally comes down to the opinions of fans and critics. Australian artists such as Jet and Rogue Traders (headed by former Neighbours star Natalie Bassingthwaite) are often the source of many disputes, whereas Powderfinger are still generally regarded as [alternative rock](#) despite their commercial success.

There are many Chinese pop rock bands and singers, including F.I.R, Jay Chou, JJ Lin, and Stephani Sun. Japanese pop rock artists include L'Arc~en~Ciel, the brilliant green, and Nana Kitade.

# Popping

**Popping** (a.k.a. **hitting**) is a [funk dance](#) and street dance style based on the technique of quickly contracting and relaxing muscles to cause a jerk in the dancer's body, referred to as a *pop* or a *hit*. This is normally done continuously to the rhythm of a song in combination with other movements.

Popping is also used as an umbrella term for a group of illusionary dance styles and techniques that are often combined with popping to create a more varied performance.

It's generally believed that the dance evolved in California in the 1970s and was originally inspired by locking. It was later incorporated into both the [hip hop](#)- and [electronica](#) dance scenes.

## History

In the late 1970s a popping group called Electric Boogaloos (earlier known as the Electronic Boogaloo Lockers) made popping and some of its related styles famous by performing on the television program called Soul Train. The Electric Boogaloos themselves state that their founder Boogaloo Sam came up with the popping technique and the basics of the electric boogaloo dance style in 1975, after being inspired by one of the pioneer locking groups known as The Lockers.

Most sources from famous and old generation poppers, and people who were alive during the time, agree that the Electric Boogaloos came up with the foundations of popping and some of its related styles, while some argue that popping existed in other areas of California in the late 1960s, before Electric Boogaloos was started.

The mainstream media greatly confused the naming structure of the funk style dances by calling it breakdancing. The movie Breakin' and Michael Jackson's popularity contributed to the naming confusion as moonwalking (known as *backsliding* in popping terminology) came to be associated with breakdancing instead of popping.

## Techniques and styles

There are a number of techniques and styles that are often combined with popping to enhance the dancer's performance and create a more varied show. When using *popping* as an umbrella term, these can also be considered a part of popping.

### Animation

A style and a technique that attempt to imitate film characters being animated by stop motion. The technique consists of moving rigidly and jerky, using the strobing technique of halting at very small intervals or tensing of muscles, to make it appear as the dancer has been animated frame by frame. The resulting motion is also reminiscent of strobing, but with the intention of impersonating stop-motion characters and not, as in strobing, the movement itself. This style was heavily inspired by the dynamation films created by Ray Harryhausen.

### Boogaloo/electric boogaloo

A fluid leg-oriented style utilizing rolls of the hips, knees and head. This style was created and made famous by the Electric Boogaloos.

### Dime stopping

A technique of moving at a steady pace and then abruptly coming to a halt, as if attempting to stop on a dime. This is often combined with a pop at the beginning and/or end of the movement.

### Floating, gliding and sliding

A set of footwork-oriented techniques that attempt to create the illusion that the dancer's body is floating smoothly across the floor, or that the legs are walking while the dancer travels in unexpected directions.

### Liquid dancing

An illusionary dance style that focuses on flowing and continuous liquid-like motions, with concentration on the fingers, hands and arms. It is stylistically connected to – and often mixed with – waving. Liquid dancing is common in [rave](#) culture, and some dancers consider it a complete style of its own.

### Popping/hitting

The technique of quickly contracting and relaxing muscles to create a jerking effect (a *pop* or *hit*) in the dancer's body. Popping can be

concentrated to specific body parts, creating variants such as arm pops, leg pops, chest pops and neck pops.

#### Puppeting

A style imitating a puppet tied to strings. Normally performed alone or with a partner acting as the puppet master pulling the strings.

#### Robot/botting

The robot is a style imitating a dancing robot or mannequin.

#### Slow motion

Moving very slowly with exaggerated movements to make it appear as if the dancer is viewed in slow motion.

#### Strobing

Using the same principle as dime stopping, but movements between halts should be shorter, and as quick and regular as possible to give the impression that the dancer is moving within a strobe light.

#### Ticking

A way of popping where the dancer pops at very small intervals.

#### Tutting/King Tut

Inspired by the art of Ancient Egypt, tutting exploits the body's ability to create geometric positions and movements, predominately with the use of right angles.

#### Vibrating

Tensing muscles very hard, causing them to shake or vibrate.

#### Waving

Waving is composed of a series of fluid movements that give the appearance that a wave is travelling through the dancer's body. It is often mixed with liquid dancing.

## Notable poppers

David "Elsewhere" Bernal  
Michael "Boogaloo Shrimp" Chambers[5]  
Steffan "Mr. Wiggles" Clemente  
Bruno "Poppin Taco" Falcon[5]  
Timothy "Poppin Pete" Solomon[6]

### Street dance

[Hip hop dance](#) - **Popping**

Categories: [Funk dance](#)

## Pop-rap

**Pop rap** is the name given to a style of [hip hop](#) that has a strong [pop music](#) influences. In the pop rap sound, the rougher elements of hip hop music are removed and hooks are used in order to achieve a crossover-friendly sound. By the way of marrying the beats and rhymes with the potent melodic hooks, of course, which would normally be found in the usual pop song structure. It often has the tendency to be less aggressive than other varieties of [hip hop](#).

## Overview

The style became popular in the early 1990s, as hip hop music found commercial success. Pop rappers were seen as less "threatening" to a predominantly juvenile audience, as against the hardcore [gangsta rap](#) gaining in popularity. Performers such as Vanilla Ice were able to harness the general aesthetic of hip hop music to a radio-friendly sound (and subject matter). Many pop-rap hits sampled instantly-recognisable hits as a backing track, "U Can't Touch This" being the prime example, lifting the bass riff from Rick James' "Superfreak." The increasing popularity of hip hop as the 21st century began is often ascribed to pop rap's stylistic matter. Undoubtedly, most of the popular acts by this point were heavily informed by pop rap with their reliance on well-known samples and danceable tunes. However, because some have complained of its mainstream appeal, some hardcore influences were added to it by the mid or late 1990s in order to try deflecting the backlash over their accessibility.

## History

Pop-rap has been popular since its beginning in the late-1980s, after various [hip hop](#) artists commenced entering the mainstream. LL Cool J just may have been the very first pop-rapper in history, when he rose to prominence on his 1985 debut album *Radio*. When he joined Russell Simmons' Def Jam label and decided to try merging [rap](#) with pop and [R&B](#) influences, some people were skeptical that it would ever work out perfectly. But in the end, one of *Radio*'s singles, the [rap-ballad](#) "I Need Love", actually became a success. The origins of Pop-rap lay in artists like Tone-Loc, Young M.C., and DJ Jazzy Jeff & The Fresh Prince putting emphasis right on their good-humored, storytelling skills, to great chart success. They were followers who also began recording similarly amiable party tunes and novelties. Since there had been a possibility of accepting this as real music, other M.C.s started to play up rap's connection to pop, [R&B](#), and [dance](#) music.

Some pop-rap artists looked to taking samples of songs from other sources in order to supply and support their melodies; others created their own original tunes to go with their lyrics which turned into hits that way. As a result of the former, pop-rap was frequently mocked and taken to court for the use of borrowing hooks from previous songs by other artists without shifting the appropriations very much, if at all. This came to light when hip-poppers like M.C. Hammer and Vanilla Ice arrived on the scene in 1990, and caused controversy by lifting hooks from prior songs for use on their own hits. But pop-rap didn't always get a completely deserved bad reputation, since there have been plenty of pop-rap M.C.s who continued to score hits on the charts while maintaining their own unique sounds: P.M. Dawn, Naughty By Nature, Das EFX, Salt-N-Pepa, House of Pain, Sir Mix-A-Lot, Coolio, etc.

By the late 1990s, pop-rap was ruled by artists they had affected or mentored, as well as artists who blended [rap](#) with urban [soul](#). R&B-styled hooks and instantly recognizable samples of well-known soul and pop songs from the 1970s and 1980s were the staples of this sound, which was showcased primarily in his latter-day work for The Notorious B.I.G. ("Mo Money, Mo Problems"), Ma\$e ("Feels So Good"), and artists such as Jay-Z ("Can I Get A...") and Nas's ("Street Dreams"). Very little of this commercially minded music was met with acclaim from hip hop enthusiasts or critics, however - Puff Daddy's "loop it and leave it" style of sampling, which most of the time just consisted of rapping over someone else's instrumental, was criticized heavily.

Heavily Pop-inflected [gangsta rap](#) continues to be successful into the 21st century, with many artists deftly straddling the divide between their hip hop audience and their pop audience, such as 50 Cent, D4L and Nelly.

## **Notable pop rappers**

DJ Jazzy Jeff & the Fresh Prince and Will Smith as a solo act  
MC Hammer  
Vanilla Ice  
Kris Kross  
Puff Daddy and Ma\$e  
Nelly  
Bow Wow  
J-Kwon  
Mike Jones  
Lil Romeo  
D4L  
Kanye West

## Popular music

**Popular music** is [music](#) belonging to any of a number of musical styles that are accessible to the general public and mostly distributed commercially. It stands in contrast to [classical music](#), which historically was the music of elites or the upper strata of society, and traditional [folk music](#) which was shared non-commercially. It is sometimes abbreviated to **pop music**, although [pop music](#) is more often used for a narrower branch of popular music.

## Definitions

The term "popular music" is used in broad and narrow senses. At its broadest, it refers to all music other than classical music, also known as art music. In the early 19th century, the traditional songs of the common people were referred to as "popular songs." By the late 19th century these songs were referred to as "folk songs." At that time, a distinction was made between folk music and more recently developed urban popular music. Today, popular music is distributed via mass media such as recordings and radio (as classical music is now also). Popular music forms part of popular culture. For specific varieties of popular music, see the list of genres below.

See the separate article on [pop music](#) for the narrower genre of very commercial, light, catchy, melodic music.

## Theories of popular music

Among scholars in the humanities, a broader range of definitions have been proposed.

Frans Birrer (1985, p. 104) gives four conceptions or definitions of "popular" music:

1. *Normative definitions.* Popular music is an inferior type.
2. *Negative definitions.* Popular music is music that is not something else (usually 'folk' or 'art' music).
3. *Sociological definitions.* Popular music is associated with (produced for or by) a particular social group.
4. *Technologico-economic definitions.* Popular music is disseminated by mass media and/or in a mass market.

All of these, according to Middleton (1990,p.4) "are interest-bound; none is satisfactory." According to Hall (1978, p.6-7), "The assumption...that you might know before you looked at cultural traditions in general what, at any particular time, was a part of the elite culture or of popular culture is untenable." Thus popular music must be comprehended in relation to the broader musical field (Middleton 1990, p.11).

Bennett (1980, p.153-218) distinguishes between 'primary' and 'secondary' popular culture, the first being mass product and the second being local re-production, discussed further below.

"While repetition is a feature of all music, of any sort, a high level of repetition may be a specific mark of 'the popular', enabling an inclusive rather than exclusive audience." (Middleton 1990, p.139)

## The nature of popular music

Fred Lerdahl ( Lerdahl's theories explicitly exclude "associational" details which are used to help articulate form in popular music, while Allen Forte's book *The American Popular Ballad of the Golden Era 1924-1950* analyses popular music with traditional Schenkerian techniques. (Middleton 1999, p.144)

### Popular music as a business enterprise

Much popular music is the product of the modern business enterprise, disseminated for the purpose of earning a profit. Executives and employees of popular music businesses try to select and cultivate the music that will have the greatest success with the public, and thus maximize the profits of their firm. In this respect, popular music differs from traditional [folk music](#), which was created by ordinary people for their own enjoyment, and from [classical music](#), which was originally created to serve the purposes of the Church or for the entertainment of the nobility. (Today classical music is often subsidized by governments and universities.)

Although the controlling forces of popular music are business enterprises, young people who aspire to become popular musicians are not always driven by the profit motive. Rather, they often want to find an outlet for their sense of expression and creativity, or simply to have fun. Historically, the conflicting motives of business people and musicians has been a source of tension in the popular music industry.

Debate continues about the status of popular music. Some emphasize the commercial motive and suggest the big companies manipulate the audiences and sell them products with no intrinsic value. This is the debate about "authenticity" which rages whenever popular music is discussed. Commercial interests can cause the dilution of music as corporations take over their distribution, and may cause music to move away from the grassroots level of Folk or Blues. Several movements such as [punk](#) in the 80s, and [Indie](#) in the 90s, have attempted to try to take back control.

The electric guitar and amplification has had a big impact on modern music. In the 30s and 40s amplified instruments became necessary to compete with the loud volumes in the Big Swing bands of the era. Gibson introduced the first Gibson Les Paul solid body guitar in 1952. In the 1960s, the tonal palette of the electric guitar was further modified by introducing an effects box in its signal path, the wah-wah pedal.

## Classical music in the 20th Century

Classical music compositions in the 20th century attempted to strip away the erroneous, the extra details, and as with modern art, remove everything apart from the essence of the image. It was often atonal, dissonant and discordant, and used the unexpected. It is often characterised by a lack of harmony and by a harsh or confused mingling of sounds. As composer and broadcaster Howard Goodall points out, (20th Century Greats: BBC Channel 4) Classical music soon 'began a perilous journey into an arid form of modernism that the mainstream audience couldn't, or didn't want to, follow.' Classical music lost the mainstream in the 1920s, with popular music gaining in influence.

Which 20th century composers will still be around and enthralling audiences in 300 years time? Though the earlier composers, like Stravinsky and Shostakovich, were pushing the boundaries, their compositions were still related to the work of previous composers.

By the 1920s, popular music entered the process with songs that were catchy and entertaining, though often banal in their simplicity, but began to rival classical compositions in their complexity and sophistication. This transformation was led by Cole Porter, a musician who was part of a generation of gifted composers that developed the musical on Broadway in New York, and included George Gershwin and Irving Berlin. Porter was classically trained and used classical techniques in his music. He also drew on the new rhythms and beats in jazz; the rhythms of Porter's music fused European with African American traditions. The best interpretations of Porter's songs were by some of the greatest African American jazz, blues and swing singers, such as Ella Fitzgerald, Sarah Vaughan and Billie Holiday. Porter introduced songs for all to enjoy and re-established the connection between the kind of music everyone liked and that enjoyed by the educated classes.

In the 1920s [Jazz](#) was the rhythm of the moment, and the lifeblood of popular music. The biggest change in music was in the rhythm, as the two worlds of Folk music and the Caribbean traditions collided. Traditional Folk music was in Triple time, but the sounds of the Caribbean were in 2 and 4 time. Jazz also has brilliant harmonies and melodies. Porter used both the folk and the jazz rhythms in his songs, creating a dynamic interplay. He also used minor keys, which require greater musical complexity, but make songs that are more mysterious and exotic. The Blues had also arrived, and the new dances of the Foxtrot and the Charleston.

## Performance of popular music by amateurs

Many people play popular music together with their friends, often in garages and basements, on a casual amateur basis. This activity is one of the most widespread forms of participatory music-making in modern societies. As participatory music, "garage bands" are in a sense a resurrection of the old tradition of [folk music](#), which in premodern times was composed and performed by ordinary people and transmitted exclusively by word of mouth. The difference between the old folk music and modern amateur performance of popular music is that the participants in the latter genre are well acquainted with the expert performances that they hear on recordings, and often try to emulate them.

The older folk music of a society often lives on in a popularized version, which is likewise performed by experts and commercially disseminated. Such updated versions of folk music often have heavy amateur participation.

## **Form**

Form in popular music is most often sectional.

## **Performers**

A list of performers of popular music can be found at:

## Genres

Popular music dates at least as far back as the mid 19th century. Below is a list of genres.

Different genres often appeal to different age groups. These often, but not always, are the people who were young when the music was new. Thus, for instance, [Big band](#) music continues to have a following, but it is probably a rather older group, on average, than the audience for [rap](#). For a few of the genres listed below (for instance, [Ragtime](#)), the original target generation may have died out almost entirely.

This "generation gap" in the consumption of popular music is particularly marked since the second world war and the increased economic and social independence of younger people. Music hall and other forms before the 1940s are not so clearly marked by generation.

- Adult Contemporary
  - Album-oriented rock
  - Middle of the road
- [Alternative rock](#)
  - Agit-pop
  - [Emo](#)
  - [Goth rock](#)
  - Grunge

Show Tunes are generally considered to be in between popular and art music. Examples being that "Memory" (*Cats*) is a very acceptable song, while only select groups of people enjoy listening to "One" (*A Chorus Line*), "Jellicle Songs for Jellicle Cats" (*Cats*), "The Dream" (*Fiddler on the Roof*), "We'd Like to Thank You, Herbert Hoover" (*Annie*), "Over the Moon" (*RENT*), etc.

### **Genres that are not popular music**

Musical genres usually considered not to be popular music include:

- Most [classical music](#), including [opera](#)
- [Children's songs](#) (including [nursery rhymes](#) and jumprope songs)
- [Folk music](#), as created by traditional performers
- [Gregorian chant](#), [hymns](#), and many other forms of religious music
- Military music
- [National anthems](#) and other patriotic music
- Sea shanties and other work songs

As noted earlier, these have a distinct character from popular music: either they are transmitted by word of mouth rather than in organized

fashion (children's songs, authentic folk music) or else they are produced to fill the needs of a particular social institution (church, aristocracy, the military, or the state). Note that music pieces of each of these genres can become part of the popular music either in their pure form (like various gregorian compilation CD's) or as remixes (like Moby's Play).

## Classical music and popular music

The relationship (particularly, the relative value) of classical music and **popular music** is a controversial question. Some partisans of classical music may claim that classical music constitutes art and popular music only light entertainment. However, many popular works show a high level of artistry and musical innovation and many classical works are unabashedly crowd-pleasing.

The elevation of classical music to a position of special value is closely connected to the concept of a Western canon, and to theories of educational perennialism.

The very distinction between classical and popular music is blurred in the border regions, for instance [minimalist music](#) and light classics, and are disregarded as art music. In this respect music is like fiction, which likewise draws a distinction between classics and popular fiction that is not always easy to maintain.

"Neat divisions between 'folk' and 'popular', and 'popular' and 'art', are impossible to find... arbitrary criteria [is used] to define the complement of 'popular'. 'Art' music, for example, is generally regarded as by nature complex, difficult, demanding; 'popular' music then has to be defined as 'simple', 'accessible', 'facile'. But many pieces commonly thought of as 'art' (Handel's 'Hallelujah Chorus', many Schubert songs, many Verdi arias) have qualities of simplicity; conversely, it is by no means obvious that the Sex Pistols' records were 'accessible', (trashy?) Frank Zappa's work 'simple', (Frank Zappa is considered by many a serious composer) or Billie Holiday's 'facile'." (light?) (Middleton, 1990)

### Complexity

It might be argued that, at least on the average, classical works have greater musical complexity than popular music. For instance, classical music is distinguished by its heavy use of development, and usually involves more modulation (changing of keys), less outright repetition, and a wider use of musical phrases that are not default length--that is, four or eight bars long (however, much minimalist music goes against these tendencies, thus are considered by many non-serious music).

This is not to say that popular music is *definitively* or *always* simpler than classical. The "default length" of phrases which classical music

supposedly deviates from were set as the default by music of the common practice period. Jazz, rap and many forms of technical metal, for instance, make use of rhythms more complex than would appear in the average common practice work, and popular music sometimes uses certain complex chords that would be quite unusual in a common practice piece. Popular music also uses certain features of rhythm and pitch inflection not analyzable by the traditional methods applied to common practice music.

One may argue that it is normally only in classical music that very long works (30 minutes to three hours) are built up hierarchically from smaller units (phrases, periods, sections, and movements). Structural levels are distinguished by Schenkerian analysis. Fred Lerdahl (1992), for example, claims that popular music lacks the structural complexity for multiple structural layers, and thus much depth. However, Lerdahl's theories explicitly exclude "associational" details which are used to help articulate form in popular music, while Allen Forte's book *The American Popular Ballad of the Golden Era 1924-1950* analyses popular music with traditional Schenkerian techniques. (Middleton 1999, p.144)

Bach had many contemporaries whose music was mediocre at best, and today their music is forgotten, surviving perhaps in libraries. The repertoire of classical music is skewed toward works recognized as excellent by listeners over long periods of time.

It follows that genres of popular music that have existed for a long time might also produce works that show staying power. For instance, the work of Scott Joplin, a popular musician of about a century ago, continues to be played--often, curiously enough, by classical musicians. The advent of high fidelity audio recordings in the 1950s meant that the actual performances of popular musicians could be preserved forever, and this has raised the possibility that certain works popular music will achieve permanent status in their original recorded form. This may be happening now in the case of the most outstanding artists.

## **Influences between classical and popular music**

Works of classical music sometimes achieve a sudden, hard to explain popularity, and thus take on the temporary status of popular music; for details, see [crossover](#). Moreover, many popular songs over the years have made use of themes and melodies from well-known classical pieces.

Songwriters such as Paul Simon have used classical techniques such as, during his early solo career in the 1970s, the twelve tone technique, though Simon actually only employs the full chromatic rather than strict tone rows (Everett 1997).

Versatile artist Michael Jackson used excerpts of classical music in his works, and composed for orchestra some postmodernistic/polystylism pieces, as well as ones influenced by symbolism and impressionism.

## Posse cut

**Posse cut** is a popular form of song in [hip hop music](#), that involves successive verses by four or more [rappers](#).

Posse cuts are arguably the original form of the hip hop track; in hip hop's infancy, tracks would more often than not take the form of a freestyle cypher, where one rapper would deliver a usually mostly improvised verse before passing the microphone to the next, with this repeated until all the rappers present (or, all of "the posse") had a chance to rhyme. Often call-and-response chants would be involved, which originally would be a chance for rappers to interact with a crowd, but which were preserved when the posse cut made the jump to the recorded form. Many classic early hip hop tracks, such as Afrika Bambaataa & the Soul Sonic Force's "Zulu Nation Throwdown", took the form of a posse cut.

The posse cut became established in the eighties as a way for rappers to give exposure to their friends, or their posse. However, towards the end of the eighties and the start of the nineties, the posse cut began to be used as an "All-Stars" device to bring together rappers who had respect for each other's skills on the microphone, or a way to unite various well-known and respected artists to deliver an important message. The former's most famous example from this period is "The Symphony", organized and produced by Marley Marl and featuring Master Ace, Craig G, Kool G Rap and Big Daddy Kane. The latter form, the posse cut with a message, was most famously seen in "Self Destruction", organized by KRS One's Stop The Violence movement, which brought together the leading hip hop artists of the day: KRS One, Stetsasonic, Kool Moe Dee, MC Lyte, Just Ice, Doug E. Fresh, Heavy D, Public Enemy and Ms. Melodie.

In the nineties, the posse cut began to gain a new function as a way to introduce new talent to the world. The most famous example of this was Nas, whose early appearance on Main Source's "Live At The Barbeque" in 1991 increased his reputation hugely and created enormous hype for his debut album, which was ultimately titled *Illmatic* and released in 1994. Busta Rhymes' appearance on A Tribe Called Quest's "Scenario" had a similar effect, though unlike Nas Busta already had a sizeable reputation prior to his appearance on the song. The group Wu-Tang Clan, who debuted in 1993, also popularized the posse cut considerably; with a group of nine rappers as well as countless associates, many if not most Wu-Tang tracks have four or more rappers. Some of their more famous posse cuts are "Protect Ya Neck", "Da Mystery Of Chessboxin" and easily the most commercially successful posse cut in history, the 1997 hit single "Triumph".

It has now become fairly common practice for hip hop albums to have at least one posse cut.

## Famous posse cuts

2Pac : "Got Ya Mind Made Up" featuring Method Man, Redman & Tha Dogg Pound (from All Eyez On Me, 1996)  
Afrika Bambaataa & the Soulsonic Force : "Zulu Nation Throwdown"  
A Tribe Called Quest : "Scenario" featuring Leaders Of The New School; "Show Business" featuring Diamond D, Sadat X and Lord Jamar (both from The Low End Theory, 1991) ; "Rock Rock Y'all" featuring Mos Def, Jane Doe, Punchline & Wordsworth (from The Love Movement, 1998)#  
Canibus : "Horsementality" featuring Killah Priest, Ras Kass & Kurupt (from 2000 B.C., 2000)  
Craig Mack: "Flava In Ya Ear (Remix)" featuring Biggie Smalls, Busta Rhymes, Rampage & LL Cool J  
Dr. Dre: "Some L.A. Niggaz" featuring Defari, Xzibit, Knoc-Turn'al, Time Bomb, King Tee, & Kokane (from Dr. Dre 2001, 1999)  
Fat Joe: "John Blaze" featuring Raekwon, Big Punisher, Jadakiss & Nas (from Don Cartagena, 1996)  
Heavy D: "Don't Curse" featuring Big Daddy Kane, Kool G Rap, Q-Tip, Grand Puba, Pete Rock, and CL Smooth (from Peaceful Journey); "A Buncha Niggas" featuring Biggie Smalls, Busta Rhymes, Guru, Rob-O & Third Eye (from Blue Funk)  
LL Cool J: "4, 3, 2, 1" featuring Method Man, Redman, Canibus & DMX (from Phenomenon, 1996)  
Main Source : "Live At The Barbeque" featuring Nas, Joe Fatal & Akinyele (from Breaking Atoms, 1991)  
Marley Marl/Juice Crew: "The Symphony" featuring Big Daddy Kane, Kool G Rap, Craig G and Masta Ace (all of the Juice Crew) (1989)  
Mobb Deep: "Eye For An Eye" featuring Raekwon & Nas; "Right Back At You" featuring Ghostface, Raekwon & Big Noyd (from The Infamous, 1996)  
Nas: "Affirmative Action" featuring Foxy Brown, Cormega & AZ (from It Was Written, 1996)  
Outkast : "Y'all Scared" featuring Goodie Mob (from Aquemini, 1999)  
Redman : "Close Ya Doorz" featuring Roz, Tame One, Young Zee, D-Don & Gov-Matic (from Doc's Da Name 2000, 1998) ;

"Bricks Two" featuring Double O, D-Don, Roz & Shooga Bear  
(from Malpractice, 2001)

The Roots : "The Session (The Longest Posse Cut In History)"  
featuring Shortie No Mass, Pazi Plant, Mr. Manifest, Lord Akil &  
A.J. Shine (from Organix, 1993)

Stop The Violence Allstars (KRS One, Stetsasonic, Kool Moe  
Dee, MC Lyte, Just Ice, Doug E. Fresh, Heavy D, Public Enemy  
and Ms. Melodie : "Self Destruction" (1989)

Sway & Tech: "The Anthem" featuring Chino XL, Eminem, Jayo  
Felony, Kool G Rap, KRS-One, Pharoahe Monch, RZA,  
TechN9ne, and Xzibit

The West Coast Rap All-Stars : "We're All In The Same Gang"  
featuring King Tee, Body & Soul, Def Jef, Michelle, Tone-Loc,  
Above The Law, Ice-T, Dr. Dre, MC Ren, J.J. Fad, Young MC,  
Digital Underground, Oaktown's 3.5.7, MC Hammer, and Eazy-  
E.

Wu-Tang Clan : "Protect Ya Neck", "7th Chamber", "Da Mystery  
Of Chessboxin", (from Enter the Wu-Tang (36 Chambers),  
1993) ; "Triumph", (from Wu-Tang Forever, 1997; most of the  
other tracks on this album are also posse cuts) ; "Protect Ya  
Neck (The Jump Off)", (from The W, 2001) ; "Uzi {Pinky Ring}",  
(from Iron Flag, 2002)

## Post-grunge

**Post-grunge** (referred to as **nu-grunge** in Britain) is a subgenre of American [alternative rock](#) that emerged in the mid-1990s as an offshoot of the Seattle [grunge](#) movement.

It is characterized by its radio-friendly style, distorted but often simple guitar riffs, and "soft verse, loud chorus" song patterning. In its broadest sense, post-grunge refers to any band influenced by the original grunge sound. As such it encompasses a wide variety of styles and can be used to describe bands ranging from Sugar Ray and Cake to Godsmack and Filter.

However, the term is now most often used in reference to the ubiquitous [pop rock](#) music of the late nineties produced by bands such as Third Eye Blind and matchbox twenty. At the turn of the millennium post-grunge began to experience a stronger resurgence as bands like Puddle of Mudd and Nickelback began to gain popularity. Some of these newer bands alienated fans of the original grunge and early post-grunge sound, and are often referred to simply as either alternative rock or "modern rock" rather than post-grunge.

Many grunge and early post-grunge songs can still be heard on commercial radio.

## History

Post-grunge developed from the grunge music scene of the early 1990s. The breakout success of bands such as Nirvana and Pearl Jam led to [record labels](#) becoming intensely interested not only in grunge, but also in [alternative rock](#) in general. By 1993 some of the first post-grunge bands, notably Collective Soul and Live, had been signed to major labels and were beginning to garner mainstream attention.

It is interesting to note, however, that most of these bands were not labeled "grunge" at the time (Bush being an exception); rather, they were lumped into the more general category of alternative rock with bands such as the Red Hot Chili Peppers and R.E.M., whom radio stations found unclassifiable at the time. In fact, some early post-grunge bands appear to owe more to traditional 1970s album rock than the underground [punk](#) and [metal](#) that inspired Seattle grunge bands.

In 1995 Foo Fighters released their self-titled debut album. There was much hype surrounding the album, since two of the band's members - Dave Grohl and Pat Smear - had been involved with Nirvana, one of the key bands of the early 1990s grunge movement. The album was well-received and the term "post-grunge" was coined to describe this new, radio-friendly, "life after Nirvana" sound. Following the Foo Fighters' success, several of the aforementioned bands (who were roughly similar in style) began to be labeled as post-grunge as well and the genre began to come into its own.

During the next few years the key early post-grunge bands continued to meet with critical and commercial success, as did newcomers such as Better Than Ezra and Sponge. Although these bands and several others helped to spread the genre's popularity, their successes were eclipsed by the explosion of popularity that resulted from Australian band Silverchair's debut album, Frogstomp, in late 1995. The album became a multi-platinum international hit and made the young band one of the highest grossing acts in the world. Frogstomp's release also helped divide post-grunge bands into two categories: those who came before Frogstomp, and those who came after, much as Nirvana's Nevermind album had helped do with grunge a half-decade earlier.

During the rest of the decade, post-grunge continued to gain mainstream popularity and by 1998 it and [pop punk](#) (the two genres themselves having somewhat meshed together by this point) were arguably the two most popular genres of American alternative rock. Newer

bands such as Third Eye Blind and Matchbox Twenty produced some of the biggest hit singles of the latter 1990s.

Despite the increased number of post-grunge artists, no city or region ever emerged as a clear focal point for the genre. This was in stark contrast to original grunge, which was centered around Seattle and the Pacific Northwest. Perhaps the closest analog for post-grunge was the central Florida area, where an exceptional number of post-grunge bands emerged in the late 1990s, the most important of which being Creed and Matchbox Twenty. Silverchair's time in the limelight had begun to fade by the time that Creed's second album, *Human Clay*, was released in 1999. That album went on to surpass even *Frogstomp* in terms of sales and airplay, selling over eleven million copies and becoming the biggest commercial hit since *Nevermind*.

Although by 2000 post-grunge was still going strong, several other musical styles were gaining increased radio play, especially [hip hop](#) and [boy bands](#), and alternative rock began to lose the strong grip it had held on pop music in the US throughout most of the 1990s. It should also be noted that at this point the genres within alternative rock had become so intertwined (most, although not all, of the newer post-grunge bands also incorporated equal parts of pop punk or [nu metal](#) into their music) that the term "post-grunge" fell out of favour and "modern rock" or "nu-rock" began to replace it as a catch-all term. This trend continues as of 2005 and, although it is rarely referred to as "post-grunge" anymore, the genre continues to be a serious influence in modern rock with bands such as Nickelback, Puddle of Mudd, Staind, 3 Doors Down and Audioslave enjoying immense success.

## Comparison to grunge

Post-grunge is often characterized as being less "dirty" and having a more mainstream sound than other grunge subgenres. Some believe that the entire subgenre was actually created by music label executives as a way to repackage grunge as [pop music](#) and market it to mainstream audiences. This directly contrasts with the original "anti-corporate rock" ethic that had spawned grunge music during the late 1980s and early 1990s. Thus, many grunge fans revile post-grunge and denounce these bands as [sellouts](#).

Traditional rock fans may criticize post-grunge as being derivative music that merely copies the influences of older bands rather than creating new ideas. The band Creed, for example, is often derided as a "knockoff" of Pearl Jam. Other newer music subgenres such as [nu metal](#) (to [metal](#)) and [pop punk](#) (to [punk](#)) are also criticized for similar reasons. Detractors occasionally use the umbrella term "nu rock" to describe all of these genres. However, the term has recently fallen out of favor, as there is now a considerable blurring of the line between genres; instead, most people once again use [alternative rock](#) as a catch-all term.

## Post-hardcore

**Post-hardcore**, as the name might suggest, is a musical offshoot of the [hardcore punk](#) movement. The earliest appearances of the genre were in Washington, D.C. in the mid- to late-1980s (see the era's releases on Dischord Records, for example), though it was not widely known until the early 1990s. Post-hardcore, as a musical genre, is marked by its precise rhythms and loud guitar-based instrumentation accompanied by vocal performances that are as often sung as whispered or shouted. The genre has developed a unique balance of dissonance and melody, in part channeling the loud and fast hardcore ethos into more measured, subtle forms of tension and release. It shares with its hardcore roots an intensity and social awareness as well as a DIY punk ethic, yet eschews much of the unfocused rage and loose, sometimes amateurish musicianship of [punk rock](#).

One of the most influential and prolific post-hardcore bands was El Paso's At the Drive-In. The genre also includes bands with decidedly [art rock](#) leanings such as Fugazi, Drive Like Jehu, Rites of Spring, Moss Icon, Quicksand, and Hoover.

The original post-hardcore sound became more and more difficult to find throughout the 1990s and has nearly vanished from the public eye, though the genre still thrives in more underground circles as well as in new, more radical forms. Related genres include both [emo](#) and [math rock](#), which share a common heritage with post-hardcore, though these two genres have since diverged and developed uniquely unto themselves.

## Postminimalism

**Postminimalism** is a term utilised in various artistic fields for work which is influenced by, or attempts to develop upon the work of [minimalism](#). The expression is used specifically in relation to music and the visual arts, but can also be employed in any field by which the subject is said to use minimalism as a critical reference point.

## Visual art

In visual art it refers specifically to artists who utilise minimalism either as an aesthetic or conceptual reference point from which to develop. The term does not refer to a particular movement but rather an artistic tendency. Postminimalist artwork is often associated or confused with conceptual art; frequently a work or artist can be described as both, as it is this conceptual element which regularly distinguishes it from Minimalism. Artworks often transpose reference to everyday objects or functions onto the austere formalist approach of their predecessors. However with such a diverse and disparate group there are no definite correlations between artists.

Examples of such work include pieces such as *Water-Tower* by Rachel Whiteread whereby the inside of a water-tower is cast in clear resin and displayed where the original tower stood. The purity of form found in minimalism is used, but through the application of the commonplace. An earlier example would be Eva Hesse, an artist whom developed the themes of 'the grid' and 'seriality' so often found in minimalism but through the obvious hand made approach of her works introduced an element of the human missing in the habitually machine or custom made products of minimalism. Another variant is found in the work of such artists as Tom Friedman whereby an absurdity and humour is introduced. With *Untitled* of 1992, Friedman asked a witch to curse the space above a gallery pedestal, as such displaying to the unknowing viewer simply the paradigmatic minimalist white cube, but with the knowledge of its production comes further understanding. As such there is an initial formalist response to the piece's structure; secondly there is a conceptual response. This is typical of a postminimalist approach to art production.

Other artists who may be considered postminimal include:

Eva Hesse

Damian Hirst

Mona Hatoum

Gabriel Orozco

Anish Kapoor

Felix Gonzalez-Torres

Wolfgang Laib

Damian Ortega

Charles Ray

## Music

In its general musical usage, *postminimalism* refers to that influenced by [minimal music](#). Writer Kyle Gann has more strictly used the term to define a widespread style that flourished in the 1980s and 1990s, characterized by

1. a steady pulse, usually continuing throughout a work or movement;
2. a diatonic pitch language, tonal in effect but avoiding traditional functional tonality;
3. general evenness of dynamics, without strong climaxes or nuanced emotionalism; and
4. unlike [minimalism](#), an avoidance of obvious or linear formal design.

Despite this last, minimalist procedures such as additive and subtractive process are common in postminimalism, though usually in disguised form, and the style has also shown an omnivorous capacity for absorbing influences from world and popular musics (Balinese gamelan, [bluegrass](#), Jewish cantillation, and so on).

Composers who may be considered postminimalist include:

John Adams  
Eve Beglarian  
David Chesworth  
Robert Davidson  
William Duckworth  
Graham Fitkin  
Peter Garland  
Michael Gordon  
Eleanor Hovda  
Scott Johnson  
David Lang  
Paul Lansky  
Robert Steadman  
Lois V Vierk  
Stephen Scott  
Michael Torke  
Julia Wolfe  
Evan Ziporyn

For another musical style derived from minimalism, see [Totalism \(music\)](#).

## Post-modern Classicism

**Postmodern Classical music** is a musical *style*. This type of music contains characteristics of postmodern art—that is, art *after* [modernism](#) (see [Modernism in Music](#)). It favors eclecticism in [musical form](#) and [musical genre](#), and often combines characteristics from different genres, or employs jump-cut [sectionalization](#) (such as blocks). It tends towards traditional harmonic practice while at the same time employing colorful orchestration and generally traditional serious forms. These forms usually include all the sonata-based forms such as [symphony](#), as well as traditional choral forms in which language and the poetic is placed as the most important aspect of musical lyricism.

## **The postmodern classical musical style**

While post-modern music comprised a change in the fundamental idea of what music is typically concerned with, present day classicists apply many of the lessons learned from the realism presented in art of nineteenth century romanticism to combine expressive works which generally "tell a story" in modern, contemporary terms. Thus, a contemporary classicist takes great delight in basing his music on extramusical art such as literature, poetry, the visual arts and cinema.

### **Postmodern classical techniques and their application**

Just as the periods of Mozart and Stravinsky saw an interest in building upon common practice harmonic and contrapuntal techniques, so postmodern classicism seeks to enfold everything from [ethnomusicology](#) to tonal [serialism](#) to layered orchestrations and pop/world rhythms. Any techniques associated with the eclecticism of modern music worldwide is subject to use within this style, including the most arcane and traditional. Elements from world music and even so-called popular music have also provided techniques and means of expressions within new eclectic styles.

### **The emergence of postmodern eclectic styles**

It was inevitable with the ingrown cynicism of much intellectual and emotionally sterile academic music of the second half of the twentieth century, that there would come a time when "popular music" eventually found as much if not more seriousness than so-called "serious" music. This is an outgrowth of the academic fascination with the way music looks upon the page, rather than what it sounds like. Arnold Schoenberg makes plain his own stance regarding the visual nature of western musical tradition when he spent quite a long time after the composition of the Gurrelieder avoiding music composition altogether, devoting himself to painting instead. It is little wonder the atonalists pride themselves more upon grace of line and oddness of tone in general, rather than plumbing the soul of nature for musical sounds as yet undiscovered. Thus the long arm of tradition remains long after many of these upstarts had their say, ivory tower and all. While much good has come out of the experiments of the atonalists and serialists, it is the artist steeped in the maintaining of a rich, western music

tradition which will contribute to the eventual hope of the art's advancement. One of the most notable uses of modernistic experimentation has been to create a music so detached from common mores of communication, that it has been found useful in expressing such ideals as insanity, detachment, self-absorption and abject cynicism.

A precursor to postmodern classicism would be found in the third stream style of music of the 1970's and 80's, with such popular artists as Keith Emerson, Rick Wakeman, and the band Pink Floyd.

## **Composers cited as important to postmodern classical music**

### Classical/Jazz

Nicolas Rimsky-Korsakov  
Ottorino Respighi  
Charles Ives  
Bela Bartok  
Kaikhosru Shapurji Sorabji  
Charlie Parker  
John Adams  
Steve Reich  
George Rochberg  
John Kenneth Graham

### Rock/Pop

The Beatles  
The Who  
Emerson, Lake and Palmer  
Yes  
Pink Floyd  
Frank Zappa  
Soundgarden  
Brian Eno  
Jefferson Starship  
Phish  
Widespread Panic  
Grateful Dead

## Postmodern music

**Postmodern music** is both a musical *style* and a musical *condition*. As a musical *style*, postmodern music contains characteristics of postmodern art—that is, art *after* [modernism](#) (see [Modernism in Music](#)). It favors eclecticism in [musical form](#) and [musical genre](#), and often combines characteristics from different genres, or employs jump-cut [sectionalization](#) (such as blocks). It tends to be self-referential and ironic, and it blurs the boundaries between "high art" and kitsch. Daniel Albright (2004) summarizes the traits of the postmodern style as bricolage, polystylism, and randomness.

As a musical *condition*, postmodern music is simply the state of music in postmodernity, music after modernity. In this sense, postmodern music does not have any one particular style or characteristic, and is not necessarily postmodern in style or technique. The music of modernity, however, was viewed primarily as a means of expression while the music of postmodernity is valued more as a spectacle, a good for mass consumption, and an indicator of group identity. For example, one significant role of music in postmodern society is to act as a badge by which people can signify their identity as a member of a particular subculture.

Jonathan Kramer posits the idea (following Umberto Eco and Jean-François Lyotard) that postmodernism (including *musical* postmodernism) is less a surface style or historical period (i.e., condition) than an *attitude*. Kramer enumerates 16 "characteristics of postmodern music, by which I mean music that is understood in a postmodern manner, or that calls forth postmodern listening strategies, or that provides postmodern listening experiences, or that exhibits postmodern compositional practices."

According to Kramer, postmodern music:

"(1) is not simply a repudiation of modernism or its continuation, but has aspects of both a break and an extension; (2) is, on some level and in some way, ironic; (3) does not respect boundaries between sonorities and procedures of the past and of the present; (4) challenges barriers between 'high' and 'low' styles; (5) shows disdain for the often unquestioned value of structural unity; (6) questions the mutual exclusivity of elitist and populist values; (7) avoids totalizing forms (e.g., does not want entire pieces to be tonal or serial or cast in a prescribed formal mold); (8) considers music not as autonomous but as relevant to cultural, social, and political contexts; (9) includes quotations of or references to music of many traditions and cultures; (10) considers technology not only as a way to preserve and transmit music but also as deeply implicated in the production and essence

of music; (11) embraces contradictions; (12) distrusts binary oppositions; (13) includes fragmentations and discontinuities; (14) encompasses pluralism and eclecticism; (15) presents multiple meanings and multiple temporalities; (16) locates meaning and even structure in listeners, more than in scores, performances, or composers."

# The postmodern musical style

## Modernist influences and postmodern philosophy

In the modern period, recording of music was seen as a way of transcribing an external event, as a photograph is supposed to record a moment in time. However, with the invention of magnetic tape in the 1930's the ability to directly edit a recording, and create a result which did not actually occur, made it possible for a recording to be viewed as the end product of artistic work itself. Through the 1950's, most music, even popular music, presented itself as the capturing of a performance, even if that performance was mic'ed to improve hearing of different parts.

Antecedents to this process, including the electronic music of Edgard Varèse, can be found dating back for several decades, and in 1948 Pierre Schaeffer would use tape to "compose" pieces, however it is with the advent of Rock 'n' Roll and particularly producer Phil Spector and Glenn Gould in [classical music](#) in the late 1950's that the idea of using tape to create a stand alone artistic work became more and more prevalent. However, it was with the studio recordings of the Beatles where the full use of multi-track recording and layering became common to popular music. The creation of this recording process transformed [pop music](#). Rock and [hip hop](#) both extend this process further, by using more and more sophisticated techniques to layer and mix individual tracks.

The rise of popular music created another pressure on music, which would lead to another strand of post-modernity, namely the ability to create a sufficiently large audience for works. In the Modernist view, such a connection was unnecessary - people would naturally gravitate towards "serious" music as the place where ideas could be presented in musical form, rather than "popular" music, which was seen, as the Victorians had seen it, as subsidiary to the more "weighty" genres. As with Post-modern philosophy, post-modern music questioned whether this hierarchy of "high" and "low" culture was correct or appropriate.

A third strand of post-modern music is a change in the fundamental idea of what music is supposed to be "about". As the period wore on, the idea that "music is mainly about itself", became more and more firmly entrenched. Reference was not merely a technique, but the substance of music. Musical works allude to other musical works, not because they can, but because they must. This is part of the general change from [Modernism](#) which saw the basic subject of art being the most pure elements of musical

technique - whether intervals, motivic fragments or rhythms - to [Postmodernism](#) which sees the basic subject of art being the stream of media, manufactured objects, and genre materials. In other words, post-modernity views the role of art to be commenting on the consumer society and its products, whereas modernism sought to convey the "reality" of the universe in its most fundamental form.

## **Postmodern techniques and their application**

The ability to [record](#) and mix, and later sample, would feed into this idea, with the inclusion of "found sounds", snippets of other recordings, spoken voices, noises, and sampled tableaux into music. Pioneers include Edgard Varèse, who began to experiment with the possibilities of new electronic instruments, using [synthesizers](#) and tape loops. John Cage used tapes, radios, and record players to reproduce prerecorded sounds in a wide variety of ways in works such as the series "Imaginary Landscape" and "Europera." Early examples in popular music include Abbey Road, Pink Floyd's Meddle and the "dub" style of music of Lee 'Scratch' Perry. As digital technology has made sampling easy, it has become very common in [hip hop](#), and is taken to its extreme in [Bastard pop](#).

As composers became interested in incorporating pre-existing sounds, they also looked to emulate the effect using only conventional instruments, by extensive quotation from pre-existing material. Quotation and reference to earlier work in principle was not new, as composers such as Richard Strauss and Charles Ives are famous for its use in their tone poems and symphonies nearly a century before and after, and it is essentially the basis behind organum, parody mass, and other early musical genres. However, the completeness of the collage or thorough use of a pre-existing piece went far beyond earlier composers' brief quotations or use of a *cantus firmus*. George Rochberg has used pieces from the classical repertoire as the basis for many of his compositions, essentially composing a frequently ironic commentary on an earlier work. Olivier Messiaen's "Oiseaux Exotiques" and "Catalogue d'Oiseaux" are collages of bird songs, precisely notated by species in the score, gathered together in a musical form.

Another often cited post-modern musical collage is the third movement of Luciano Berio's "Sinfonia," which uses the scherzo of Gustav Mahler's "Resurrection Symphony" as a musical foundation, and text from Samuel Beckett's "The Unnameable," but adds quotations spanning classical repertory, as though they were sampled or found haphazardly by spinning a radio dial. Berio himself, though, in "Two Interviews" and elsewhere, rejects and distances himself from notions of "collage," arguing that each reference is hardly haphazard; rather, each quotation carefully evokes the

context of its original work, creating an open web, but an open web with highly specific referents and a vigorously defined, if self-proliferating, signifier-signified relationship. "I'm not interested in *Italic text*collages/*italic text*, and they amuse me only when I'm doing them with my children: then they become an exercise in relativizing and 'decontextualizing' images, an elementary exercise whose healthy cynicism won't do anyone any harm," Berio tells interviewer Rossana Dalmonte, in what reads like Berio attempting to distance himself from composers like John Zorn or Uri Caine, for whom juxtaposition itself can provide meaning. Berio's self-distinction, while it does not need to be believed by analysts or musicians, nevertheless runs counter to the later postmodern practice of mixing "high" and "low" found objects "haphazardly" or without regard to an affirmative or negative sense of constructive quality. In other words, it is not only the composition of the "collage" that conveys meaning; it is the particular composition of the component "sound-image" that conveys meaning. (And in the sense Berio clings to the notion of music conveying an affirmative, even extra-musical, meaning, perhaps he, or other "academic" composers like Messiaen or Stockhausen, is not so postmodern in the sense that it is, for better or worse, used in current critical circles to convey some sort of eternal, neutral equivocation between musical texts.)

A related aspect of post-modern classical music was an interest in reducing the role of a composer in musical composition, not by the use of pre-composed material, but instead by the use of random procedures in composition and performance. This began as a reaction to elements of late [modernism](#), specifically the modernist project of [atonality](#), begun by Arnold Schoenberg, which had been taken to its logical conclusion, total serialism, by such late modernist composers as Pierre Boulez, Karlheinz Stockhausen, and others. A group of composers, including Boulez, Stockhausen, and especially John Cage began introducing elements of 'chance' in their music to create aleatory music. Cage is famous for using the I Ching to direct his compositions, essentially removing himself from the compositional procedure. On the other hand, his piece 4'33" is performed by a silent pianist, and is said to consist entirely of environmental noise. Aleatory music began to blur the boundaries between the composer and the audience, and between the musician and the environment, which was a postmodern trend.

At the same time, there was also a new interest in non-Western music, early music (typically meaning pre-[Baroque](#)), and popular music. This attention to all musical traditions is a general post-modern feature; for them the division between "high" and "low art" is illusory. György Ligeti found rhythmic elements of Pygmy song that fit his own sensibilities, and they influenced his later compositions. Olivier Messiaen studied Indian music and [medieval music](#) thoroughly, and some of his scores make reference to

Indian tala or plainchant. Tan Dun, born in China, has sought ways in his compositions to unite the Chinese and Western strands of music. Steve Reich studied West African drumming, Indonesian gamelan, and Hebrew cantillation, and his works are sometimes compared to Perotin or [rock music](#). Further eroding the wall between "art music" and "popular music," a number of [DJs](#) have [remixed](#) his work on the album *Reich Remixed*. Glenn Branca and Rhys Chatham have worked with rock musicians and combined the techniques of classical and popular music.

The approach of post-modern and modern composers with regard to foreign, obsolete or popular musical idioms differs substantially from the "exotic" references of earlier composers. One key difference is the thoroughness of the study. Mozart's "Rondo alla Turca" is supposedly influenced by Turkish music, but it is a superficial and stereotypical reference imposed in a pure classical form. Post-modern composers have continued the modern trend begun by Béla Bartók in making systematic studies and have generally sought in earnest to understand the underlying principles of exotic music by years of study or performance in the idiom. The result is often more subtly incorporated into the composer's vocabulary, so much that one may not imagine the source of the foreign elements until they are pointed out.

## **The emergence of postmodern styles**

In the late 1950s and 1960s began both a series of new styles, influenced by post-modern conditions, and an incorporation of post-modern elements into existing styles.

In popular music, [jazz](#), [rhythm and blues](#), and early rock and roll, all begin to become shaped by not only new technology, but a fundamentally different way of producing recordings. Instead of trying to achieve a rounded three-dimensional sound in imitation of the concert experience, recordings increasingly brought vocals to the fore and made the rest of the sounds into a single "wall" behind the main track. By the mid 1960s this "wall of sound" style was the standard of most commercial radio. The full incorporation of the studio mixing techniques, electronics and use of layering would lead to the establishment of [rock](#). "Pop" music, as a specific sub-genre, would eschew the prominent electric-guitar sound of rock in favor of synthesizers, acoustic instruments, and more subdued rhythm sections.

At the same time, [dance music](#), particularly the "[disc jockeys](#)" at urban parties, was creating a different road into post-modernity in music. Their approach was to take records on turntables, and by hand control the speed of the turntable, and using the mixing board as an instrument, add reverb,

suburb and other sound effects. At the same time they would speak into the microphone, using the dance tracks as a background for their own speech, which would lead, eventually to eventually evolving into the DJing and MCing of [hip hop music](#). Further evolution in the 1990s [turntablism](#) movement focused on the DJing aspect of hip hop, with music made almost *entirely* of samples. DJ Shadow is the most well known turntablist DJ, but Q-Bert and Mixmaster Mike of the Invisibl Skratch Piklz, DJ Spooky and Cut Chemist were also highly influential.

In classical music, [minimalism](#) is usually regarded as the first "post-modern" style. Minimalism was in part a reaction to the perceived inaccessibility and sterility of modernist classical music of such composers in the tradition of Arnold Schoenberg, Pierre Boulez, the early John Cage, and others among the avant-garde. The earliest minimalist composers included LaMonte Young, who had studied under Schoenberg and incorporated elements of serialism in his early minimalist works, and Terry Riley, who was largely influenced in his composition by the repetitiveness of Indian music and [rock music](#).

Minimalism and related postmodern musical styles laid the groundwork for re-integrating popular and 'highbrow' music, which had been separated since the rise of modernism. By the 1970s, avant-garde rock and pop musicians (such as Suicide and Throbbing Gristle) had become interested in electronic instrumentation, the use of Eastern rhythms and unconventional instruments (for example the use of the sitar by the Beatles) and drone-like or repetitive music, stylistically similar to minimalism (such as the music of The Velvet Underground, Tangerine Dream, Kraftwerk, and later, Stereolab). Tape loops also prefigured the use of 'sampling' in [techno music](#) and [house music](#), and the 'scratching' of [hip hop music](#). Moreover lessunder the 'ironic' 'cut and paste' approach of Stockhausen's later work (which used elements from both 'high' and 'low' art) was highly influential on many pop and rock composers in the 1970s, 1980s, and 1990s: see, for example, or The Residents.

Postmodern [jazz](#), also, has influenced contemporary pop/rock music. This has developed from two main sources, the innovations of Charlie Parker in the immediate post-war period, and (again) Arnold Schoenberg: this time, however, not so much his serial work as his pre-WWI 'atonal' style, where all forms of tonality were abandoned. The merging of these two traditions led to the development of [free jazz](#) in the 1950s by Ornette Coleman who went onto inspire a new generation of musicians in the 1960s and 1970s: for example, John Coltrane, Albert Ayler and Sun Ra. Free jazz was hugely influential on many avant-garde rock musicians: for example Captain Beefheart, and, in a completely different way The Stooges and Lou Reed (who eventually worked with Coleman in 2003 on the *Raven* album). These artists themselves were influential on a

generation of [punk](#) musicians in the 1970s and 1980s (see for example The Lounge Lizards and The Pop Group). In the 1970s Miles Davis repaid the compliment by incorporating elements of [funk](#) and [rock](#) into his sound, most notably on his *Bitches Brew* album. Again, this has been hugely influential on contemporary rock and jazz.

[Post-rock](#) is a term that has begun to be used for bands that used "rock instrumentation for non-rock purposes, using guitars as facilitators of timbres and textures rather than riffs and power chords" as was originally described by Simon Reynolds in issue 123 of *The Wire* (May 1994).

Although the concept may refer to bands having dissimilar music, most post-rock music is mainly instrumental and of an introspective sort.

The number of bands within the post-rock movement has increased significantly during the last years. Bands such as Mogwai, Tortoise, Explosions in the Sky, Mono, Sigur Rós, múm and Godspeed You! Black Emperor have become fairly known. Their melodic, rich instrumentalization and strong emotional content have become the epitome of most post-rock music composed nowadays.

## The postmodern musical condition

As a musical condition, postmodern music is music situated *after* the modern age, during the present period, where music has become valued primarily as a commodity and a culture, rather than a form of idealized [modernist](#) expression for its own sake. Some authors have suggested that the transition in music from modern to postmodern occurred in the late 1960s, influenced in part by [psychedelic music](#) and the late Beatles albums. (Sullivan, 1995, p.217.) In the 1970s, the postmodern condition continued with the advent of [disco](#), [heavy metal](#), [hip hop](#), and a newly-commodified [country music](#).

The difference between modern music and postmodern music then is that modernist music was characterized by a focus on musical fundamentals and expression. In postmodern music, however, the commodity being sold by record companies and pop stars is not the fundamentals of the music, but the cultural image surrounding the music, which reverberates through film, television, and other media.

## Causes and theories of post-modernity in music

For some, post-modernity is degenerate modernity, the critic Theodor Adorno being a prominent example of the idea that trends of music after [serialism](#) represent the banalization of and regression from modernity.

Others follow Fredric Jameson, who holds that post-modernity is the condition of late capitalism and the decline of identity creating metanarratives, such as nation-states. Some bands which may be considered post-modern such as Radiohead and Godspeed You! Black Emperor have indeed presented a strong opposition to current capitalism ideals and state of western society.

Another theory advanced is that post modernism is the explicit reaction to the rise of a mass production consumer society, and is linked to the need to create coherence and aesthetic value from the artifacts and patterns of that society.

As with modernity and postmodernity in general, modernity may be considered to not have yet ended, and thus there is no postmodern condition.

Dutch's Ultra - German's Neue Deutsche Welle - Brazilian's Dark

[Post-punk revival](#) - [Punk rock](#) - [Industrial music](#) - [Alternative Rock](#) - [Gothic rock](#) - Positive punk

**Post-punk** was a musical movement beginning at the end of the 1970s, following on the heels of the initial [punk rock](#) "explosion". For the more recent "post-punk" movement in rock music, see [post-punk revival](#).

## History

During the first wave of punk, roughly spanning 1974–1978, bands such as the Sex Pistols, The Clash, The Ramones, and The Damned began to challenge the current styles and conventions of rock music by stripping the musical structure down to a few basic chords and progressions with an emphasis on speed and attitude. Yet as punk itself soon came to have a signature sound a few bands began to experiment with more challenging musical structures, lyrical themes, and a self-consciously art-based image, while retaining punk's initial iconoclastic stance.

Typically more introverted, complex, arty, and [experimental](#) than classic punk rock or the more pop-oriented [New Wave music](#), post-punk laid the groundwork for [alternative rock](#) by broadening the idea of what punk and underground music could do, incorporating elements of [Krautrock](#), Jamaican [dub music](#), American [funk](#), and studio experimentation into the punk rock genre. It found a firm place in the 1980s college rock scene, and left behind several major sub-genres. However, post-punk's biggest influence remains in the vast variety of sounds and styles it pioneered, many of which proved very influential in the later alternative rock scene.

Classic examples of post-punk outfits include Gang of Four, Joy Division, Echo & the Bunnymen, and Wire. Bands such as Crass and The Fall also came within the scope of post-punk, as with several outfits formed in the wake of traditionally punk rock groups: Magazine from Buzzcocks, for instance, or Public Image Ltd. from the Sex Pistols. A list of predecessors to the post-punk genre of music might include Television, whose album *Marquee Moon*, although released in 1977 (when the punk genre was just forming), is considered definitively post-punk in style. (However, many would argue that bands such as Television, Talking Heads, and the Voidoids were all core punk, as it was the raw originality and diversity of sound and style that was punk.) Other groups, such as The Clash, remained predominantly punk in nature yet inspired and were inspired by elements in the post-punk movement.

Championed by late night BBC [disc jockey](#) John Peel and record label/shop Rough Trade (amongst others, including Postcard Records, Factory Records, Falling A Records, Fast Product, and Mute Records), "post-punk" could arguably be said to encompass many diverse groups and musicians. The original post-punk movement took place largely in England, with significant scenes throughout the world, though North America and other non-European bands weren't often recognized

worldwide (with some notable exceptions, such as North Americans Pere Ubu, Lydia Lunch, Suicide, early Hüsker Dü and Mission of Burma).

The original post-punk movement ended as the bands associated with the movement moved away from its aesthetics, just as post-punk bands had originally left punk rock behind in favor of new sounds. Many post-punk bands, most notably The Cure and Siouxsie & the Banshees, evolved into [gothic rock](#) (formerly a style of the larger post-punk movement) and became identified with the [goth](#) subculture. Some shifted to a more commercial New Wave sound, while others were fixtures on American college radio and became early examples of alternative rock.

## Post-punk revival

The **post-punk revival** is a movement in modern [rock](#) music, being part of the larger [indie/garage rock](#), [punk](#), and [dance](#) genres. The post-punk revival draws in part on the conventions of the original [post-punk](#) sound from the early 1980s, yet is also an extension of and reaction to the more pop-oriented punk music of the 1990s. The movement began and is most prominent in English speaking countries such as the US, the UK, and Australia, and has been especially tied to the New York City music scene.

## History of the post-punk revival

Originally, the term "post-punk" was coined to describe those groups which in the late seventies and early eighties took punk and started to experiment with more challenging musical structures, lyrical themes, and a self-consciously art-based image, while retaining punk's initial iconoclastic stance. Classic examples of post-punk outfits include Gang of Four, Joy Division, The Raincoats, and Wire.

At the turn of the century, the term "post-punk" began to appear in the music press again, with a number of critics reviving the label to describe a new set of bands that shared some of the aesthetics of the original post-punk era. A reevaluation of the sonic conventions from that era, this second wave of post-punk incorporates elements of the dance and [indie](#) music of the late-1980s and 1990s in much the same way that the original post-punk movement was informed by the [krautrock](#), [dub](#), and [disco](#) music of the 1970s.

## The dual meaning of post-punk

The use of the term "post-punk" to describe two distinct waves of rock music, despite their many differences, has stuck. It is legitimized not only by the broad consensus that has emerged to call the groups listed here post-punk but also by the historical positions of each movement, relative to the dominant punk rock music of their respective eras. The first form of post-punk was seen as a response to late-1970s punk rock; the twenty-first century variant as a response to 1990s punk rock.

Earlier attempts to revive the term "post-punk" were not successful. In the early-1990s some critics referred to groups like Fugazi and Girls Against Boys as "post-punk" without this label gaining widespread use. These groups are now widely considered [hardcore punk](#) or [post-hardcore](#).

Unlike the original post-punk artists, who were often deliberately difficult and obtuse, many bands of the post-punk revival have been more accessible and radio-friendly, leading some to claim that they are not stylistic torchbearers of the post-punk style but are instead simply a variant within the dominant commercial style of [rock music](#).

**Post-rock** is a [music genre](#) characterized by nontraditional use of instruments and high musical density. Although firmly rooted in the [indie](#) scene, post-rock's elusive and complex style bears little resemblance musically to [indie rock](#) or other styles more commonly associated with the scene. The connection with the indie scene is more closely related to the fact that post-rock music is often recorded on independent [labels](#), and therefore sharing the same level of obscurity.

The term was coined by Simon Reynolds in issue 123 of *The Wire* (May 1994) to describe a sort of music "using rock instrumentation for non-rock purposes, using guitars as facilitators of [timbres](#) and textures rather than riffs and power chords."

Originally used to describe the music of such bands as Cul-de-Sac, Stereolab, Disco Inferno, Seefeel, Bark Psychosis and Pram, it spread out to be frequently used for all sorts of [jazz](#)- and [Krautrock](#)-influenced, instrumental, [electronica](#)-added music made after 1994. Bands from the early 1990s such as Slint, or earlier, such as Talk Talk were influential on this genre.

As with many musical genres, the term is arguably inadequate: it is used for the music of Tortoise as well as that of Mogwai, two bands who have very little in common besides the fact that their music is largely instrumental.

## History of the scene

The band Tortoise was among the founders of the movement. After the second Tortoise LP *Millions Now Living Will Never Die*, the band became a post-rock icon. After many bands (e.g., *Do Make Say Think*) began to record music inspired by the "Tortoise-sound", and were often described as post-rock.

In the late nineties, Chicago, Illinois, became the home base of many different groups. John McEntire (of Tortoise) became an important producer for lots of them, as well as Jim O'Rourke (of *Brice-Glace*, *Gastr del Sol* and many more). *Godspeed You! Black Emperor!* (from Montreal, later renamed *Godspeed You! Black Emperor*) and *Mogwai* (from Glasgow) were among some of the influential bands of the scene to arise during this time. Post-rock began to range from the slow, guitar-based ambience of *Boxhead Ensemble*, through the mid-tempo rock of *Radiohead*, to the up-tempo electronica of *Stereolab*.

By the early 2000s, the term had started to fall out of favor. It became increasingly controversial as more critics outwardly condemned its use. Even the bands for whom the term was most frequently assigned (for example, *Cul-de-Sac*, *Tortoise*, and *Mogwai*) rejected the label that it placed on them. The wide range of styles covered by the term most likely robbed it of its usefulness. Bands like *My Bloody Valentine* are often referred to as post-rock thanks to the overuse of the term when categorizing rock bands with a more experimental edge to them.

Today, despite criticism of the term, the post-rock genre lives on. *Explosions in the Sky* and *Mono* are among the post-rock bands which have recently risen in popularity, due to the emphasis on [melody](#) and emotional content within their music. Some relatively "commercial" bands such as *Yourcodenameis:milo* and *Hope Of The States* have adopted the quiet-loud-quiet-loud songwriting approach used by bands such as *Mogwai*. However, the movement hasn't caught on significantly in mainstream music. Many new post-rock bands remain in the underground; notable examples include *Akira*, *Because of Ghosts* and *Red Sparowes*.

## The post-rock sound

As mentioned above, the post-rock sound incorporates a wide variety of musical genres, such as [ambient](#), [jazz](#), [electronica](#), [experimental](#), and sometimes even [rock](#) itself. The post-rock approach to music, including emphasis on instrumental work and sound textures, is similar to the earlier [New Age](#) movement, which came out of the modern folk tradition. Another genre closely related to post-rock is [math rock](#), characterized by more percussive timbres, more dissonant harmonic gestures, and more prog-influenced arrangements.

[Lyrics](#) are often omitted from post-rock music, however this does not necessarily mean vocals are always absent. Some post-rock bands employ vocals as an instrument, incidental to the overall sound, rather than the more traditional use where clean, interpretable vocals are important for poetic and lyrical meaning. Post-rock vocals are usually soft and droning, and can be infrequent or present in irregular intervals. Jessica Bailiff is a good example of this style of droning vocals. Sigur Rós, a band known for their distinctive vocals, have even fabricated a language which they call 'Hopelandic', described by the band as *"a form of gibberish vocals that fits to the music and acts as another instrument"*.

Wider experimentation and blending of other genres have recently taken hold in the post-rock scene. Many bands such as Red Sparowes and Pelican have been fusing [metal](#) with post-rock, the Appleseed Cast's Low Level Owl project of 2001 saw the previously [emo](#) band totally expand their sound with an ambitious double-album suite of atmospheric songs and [ambient](#) instrumentals. Some post-rock bands such as Bossk have even been using vocals similar to those found in [death metal](#). Bands such as 65daysofstatic and From Monument to Masses incorporate electronica and sampling elements into their tracks. The lines between post-rock and [post-hardcore](#) are also slowly being blurred by bands like Oceansize, Peace Burial at Sea and Youthmovie Soundtrack Strategies. Other bands such as Rachel's and Clogs combine post-rock with classical music.

# Power ballad

**Power ballad** is the name given to a certain genre of [songs](#) that were frequently included on [arena rock](#), [hard rock](#) and [heavy metal](#) albums in the 1970s and 1980s though the style has evolved into more modern forms since.

These songs often explored various sentimental themes such as yearning and need, love and loss. In their generally confessional nature they were positioned as atypical to metal's more usual lyrical themes of hedonism, violence, or the occult. The term power ballad is a misnomer, as they are not ballads at all but are typically love songs. In the years when record companies first considered the marketability of power ballads, they probably figured that the phrase *power ballad* was more accessible and appealing than the phrase *metal love song*.

## Format

Typically, a power ballad begins with a soft [keyboard](#) or [acoustic guitar](#) introduction. Heavy [drums](#) and distorted [electric guitars](#) don't enter into the arrangement until, perhaps, the chorus or even later in the song, in the more modern takes (Such as Creed's "With Arms Wide Open" or Evanescence's "My Immortal"). The electric guitar parts usually take the form of simple root/fifth chords which sustain until the next chord change, but screaming, melodic guitar solos are also important markers of this genre. The interplay throughout the arrangement between "clean" [timbres](#) and distorted ones is crucial to the creation of emotional tension in the power ballad aesthetic.

## History

Power ballads came into popularity initially at the insistence of a record company in hope of scoring a Top Forty hit and in the genre's formative years, were written only grudgingly by band members. However in recent years, power ballads have been re-imagined (as has much of 1980s culture) as something "authentic" rather than something "manufactured" (i.e. pushed onto bands by record labels). For instance, VH1's advertising copy for its top-25 countdown show on power ballads states: "These bands had a fantastic sense for what their fans wanted. In most cases their record labels and managers didn't want them to do these songs." In any event, power ballads were often a band's most (or only) commercially successful

songs. Because of the perceived superficiality of their sentiment, though, power ballads were consistently despised by music critics, who rejected the way metal musicians actively borrowed the musical codes normally reserved for more "authentic" styles of rock.

An important precursor for the form was The Carpenters' "Goodbye to Love" single in 1972, which featured a fuzz-tone screaming guitar solo (by Tony Peluso) in the middle of a Middle of the road vocal.

Power ballads originated in the 1970s with [arena rock](#) bands like Styx, Boston, REO Speedwagon and Journey; it also existed in contributions from the exponents of Power Pop. Indeed, early examples of power ballads would be Don't Wanna Say Goodbye by the Raspberries from its 1972 album *The Raspberries*, and Styx's "Lady" from its 1973 album *Styx II*. As a solo artist, Raspberries lead singer and chief songwriter Eric Carmen created the #2 hit *All By Myself* in 1976, which was subsequently covered by artists such as Shirley Bassey, Celine Dion, and El Divo.

Later development of the style from the mid-1980s to the early 1990s is exemplified by Scorpions' "Still Loving You", Dokken's "Alone Again"; Skid Row's "I Remember You"; Night Ranger's "Sister Christian"; Mötley Crüe's "Home Sweet Home"; Cinderella's "Nobody's Fool" and "Don't Know What You Got (Till It's Gone)"; Guns N' Roses' "Don't Cry"; Whitesnake's "Slow and Easy" and "Is This Love"; White Lion's "Wait"; Great White's "Rock Me", "Save Your Love", "The Angel Song" and "House of Broken Love"; Van Halen's "Love Walks In"; Poison's "Every Rose Has Its Thorn"; Extreme's "More Than Words"; Aerosmith's "Angel"; and Warrant's "I Saw Red". For some 1970s arena rock artists, the power ballad was also responsible for helping to revive their careers in the 1980s; examples include Heart's "These Dreams" and Cheap Trick's "The Flame".

The term "power ballad" is still used to this day in reference to songs such as Avril Lavigne's "I'm with You", Lifehouse's "Hanging by a Moment", Velvet Revolver's "Fall to Pieces", Kelly Clarkson's "Because of You", Nickelback's "Someday", Slipknot's "Vermillion Pt. 2", Stone Sour's "Bother", Black Label Society's "In This River", and Staind's "It's Been a While". Even thrash bands like Metallica had a few with "Nothing Else Matters", "The Unforgiven", "Fade to Black" and "Welcome Home (Sanitarium)"; Testament's "The Ballad", Metal Church's "Watch the Children Pray", and Pantera with "Cemetery Gates" and "This Love".

## **Present Use**

Occasionally, the term *power ballad* is applied more generally to earlier rock songs which start slowly and quietly and then gradually crescendo to a powerful, climactic end. This usage is far less common, however, and

seems to be a retroactive application of the genre's name to pre-1980s album-oriented rock songs such as Led Zeppelin's "Stairway to Heaven," Lynyrd Skynyrd's "Free Bird," and Aerosmith's "Dream On", which vaguely fit the power ballad aesthetic.

Generally, a power (or rock) ballad is considered suitable for [slow dancing](#) because of its slow beat.

**Typical instruments:** Vocals - [Electric guitar](#) - [Bass guitar](#) - [Drums](#) - [Keyboards](#)  
**Mainstream popularity:** Medium to Large

[Timeline of heavy metal](#)

**Power metal** is a style of [heavy metal music](#) with the aim of evoking an "epic" feel, often within a fantastic or (less often) symphonic context. There is some dispute about the term, which can refer to two different, but related styles: one pioneered and largely practiced in North America, and one based in Germany and Scandinavia. In contemporary usage, "power metal" generally refers to the European style.

## American power metal

American power metal, like European power metal, was influenced by Rainbow, Iron Maiden, Judas Priest, Dio, Queensrÿche, Plus Ultra, and Helloween. Some consider modern American bands like Iced Earth and Nevermore to be the descendants of this style, but others claim that the movement has ended, swallowed by better known styles such as Thrash and European power metal. Others consider the genre in America on the rise again, with fledging American power metal bands in places such as New York (home to Manowar, Zandelle, Gothic Knights, Twilight Odyssey, and pioneering NY band Virgin Steele). Kamelot, who originated in the state of Florida, has recently emerged as a forerunner in popular power metal bands with the release of their album *The Black Halo* (with guest appearances from Dutch Simone Simons, vocalist for the Dutch Symphonic metal band Epica, and the lead vocalist of Norwegian Symphonic Black Metal band Dimmu Borgir, Shagrath). It should be noted however that in the musical sense, Kamelot is very much a European power metal band. Following Kamelot, the Nebraska-based power metal band Cellador was signed August of 2005 to Metal Blade Records, signalling a return of the style by a homegrown band to a noted record label in America, although their sound is more similar to European power metal.

## European power metal

In the mid-1980s, European bands such as Helloween (Germany) and Europe (Sweden) put even more attention to the melodic development of the songs. Helloween mixed fast speed metal riffs with melodic ones and added Iron Maiden-like powerful vocals, further cleaning the sound. Their albums *Keeper of the Seven Keys, Part 1* (1987) and *Keeper of the Seven Keys, Part 2* (1988) are generally regarded as a milestone of this genre. Subsequently, European-style "happy metal" has spread across the continent (particularly to Finland) and worldwide, though it is comparatively unpopular in the United States, United Kingdom and other English speaking countries.

Recently, however, many power metal bands have abandoned the "happy-metal" sound of their predecessors, and have adopted a more [epic](#) sound combined with the power metal core. Bands such as Blind Guardian have combined their classic power metal sound with an orchestral background as Rhapsody or Angra have done.

### Musical characteristics

Power metal, as the term is used today, places primary importance on an epic sound, usually at high speeds, primarily due to its [speed metal](#) roots, and with catchy melodies. Whereas most rock lyrics focus largely on "the real world" - personal experience, historical incidents, social commentary, etc. - power metal often treats epic, cosmological or metaphysical themes. Many power metal songs draw inspiration from religion, science fiction, mythology, and fantasy, and they tend to be more optimistic than most metal lyrics.

Power metal vocals are generally "clean", as opposed to the growling vocals that characterise [death metal](#), and are delivered by a trained vocalist. Following in the tradition of Bruce Dickinson and Rob Halford, power metal vocalists tend to sing in a high register and often in falsetto. Some singers, such as Hansi Kürsch of Blind Guardian, record multi-layered vocals reminiscent of Queen. Because of the primary importance of vocals in power metal, vocalists generally do not double as guitarists as in other styles of metal, which is why Hansi Kürsch stepped down as bassist for Blind Guardian after their album "The Forgotten Tales"; Hansi said that he wanted to focus on enhancing his vocals both in and out of the studio. This is also the case as to why Kai Hansen recruited Michael Kiske for

Helloween after Kai himself sang on the first two Helloween albums. When Kai formed Gamma Ray with Ralf Scheepers, his singing took a back seat as Ralf fronted the band. Although, after Ralf quit the band, Kai returned to singing and currently is both the vocalist and the lead guitarist of the band.

Power metal guitarists and bassists generally play rapid streams of notes, but change [chords](#) comparatively slowly, with a harmonic tempo of once per measure or slower. Fast and demanding guitar solos, however, are almost guaranteed.

Power metal drummers generally play with two bass drums for added speed, often playing a constant stream of sixteenth notes with snare drum accents on the beat. Some bands defy this formula, but it is surprisingly universal.

Many bands also play with a keyboardist, but keyboards are not generally a musical focus. A few, such as the Italian band Rhapsody, have also been known to record with more symphonic elements. Rhapsody actually calls their style of music "Hollywood Metal," emphasizing its resemblance to modern [film scores](#).

This style is most popular in Europe, Japan, and some countries of South America (including Brazil, Venezuela, Argentina and Chile), and has a growing popularity in certain parts of North America.

## Power noise

**Power noise** (also known as **powernoise**, **rhythmic noise**, "**noize**" and occasionally as **distorted beat music**) is a subgenre of [industrial music](#) that takes its inspiration from some of the more structured and distorted early industrial acts, such as Esplendor Geométrico. There are also influences from [hardcore techno](#), [noise](#) and [technoid](#). The term "power noise" was originally coined by Raoul Roucka in 1997, who records as Noisex, with the track "United (Power Noise Movement)". Typically, power noise is based upon a distorted kick drum from a drum machine such as a Roland TR-909, uses militaristic 4/4 beats, and is usually instrumental. Sometimes a melodic component is added, but this is usually secondary to the rhythm. Power noise tracks are typically structured and danceable, but are known to be occasionally abstract. This genre is showcased at the annual Maschinenfest festival in Krefeld, Germany, as well as at Infest in Bradford, UK.

The term "power noise" should not be confused with the term "power electronics", which is a subgenre of noise.

## Power pop

**Power pop** is a long-standing [musical genre](#) that draws its inspiration from 1960s British and American pop music. Musically the style is characterized by strong melodies, crisp vocal harmonies, economical arrangements and prominent guitar riffs, with instrumental solos kept to a minimum, and blues elements largely downplayed. Usually groups hew to the traditional rock band instrumentation of one or more electric guitars, electric bass guitar, and drum kit, with perhaps electric keyboards or synthesizers added. Badfinger's "No Matter What" (1970), The Raspberries' "Go All The Way" (1972), and The Knack's "My Sharona" (1979) are some of the most commercially successful singles best representative of the power pop genre. While its cultural impact has waxed and waned over the decades, it is among rock's most enduring subgenres: a listener who has heard the '60s smash "A Hard Day's Night" by The Beatles or the 2003 hit "Stacy's Mom" by Fountains of Wayne has heard power pop.

## Formative years: 1960s - early 1970s

The term was coined in an interview with Pete Townshend of The Who in 1967, in which he said "power pop is what we play". As early as 1965, the Everly Brothers were playing music that can be called power pop; their "I'll See Your Light" displayed jangling guitars and an oblique harmonic approach that built upon the innovations of The Beatles and The Byrds. Those groups, along with The Who, are often cited as the progenitors of power pop. The Who, inspired by the melodicism of The Beatles and the driving rhythms of American R&B, put out several songs in the early "Mod" phase of their career (1965-1966) that can be considered the first true power pop songs: "I Can't Explain", "The Kids Are Alright", "I'm a Boy", "Happy Jack", "So Sad About Us", and in 1967, "Pictures of Lily". All of these songs are propelled by Keith Moon's aggressive drumming and Pete Townshend's distinctive power chords but also hold strong melodies and euphonic harmonies. The Beatles took inspiration from The Who's contemporary singles and released such hard-edged but melodic mod rockers as "Paperback Writer" and "Day Tripper" in the mid '60s. Many groups that arose in the wake of The Beatles' success were also important in the evolution of the style, such as the Left Banke, The Beau Brummels, the Knickerbockers and The Zombies.

Modern power pop gained momentum in the late '60s with the first recordings by the British group Badfinger (though it must be pointed out that at this time, bands and recordings were not yet classified as "power pop"). Badfinger singles such as "No Matter What," "Baby Blue" and "Day After Day," all recorded around 1970, were the template for the power pop that followed in the late 1970s. In the early '70s the form was further codified by the work of The Raspberries (who may have been the first band to earn the appellation, in a mid-1970's article in Rolling Stone Magazine), Big Star, Blue Ash, Artful Dodger, Dwight Twilley and Todd Rundgren. At this stage, groups performing music later to be termed "power pop" were nearly all American, and the first albums by Big Star and The Raspberries are still considered among the genre's essential recordings. Although Rundgren and The Raspberries achieved some chart success during the period, Big Star spent years relegated to cult status, earning a wider name only after being extolled in the '80s by bands like R.E.M. and The Replacements. Regardless of chart success, many of these early 1970s bands who deliberately incorporated British Invasion influences in their music were considered strongly out-of-fashion in a rock music world dominated by soft rock artists like The Carpenters, the singer-songwriters such as Carole King, and hard rock groups like Deep Purple or Led Zeppelin.

## Commercial peak: late '70s - early '80s

### USA

However, in the late '70s and early '80s, spurred by the accompanying, contemporary success of [New Wave](#) and [punk rock](#) (music which was similarly driving and stripped-down) Power pop enjoyed its most visible and prolific period, with American groups like dB's, Cheap Trick, The Knack, The Romantics, 20/20, Paul Collins Beat and Shoes, among countless other bands, springing upon the rock music scene. These late 1970s bands -- many of whom were now specifically referred to as "power pop" -- had as their immediate and most important influence the early 1970s bands like Badfinger and the Raspberries, rather than the British Invasion bands that were the genre's original influence. These new power pop bands favored a leaner, punchier, more punkish attack than their early 1970s counterparts. Perhaps the most successful power pop single of all-time, The Knack's "My Sharona", notched six weeks in the number one position atop the Billboard Hot 100 in 1979. Cheap Trick's "I Want You to Want Me" was another monumentally successful power pop single of the era.

### UK

These American groups had British contemporaries, but the term "power pop", as used in the UK, referred to a somewhat different style of music. It was commonly applied to British groups such as The Jam--for several years in the late '70s and early '80s the most popular group in Britain--and groups that followed in The Jam's wake such as The Vapors, The Jags, and The Chords. These groups have all been variously described as "[mod revival](#)", "[punk](#)", "[new wave](#)", and "power pop". Lacking the influence of American pioneers such as Big Star and The Raspberries, these bands were rather inspired by '60s beat/British Invasion groups, particularly The Who and The Beatles, and, spurred by contemporary punk aesthetics, speeded up the pace.

Other UK artists of the late '70s commonly identified as power pop were new wave groups like XTC and Elvis Costello & The Attractions. Neither group sported the mod image or overt '60s influence of The Jam and their followers, nor the Big Star/Raspberries-derived sound of the US groups at the time, but both played driving, melodic music. Similarly, American new wave group Blondie, which had a massive following in Britain, was often labelled power pop in the UK press.

Finally, a handful of successful groups in the UK at the time did boast the traditional power pop sound as inspired by The Raspberries and Big Star, most visibly The Records and Bram Tchaikovsky. Singles from these groups, such as The Records' "Starry Eyes", and Bram Tchaikovsky's "Girl Of My Dreams", rivaled or even surpassed their American counterparts in terms of capturing the essential elements of power pop. Unsurprisingly, these bands were far more successful in America than in their homeland.

## Contemporary power pop: 1980s - today

In the 1980s and 1990s power pop continued to be a creatively viable if commercially limited genre, as artists such as Marshall Crenshaw (whose first two albums are considered classics of the genre), Matthew Sweet, Teenage Fanclub, Material Issue, The Posies and Jellyfish drew inspiration from Big Star, the Beatles and [glam rock](#) groups of the early 1970s like T. Rex and Sweet.

In the mid-1990s up through the '00s, power pop flourished in the underground via acts such as The Shazam, Sloan and You Am I, and on underground labels such as Not Lane Recordings, Kool Kat Musik and Jam Recordings. The sound also made a mainstream appearance with the success of Weezer and Ozma, precursors to younger acts, such as Rooney & Luzer. Some 1990s rock acts, such as Nirvana and Oasis, bore unmistakable signs of power pop influence. Today, power pop traits are prominently displayed by groups such as Fountains of Wayne, All-American Rejects, Click Five, Stingray Green and The Dandy Warhols, and found in the work of pop punk bands like Blink-182, Tsar, and emo bands like Jimmy Eat World.

# Contemporaries in Britain

The influence of popular British power pop bands from the late 1970s and early 1980s can be found in contemporary British bands such as the Futureheads, Maxïmo Park, Farrah, the Duels, Special Needs, Razorlight and the Rifles.

# Power trio

The **power trio** is a [rock and roll](#) format popularized in the 1960s.

The rise of the power trio was made possible in part by developments in amplifier and guitar technology that permit the guitar to provide more sound than before. Particularly, the advent of electric bass guitar defined the bottom end and filled in the gaps. Perhaps the first embryonic "power trio" may have been Buddy Holly and The Crickets, whose onstage sound relied on a driving rhythm section that underpinned Holly's guitar and voice. A true power trio has one lead guitar, one bass and one drummer.

However, the prototypical power trios were exemplified by The Jimi Hendrix Experience and Cream. These two groups laid down the framework for all other subsequent power trios; extended improvisation, hyperamplification, and the use of effects (such as delay, distortion, etc.) to round out and modify the group sound. Quite often, power trio music reflects a [blues](#) or [jazz](#) influence, since these two types of music invite improvisation.

During the late 1960s, many groups used power trio instrumentation while adding a vocalist. These could include The Who, Led Zeppelin, and Black Sabbath. Although none of these were ever particularly identified as power trios, the music that they created is influenced by, and follows the same musical format as, many of the pioneering power trios.

The traditional power trio has a lineup of [guitar](#), [bass](#) and [drums](#), leaving out the rhythm guitar or keyboard often featured in rock music. However, some power trios also experimented with keyboards and sequencers in the studio, most notably the Canadian trio Rush, whose bassist-frontman Geddy Lee has often demonstrated his multi-instrumental capabilities on diverse rock albums such as 1977's *A Farewell to Kings* and 1985's *Power Windows*. Modern digital technology has also enabled a power trio to duplicate their studio performances in concert, as evidenced by Rush's 1989 live album, *A Show of Hands*, where Lee simultaneously sings, plays bass, and plays keyboard with foot pedals. This technology, in combination with their style and production, have given the band the nickname of "Canadian Power Trio".

One of the longest-lasting and most popular power trios is ZZ Top. Beginning from their roots as a blues-oriented, Cream-like power trio on albums such as *Tres Hombres*, the band increased their audience through a series of hit songs and albums. In many cases, the music of power trios is ignored or minimized by the music industry, but with a combination of wit, image, and musical dexterity ZZ Top became one of the few power trios to attain widespread popularity. Like Rush, ZZ Top has often used technology to expand their band's sound, but have never forgotten their blues roots. Unlike many power trios, ZZ Top also injects a deliberate element of humor into their music, which may account for part of their continued popularity.

Power trios have been characterized as loud and bombastic, often embarking on long improvised jams. Typically, vocals and songwriting were less important than instrumental performance or overall impact. Compare, for instance, the Jeff Beck Group, (with Rod Stewart on vocals) with Beck, Bogert, and Appice, a similar lineup without a significant vocalist. The latter was called a power trio, whereas the Jeff Beck Group was not. The emphasis on guitar solos and crashing rhythm sections in the power trio contributed to the development of [heavy metal](#), although some power trios would prefer [hard rock](#) labels.

Some 1970s British groups, such as Genesis and UK began with larger lineups, but eventually became keyboard-oriented trios in the mode of Emerson, Lake, and Palmer. However, due to the absence of a lead guitarist, these [progressive rock](#) groups are not usually considered 'true' power trios.

Perhaps the most famous power trios include the aforementioned Rush, Cream, ZZ Top, and The Police.

Other well-known trios from the 1970s and 1980s include Budgie, Grand Funk Railroad, Triumph, Blue Cheer, Cactus, Glass Harp, Motörhead, The Minutemen, West, Bruce and Laing, and the Robin Trower Band. Although power trios fell out of fashion during the 1980s, some continued to emerge well into the next decade, such as King's X, Green Day, Jawbreaker, and Nirvana.

The 1990's edition of King Crimson toured as an alleged "double power trio," (according to leader Robert Fripp) with two drummers, two bassists and two guitars. The traditional power trio continues to be represented by newer groups such as Gov't Mule and the North Mississippi Allstars, among many others who have sprung out of the jam band scene.

# Power violence

**Powerviolence** is a cross breeding of musical genres [hardcore punk](#) and [grindcore](#) that was first mentioned by name in the song Hispanic Small Man Power (H.S.M.P.) by genre pioneer Man Is The Bastard. Powerviolence is generally played at a frantic speed, often employing blast beats, and expressing frenzied rage. Its nascent form was pioneered in the late 1980s in the music of hardcore punk bands Infest and No Comment, themselves heavily influenced by earlier bands like Siege, Lärm and the Neos. The microgenre solidified into its most commonly recognized form in the early 1990s with the sounds of bands such as Man is the Bastard, Crossed Out, and No Comment.

Musically, the majority of bands focus on speed, brevity, and constant tempo changes, without the metallic influence that grindcore is generally known for in its songwriting and production techniques. This is meant to contrast with modern grindcore variants that have become increasingly associated with [death metal](#) and other forms of [extreme music](#) as well as many more modern hardcore and [metalcore](#) bands slowly moving away from certain roots of the traditional hardcore. Powerviolence songs are often very short; it is not uncommon for them to last less than 20 seconds.

The aforementioned song H.S.M.P. mentions Crossed Out, No Comment, Capitalist Casualties, Manpig, and Man is The Bastard by name. Other bands commonly associated with Power Violence include, Neanderthal (a pre-cursor to Man Is The Bastard), Infest, Despise You, Drop Dead, Lack Of Interest, and Spazz. Wood has reportedly claimed that the term was meant as nothing more than a joke and has expressed his dismay about its increasingly common use as a descriptive term very explicitly.

Spazz vocalist Chris Dodge's record label Slap a Ham was a fixture during the rapid rise and decline of powerviolence, releasing influential records by the likes of Neanderthal, No Comment, Crossed Out, Infest, Spazz, etc. The label's Fiesta Grande was an annual powerviolence festival held at 924 Gilman from 1992 to 2000. Spazz drummer Max Ward's label 625 Thrashcore has started their own festival, 'Super Sabado Gigante', in a similar vein.

# Precompositional

In [music](#), **precompositional** decisions are those decisions which a [composer](#) decides upon before or while beginning to create a [composition](#). These limits may be given to the composer, such as the length or style needed, or entirely decided by the composer.

Precompositional decisions may also include which [key](#), [scale](#), [musical form](#), style, [genre](#), or idiom in which to write, to use techniques such as the [twelve tone technique](#), [serialism](#), or not to use a system at all. Other examples may include isorhythm, ostinato, passacaglia, chaconne, [rhythms](#), or [chord progression](#).

Precompositional decisions do not necessarily, and almost always do not, preclude compositional decisions, and may actually allow the initial consideration of the choices to be made. One might say that, "thus, while it liberates imagination as to what the world *may* be, it refuses to legislate as to what the world *is*" (Bertrand Russell, *Our Knowledge of the External World*). Thus precompositional decisions do not necessarily ease the compositional choices.

On the other hand the concept of precompositional decisions is unclear as it is often impossible to determine which decisions occur before or during a composition.

## Prehistoric music

In the [history of music](#), **prehistoric music** (previously called **primitive music**) is all [music](#) produced in preliterate cultures (prehistory), beginning somewhere in very late geological history. Prehistoric music is followed by [ancient music](#) in most of Europe (1500 BCE) and later musics in subsequent European-influenced areas, but still exists in isolated areas.

Prehistoric music thus technically includes much of the world's music before European expansion and domination, for example, traditional [Native American music](#) of preliterate tribes and Australian Aboriginal music. However, it is more common to call the "prehistoric" music of non-European continents, especially that which still survives, as [folk](#), indigenous or traditional music.

## Origin of music

The origin of [music](#) likely stems from natural sounds and [rhythms](#): the human heartbeat, the [songs of birds](#), the rustling of wind through trees, the thunder and sound of rain, the dripping of water in a cave, the crackle of a burning fire and the sounds of waves breaking on a beach or bubbles in a brook. Man-made music echoes these soundscapes using patterns, repetition and tonality.

Aside from the bird song, music is not entirely the field of humankind. Monkeys have been witnessed to beat on hollow logs. Although this might serve some purpose of territorialism, it suggests a degree of creativity and seems to incorporate a call and response dialogue. See: [zoomusicology](#).

It is most likely that the first [musical instrument](#) was the [human voice](#) itself, which can make a vast array of sounds, from [singing](#), humming and [whistling](#) (more musical forms) through to clicking, coughing and yawning (less musical).

Most likely the first instruments were [percussion instruments](#), the clapping of hands, stones hit together, or other things that are useful to create [rhythm](#). E.g., see external link below on the "Stages in the Evolution of Music."

Music can be theoretically traced to prior to the Oldowan era of the Paleolithic age, the anthropological and archeological designation that suggests when stone tools first began to be used by hominids. The noises produced by work such as pounding seed and roots into meal is a likely source of rhythm created by early humans.

Prehistoric music varies greatly in style, function, general relation to culture, and complexity. The Timbila music of the Chopi is considered one of the most complex preliterate musics.

One published theory involved in the acoustic influences on the origin of music, originally published in 1958, is called the *trio theory*, claiming that influence from the most audible overtones of the three most nearly universal intervals (found across time & cultures, namely, a tone's octave, 4th and 5th), when their overtones are placed within the range of that octave, will evolve into the most widespread of scales: the pentatonic, the diatonic major & minor (depending how many of the audible overtones are so placed). The unequal audible strengths of the overtones determine over time the role & power of each note in a scale (tonic, dominant or subdominant) -- i.e., tonality and tonal scales.

### Oldest known song

The world's oldest known song (Assyrian cuneiform artefacts) is 4,000 years old inscribed into a clay tablet. It is diatonic, and is the oldest example of harmony, similar to English gymel. It can be heard at Evidence of Harmony in Ancient Music.

## The oldest flutes

The oldest [flute](#) found is believed to be the so-called Neanderthal flute that was dug up in Slovenia in 1995 in the cave Divje Babe I (Idrijca Valley, Western Slovenia) by the Slovenian paleontologist Dr. Ivan Turk of Slovenian Academy of Sciences and Arts (SAZU). It is estimated to be about 45,000 years old and was found in the fifth mousterian level (middle paleolithic). The flute was made of a hollow bear femur and has four holes, two of which are intact and two of which are incomplete, all four in a straight alignment, with approximately equal diameters. It is broken and can not be played anymore, but as is, it can be blown and produce musical sounds. These sounds have been documented by Turk, et al, who discovered the artifact.

There remains plenty of place for speculation about its origin until the conclusive evidence is found. On the basis of experiments, it is easier to demonstrate the hypothesis of an artificial (human) than a natural (carnivore) origin of the holes. The holes in a flute are aligned in a spacing that is consistent with that required to produce the diatonic scale. The spacings between the holes in this "Dive Babe" flute are not equal, but nearly perfectly match the spacings of four holes that would be found on a modern version of a simple "minor scale" flute. If the original bone were long enough (as was suggested by 3 different museum paleontologists based on the bone's width-to-length ratio usual in a juvenile cave bear femur), it could produce the diatonic scale notes closely in tune. (See "Neanderthal Flute", in the links below for more details.)

No animal has teeth spaced in this fashion and animals normally turn bones as they gnaw on them making carnivore-induced, aligned holes less likely as an explanation for the flutes appearance. The odds for such an appearance to have occurred by chance bites have been [calculated] and are only one in millions.

However, at the time at which it was made, neither the technology of working bones nor the necessary artistic (symbolic) behaviour are supposed to have been developed, although weak signals exist for both, the number of which is gradually increasing with new finds. The Neanderthal was perhaps intellectually closer to modern humans than has previously been accepted.

### Ancient Chinese flutes

In 1999 several flutes were found in Jiahu in Henan Province, China. They date to about 9,000 BC. They have between 5 and 8 holes each and were made from a hollow bone of a bird, the red-crowned crane. At the time of the discovery, one was found to be still playable. The bone flute plays both the five or seven-notes scale of Xia Zhi and six-notes scale of Qing Shang of the ancient Chinese musical system.

## Cycladic culture (Crete)

In the Aegean sea (eastern Mediterranean Sea), north of Crete lies a group of small islands known as the Cyclades (Ἰκλιὰδες). On one of these, the island of Keros (Κέρος), two marble statues from the late Neolithic culture called Early Cycladic culture (2900 BC-2000 BC) were discovered together in a single grave in the 19th century. They depict a standing double flute player and a sitting musician playing a triangular-shaped lyre or harp. The harpist is approximately 23 cm (nine inches) high and dates to around 2700-2500 BC. He expresses concentration and intense feelings and tilts his head up to the light. The meaning of these and many other figures is not known; perhaps they were used to ward off evil spirits or had religious significance or served as toys or depicted figures from mythology.

The discovery of this and similar pieces (they are very simplified and abstract in form) in the late 19th century had considerable influence on the sculpture of the early 20th century, for example on that by modernists such as Picasso and Modigliani.

# Prima pratica

**Prima pratica**, literally "first practice", refers to early [Baroque music](#) which looks more to the style of Palestrina, or the style codified by Gioseffo Zarlino, than to more "modern" styles. It is mainly used in comparison with seconda pratica music, and it can be used in modern texts synonymously with stile antico, which is compared with stile moderno, which can be used synonymously with seconda pratica. The term prima pratica was first used during the conflict between Giovanni Artusi and Claudio Monteverdi about the new musical style.

At first *prima pratica* referred only to the style of approaching and leaving dissonances. In his *Seconda parte dell'Artusi* (1603), Artusi writes about the new style of dissonances, referring specifically to the practice of not properly preparing dissonances (see [Counterpoint](#), and rising after a flattened note or descending after a sharped note. In another book, his *L'Artusi, overo Delle imperfettioni della moderna musica* (1600) ("The Artusi, or imperfections of modern music") Artusi had also attacked Monteverdi specifically, using examples from his madrigal "Cruda Amarilli" to discredit the new style.

Monteverdi responded in a preface to his fifth book of madrigals, and his brother Giulio Cesare Monteverdi responded in *Scherzi Musicale* (1607) to Artusi's attacks on Monteverdi's music, pointing out their view that the old music subordinated text to music, and that the new music the text dominated the music. Old rules of counterpoint could be broken in order to better serve the text. According to Giulio Cesare, these concepts were a hearkening back to ancient Greek musical practice.

## Process music

**Process music** or **systems music** is music which arises from a process, and more specifically, music which makes that process audible. The term pre-dates and is often used synonymously with [minimalism](#).

A number of Steve Reich's early works are examples of process music, particularly a specific process called phase or phasing. In his 1968 work *Pendulum Music*, a number of microphones are connected to a number of loudspeakers, and each is allowed to swing freely above the loudspeaker it is connected to until it is still - the feedback that results from this process, as each microphone passes above its loudspeaker, makes up the music (see also Reich's short 1968 essay *Music as a Gradual Process*). György Ligeti's *Poème symphonique* (1962), in which a hundred metronomes are set to different tempos and allowed to run down is another notable example.

Process music can also be created using relatively traditional instrumental techniques - Reich's *Piano Phase* is an example. James Tenney is another composer who is concerned with process, such as in his tribute to Steve Reich, *Chromatic Canon*, in which a tone row is eventually built up and, one note at a time, from what started as a repeated open fifth, before returning by the same path.

Michael Nyman has described how the generally minimalistic tonal music associated with process music arose from the influence of and reaction against process based music of extreme determinism or indeterminism using serial, aleatoric, and stochastic methods.

Within the field of popular music, process music made its strongest early appearance in the [ambient](#) works of Brian Eno, notably his first foray into the genre, *Discreet Music*. On several of the tracks of this album, musicians were instructed to play a small section of Johann Pachelbel's *Canon in D major* in different ways. On one piece, for instance musicians played the section at different speeds, the speed determined purely by the pitch of the instrument used. Thus the bass instruments played the section at a slower rate than the treble instruments, and the new piece created was shaped by these melodic lines drifting in and out of phase with each other.

## Program music

**Program music** is [music](#) intended to evoke extra-musical ideas, images in the mind of the listener by musically representing a scene, image or mood . By contrast, [absolute music](#) stands for itself and is intended to be appreciated without any particular reference to the outside world. The term is almost exclusively applied to works in the [European classical music](#) tradition, particularly those from the [Romantic music](#) period of the 19th century, during which the concept was popular, but pieces which fit the description have long been a part of music. The term is usually reserved for purely instrumental works (pieces without singers and lyrics), and not used, for example for [Opera](#) or [Lieder](#).

# History of program music

## Renaissance Period

Composers of the [Renaissance](#) wrote a fair amount of program music, especially for the harpsichord, including works such as Martin Peerson's *The Fall of the Leafe* and William Byrd's *The Battell*. For the latter work, the composer provided this written description of the sections: "Souldiers sommons, marche of footemen, marche of horsmen, trumpetts, Irishe marche, bagpipe and the drone, flute and the droome, marche to the fighte, the battels be joyned, retreat, galliarde for the victorie."

## Baroque period

Probably the most famous work of the [Baroque](#) era is Antonio Vivaldi's *The Four Seasons* a set of four concertos for violin and string orchestra that illustrate the seasons of the year with rain, buzzing flies, chilly winds, treading on ice, dancing peasants, and so on. The program of the work is made explicit in a sequence of four sonnets written by the composer. Another well-known Baroque program work is Johann Sebastian Bach's *Capriccio on the Departure of a Beloved Brother*, BWV 992, whose sections have charming descriptive titles ("Friends gather and try to dissuade him from departing," "They picture the dangers which may befall him," "The Friends' Lament," "Since he cannot be dissuaded, they say farewell," "Aria of the Postilion," "Fugue in Imitation of the Postilion's horn.")

## Classical era

Program music was perhaps less often composed in the [Classical](#) era. At this time, perhaps more than any other, music achieved drama from its own internal resources, notably in works written in [sonata form](#). It is thought, however, that a number of Joseph Haydn's earlier symphonies may be program music; for example, the composer once said that one of his earlier symphonies represents "a dialogue between God and the Sinner". It is not known which of his symphonies Haydn was referring to. A minor Classical-era composer, Karl Ditters von Dittersdorf, wrote a series of symphonies based on Ovid's *Metamorphoses*.

## Romantic period

Program music particularly flourished in [Romantic](#) era. As it can invoke in the listener a specific experience other than sitting in front of a musician or musicians, it is related to the purely Romantic idea of the *Gesamtkunstwerk* describing Wagner's Operas as a fusion of many arts (set design, choreography, poetry and so on), although it relies solely on musical aspects to illustrate a multi-faceted artistic concept such as a poem or a painting. Composers believed that the dynamics of sound that were newly possible in the Romantic orchestra of the era allowed them to focus on emotions and other intangible aspects of life much more than during the Baroque or [Classical](#) eras.

Beethoven felt a certain reluctance in writing program music, and said of his 1808 Symphony No. 6 (Pastoral) that the "whole work can be perceived without description – it is more an

expression of feelings rather than tone-painting"[3]. Yet the work clearly contains depictions of bird calls, a babbling brook, dancing peasants, a storm, and so on. Beethoven later returned to program music with his Piano Sonata Op. 81a, *Les Adieux*, which depicts the departure and return of his close friend the Archduke Rudolph.

Hector Berlioz's *Symphonie Fantastique* was a musical narration of a hyperbolically emotional love story he wrote himself. Franz Liszt did provide explicit programs for many of his piano pieces, but he is also the inventor of the symphonic poem. In 1874, Modest Mussorgsky composed using only the dynamic range of one piano a series of pieces describing seeing a gallery of ten of his friend's paintings and drawings in his *Pictures at an Exhibition*, later orchestrated by Maurice Ravel. The French composer Camille Saint-Saëns wrote many short pieces of program music which he called *Tone Poems*. His most famous are probably the *Danse Macabre* and several movements from the *Carnival of the Animals*. The composer Paul Dukas is perhaps best known for his tone poem *The Sorcerer's Apprentice*, based on a tale from Goethe.

Possibly the most adept at musical depiction in his program music was the German composer Richard Strauss, whose symphonic poems include *Tod und Verklärung* (portraying a dying man and his entry into heaven), *Don Juan* (based on the ancient legend of Don Juan), *Till Eulenspiegels lustige Streiche* (based on episodes in the career of the legendary German figure Till Eulenspiegel), *Don Quixote* (portraying episodes in the life of Cervantes' character, Don Quixote), *Ein Heldenleben* (which depicts episodes in the life of an unnamed hero often taken to be Strauss himself) and *Sinfonia Domestica* (which portrays episodes in the composer's own married life, including putting the baby to bed). Strauss is reported to have said that music can describe anything, even a teaspoon!

## Twentieth century

In the twentieth century, Alban Berg's *Lyric Suite* was thought for years to be beingst is abstract music, but it been discovered it was in fact dedicated to Hanna Fuchs-Robettin, and George Perle discovered in 1977 that the last movement contained a setting of a poem by Baudelaire . He based important [leitmotifs](#) on their initials: A–B–H–F for Alban Berg (A.B.) and Hanna Fuchs-Robettin (H.F.).

## Popular music as program music

The word "program music" is not used while speaking of popular music. The tradition of purely orchestral program music is continued in pieces for jazz orchestra, most notably several pieces by Duke Ellington. Instrumental pieces in popular music often have a descriptive title which suggests that they could be categorized as program music. Also lots of instrumental albums that have been related that are completely devoted to some programmatic idea (for example China by Vangelis or Songs of the Distant Earth by Mike Oldfield). Genres of popular music that often have music that could be seen as program music include [ambient](#), [new age](#), [surf rock](#), [jazz fusion](#), [progressive rock](#), [art rock](#) and various genres of [techno](#) music.

## Is all music program music?

Some people and theories argue that there is indeed no such thing as true "absolute music" and that music always at least conveys or evokes emotions. While non-professional listeners often claim that music has meaning (to them), "new" musicologists, such as Susan McClary (1999), argue that so called "abstract" techniques and structures are actually highly politically and socially charged, specifically, even gendered. This may be linked to a more general argument against abstraction, such as Mark Johnson's argument that it is, "necessary...for abstract meaning...to have a bodily basis." (McClary, 1991) However, a more loosely specific definition of absolute music as music which was not composed with a programmatic intent or plan in mind may be adopted.

More traditional listeners often reject these views sharply, asserting that music can be meaningful, as well as deeply emotional, while being essentially about itself (notes, themes, keys, and so on), and without any connection to the political and societal conflicts of our own day.

As such, most classical music is absolute music, as is suggested by titles which often consist simply of the type of composition, a numerical designation within the composer's oeuvre, and its key. Bach's Concerto for Two Harpsichords in C Minor, BWV 1060; Mozart's Piano Sonata in C Major, K. 545, and Beethoven's Symphony No. 7 in A major (Opus 92) are all examples of absolute music.

Program music was quite popular during the [romantic era](#). Many mainstream "classical" works are unequivocally program music, such as Richard Strauss's An Alpine Symphony, which is a musical description of ascending and descending a mountain, with 22 section titles such as "Night," "Sunrise," "By the Waterfall," "In Thicket and Underbrush on the Wrong Path," "Summit," "Mists Rise," and "Storm and Descent." Beethoven's Symphony No. 6 is clearly program music, too, with titled movements and instrumental depictions of bird calls, country dances, and a storm. Some might criticize Disney's animators for providing a pictorial interpretation of Bach's Toccata and Fugue in D Minor, but nobody can deny an extramusical association for Dukas's The Sorcerer's Apprentice. During the twentieth century, the increased influence of modernism and other anti-Romantic trends contributed to a decline in esteem for program music, but audiences continued to enjoy such pieces as Arthur Honegger's depiction of a steam locomotive in Pacific 231. Also, program music lives on in movie [soundtracks](#), which often feature ultra-modern sounding atonal programmatic music.

Music that is composed to accompany opera and ballet is, of course, program music, even when presented separately as a concert piece. Aaron Copland was amused when a listener said that when she listened to Appalachian Spring she "could see the Appalachians and feel Spring," the title having been a last-minute thought, but it is certainly program music. Film scores are always program music, and some of them, such as Prokofiev's music for Alexander Nevsky, have found a place in the classical concert repertoire.

And, of course, there is music that falls in between, with titles that clearly suggest an extramusical association, but no detailed story that can be followed and no musical passages that can be unequivocally identified with specific images. Examples would include Dvořák's Symphony No. 9, From the New World or Beethoven's Symphony No. 3, Eroica.

In popular music, by contrast, the norm is programmatic music, usually vocal. A common term for non-vocal popular music, and thus for practical purposes a term for absolute music in a popular context, is "instrumental" or "instrumental section".

While the debate is of interest to many, for practical purposes most scholars use the term "program music" in the narrower sense described above.

## **Symphonic poems**

Single movement orchestral pieces of program music are often called [symphonic poems](#).

## Progressive bluegrass

**Progressive bluegrass**, also known as **newgrass** (a term attributed to New Grass Revival member Ebo Walker), is one of two major subgenres of [bluegrass music](#). Progressive bluegrass came to widespread attention in the late 1960s and 1970s, as some groups began using electric instruments and importing songs from other genres (particularly rock & roll), and important groups from that period include the New Grass Revival, J. D. Crowe and the New South, the Dillards, Boone Creek, Country Gazette, and the Seldom Scene. However, progressive bluegrass can be traced back to one of the earliest bluegrass bands. A brief listen to the banjo and bass duets Earl Scruggs played even in the earliest days of the Foggy Mountain Boys give a hint of wild chord progressions to come. The four key distinguishing elements (not always all present) of progressive bluegrass are instrumentation (frequently including electric instruments, drums, piano, and more), songs imported (or styles imitated) from other genres, non-traditional chord progressions, and lengthy "jam band"-style improvisation.

Currently performing progressive bluegrass bands and musicians include the Czech band Druhá Tráva, bassist Missy Raines, and Alison Krauss and her band Union Station. Others who have been known to occasionally play progressive bluegrass include Béla Fleck and the Flecktones, and Nickel Creek.

## Progressive electronic music

**Progressive electronic music** (occasionally **progressive electronic dance music** or **prog**) is a collection of [electronic music genres](#) which draw upon the concepts of [progressive music](#) and includes the subgenres of progressive trance, progressive house, progressive techno and progressive breaks.

## Overview

Most electronic dance music tracks released are produced with certain features that are favourable for [DJs](#) to [beatmatch](#) records together with an almost seamless sound to it. Unlike the obvious song structures of genres like hard house or [Hi-NRG](#), the peaks and troughs in a progressive dance track tend to be less obvious. Layering different sounds on top of each other and slowly bringing them in and out of the mix is a key idea behind the progressive movement.

When discussing progressive electronic styles, the term "progressive" typically refers to the *progressive structure* (that changes occur incrementally, as in the case of *progressive house*). The exception is *progressive trance*, since trance is typically progressive in structure already. *Progressive trance* usually refers to a type of trance music that's minimalistic and more beat and percussion centric.

In the case of progressive house, the term 'progressive' can also refer to the style's open mindedness to bring in new features to prog-house tracks. Such elements can be almost anything, like a guitar loop, computer generated noises, typical elements of other music genres etc. Please consider that this feature makes the genre change all the time, apparently faster than the other electronic genres (such as [trance](#) and [techno](#)).

## Progressive house

Progressive house has its origins in Britain in the early 1990s, with the output of the Guerrilla record label and Leftfield's first singles (particularly "Song of Life") inspiring, according to various accounts, either Genesis P-Orridge of Throbbing Gristle fame or then Mixmag editor Dom Phillips to coin the term. In 1992, what was to be the first superclub, Renaissance threw open its doors in the small mining town of Mansfield, and its DJs - particularly Sasha and the then-unknown John Digweed - were instrumental in pushing the sound in its early days. The music itself consisted of the 4-to-floor beat of house music allied to deeper, dub-influenced basslines and a more melancholic, emotional edge. Often, the ethereal "swirly" textures of early [trance](#) could be heard in the mix, and various other elements from across the electronic spectrum. "Song of Life", for instance, has a [trip-hop](#) like down-pitched breakbeat and a high-energy Roland TB-303 riff at various stages.

The centre-of-gravity of the sound, so to speak, has shifted over the years. After the release of Brian Transeau's (aka BT) debut album "Ima", for instance, the bulk of the style's records were in a more ethereal, melodic style. (That record was also an enormous influence on the nascent progressive trance sound.) Then, as trance became more and more popular and melodic, prog darkened and acted as a deliberately underground counterpoint, merging with tribal house to produce many very minimal percussive tracks as this decade kicked off, becoming a new sub-genre, 'Dark House' (this also marked the return to the sound of Sasha and Digweed, who had picked up and popularised the progressive trance sound in the interim).

Meanwhile, the Melbourne-centred Australian progressive scene, whose luminaries include Phil K and Luke Chable pioneered a distinctive sound of their own - marked by trancy pads, high-pitched twinkly lead lines and more frequent use of vocals, this style was pushed heavily in Britain and elsewhere by lapsed trance DJ Dave Seaman and expat Australian Anthony Pappa and was by 2003 the main style of progressive dance. Its influence even fed back into trance, with many sub-genre trademarks finding their way into the so called "Anjuna sound" centred on Above & Beyond's record label Anjunabeats.

Since 2005, progressive house has largely taken a back-seat in the dance music world, with most of the scene's major DJs playing electro- and [tech-house](#) and [minimal](#) instead.

## Progressive trance

Progressive trance is a popular sub-genre in [trance music](#) and contains elements of [house](#), [techno](#) and [ambient](#) music. The basic formula of trance became even more focused on the anthemic qualities and melodies, moving away from predictable arpeggiated analog synth patterns (aka *acid synth lines*). Acoustic elements and spacey pads became popular, compositions leaned towards incremental changes (aka [progressive](#) structures), sometimes composed in thirds (like Brian Transeau frequently does). The sound became more and more ethereal and heavenly. Progressive trance contains very intuitive elements, such as unusual basslines or original synths, which generally make it more "catchy".

The structure of progressive trance is different from a typical techno track. The introduction generally starts with slower ambient beats. Following this section is a "breakdown" and then the main melody. Electronic effects and vocals are usually in both the intro and the coda.

Phrases can be any multiple of 4 bars (4-8-12-16 etc.) in most typical progressive trance tracks. Phrases usually begin with the introduction of a new or different melody, or the introduction of hi-hats to the track. In progressive trance there may be four more simultaneous layers.

Known artists in this [electronic music](#) genre include Paul Van Dyk, Brian Transeau, James Holden, Josh Gabriel & Dave Dresden, Luke Chable, Deepsky, Sasha, Hernan Cattaneo and John Digweed. Newer artists include Terje Bakke, The Last Atlant, Hydroid, Gerry Cueto, Markus Schulz.

## Progressive psytrance

Progressive psytrance is the progressive form of [psychedelic trance](#). Some see it as the evolution of [minimalist trance](#). Important artists in the genre include Atmos, Son Kite, Beat Bizarre, Krueger & Coyle, Vibrasphere, Sensient, Phacelift, Krumelur, Phony Orphants, Ticon and Igneous Sauria. Contrary to mainstream progressive trance, psy-progressive is usually not as uplifting as it puts more focus on sound production rather than melody. The structure is not well-defined as in most other styles of progressive trance.

## Progressive breaks

Progressive breaks is a relatively recent phenomenon, essentially growing out of [nu skool breaks](#) and progressive house. (However, Way Out West was fusing progressive house, trance and breaks in a successful commercial fashion with "The Gift" and "Domination" in 1996 with Hybrid introducing "Symphony" the same year.) As a popular style in its own right, its roots lie in Australia - the Antipodean nation has fertile breaks and progressive scenes and so a cross-pollination between the two was always likely. Due to its roots in those scenes, progressive breakbeat is mostly of a trancier feel, with plenty of atmospheric pads and melodies. Most artists working in the genre also work in its immediate relatives too (a common feature of the Aussie scene is a collaboration between two prominent production teams, one turning in a house mix and the other a breaks rub), with only the likes of Hybrid really sticking to it consistently. That said, it is one of the more exciting developments on the progressive scene.

Progressive breaks artists include Digital Witchcraft, Momu, Hybrid and progressive house artists include Leftfield, BT, Steve Porter; however, the lines between these progressive styles and progressive trance, as groups such as Way Out West and Fluke have shown with their works, are less pronounced now than they were originally.

## Progressive drum & bass

There are a few forms of [Drum & Bass](#) which are considered [progressive](#). [Neurofunk](#), a progression of the Techstep subgenre incorporates elements of [Jazz](#) and [Funk](#) along with multiple [electronic](#) influences including [Techno](#) and [Trance](#). The style also follows traditional progressive form, building up to a peak of intensity. [Drumfunk](#), a relatively new subgenre, is also considered progressive by many, along with Techstep itself.

## Similarities in progressive genres

Since about 2000, *progressive house* and *progressive trance* have mostly converged, it's very difficult to differentiate one from another. While the faster (130-140bpm), more energetic records can continue to be classified as *progressive trance*, most producers from both styles have moved towards a softer, slower (110-130bpm) sound, and prefer to be classified as *progressive house*. In addition since 2000 many *psychedelic trance* artists also moved to a slower (125-138bpm) range branding their style as *progressive trance* or *progressive psytrance*.

## Artists and labels

[DJs](#) who play progressive sounds include:

John Digweed

**Typical instruments:** [Electric guitar](#) - [Bass guitar](#) - [Drums](#) & [Percussions](#) - [Keyboards](#)

**Mainstream popularity:** Popular among [heavy metal music](#) fans

[Timeline of heavy metal](#)

**Progressive metal** (often shortened to **prog**, or **prog metal** when differentiating from [progressive rock](#)) is a genre of [heavy metal music](#) which shares traits with progressive rock including use of complex compositional structures, odd time signatures, and intricate instrumental playing. The high level of musical proficiency is often combined with a lyrical counterpart in the form of epic textual concepts, resulting in lengthy songs and [concept albums](#). As a result of these factors, progressive metal is rarely heard on mainstream radio and video programs.

# History

The origins of progressive metal can be traced back to [progressive rock](#) acts of the 1960s and '70s such as Yes, Queen, Pink Floyd, King Crimson, Genesis and Rush. However, progressive metal did not develop into a genre of its own until the mid-1980s. Acts such as Fates Warning, Queensrÿche and Dream Theater took elements of these progressive rock groups – primarily the instrumentation and compositional structure of songs – and merged them with heavy metal characteristics attributed to bands like Metallica, Megadeth, Deep Purple, Black Sabbath, Death, and Iron Maiden. The result could be described as a progressive rock mentality with heavy metal sounds.

The genre received mainstream exposure in the early 1990s when Queensrÿche's "Silent Lucidity" (from 1990's *Empire*) became a radio and MTV hit. It was not a typical progressive metal song, but nonetheless it opened Queensrÿche's music to a whole new legion of fans, which in turn had an effect on the popularity of other progressive metal bands of the time. In 1993, Dream Theater's "Pull Me Under" (from 1992's *Images and Words*) became popular on radio and MTV. It is a more typical progressive metal song than "Silent Lucidity", but still more accurately described as straight heavy metal.

Today progressive metal thrives and is at its most popular. Leading the way is Dream Theater who have gained in popularity over the years. They now sell out shows and have many instructional videos and side projects. They have influenced and helped the evolution of the genre. Much of the progressive metal that has come out in their wake has had a very similar sound (Vanden Plas, Threshold). On the other hand, in the true spirit of progressive music there have been some unique bands to emerge from the growth in popularity of the genre.

Emerging in the 90's bands like Pain of Salvation, Opeth, Ayreon, and Symphony X each inadvertently re-invented the wheel with their styles, straying from the typically traditional progmetal sounds of Dream Theater and 1990's Fates Warning into almost their own band specific genres.

Also important to the development of progressive metal was the idea of "technical" metal that arose almost simultaneously in the 80's, having a big impact on bands to come. At the forefront were bands like Watchtower, Atheist and Cynic showing of their technical skills in time signature and guitar playing. But these bands tended to be much more heavy metal based than focused in progressive metal, however this kind of playing style went on to become conducive to the progressive metal genre.

Currently progressive metal stands on the principle of using all the past traits associated with it. While many bands still look back to other rock bands for inspiration, main influences on bands of the progressive metal genre have belonged to its pioneers. Bands like Sun Caged and Circus Maximus show heavy influence of both traditional progressive metal and several of the 1990's bands. Bands like Dark Suns look to the influences of Opeth, Pain of Salvation and Anathema to find their own interesting sound.

## Diversity

Progressive metal can be broken down into countless sub-genres corresponding to certain other styles of music that have influenced progressive metal groups. For example, two bands that are commonly identified as progressive metal, King's X and Opeth, are at opposite ends of the sonic spectrum to one another. King's X are greatly influenced by softer mainstream rock and [grunge](#). Paradoxically, Pearl Jam bassist Jeff Ament once said, "King's X *invented* grunge," meaning that they influenced a genre which had influenced them. Opeth's growling vocals and heavy guitars (liberally intermixed with gothic-evocative acoustic passages) often see them cited as [death metal](#).

[Classical](#) and symphonic music have also had a significant impact on sections of the progressive metal genre, with bands such as Symphony X and Shadow Gallery fusing traditional progressive metal with a complexity and grandeur usually found in classical compositions. Similarly, bands such as Liquid Tension Experiment and Planet X have a [jazz](#) influence, with extended solo sections that often feature "trading solos". Furthermore, Liquid Tension Experiment exhibits an improvisational element that is rare in heavy metal, usually a very structured genre. Another important band, Cynic, fused progressive metal, death metal, and jazz/fusion in a very diverse and unique work known as Focus.

## Progressive music

**Progressive music** is the name given to a certain approach to [musical composition](#) that has been applied to several different [music genres](#). One way the term has been applied is to subgenres that have evolved from their root genre by innovating, either through incorporating instruments from other genres or using new techniques within the framework provided by the instrumentation of the root genre to make a new or [crossover](#) style. Another is in reference to a gradual build-up of energy within progressive music track or throughout an [album](#).

## History

The description "progressive" was first applied to [jazz](#). The term, coined by Stan Kenton, was in reference to [cool jazz](#) tracks that used instrumentation create an almost [art rock](#) like sound. The genre is closely related to [bebop](#).

# Progressive rock

*Main article:* [Progressive rock](#)

In [rock](#), the word usually describes music that expands traditional musical structures by adopting influences of [jazz](#), [symphonic](#), [folk](#) and [world music](#). Progressive rock artists often string together the songs so that the entire album will become an uninterrupted musical "journey". Long tracks that can be divided into separate movements, all with its own place in the overarching theme of the song, are very common in prog. An important aspect of progressive rock is the juxtaposition of contrast elements such as the raw, loud and fast with the calm and slow. Thus progressive rock not only tends have strong [melodic](#) elements, but also expands the harmonic margin of rock music by utilizing atonal patterns from modern classical music as well as advanced chords from jazz theory. Progressive rock's popularity peaked in the early to mid 1970s with bands such as the "big four" consisting of Yes, Genesis, Emerson, Lake & Palmer and King Crimson.

## Examples of progressive rock artists

Camel  
Emerson, Lake & Palmer  
Genesis  
Van der Graaf Generator  
King Crimson  
Pink Floyd  
Gentle Giant  
Jethro Tull  
Kansas  
Marillion  
Procol Harum  
Rush  
Soft Machine  
The Mars Volta  
Yes  
Young Democrats  
Frank Zappa

# Progressive metal

*Main article:* [Progressive metal](#)

Progressive metal emerged in the 1980s with thrash bands such as Diamond Head (Lightning to the Nations), Metallica (...And Justice For All) and Megadeth (Rust In Peace), who brought complicated guitar compositions, time changes, and longer songs to heavy metal. Combined with traditional sounds of the 70s movement of prog rock, progressive metal has evolved through the work of artists like Dream Theater, Opeth, Queensrÿche, Stratovarius, Symphony X, and Tool.

# Progressive electronic music

*Main article:* [Progressive electronic music](#)

Progressive electronic music styles include the progressive subgenres of [house](#), [techno](#), [trance](#) and [breakbeat](#) (also known as *breaks*). The use of the term here applies to both the use of new instrumentation within existing genres to create a new sound and the use of arrangement and dynamics to subtly (unlike with genres such as [hard house](#) or [Hi-NRG](#)) build up to peaks within the track, something used creatively by [DJs](#) who [beatmatch](#) to build up energy on the dance floor when playing to a crowd.

# Progressive rock

**Progressive rock** (shortened to **prog rock** or **prog**) is an ambitious, eclectic, and often grandiose style of [rock music](#) which arose in the late 1960s, reached the peak of its popularity in the 1970s, and continues as a musical form to this day. Progressive rock artists sought to move away from the limitations of popular rock and pop music formats, and "progress" rock to the point that it could achieve new forms, often alluding to the sophistication of [jazz](#) or [classical music](#). Progressive rock began in England and remained largely a European movement, although there are a few notable American and Canadian progressive rock bands. Over the years various sub-genres of progressive rock have emerged, such as [symphonic rock](#), [math rock](#), [space rock](#) and [progressive metal](#). Another term, [art rock](#), has occasionally been used interchangeably with "progressive rock," although it is even broader and less well defined, and may denote bands with no connection to prog rock (see article).

It is musical *complexity*, as well as the virtuosity of the musicians, which most distinguishes progressive rock. Other forms of rock may have extremely talented musicians, but they work mostly in simple meters, song structures, and harmonies. In the late 1970s, due to [punk rock](#) ideology and the existence of an increasing number of commercial "progressive rock" bands seen to be watered down or uncreative, the genre attracted criticism. By the 1980s progressive rock was no longer hailed as radical and cutting edge - an image which had been one reason for its success in the first place. New sub-genres like Rock in Opposition (RIO) and [avant-progressive rock](#) arose as an alternative to the so-called "dinosaur" bands topping the charts. Today progressive rock fans remain divided roughly between those who value the instrumental skills and ambitious concept albums typifying early progressive bands (as well as more recent bands following that style), and those who value a radical spirit of experimentation above technical complexity and a recognizably "prog" sound. Many listeners in the latter category disavow the idea of prog rock altogether, but the style continues to appeal to a cult of listeners, and its early pioneers remain widely popular.

The major acts that defined the genre in the 1970s are Jethro Tull, Yes, Genesis, Pink Floyd, Emerson, Lake & Palmer, Rush, Gentle Giant and King Crimson. Progressive rock is difficult to define in a single conclusive way as these bands do not sound especially alike. Outspoken King Crimson leader Robert Fripp has voiced his disdain for the term. Indeed, in some cases the bands themselves or well-known critics would question whether one or another of these bands were really progressive rock bands at all. (This article shall assume that they are, or at least, that they were in the 1970s). There is also debate on whether the musical output of artists and bands as varied as Frank Zappa, Deep Purple, Phish, and Tool belongs to the genre.

# Characteristics of progressive rock

There is probably no single element that is shared by all music that has been considered to be progressive rock. Still, there are certainly noticeable trends; these common, though not universal, features are:

- Long compositions, sometimes running over 20 minutes, with intricate melodies and harmonies. These are often described as epics and are the genre's clearest nod to classical music. A very early example (perhaps the first multi-part suite to appear in prog rock) is *In Held Twas In I* by Procol Harum, clocking in at 17:30. Classic examples include Pink Floyd's 23-minute *Echoes*, Genesis' 23-minute *Supper's Ready*, Jethro Tull's 44 minute "Thick As a Brick", and Yes' *Tales From Topographic Oceans*, a double-album that contains only four songs. More recent examples include the 33-minute *Cassandra Gemini* by The Mars Volta and the 42-minute *Six Degrees of Inner Turbulence* by Dream Theater.
- Related to and overlapping with these lengthy compositions, many progressive rock songs are made up of shorter parts (often, but not always, explicitly called out on the track list of the album on which they appear) that in some cases could be songs in their own right. Often, pieces are divided into movements in the manner of classical suites. For example, Yes' *Close to the Edge* is divided into four parts, Rush's *2112* into seven, Pink Floyd's *Shine On You Crazy Diamond* into nine. Yes' single *Soon* is actually a five-minute excerpt from *The Gates of Delirium*, which is over 20 minutes long; similarly, parts of Jethro Tull's aforementioned *Thick as a Brick* have appeared as songs in their own right on various compilations.
- Lyrics that convey intricate and sometimes impenetrable narratives, covering such themes as science fiction, fantasy, history, religion, war, madness, and literature. It is relatively rare for progressive rock songs to be about love or sex, and practically unheard-of for such songs to concern other pop staples such as dancing or cars.
  - Most progressive rock bands have also avoided direct political commentary, preferring to shade their views in fictional or allegorical settings — for example, Genesis' album *Selling England by the Pound* is tied together by a theme of commercialism versus naturalism. (A number of notable exceptions exist, though most postdate progressive rock's commercial heyday.)
- [Concept albums](#), in which a theme or storyline is explored throughout an entire album or series of albums, sometimes in a manner similar to a film or a play, often called "rock operas" (a term popularized by The Who, though they are not generally considered a progressive rock act). In the days of vinyl, concept albums were often two-record sets with strikingly designed gatefold sleeves. Famous examples include *The Lamb Lies Down on Broadway* by Genesis, and the series of albums by Pink Floyd, starting with *The Dark Side of the Moon*. More recent examples include *Operation: Mindcrime* by Queensrÿche and *Metropolis Part II: Scenes from a Memory* by Dream Theater.
  - Some themes of progressive concept albums include: the story of a mechanical-organic chimaera, in the first half of Emerson Lake & Palmer's *Tarkus*; the symbolic story of two planets where light and darkness alternates, in Le Orme's *Felona e Sorona*; the

satirical and social-critic poem by a fake little genius, in Jethro Tull's *Thick As a Brick*; the visionary and mythological deeds of a Puerto Rico migrant, in Genesis' *The Lamb Lies Down on Broadway*; the adaptation of Nietzsche's *Zarathustra*, in Museo Rosenbach's LP with the same name, and of Darwin's *The Origin of Species* in Banco del Mutuo Soccorso's *Darwin*.

- Prominent use of instruments unusual in rock music, including electronic instrumentation, as well as unusual vocal styles. Perhaps the most famous example of such instrumentation is the extensive use of the flute by Jethro Tull frontman Ian Anderson. Keyboard instruments including the synthesizer, organ, piano, and Mellotron are very common in progressive rock, much less so (though by no means unheard-of) in other rock genres. Other examples include the use of nonwestern instruments, particularly ethnic percussion. Gentle Giant are the progressive rock band best known for their vocal style, though many progressive rock singers such as Peter Hammill of Van der Graaf Generator take highly unusual approaches as well.
  - Related to this is the prominence of multi-instrumentalists such as Mike Oldfield, Ian Anderson, and Neal Morse.
  - Perhaps surprisingly, in the progressive heyday, the use of orchestras and choirs was quite rare among the best-known progressive rock bands; the most famous examples from the late 60s and early 1970s are probably the title suite from Pink Floyd's *Atom Heart Mother*, The Nice's *Five Bridges Suite* and Yes' second album *Time and a Word*, all of which predate those bands' most successful, and arguably most progressive, period. More usually, the aforementioned Mellotron was used to simulate strings or a choir. Less well-known bands such as Renaissance did make extensive use of an actual orchestra. Such instrumental choices, particularly the use of orchestras, have become much more common in recent progressive rock.
- Use of unusual time signatures, rhythmic techniques, [scales](#), or [tunings](#). Many pieces use multiple time signatures and/or tempi, sometimes concurrently (King Crimson's "Thela Hun Ginjeet", for example, contains passages in which some band members play in 7/8 and others in 4/4 to create an "off-balance" effect).
- An extremely wide dynamic range, with very quiet and very loud passages often occurring in the same piece of music. Use of compression to reduce this effect is much less common than in other forms of rock music. This is characteristic of music that is meant to be listened to relatively closely and for its own sake, as opposed to relatively casually or as background noise (as are several of the features on this list, in fact).
- Solo passages for virtually every instrument. This contributed to the fame of such performers as guitarist Steve Howe, keyboardists Rick Wakeman and Keith Emerson, and drummer Neil Peart.
- Inclusion of classical pieces on albums. For example, Emerson, Lake and Palmer have performed arrangements of pieces by Copland, Bartók, Moussorgsky and others, and often feature quotes from J. S. Bach in lead breaks. Sometimes these pieces are significantly reinterpreted; Jethro Tull recorded a version of a Bourée by Bach in which they turned the piece into a "sleazy jazzy night-club song" (in Ian Anderson's own words).
- An aesthetic linking the music with visual art, a trend started by The Beatles with Sgt. Pepper's Lonely Hearts Club Band and enthusiastically embraced during the prog heyday. Some bands became as well-known for the art direction of their albums as for their sound, with the "look" integrated into the band's overall musical identity. This led to fame for particular artists and design studios, most notably Roger Dean for his work with Yes, and Storm Thorgerson and his studio Hipgnosis for their work with Pink Floyd and others. H.R. Giger's painting for Emerson, Lake and Palmer's *Brain Salad Surgery* is one of the most famous album sleeves ever produced, although it was censored to remove a phallus. By way of contrast, Charisma Records allowed Paul Whitehead to produce evocative gatefold album covers and sleeves for Genesis and Van der Graaf Generator without interference from the record label.
- The use of sound effects in compositions, otherwise known as [Musique concrète](#). This is a particular trademark of Pink Floyd with examples including the entirety of "Speak to Me", the opening track from *Dark Side of the Moon*, but other bands did this too; for example, sounds

of warfare can be heard throughout Jethro Tull's single "Warchild". The Mars Volta make heavy use of ambient noise on their album Frances the Mute.

- Exchanging of members. Though not nearly to the degree of jazz artists, there is a tendency for members of progressive rock groups to work between bands and create side projects. For instance, Jon Anderson of Yes sang on a King Crimson album, and Robert Fripp of King Crimson played on two Van der Graaf Generator albums. Drummer Bill Bruford has worked with Yes, Genesis (very briefly), King Crimson, prog supergroup UK, and many other projects. In the 1990s, a touring version of Yes that included almost everyone who had ever been a member included two full lineups who played in various combinations "in the round" during concerts. More recently, Dream Theater side projects have come to outnumber the band's own albums, involving nearly every current and former member of the band working with a bewildering variety of members of other recent prog bands.

# History of progressive rock

## Precursors

Progressive rock was born from a variety of musical influences in the late 1960s. The later Beatles and many [psychedelic](#) bands began to combine traditional rock music with instruments from classical and Eastern music. An important precursor, Beck's Bolero, composed by then-Yardbirds Jeff Beck and Jimmy Page in 1966, is a brief reworking of Maurice Ravel's "Boléro". [Psychedelic rock](#) continued this experimental trend and began to compose very long pieces, although usually without any carefully thought-out structure (for example, Iron Butterfly's "In-A-Gadda-Da-Vida" or "1983...(A Merman Should I Turn to Be)" by Jimi Hendrix).

Bands such as The Nice and the Moody Blues began deliberately combining rock music with classical music, producing longer pieces with deliberate structures. German electronic music pioneers Tangerine Dream introduced a variety of synthesisers, tape effects, and other unusual sounds in their compositions, usually in purely instrumental albums. By the mid- to late-'60s, The Who had also created concept albums and rock operas, as well as long live rock song performances — although those were often in the more blues-based improvisational style also featured by contemporaries Cream and Led Zeppelin.

All these bands are sometimes considered "early progressive," or as part of a transitional genre between psychedelic and progressive, sometimes referred to as proto-prog.

## First progressive rock acts

Key early progressive rock bands included The Nice and Soft Machine and the roots of the genre can be traced back to the mid-sixties. However, King Crimson's appearance in February 1969 is often seen as a pivotal moment. King Crimson were quickly followed by other English progressive rock bands, including Yes, Genesis, Pink Floyd, Emerson Lake and Palmer (ELP), and Jethro Tull. It is worth noting that, aside from ELP, these bands began their careers before King Crimson, and changed their musical styles considerably following the release of *In the Court of the Crimson King*. As for ELP, they inherited their singer and bassist, Greg Lake, from the original King Crimson lineup.

Progressive rock also gained momentum when many rock fans grew disillusioned with the "Peace and Love" movement. Progressive rock often distanced itself from the "smiles and sunshine" of 1960s pop music and moved towards darker and sometimes more violent themes. For example, Genesis' *Trespass* includes "The Knife", a song about a violent demagogue, and "Stagnation", a song about a survivor of a nuclear attack. Genesis labelmates, Van der Graaf Generator, often took an existentialist approach that bordered on nihilism, even in album titles, such as *Godbluff*.

Progressive rock was especially popular in continental Europe. Indeed, progressive rock was the first form of rock that actually captivated countries such as Italy and France. This era saw a great number of European progressive rock bands, most notably Premiata Foneria Marconi (PFM), Area and the aforementioned Banco del Mutuo Soccorso and Le Orme from Italy, and Ange and Magma from France. Of these bands, only PFM was significantly successful in the English-speaking world. Germany also had a significant progressive movement, often referred to as Krautrock. The Italian progressive rock has been considered somehow a case of its own (sometimes cited as a separated genre, as "Italian symphonic rock"): although most of the bands scored appalling success even in their home country (often releasing only one LP), today CDs of otherwise unknown groups like Museo Rosenbach, Osanna, Il Balletto di Bronzo, Semiramis

etc., along with the more renowned ones, are increasingly sought by fans as true classics of the genre, and also attracting the interests of higher musical critics and universities.

A strong element of avant-garde and counter-culture has long been associated with a great deal of progressive rock. In the 70's, Chris Cutler of Henry Cow formed a loose collective of artists referred to as Rock in Opposition or RIO, whose purpose was essentially to make a statement against the music industry. The original members included such diverse groups as Henry Cow, Samla Mamma Manna, Univers Zero, Etron Fou Leloublan, Stormy Six, and later Art Zoyd, Art Bears, and Aqsak Maboul. The Rock in Opposition movement was short lived, but the artists came to be recognized as some of the originators of [Avant-progressive rock](#). Dark melodies, angular progressions, dissonance, free-form playing, and a disregard for conventional structure are all elements that have been used to describe these artists.

## Rise and fall

Fans and music historians have a variety of ways to categorize the flavors of 1970s progressive rock. The Canterbury scene can be considered a sub-genre of progressive rock, more oriented towards Jazz rock, or simply another collection of true progressive rock bands. Other bands took the genre in a more commercial direction. These bands, including Renaissance, Queen and Electric Light Orchestra, are sometimes classified as "progressive rock", "commercial rock", or "symphonic pop." Over time, Led Zeppelin and Supertramp, among others, also incorporated more unusual instrumental elements, odd time signatures, and long compositions into their work. In a similar "prog pop" vein was Manfred Mann's Earthband. A feature of The Earthband were virtuoso Minimoog solos by Mann and they were considered a top class prog act which was surprising given Manfred Mann's more well known 60's heritage.

Progressive rock's popularity peaked in the mid-1970s, when prog artists regularly topped readers' votes in mainstream popular music magazines in England and America. By this time, several New World progressive rock bands had been formed. Kansas, which had actually existed in one form or another since 1971, became one of the most commercially successful of all progressive rock bands. Toronto's Rush were equally successful, with a string of hit albums extending from the mid-1970s to the present (though little of their recent work falls into the progressive rock category). Less commercially successful, but at least as influential as either band, were the Dixie Dregs, from Georgia (arguably more of a fusion band).

With the advent of [punk rock](#) in the late 1970s, popular and critical opinion in England and America moved toward a simpler and more aggressive style of rock, with progressive rock increasingly dismissed as pretentious and overblown. This attitude has remained until the present day, though it began to diminish since about 2004.

## 1980s revival

The early 1980s saw something of a revival of the genre, led by innovative artists such as Marillion, IQ, Twelfth Night, Pendragon, Galahad, Pallas, and Saga. Groups that arose during this time are sometimes termed neo-progressive or neo-prog (also referred to as the New Wave Of British Prog Rock). Bands of this style were influenced by '70s progressive rock groups like Genesis, Yes, and Camel, but incorporated some elements that were reflective of the New Wave and other rock elements found in the 80s. The digital synthesiser became a prominent instrument in the style. Neo-prog continued to remain viable into the '90s and beyond with bands like Arena, Jadis, Collage, and Iluvatar. Their sound was generally similar in style and sound to neo-prog pioneers like Marillion and IQ, which differentiated them from the emerging Third Wave movement in the 1990s.

Some progressive rock stalwarts changed musical direction, simplifying their music, making it more commercially viable. In 1982, the much anticipated supergroup Asia, composed of Steve Howe (Yes), Carl Palmer (ELP), John Wetton (King Crimson), and Geoff Downes (Yes),

surprised (and disappointed) with their pop-oriented debut album. Top 5 single "Heat of the Moment" rotated heavily on MTV for years, while the first Asia album established a sales record for 1982. This demonstrated a market for more commercialized British progressive rock -- incidentally, the same style purveyed by North American Top-40 stalwarts such as Styx and Journey for several years.

Other British bands followed Asia's lucrative example. In 1983, Genesis achieved some international success with "Mama", a song with heavy emphasis on a drum machine riff. This signalled a very commercial direction during the 1980s. In 1984, Yes also had a surprise comeback with 90125, featuring their only number one (US) single, "Owner of a Lonely Heart." Written by guitarist Trevor Rabin prior to joining Yes, "Owner" was accessible enough to be played at discos, and more recently has been remixed into a trance single. Often sampled by hip-hop artists, "Owner" also incorporated contemporary electronic effects, courtesy of producer/ex-member Trevor Horn. Likewise, Pink Floyd's A Momentary Lapse of Reason in 1987 was a departure from their traditional extended play [concept albums](#), featuring much shorter songs and an all together much more electronic sound.

Many progressive rock fans were unhappy with the direction taken by these bands, but others simply accepted the changes and enjoyed the music. Yes, for instance, enjoyed a brief renaissance during the 1980s with a mixture of old and new fans. Moreover, other progressive rock bands like Rush arguably released some of their best material during the early and mid-1980s, due to a merge of new wave and early progressive sounds.

## Third wave and prog metal

The progressive rock genre enjoyed another revival in the 1990s. A notable kickoff to this revival were a trio of Swedish bands Änglagård, Anekdoten and Landberk in 1992-1993. Later came the so-called "Third Wave", spearheaded by such bands as Sweden's The Flower Kings, the UK's Porcupine Tree, Italy's Finisferre and Deus Ex Machina, and Spock's Beard, Echolyn and Glass Hammer from the United States. Arjen Anthony Lucassen with the backing of an array of talent from the progressive rock genre, produced a series of innovative concept albums. While not necessarily sounding alike, many of the Third Wave bands had very strong ties musically to the 1970s progressive rock acts, often to the point of sounding 'retro' in nature.

One of the most commercial bands of the [alternative rock](#) movement, The Smashing Pumpkins, incorporated progressive rock into their unique, eclectic style, going so far as to release two albums dealing with the same concept, and Seattle's Soundgarden helped bridge the gap between progressive rock and the [Grunge](#) movement. Phish would often be referenced in their early albums as a technical example of progressive rock due to their unique sound and the incorporation of many elements considered to be "characteristic" of progressive rock. Their 1988 release Junta is often seen as a 1980s progressive rock landmark.

In recent years, one of the more commercially viable categories of prog has been [progressive metal](#), which mixes some of the common elements associated with progressive rock (lengthy compositions, concept albums, virtuosity) with the power and attitude associated with [metal](#). One distinguishing characteristic is the prominence of a keyboard instrument to a music (metal) that is normally fairly guitar dominant. Several of the leading bands in the prog-metal genre (Dream Theater (U.S.), Ayreon (Netherlands), Opeth (Sweden), and Fates Warning (U.S.)) cite pioneer progressive hard-rockers Rush as a prime influence, although their music shows large influences from bands such as Black Sabbath or Deep Purple as well. Tool have cited pioneers King Crimson as an influence on their work. King Crimson opened for Tool on their 2002 tour, and expressed admiration for Tool while denying the "prog" label .

Meanwhile, other heavy metal bands *not* generally considered prog-metal, such as System of a Down have nevertheless incorporated prog-influenced elements like bizarre shifts in time signatures and tempo in their music. In recent years, a number of heavily classical-influenced goth metal bands have emerged in Europe, most notably Finland's Nightwish. Though they probably do not think of themselves as progressive metal bands, fans of the genre often

consider them to be such and indeed, several could claim at least as many of the "characteristics of Progressive Rock" listed above as bands like Dream Theater.

It should be noted that the term "progressive" in the early 1970s had been coined to emphasize the *newness* of these bands, but by the 1980s the term had become the name of a specific musical style. As a result, bands such as King Crimson which continued to update their sound were not always called "progressive", while some newer self-described "prog" bands purchased vintage mellotrons in order to recreate the sound of early 1970s prog. Fans and hostile critics alike had established "progressive rock" as the permanent name of this genre, and so the connection to the usual meaning of "progressive" became irrelevant.

## Influences

The work of contemporary artists such as Ween, post-rock bands like Sigur Rós and Godspeed You! Black Emperor, and alternative or new prog groups like Radiohead and Muse could be said to incorporate some of the elements of progressive rock, sometimes combined with the aesthetic sensibilities of punk rock. A better example of a contemporary progressive band however is probably The Mars Volta, who are notable for intentionally fusing punk with progressive rock, two elements once polar opposites. The cult English band Cardiacs has specialised since 1980 in a kind of progressive punk sound which has influenced a slew of other bands who are occasionally described (with tongue-in-cheek) as pronk acts. Among the more experimental and avant garde musicians, the Japanese composer Takashi Yoshimatsu publicly cites progressive rock bands as a prime influence on his work, while Chicago's indie-rock band The Fiery Furnaces could also be considered progressive, blending electronic and orchestrated bits into their craft, while also expanding on The Who's mini rock-opera ethic.

There are also a number of contemporary prog bands, such as Mostly Autumn that combine Celtic, and sometimes pagan, influences with earlier prog rock styles. Other bands of note incorporating progressive rock into their sound include The Mars Volta, Umphrey's McGee, Porcupine Tree, Dredg, The Dillinger Escape Plan, Kayo Dot, and Opeth.

## Progressive Rock Festivals

Renewed interest in progressive rock in the 90s eventually led to the beginnings of musical events and festivals that centered around progressive rock acts. The first ProgFest was held on May 29th, 1993, in UCLA's Royce Hall and featured Sweden's Anglagard, England's IQ, Quill, and Citadel. Interest in the festival was large enough for others in the U.S.A. to start similar events. ProgDay, held at Storybook Farm near Chapel Hill, North Carolina, first emerged during Labor Day weekend in 1995 and is planning its 12th festival in 2006.

The most successful of these festivals to date is NEARfest, which held its first event on June 26th & 27th, 1999 in Bethlehem, PA to approximately 400 fans. With a diverse lineup and an ability to get big name talent, the festival eventually grew in popularity to fill a 1,000 seat venue, and later relocated to Trenton, NJ in 2002 to a venue which seated over 1,850. The festival relocated back to Bethlehem, PA in 2004 and is still active.

Other current festivals of note include Rosfest in Phoenixville, PA, Baja Prog in Mexicali, Mexico, CalProg in Whittier, CA, Prog In The Park in Rochester, NY, Gouveia Art Rock in Portugal and Rio Art Rock Festival in Rio de Janeiro, Brazil.

# Progressive Southern Gospel

|                               |  |
|-------------------------------|--|
| <b>Stylistic origins:</b>     | Sacred Harp music, shape note singing, hymns, Southern Gospel  |
| <b>Cultural origins:</b>      | Late 19th century white evangelical Americans  |
| <b>Typical instruments:</b>   | guitars, drums, keyboards, percussion  |
| <b>Mainstream popularity:</b> | Original Southern gospel music was popularized by such secular artists as Elvis Presley and Tennessee Ernie Ford and has been incorporated into evangelistic meetings by notable ministers Billy Graham and Jimmy Swaggart |

Bluegrass gospel, Southern Gospel

southeastern and midwestern United States

## Origins

**Progressive Southern Gospel** is an American music genre that has grown out of Southern Gospel over the past couple of decades. The style can trace its roots to groups like the Nelons in the 1980s, who appeared regularly on events with traditional Southern Gospel groups despite their sound which was called "middle of the road" at the time.

Current Progressive Southern Gospel is characterized by its blend of traditional Southern Gospel instrumentation with elements of modern Country and pop music. Hints of other styles are frequently employed in the mix as well. In some Progressive Southern Gospel, you can hear a touch of Cajun, Celtic, Bluegrass, or even Southern Rock.

Where traditional Southern Gospel more often emphasizes blend and polish, Progressive Southern Gospel tends to be presented with a more emotional tone. Vocalists are known for experimenting, stretching, scooping, slurring, and over accentuating melodies and diction.

Lyrical, Progressive Southern Gospel songs are patterned after traditional Southern Gospel in that they maintain a clear evangelistic and/or testimonial slant. In many cases, lyrical content and/or Country diction are the only elements separating a Progressive Southern Gospel artist from a pop oriented, Contemporary

## **Impact of The Gaither Homecoming Series**

In the early 1990's, songwriters Bill and Gloria Gaither developed an enterprise known as The Gaither Homecoming Series. This did much to introduce Progressive Southern Gospel to the masses. Through video and television distribution many Progressive Southern Gospel artists such as The Martins, The Hoppers and The Isaacs became household names.

The series has also taken these groups to such places as Ireland; Sydney, Australia; London, England; and South Africa; not to mention almost every major US city for live concerts.

## Sample Artists

Several groups have made Progressive Southern Gospel their genre of choice. One of the most popular and outstanding of these are the Crabb Family. With origins that go back to the country gospel genre this group has now become one of the leaders in Progressive Southern Gospel and has even crossed over to contemporary christian as well.

Another group that has made a huge impact on the Progressive Southern Gospel genre would be The Isaacs. This group is deeply rooted in bluegrass gospel but over the last decade has erupted onto the Progressive scene with such hits as "Friend To The End", "Stand Still", "Carry Me" and the a capella spiritual "I Have A Father Who Can".

Other artists in the Progressive Southern Gospel genre include The Talley Trio, The Jody Brown Indian Family, The Hoppers and The Martins.

## Promenade concert

Although the term **Promenade Concert** is normally associated today with the series of concerts founded in 1895 by Robert Newman and the conductor Henry Wood – a festival known today as the BBC Proms - the term originally referred to concerts in the pleasure gardens of London where the audience could stroll about while listening to the music (French *se promener* = to walk).

Pleasure gardens which levied a small entrance fee and provided a variety of entertainment had become extremely popular in London by the eighteenth century. Music was provided from bandstands (known as “orchestras”) or more permanent buildings, and was generally of the popular variety: [ballroom dances](#), quadrilles (medleys), [cornet](#) solos etc. Other entertainments would have included fireworks, masquerades and acrobatics. There were 38 gardens which are known to have provided music. Perhaps the most famous of these were Vauxhall Gardens (1661-1859), south of the Thames. Known at first as New Spring Gardens this was the favourite haunt of diarists Samuel Pepys and John Evelyn. The music of Handel was very popular here in the eighteenth century, and in 1738 there was even a statue erected of Handel playing the lyre. The Gardens were described as fashionable in the late 18th and early 19th century by Fanny Burney and William Thackeray. Aristocracy and royalty mingled with the ordinary folk. On 21st April 1749 twelve thousand people paid 2s 6d each to hear Handel rehearsing his Music for the Royal Fireworks in Vauxhall Gardens, causing a three-hour traffic jam on London Bridge. The music had been commissioned by the king in celebration of the Treaty of Aix-la-Chapelle. The performance six days later in Green Park was even more spectacular, especially when the building caught fire. The composer Dr Thomas Arne was appointed composer of Vauxhall Gardens in 1745. It was here that many of his songs achieved their great popularity. The musicians were housed in a covered building while the audience strolled outside. In the nineteenth century Sir Henry Bishop was the official composer to the Gardens. Many of his songs, which include Home! Sweet home!, were performed there. Vauxhall Gardens remained a national institution until 1859.

Another prestige venue for promenade concerts was Ranelagh Gardens (1742-1803). Here both musicians and audience were under cover in a gigantic Georgian rotunda which can be seen in a painting of Canaletto in the National Gallery. It was here that Wolfgang Amadeus Mozart performed on the harpsichord and organ as a child prodigy in 1764. Joseph Haydn, too, appeared here during his visits to London.

The term “promenade concert” seems to have been first used in England in 1838 when London’s Lyceum Theatre announced ‘Promenade Concerts a la Musard’. Philippe Musard was a French musician who had introduced open air concerts in the English style in Paris. Musard came to England in 1840 to conduct some of the concerts in the Lyceum Theatre. His programmes consisted of overtures, waltzes, popular instrumental solos and quadrilles. The success of Musard’s concerts led to further musical promenade concerts, both in London and other places including Bath and Birmingham. The Crown and Anchor Tavern in the Strand gave a series of concerts given by the band of the Theatre Royal, Drury Lane under the direction of Henri Valentino. In 1840 Edward Eliason, leader of the orchestra of Drury Lane Theatre, started a series of “Concerts d’été” with an orchestra of nearly a hundred players. Soon there was also a series of “Concerts d’hiver” under Louis Antoine Jullien (1812-1860). Jullien was a genuine musician whose performances were combined with outrageous showmanship: Beethoven was conducted with a jewelled baton. With his extravagant clothing and long black hair and moustache he would go through a series of circus antics including having his white kid gloves brought to him on a silver salver. He conducted with his back to the orchestra in order to face his audience. His orchestra were often joined by the bands of the Royal Artillery or drummers from the French Garde Nationale. Jullien died in a lunatic asylum. He was succeeded by the English conductor Alfred Mellon (1820-1867), and then Luigi Arditi (1822-1903). Another notable conductor was August Manns (1825-1907) who is associated with the Saturday concerts at

London's Crystal Palace, the enormous glass building which housed the Great Exhibition in 1851.

The pleasure gardens were the chief institutions for the performance of music by English composers. Songs and vocal pieces were composed especially for them. Strophic ballads were the staple diet. The songs were often on pastoral subjects, or drinking songs, hunting songs or even songs on morbid subjects. Two famous songs that were written especially for the gardens include Arne's Shakespeare setting *Where the bee sucks* and Charles Edward Horn's setting of Herrick's *Cherry Ripe*. Gradually opera started to influence the style of music, and larger concerted pieces would be heard. Choruses from Handel's oratorios were often included. Instrumental music included the popular concerto. Organ music was played between the acts of ballad operas (Vauxhall and Ranelagh both had organs installed). In the late 19th century August Mann's concerts were exploring works by well-known composers: Brahms, Liszt, Mendelssohn, Schubert, Schumann, Smetana and Wagner. London audiences were starting to become more discerning, less likely to be taken in by extravagant showmanship, and eager to explore good music. By 1895 the time was ripe for Henry Wood to start his series of promenade concerts which continue today as the BBC Proms

# Promo Only

**Promo Only** is a [music](#) and [music video](#) subscription service for professional [disc jockeys](#). It was the first monthly music service available to music professionals on CD.

Promo Only began in 1992 when [DJ](#) Jim Robinson met up with another [DJ](#) Pete Werner on the pursuit of Janet Jackson's "Miss You Much (The Mama Mix)" re-mix. Werner was able to help out Robinson due to his connection with record labels. Robinson offered to digitally clean up 12" vinyl releases Werner received each month onto one DAT. After joking that they could even press the DAT into a CD, they realized that there was a need for putting these mixes onto CD for the emerging CD [DJ](#), and the company was born.

The Original Promo Only subscription (renamed 1 year later 'Promo Only Club') officially began in June of 1992, offering the latest 12" [Dance](#) mixes and hard to find releases. Werner and Robinson soon expanded into pop releases, with Promo Only Radio, combining the best of Top 40 pop, dance, urban and rock, after the encouragement by Columbia Records head of pop promotions, Jerry McKenna who said their was a need for it in the Radio Market.

The following years saw the appearances of more series: Urban Radio (August 1994), Country Radio (June 1995) and Modern Rock Radio (November 1995), Rhythm Radio (1997) and Promo Only started growing popular among DJs all over the US. Around 1997, Promo Only began separating their CD series' into Club and Radio. 1997 also saw the creation of Promo Only Canada based in Calgary, and Promo Only UK, based in London.

In 1998 Promo Only promotions was formed, based in New York, to Promote and A&R Dance music to Radio.

Werner and Robinson next ventured into the field of music videos buying out retiring friend Wolf Zimmerman's Milwaukee based company, Wolfram Video in 1999. Music videos were released on DVDs, and now includes six monthly series – Hot Video, Dance Mix Video, Pop Mix Video, Club Video, Country Video and Latin Video, and several specialty compilations.

Later that same year, with the purchase of National Video Service from Launch (then owned by Sony), Promo Only Business Music division based in Anaheim was formed. Promo Only BMD offers background music video services to clients such as Hard Rock Cafe, Planet Hollywood, Dave & Busters, Royal Caribbean Cruise Lines, and many more.

In 2003 Promo Only partnered with Destiny Media technology to form Promo Only MPE to Digitally deliver music to Radio in America, which is now the industry standard.

Categories: [Music industry](#).

## Promotional single

A **promo single** (short for **promotional single**) is a single that is released to club or radio outlets for the purpose of promotion of a song. It is not meant to be resold, but they are often sought out by collectors anyway. A promo single is usually sent to a radio station for it to play the radio version (which is often a radio edit, but can also be the original album version, or even a radio remix) of an artist's latest single. The promo single for radio stations often contains only the radio version of the song, but may also contain alternate radio edits, alternate radio remixes, or even call out hooks. Clubs often also played promotional singles (which are often released in the 12" Format) of singles with their latest remixes.

## Protest song

A protest song is a song intended to protest perceived problems in society such as injustice, racial discrimination, war, globalization, inflation, social inequalities. Protest songs are generally associated with [folk music](#), but in recent times they have come from all genres of music. Such songs become popular during times of social disruption and among social groups.

# History

Folk protest songs occur throughout history, the oldest protest song on record is The Cutty Wren from the peasants revolt of 1381 against feudal oppression. In the American Revolutionary War and in the abolitionist movement of the 19th century many songs came about. During the American Civil War, traditional songs such as "We Shall Overcome" served as protest songs.

In the 20th century, the union movement, the Great Depression, the Vietnam War (see Vietnam War protests), and recently, the war in Iraq spawned protest songs, such as Bob Dylan's "The Times They Are A-Changin'" (1964), Woody Guthrie's "This Land Is Your Land" (1940), and more recently, System of a Down's "Toxicity" (2001). The common form during that time, often with acoustic guitar and harmonica, was popularized by the work of Woody Guthrie and Pete Seeger in the beginning of the 20th Century and continued into the middle of the century by Phil Ochs, Joan Baez and Bob Dylan.

Neil Young continues the theme in in the 21st Century in his song, "Let's Impeach The President" - a stinging rebuke against President George W. Bush and the War in Iraq, as did Pink with her appeal to Bush in Dear Mr. President.

# Protopunk

**Protopunk** is a term used to describe a number of performers who were important precursors of [punk rock](#), or who have been cited by early punk rockers as influential.

Most protopunkers are Rock and Roll performers of the 1960s and early-1970s, though some earlier performers have been cited. [Garage rock](#) in general has been cited as quite influential in the development of punk rock. Many such garage rock artists can be found on the *Nuggets* compilations.

Protopunk has been proven difficult to define, and many widely different groups have been so dubbed. Most had a certain attitude or appearance seen as important, and not any specific musical tendencies. Significant examples include The Who (frequently called "The Godfathers of Punk" and influential on protopunk and [punk rock](#) artists from the MC5 to Green Day and many in-between), Iggy Pop (Commonly nicknamed "The Grandfather of Punk" and claimed as influential by many early punk artists) and his band The Stooges, Alice Cooper, Pere Ubu, The MC5, The Monks, David Bowie, The Velvet Underground, The Modern Lovers, T. Rex, Link Wray, and the New York Dolls.

Some protopunk bands also fall into the categories of [glam rock](#) or [UK pub rock](#). Pere Ubu, remarkably, fall into both the category protopunk and the category [post-punk](#).

Protopunk, combined with [garage rock](#), hard-edged [New Wave](#) and the garage rock revival, helped lead the way to the modern [garage punk](#) movement.

[Anarcho-punk](#) - [Anti-folk](#) - [Crust punk](#) - [Garage punk](#) - [Hardcore](#) - [Post-hardcore](#) - [Horror punk](#) - [New Wave](#) - [No Wave](#) - [Noise rock](#) - [Oi!](#) - [Pop punk](#) - [Post-punk](#) - [Psychobilly](#) - [Deathcountry](#) - [Riot grrr!](#) - Ska punk - [Streetpunk](#) - [Two Tone](#)

# Psalms

**Psalms** (*Tehilim* תְּהִלִּים, in Hebrew) is a book of the Hebrew Bible or Tanakh. Because of its original meaning as a [song](#) or [chant](#), the word **psalm** can be used to mean any religious chant or poem of praise. This article, however, deals specifically with the Psalms (with upper-case P) as the book of Scripture.

The Islamic redaction of the book of Psalms is called the Zabur, and is believed to be one of the holy books revealed by Allah prior to the Qur'an, the others being Tawrat (Torah) and Injil ([Gospels](#)).

In the Hebrew Bible, the Psalms are counted among the "Writings" or Ketuvim (one of the three main sections into which the books are grouped). In Luke 24:44 the word "psalms" refers the Writings as a whole.

The Book of Psalms, especially if printed separately and set for singing or chanting, is also called the **Psalter**.

## Composition of the Book of Psalms

The Book of Psalms is divided into 150 Psalms, each of which constitutes a religious song or chant, though one or two are long and may constitute a set of related chants. When the Bible was divided into chapters, each Psalm was assigned its own chapter. Psalms are sometimes referred to as chapters, though their individuality antedates the chapter assignments by at least 1,500 years.

The Dead Sea Scrolls contain more than 150 Psalms, including the "canonical" 150 Psalms and several "non-canonical" Psalms.

The organization and numbering of the Psalms differs slightly between the (Masoretic) Hebrew and the (Septuagint) Greek manuscripts:

### Hebrew Psalms    Greek Psalms

|         |         |         |
|---------|---------|---------|
|         | 1-8     |         |
| 9-10    |         | 9       |
| 11-113  |         | 10-112  |
| 114-115 |         | 113     |
| 116     |         | 114-115 |
| 117-146 |         | 116-145 |
| 147     |         | 146-147 |
|         | 148-150 |         |

- Psalms 9 and 10 in the Hebrew are together as Psalm 9 in the Greek
- Psalms 114 and 115 in the Hebrew are Psalm 113 in the Greek
- Psalms 114 and 115 in the Greek appear as Psalm 116 in the Hebrew
- Psalms 146 and 147 in the Greek form Psalm 147 in the Hebrew

Christian traditions vary:

- Protestant translations are based on the Hebrew numbering;
- Eastern Orthodox translations are based on the Greek numbering;
- Roman Catholic official liturgical texts follow the Greek numbering, but modern Catholic translations often use the Hebrew numbering, sometimes adding, in parenthesis, the Greek numbering as well.

Most manuscripts of the Septuagint also include a Psalm 151, present in Eastern Orthodox translations; a Hebrew version of this poem was found in the Psalms Scroll of the Dead Sea Scrolls. The Psalms Scroll presents the Psalms in an order different from that found elsewhere, and also contains a number of non-canonical poems and hymns.

For the remainder of this article, the Hebrew Psalm numbers will be used unless otherwise noted.

## Authorship and ascriptions

Traditionally the Psalms were thought to be the work of David, but many modern scholars see them as the product of several authors or groups of authors, many unknown. Most Psalms are prefixed with introductory words (which are frequently different in the Masoretic and Septuagint traditions) ascribing them to a particular author or saying something about the circumstances of their composition; only 73 of these introductions claim David as author. Since the Psalms were written down in Hebrew not before the 6th century BCE, nearly half a millennium after David's reign (about 1000 BCE), they doubtless depended on oral tradition for transmission of any Davidic material.

Psalms 39, 62, and 77 are linked with Jeduthun, to be sung after his manner or in his choir. Psalms 50 and 73-83 are associated with Asaph, as the master of his choir, to be sung in the worship of God. The ascriptions of Psalms 42, 44-49, 84, 85, 87, and 88 assert that the "sons of Korah" were entrusted with arranging and singing them; 2 Chronicles 20:19 suggests that this group formed a leading part of the Korathite singers. Hebraist Joel M. Hoffman suggests that Psalm 49 may be an anti-corruption Psalm, not "for Korah" but "against Korah."<sup>1</sup>

Psalm 18 is found, with minor variations, also at 2 Samuel 22, for which reason, in accordance with the naming convention used elsewhere in the historic parts of the Bible, it is known as the *Song of David*.

<sup>1</sup>*My People's Prayer Book Volume 9*. (Rabbi Lawrence A. Hoffman, ed.) 2004. ISBN 1580232620.

## Sections of the book

In Jewish usage, the Psalter is divided, after the analogy of the Pentateuch, into five books, each closing with a doxology or benediction (For the Orthodox Christian division into twenty *kathismata*, see **Eastern Orthodox usage**, below):

1. The first book comprises the first 41 Psalms. All of these are ascribed to David except Psalms 1, 2, 10, and 33, which, though untitled in the Hebrew, were also traditionally ascribed to David. While Davidic authorship cannot be confirmed, this probably is the oldest section of the Psalms.
2. The second book consists of the next 31 Psalms (42-72). Eighteen of these are ascribed to David and one to Solomon (Psalm 72). The rest are anonymous.
3. The third book contains seventeen Psalms (73-89), of which Psalm 86 is ascribed to David, Psalm 88 to Heman the Ezrahite, and Psalm 89 to Ethan the Ezrahite.
4. The fourth book also contains seventeen Psalms (90-106), of which Psalm 90 is ascribed to Moses, and Psalms 101 and 103 to David.
5. The fifth book contains the remaining Psalms, 44 in number. Of these, 15 are ascribed to David, and one (Psalm 127) to Solomon.

Psalm 136 is generally called "the great Hallel." But the Talmud includes also Psalms 120-135. Psalms 113-118, inclusive, constitute the "Hallel" recited at the three great feasts (Passover, Weeks, and Tabernacles), at the new moon, and on the eight days of Hanukkah. A version of Psalm 136 with slightly different wording appears in the Dead Sea Scrolls.

Psalms 120-134 are referred to as Songs of Degrees, and are thought to have been used as hymns of approach by pilgrims.

Psalm 119 is the longest Psalm. It is composed of 176 verses, in sets of eight verses, each set beginning with one of the 22 Hebrew letters. Several other Psalms too have alphabetical arrangements.

Psalm 117 is the shortest Psalm, containing but two verses.

## Psalm forms

Scholars have determined that there are a groups of psalms that can be classified together because of similarities. The main forms are:

- Hymns
- Individual Laments
- Community Laments
- Songs of Trust
- Individual Thanksgiving Psalms
- Royal Psalms
- Wisdom Psalms

## Use of the Psalms in Jewish ritual

The Mosaic ritual set out in the books of the Pentateuch or Torah makes no provision for the service of song in the worship of God. The earliest references to the use of singing in Jewish worship are in relation to David, and to this extent the ascription of the Psalms to him may express a general if not a specific truth.

Some of the titles given to the Psalms in their ascriptions suggest their use in worship:

- Some bear the Hebrew designation *shir* (Greek ode, a song). Thirteen have this title. It means the flow of speech, as it were, in a straight line or in a regular strain. This title includes secular as well as sacred song.
- Fifty-eight Psalms bear the designation (Hebrew) *mizmor* (Greek psalmos, a Psalm), a lyric ode, or a song set to music; a sacred song accompanied with a musical instrument.
- Psalm 145, and many others, have the designation (Hebrew) *tehillah* (Greek hymnos, a hymn), meaning a song of praise; a song the prominent thought of which is the praise of God.
- Six Psalms (16, 56-60) have the title (Hebrew) *michtam*.
- Psalms 7 and Habakkuk 3 bear the title (Hebrew) *shiggaion*.

Psalms are used throughout traditional Jewish worship. Several Psalms appear as part of the morning services; Psalm 145 (commonly referred to as "Ashrei," which is really the first word of each of the last 2 verses of Psalm 144), is read during or before services, three times every day. Psalms 95-99, 29, 92, and 93, along with some later readings, comprise the introduction ("Kabbalat Shabbat") to the Friday night service.

Traditionally, a different "Psalm for the Day" is read after the morning service each day of the week (starting Sunday, Psalms: 24, 48, 82, 94, 81, 93, 92). This is described in the Mishnah (the initial codification of the Jewish oral tradition) in the section "Tamid."

When a Jew dies, a watch is kept over the body and Tehillim (Psalms) are recited constantly by sun or candlelight, until the burial service. Historically, this watch would be carried out by the immediate family – usually in shifts – but what usually happens today is that the funeral home or Chevra kadisha will offer someone to keep this vigil.

Many Jews complete the Book of Psalms on a weekly or monthly basis, and say, each week, a Psalm connected to that week's events or the Torah portion read during that week. In addition, many Jews (notably Lubavitch, and other Chasidim) read the entire Book of Psalms prior to the morning (Shachrit) service, on the Sabbath preceding the calculated appearance of the new moon.

The 116 direct quotations from the Psalms in the New Testament show that they were familiar to the Judean community at the time of Jesus.

# The Psalms in Christian worship

New Testament references show that the earliest Christians used the Psalms in worship, and the Psalms have remained an important part of worship in virtually all Christian Churches. The Eastern Orthodox, Roman Catholic and Anglican Churches have always made systematic use of the Psalms, with a cycle for the recitation of all or most of them over the course of one or more weeks. In the early centuries of the Church, it was expected that any candidate for bishop would be able to recite the entire Psalter from memory, something they often learned automatically during their time as monks. Today, new translations and settings of the Psalms continue to be produced. Several conservative denominations sing only the Psalms (and the small number of hymns found elsewhere in the Bible) in worship, and do not accept the use of any non-Biblical hymns; an example is the Reformed Presbyterian Church of North America.

Some Psalms are among the best-known and best-loved passages of Scripture, with a popularity extending well beyond regular church-goers. In particular, the 23rd Psalm ("The Lord is My Shepherd", 22nd in the Greek numbering) offers an immediately appealing message of comfort and is widely chosen for church funeral services, either as a reading or in one of several popular hymn settings; and Psalm 50/51 ("Have mercy on me O God", called the Miserere from the first word in its Latin version) is by far the most sung Psalm of Orthodoxy, in both Divine Liturgy and Hours, in the sacrament of repentance or confession, and in other settings. Psalm 102/103 ("Bless the Lord, O my soul; and all that is within me, bless his holy name!") is one of the best-known prayers of praise. Psalm 137/136 ("By the rivers of Babylon, there we sat down and wept") is a moody, yet eventually triumphant, meditation upon living in slavery, and has been used in at least one [spiritual](#), as well as one well-known [reggae](#) song; the Orthodox church often uses this hymn during Lent. In popular music, the U2 song "40" is based on Psalm 40 ("I waited patiently for the Lord; and he inclined unto me, and heard my cry.")

## Eastern Orthodox usage

Eastern Orthodox Christians have long made the Psalms an integral part of their corporate and private prayers. To facilitate its reading, the 150 Psalms are divided into 20 *kathismata*, and each *kathisma* is further subdivided into three *stasi* (sing. *stasis*) as follows (using the Greek chapter numbering):

- Kathisma 1: Psalms 1-3, 4-6, 7-8
- Kathisma 2: 9-10, 11-13, 14-16
- Kathisma 3: 17, 18-20, 21-23
- Kathisma 4: 24-26, 27-29, 30-31
- Kathisma 5: 32-33, 34-35, 36
- Kathisma 6: 37-39, 40-42, 43-45
- Kathisma 7: 40-48, 49-50, 51-54
- Kathisma 8: 55-57, 58-60, 61-63
- Kathisma 9: 64-66, 67, 68-69
- Kathisma 10: 70-71, 72-73, 74-76
- Kathisma 11: 77, 78-80, 81-84
- Kathisma 12: 85-87, 88, 89-90
- Kathisma 13: 91-93, 94-96, 97-100
- Kathisma 14: 101-102, 103, 104
- Kathisma 15: 105, 106, 107-108
- Kathisma 16: 109-111, 112-114, 115-117

- Kathisma 17: 118:1-72, 73-131, 132-176
- Kathisma 18: 119-123, 124-128, 129-133
- Kathisma 19: 134-136, 137-139, 140-142
- Kathisma 20: 143-144, 145-147, 148-150

At vespers, different kathismata are read at different times of the liturgical year and on different days of the week within the same part of the year, according to the Church's calendar. In the 20th century, some lay Christians have adopted a continuous reading of the Psalms on weekdays, praying the whole book in four weeks, three times a day, one kathisma a day.

Aside from kathisma readings, Psalms occupy a prominent place in every other Orthodox service including the services of the Hours and the Divine Liturgy. In particular, the penitential Psalm 50 is very widely used. Fragments of Psalms and individual verses are used as Prokimena, or introductions to other Scripture readings. The bulk of Vespers is composed of Psalms even if the kathismata are disregarded; Psalm 118, "The Psalm of the Law," is the centerpiece of Matins. The entire book of Psalms is traditionally read out loud or chanted at the side of the deceased during the time leading up to the funeral.

## Roman Catholic usage

The Psalms have always been an important part of Roman Catholic liturgy. The Liturgy of the Hours is centred on chanting or recitation of the Psalms. Early Catholics employed the Psalms widely in their individual prayers also; however, as knowledge of Latin (the language of the Latin rite) became uncommon, this practice ceased among the unlearned. Over the centuries, the use of the Psalms in the liturgy declined as well. The Tridentine Mass preserved only isolated verses that, in some cases, were originally refrains sung during recitation of the whole Psalm from which they were taken.

When the Second Vatican Council permitted the use of vernacular languages in the liturgy, certain Psalms again became well known even to the laity. Until the Council the Psalms were either recited on a one week or less frequently (as in the case of Ambrosian rite) a two week cycle. The Breviary introduced in 1974 distributed the psalms over a four-week cycle. Monastic usage varies widely. Some use the four week cycle of the secular clergy, many retain a one week cycle, either following St Benedict's scheme or another of their own devising, while others opt for some other arrangement.

Official approval was also given to other arrangements by which the complete Psalter is recited in a one or two-week cycle. These arrangements are used principally by Catholic contemplative religious orders, such as that of the Trappists (see for example the Divine Office schedule at New Melleray Abbey).

The 1970 revision of the Roman Missal (see Mass of Paul VI) reintroduced the singing or recitation of a more substantial section of a Psalm, and in some cases an entire Psalm, after the first Reading from Scripture. This Psalm, called the *Responsorial Psalm*, is usually sung or recited responsorially, although the *General Instruction of the Roman Missal*, 61 permits direct recitation.

The *General Instruction of the Liturgy of the Hours*, 122 sanctions three modes of singing/recitation for the Psalms:

- directly (all sing or recite the entire psalm);
- antiphonally (two choirs or sections of the congregation sing or recite alternate verses or strophes); and
- responsorially (the cantor or choir sings or recites the verses while the congregation sings or recites a given response after each verse).

## Protestant usage

The psalms were extremely popular among those who followed the Reformed tradition.

Following the Protestant Reformation, verse paraphrases of many of the Psalms were set as hymns. These were particularly popular in the Calvinist tradition. Calvin himself made some French translations of the Psalms for church usage. Martin Luther's A Mighty Fortress is Our God is based on Psalm 46. Among famous hymn settings of the Psalter were the Scottish Paraphrases and the settings by Isaac Watts. The first book printed in North America was a collection of Psalm settings, the Bay Psalm Book (1640).

But by the 20th century they were mostly replaced by hymns in church services.

## Anglican usage

[Anglican chant](#) is a way of singing the Psalms that remains part of the Anglican choral tradition. The version of the Psalter in the Book of Common Prayer is an older translation (from the Great Bible) than that included in the King James Version of the Bible.

## Musical settings

Old 100th

Miserere by Gregorio Allegri

Vespro della Beata Vergine 1610 by Monteverdi

Chichester Psalms by Leonard Bernstein

Tehillim by Steve Reich

*This entry incorporates text from the public domain Easton's Bible Dictionary, originally published in 1897.*

# Psybient

**Psybient** is an [electronic music](#) genre that combines elements of [psychedelic trance](#) and ambient. It often has many dub influences and can sound "glitchy." Psybient artists include Shpongle, Entheogenic (2), Evan Bluetech, Yaniv Shulman, Kickbong, and some of the works of Younger Brother.

# Psych folk

**Psych folk** or **Psychedelic folk** is a [music genre](#) which began through the blending of [folk music](#) and [psychedelic music](#) in the 1960s. It is generally acoustic or mixes acoustic instrumentation with other influences. Chanting, [early music](#) and [world music](#) influences are sometimes apparent. Its lyrics are often concern such subjects as the natural world, love and beauty and try to evoke a state of mind associated with the effects of a psychedelic drug. Its fans see it as a way to get new perspectives and reach new aspects of consciousness and some may even listen to it while under the influence of such drugs.

## Overview

Early examples of psych folk bands were Pink Floyd with Syd Barrett, The Incredible String Band, and Tyrannosaurus Rex.

It has continued to be performed up to the present day. Other notable psych folk artists are Robyn Hitchcock, F.J.McMahon and Current 93.

Since the 1990s, Elephant Six Collective, with bands like Neutral Milk Hotel has been known to release psych folk records.

The latest generation of psych folk artists in the early 2000s include Animal Collective, DeVotchKa, Faun Fables, Gwendolyn, testface, Sun City Girls, Dame Darcy, Kemiälliset Ystävät (Finland), DOPO (Portugal), Devendra Banhart, PG Six, Pothole Skinny, Tower Recordings, Eyes and Arms of Smoke, and Deek Hoi. (See New Weird America.)

Another type of folk that incorporate world music, strange sounds and trippy lyrics include psych folk's more esoteric-oriented and hermetic-centered cousin: Apocalyptic folk. While these genres are similar, the latter two appeal more to followers of darker music, while psych folk is more favoured by psychedelic music followers in general. This relationship could be considered very analogous to the similar subject matter but different treatments.

Michael Gira has also assisted in a sort of psych folk revival. Gira named his newest project Angels of Light after San Francisco hippy Hibiscus's transcendental theatre group of the same name and is responsible for guiding the career of new psych folk rising star, Devendra Banhart.

# Psychedelic music

**Psychedelic music** is a musical style inspired by or attempting to replicate the mind-altering experience of drugs such as cannabis, psilocybin, mescaline, and especially LSD. Psychedelic music is a misnomer and should properly be called psychedelic [rock music](#), but for the purposes of this article it is not rigorously defined, and is sometimes interpreted to include everything from [Acid Rock](#) and Flower Power music to [Hard Rock](#). There are also other forms of psychedelic music that started from the same roots and diverged from the prevalent rock style into electronic music. However, an inner core of the psychedelic style of rock that came to public attention in 1967 can be recognized by characteristic features such as [modal](#) melodies; esoteric lyrics often describing dreams, visions, or hallucinations; longer songs and lengthy [instrumental](#) solos; and "trippy" electronic effects such as distortion, reverb, and reversed, delayed and/or phased sounds. The album that brought psychedelic rock into pop culture was The Beatles's Sgt. Pepper's Lonely Hearts Club Band.

While the first musicians to be influenced by psychedelic drugs were in the jazz and folk scenes, the first use of the term "[psychedelic](#)" in popular music was by the "acid-folk" group The Holy Modal Rounders in 1964. The first use of the word "psychedelic" in a rock music context is usually credited to the 13th Floor Elevators, and the earliest known appearance of this usage of the word in print is in the title of their 1966 album The Psychedelic Sounds of the 13th Floor Elevators. The psychedelic sound itself had been around at least a year earlier in the live music of the Grateful Dead and Pink Floyd, and Donovan's hit Sunshine Superman.

# History

In 1962 British rock embarked on a frenetic race of ideas that spread back to the U.S. with the British Invasion. The [folk music](#) scene also experimented with outside influences. In the tradition of [Jazz](#) and [blues music](#) many musicians began to take drugs, and include drug references in their songs. In 1965 Bob Dylan was influenced by The Beatles to bring in electric rock instrumentation in his album Bringing It All Back Home, but The Byrds beat him to it with a jangling electric hit single version of a track from the album with hints of psychedelia, Mr. Tambourine Man.

## U.S.A. in the 1960s

Psychedelia began in the United States folk scene, with New York City's Holy Modal Rounders introducing the term in 1964. A similar band called Mother McCree's Uptown Jug Champions from San Francisco were influenced by the Byrds and the Beatles to switch from acoustic music to electric music in 1965. Renaming themselves the Warlocks, they fell in with Ken Kesey's LSD-fuelled Merry Pranksters in November 1965, and changed their name to the Grateful Dead the following month. The Dead played to light shows at the Pranksters' "Acid Tests", with pulsing images being projected over the group in what became a widespread practice. Their sound soon became identified as Acid rock which they played at the Trips Festival in January 1966 along with Big Brother & the Holding Company. The festival was held at the Fillmore Auditorium and was attended by some 10,000 people. For most of the attendees, it was their first encounter with both acid-rock and LSD.

Throughout 1966, the San Francisco music scene flourished, as the Fillmore, the Avalon Ballroom, and the Matrix club began booking local rock bands on a nightly basis. The emerging "San Francisco Sound" made local stars of numerous bands, including the Charlatans, Quicksilver Messenger Service, Country Joe and the Fish, The Great Society, and the folk-rockers Jefferson Airplane, whose debut album was recorded during the winter of 1965/66 and released in August 1966. Jefferson Airplane Takes Off was the first album to come out of San Francisco during this era and sold well enough to bring the city's music scene to the attention of the record industry. Jefferson Airplane gained greater fame the following year with two of the earliest psychedelic hit singles: "White Rabbit" and "Somebody to Love". In fact, both these songs had originated with the band The Great Society, whose female singer Grace Slick left them to accept an offer to join Jefferson Airplane, taking the two compositions with her.

While the Grateful Dead were the acknowledged leaders of the San Francisco music scene in the 1960s by both local concert-goers and rival bands, their records didn't sell as well as those by many of their Bay Area peers. As a result, the Grateful Dead didn't begin to attain national popularity until around 1969-1970, when their constant touring gained them a cult following.

Although San Francisco receives much of the credit for jumpstarting the psychedelic music scene, many other American cities contributed significantly to the new genre. Los Angeles boasted dozens of important psychedelic bands, including the Byrds, Love, Spirit, the United States of America, and the Doors, among others. New York City produced its share of psychedelic bands such as the Blues Magoos, the Blues Project, and the Third Bardo. The Detroit area gave rise to psychedelic bands the Amboy Dukes and the SRC. Texas (particularly Austin) is often cited for its contributions to psychedelic music, being home to the aforementioned 13th Floor Elevators, as well as Bubble Puppy, Golden Dawn, the Zakary Thaks, Red Krayola, and many others.

The Byrds went psychedelic in 1966 with Eight Miles High, a song with odd vocal harmonies and an extended guitar solo that guitarist Roger McGuinn states was inspired by Raga and John

Coltrane.

In 1965, members of Rick And The Ravens and The Psychedelic Rangers came together with Jim Morrison to form the Doors. They made a demo tape for Columbia Records in September of that year, which contained glimpses of their later acid-rock sound. When nobody at Columbia wanted to produce the band, they were signed by Elektra Records, who released their debut album in January 1967. It contained their first hit single, Light My Fire. Clocking in at over 7 minutes, it became one of the first rock singles to break the mold of the three-minute pop song.

Initially, the Beach Boys, with their squeaky-clean image, seemed unlikely as psychedelic types. Their music, however, grew more psychedelic and experimental, perhaps due in part to writer/producer/arranger Brian Wilson's increased drug usage and burgeoning mental illness. In 1966, responding to the Beatles' innovations, they produced their album Pet Sounds and later that year had a massive hit with the psychedelic single "Good Vibrations". Wilson's magnum opus SMiLE (which was never finished, and was remade by Wilson with a new band in 2004) also shows this growing experimentation.

The psychedelic influence was also felt in black music, where record labels such as Motown dabbled for a while with psychedelic soul, producing such hits as "Ball of Confusion (That's What the World is Today)" and "Psychedelic Shack" (by The Temptations), and "Reflections" (by Diana Ross & the Supremes), and the 11-minute-long "Time Has Come Today" by The Chambers Brothers, before falling out of favour.

## **Britain in the 1960s**

In the United Kingdom, Donovan, going electric like Dylan, had a 1965 hit with Sunshine Superman, one of the very first overtly psychedelic pop records. Pink Floyd had been developing psychedelic rock with light shows since 1965 in the underground culture scene, and in 1966 the Soft Machine formed. In August 1966 The Beatles joined in the fun with their Revolver featuring psychedelia in "Tomorrow Never Knows" and in "Yellow Submarine" which combined these references with appeal to children and nostalgia, a formula repeated in "Strawberry Fields Forever" which would keep their music widely popular. From a blues rock background, the British supergroup Cream debuted in December. The Jimi Hendrix Experience with Noel Redding and Mitch Mitchell brought Jimi Hendrix fame in Britain, and later in his American homeland.

Pink Floyd's "Arnold Layne" in March 1967 only hinted at their live sound, then after the Beatles' groundbreaking album Sgt. Pepper's Lonely Hearts Club Band ("Lucy in the Sky with Diamonds") was released in June, Pink Floyd showed their psychedelic sounds in The Piper at the Gates of Dawn and Cream did the same in Disraeli Gears. In the folk scene itself blues, drugs, jazz and eastern influences had featured since 1964 in the work of Davy Graham and Bert Jansch, and in 1967 the Incredible String Band's The 5000 Spirits or the Layers of the Onion developed this into full blown psychedelia. Other artists joining the psychedelic revolution included Eric Burdon (previously of The Animals), and The Small Faces. The Who's Sell Out had an early psychedelic track "I Can See for Miles", but the album concept was out of tune with the times, and it was their later album Tommy that established them in the scene. The Rolling Stones had drug references and psychedelic hints in their 1966 singles "19th Nervous Breakdown" and "Paint it Black", then the fully psychedelic Their Satanic Majesties Request ("In Another Land") suffered from the problems the group was having at the time. In 1968 Jumpin' Jack Flash and Beggars Banquet re-established them, but their disastrous concert at Altamont in 1969 ended the dream on a downer.

## **The end of the 1960s**

A good number of the bands who pioneered psychedelic rock gave it up by the end of the 1960s. The increasingly hostile political environment and the embrace of amphetamines, heroin and cocaine by the underground led to a turn toward harsher music. At the same time, Bob

Dylan released *John Wesley Harding* and the Band released *Music from Big Pink*, both albums that rejected psychedelia for a more roots-oriented approach. Many bands in England and America followed suit. Eric Clapton cites *Music from Big Pink* as a primary reason for quitting Cream, for example. The Grateful Dead also went back to basics and had major successes with *Workingman's Dead* and *American Beauty* in 1970, then continued to successfully develop their rambling live music and produce a long string of records over the next twenty-five years.

The musicians and bands who continued to embrace psychedelia often went on to create [progressive rock](#) in the 1970s, which maintained the love of unusual sounds and extended solos but added jazz and classical influences to the mix. For example, progressive rock group Yes sprang out of three British psychedelic bands: Syn (featuring Chris Squire), Tomorrow (featuring Steve Howe) and Mabel Greer's Toy Shop (Jon Anderson). Also, psychedelic rock strongly influenced early [heavy metal](#) bands, Black Sabbath probably being the best example. Psychedelic rock, with its distorted guitar sound and adventurous compositions can be seen as an important bridge between heavy metal and earlier blues oriented rock.

Alongside the progressive stream, [space rock](#) bands such as Hawkwind, Arthur Brown's Kingdom Come and Gong maintained a more explicitly psychedelic course into the 1970s.

## More recent bands ([Neo-Psychedelia](#))

Although the groups listed here are labeled with the Psychedelic moniker, it should be noted that some Psychedelic purists claim that much of the sound is actually quite different from the original Psychedelic bands and production from the sixties, thus pointing to different terminology, such as Revival Rock or Modern Rock.

Phish, a jam band active from the early 1980s, played psychedelic music with a strong jazz influence, utilizing elaborate modal melodies and complex rhythmic accompaniment. In the mid 1980s a Los Angeles-based movement named the Paisley Underground acknowledged a debt to the Byrds, incorporating psychedelia into a folky, jangle pop sound. The Bangles were arguably the most successful band to emerge from this movement; amongst others involved were Green on Red, the Three O'Clock and Dream Syndicate. Loxley Beade from Darmstadt/Germany created a mixture of Psychedelic, Folk-Rock and oriental influences by using exotic instruments.

A British counterpoint to the Paisley Underground was a number of post-New Wave bands, including The Soft Boys and the solo albums of their singer Robyn Hitchcock, and The Teardrop Explodes and its vocalist Julian Cope. Hitchcock was heavily influenced by Syd Barrett and John Lennon. In the mid 1980s, The Shamen began with a self-consciously psychedelic curriculum influenced by Barrett and Love, before reorienting itself towards rave. Other British dabblers in psychedelia included XTC and Martin Newell with The Cleaners from Venus and The Brotherhood of Lizards.

Beginning in the late 1980s, travelers, musicians, and artists from around the world formed a new form of psychedelic music in the Indian state of Goa. Initially called Goa trance, this psychedelic music was the result of mixing the 60s influences with [industrial music](#) and [electronica](#).

Alternative rock groups also dabble in psychedelia, including Nirvana in their debut single, "Love Buzz."

The group Kula Shaker, under the leadership of Crispian Mills, created much Indian-influenced psychedelic music, such as the album "Peasants, pigs and Astronauts." Bands such as Ozric Tentacles and the Welsh Gorky's Zygotic Mynci play psychedelic music in a tradition that goes back to the 60s via acts such as Steve Hillage, Gong and their assorted side projects.

British bands Anomie and My Bloody Valentine play British garage psychedelia, citing Pink Floyd and Hawkwind as musical influences. Some electronic or electronic-influenced music termed "ambient" or "trance" such as Aphex Twin or Orbital, had it been written between 1966 and 1990, would have fallen within the category of psychedelia. Later Psychedelic trance artists such as Hallucinogen (musician) and Shpongle have continued the psychedelic music tradition within a dance-oriented context. Stoner rock acts like Kyuss and their successors also perform

explicitly psychedelic music. Bands such as The Smashing Pumpkins and Tool fused psychedelic rock sounds with [heavy metal](#), becoming highly successful [alternative rock](#) acts in the 1990s.

In Australia in the 80s, bands such as The Tripps and Prince Vlad & the Gargoyle Impalers explored and reinvigorated the psychedelic genre. Rising from the Japanese noise underground, Acid Mothers Temple mix the subtle resonance of Blue Cheer, the Grateful Dead's psychedelic sound, the thought-provoking melodies of French folk, and concrete bursts of noise that run through music of Boredoms.

Other endeavours in experimental rock with psychedelic influences include Neutral Milk Hotel, The Apples (In Stereo), Of Montreal, and Olivia Tremor Control: all members of the Elephant 6 musical collective, which was headquartered in Athens, Georgia, until its demise.

In the late 1990s and early 2000s, a new psychedelic scene flourished in the Silverlake area of Los Angeles. Among the bands were the Brian Jonestown Massacre, led by Anton Newcombe. Other bands in the scene were Beachwood Sparks. Beachwood Sparks' influences were the Byrds, Buffalo Springfield, and Gram Parsons and his Flying Burrito Brothers group. Spinning off from the Beachwood Sparks is a band called the Tyde.

More well-known bands of the Los Angeles scene were the Warlocks and BRMC. The Quarter After, a lesser-known group, is Byrds-influenced and has toured with the Brian Jonestown Massacre. The groups of the Silverlake Scene are mentioned in the documentary Dig!, which documents the rivalry between Brian Jonestown Massacre and the Dandy Warhols. A New York group is Pax Romana.

In 1999-2003, When released "The Psychadelic Waunderbaum" which contains snippets of Psychadelic garage rock grooves mixed in with industrial and Faust influenced rock, containing lyrics by Aleister Crowley and Tom Wolfe, it contains the song, Kali which could be described as an update of the Beatles, I am the Walrus. It was followed in 2001, by The Lobster Boys which is a mix of melodica, cut up/collage, lounge, and Indian rhythms, Beach Boys Pet Sounds, and noise. It has been described as almost a collaboration between Muslimgauze and XTC. When then followed it up with Pearl Harvest which takes the sound of the previous two albums. It has best been described as a Moroccan lounge psychadelic trip, with the dark content of the previous two titles.

Dungen's record "Ta Det Lugnt" received acclaim from Mojo and Pitchfork.

Also another new psychedelic band to be gaining prominence is the New York based band Pax Romana. Their album "Tapir Quasar and the Bloody" is a testimony to psychedelic rock of the 1960's, but also having links to progressive, folk, shoegaze, and surf rock. Tracks like "Approaching Holy", "Voyage of the Old Kitty Kat Man" and "Here comes the Blacksmith" have gained acclaim as have songs not on the album like "This is a New York State Alert". Their music can mostly be compared to The Beatles, King Crimson, and David Bowie.

# Psychedelic soul

**Psychedelic soul** is a subgenre of [soul music](#) that thrived during the late 1960s and early 1970s. A blending of psychedelic rock and [soul music](#), the style is best exemplified in the work of multicultural rock band Sly & the Family Stone.

Others, most notably The Temptations and their producer Norman Whitfield, War, The Undisputed Truth, and The Fifth Dimension, followed the path laid out by the work of Sly Stone and his band. Psychedelic soul led the way for a harder, less subdued sound to permeate through black music, leading the way for the mainstream [funk music](#) of the early 1970s and later [disco](#).

Psychill, [Psybient](#)

**Psychedelic trance**, often referred to as **psytrance**, is a form of [electronic music](#) that developed from [Goa trance](#) in the early 1990s when it first began hitting the mainstream. In some psychedelic trance circles and online communities, 'Psychedelic' is the preferred name for the genre as it provides an umbrella term for the many divergent styles including Goa, full on, dark, prog and [suomi](#). Referring to it as "psychedelic" also distinguishes the style from the clubbier type of [trance music](#) and reinforces the roots of Goa trance in the psychedelic community. Psychedelic trance generally has a fast tempo, in the range 135 to 150 BPM but has developed into numerous different styles within the genre all with their own range of tempos. The emphasis in psychedelic trance is placed strongly on purely synthesized timbres in terms of programming and lead melodies. The original Goa trance was often made with popular Modular synthesizers and hardware [samplers](#), but the preference in Psychedelic trance has moved to sample manipulation and storage in VST and AU software sampler applications. The use of analog synthesizers for sound synthesis has given way to digital "virtual analog" instruments like the Nord Lead, Access Virus, Korg MS-2000, Roland JP-8000 and computer VST and AU plugins like Native Instruments Reaktor. These are usually controlled by MIDI sequencers within Digital Audio Workstation (DAW) applications.

Psytrance is most popular in the UK, Israel, Portugal, Mexico, Germany, Japan, Australia, Brazil, South Africa, Serbia, Macedonia, Netherlands, the Nordic countries and India. The genre is not as well known outside its scene as [uplifting](#) or progressive is.

## Psychedelic trance vs Goa trance

The term "psychedelic trance" is used almost synonymously with "Goa trance". Goa trance is a precursor to the late 1990s psychedelic trance, which utilizes more sophisticated melodic devices and distinctive basslines. Goa trance is an almost completely defunct genre of music, based on the fact that few if any contemporary artists would describe the music they create as being of this genre. The term "Psychedelic trance" is used to distinguish the newer material made by many artists, who were formerly known to have produced Goa trance. Full On is a sub-genre characterized by "solidly driven" basslines, melodies, and frequent use of DSP Effects. Notable artists include, Spain's (Ibiza) Growling Mad Scientists G.M.S. and Israel's Astrix in comparison to the more "clubbier" minimalist and less melodic genres, such as progressive trance with more of a psychedelic influence, exemplified by many Scandinavian and German artists, including Sweden's Son Kite. Many use the term Goa trance to simply distinguish those pieces which seem to incorporate eastern, Indian, or "organic" melodies (see raga), derived from sources, like Indian classical music. This makes it easier to identify those which don't incorporate such elements, which listeners would call Psychedelic trance. These pieces tend to be more experimental and futuristic (in the case of Full on), usually using programmed melodies juxtapositionally derived from minor arpeggios Cm7, Dm7, Em7, etc and other exotic or unusual harmonic combinations (see transposition), with the intent of being multi-timbral (see glissando). Both genres, however, continue to use samples taken from sources, like sci-fi films, documentaries, etc.

# History

Psychedelic trance developed out of the early 1990s [Goa Trance](#) scene through the influence of artists such as Timeshard and Eat Static, both on the Planet Dog [record label](#).

The first pure Psychedelic trance label was Dragonfly Records, formed by the artist and trance producer Martin "Youth" Glover (a former bassist for the band Killing Joke) in Brixton, London. For this he took advantage of the organization and the studio of his already existing label, Butterfly Records. It quickly became the center of the London Psychedelic trance scene. Raja Ram and Graham Wood first produced here as The Infinity Project. Simon Posford, who worked as a sound engineer at Butterfly, later released his legendary album, Twisted as Hallucinogen on Dragonfly. This album featured the classic track "LSD" featuring a voice sample from acid guru Ken Kesey. The first compilation from Dragonfly was released as a trance sampler and was soon followed by another compilation titled Project II Trance in August of 1993. These included work from such well-known artists as the French project Total Eclipse and Mandra Gora. In 1994 it released singles from Man With No Name, Prana, Ayahuasca, Slinky Wizard and Doof. The signature Order Odonata compilation was released the same year.

At this point the scene was growing rapidly and many new labels were created. Return To The Source, a party collective first appeared. Raja Ram and Graham Wood went on to found their own label, called TIP Records (now TIP World). Tsuyoshi Suzuki worked with John Perloff to create the Matsuri Productions label. Flying Rhino Records was established by James Monroe, Dominic Lamb and George Barker (Slinky Wizard), who hired Sally Welch as manager. Simon Berry founded Platipus Records, who among other things, released the first vinyl by Technossomy. It also out licensed the famous Robert Miles' "Children". Simon's own project, Union Jack released their morning trance album There will be no Armageddon in 1996, featuring well-known tracks such as "Red Herring", "Cactus" and "Two Full Moons and a Trout".

Around this time a new label emerged in UK. Some consider Blue Room Released to be of the most important, and unusual, labels in the Psychedelic trance genre. It was led by Simon Ghahary and had solid financial backing from a British loudspeaker company. Allegedly, Ghahary had free reign to spend the money as he saw fit, regardless of sales figures. This allowed Blue Room to move away from "classic" Goa trance into new, more experimental directions. Some of the most well-known artists today were signed and had their work distributed on the Blue Room Released label. Their first compilation was titled "Outside The Reactor" was released in April of 1995 and featured work from artists such as Total Eclipse, Har-EI Prussky, and Voodoo People. Three of the most well known projects - Juno Reactor, Total Eclipse and The Infinity Project also released their debut albums that year. Soon the German project X-Dream started working with Blue Room as well, releasing their "The Frog" single and the highly influential Radio album. At its height, the label went on to release such works as Violent Relaxation by Total Eclipse, Juno Reactor's Bible of Dreams, Saafi Brothers' Mystic Cigarettes and Dragon Tales by Koxbox.

Despite being the center of production for Psychedelic trance in the mid 1990s, England had a very limited party scene. This mostly due to the Criminal Justice Bill and requirements for early closing hours in nightclubs. On the other hand, Germany had much more liberal laws, which in addition to the recent unification contributed to the development of the scene there. The German label Spirit Zone Records opened up in 1994, and ended up signing on many foreign artists such as The Infinity Project (UK), K.U.R.O. (Japan), Etnica (Italy), and Har-EI Prussky (Israel). It was also the home label of many German artists such as Electric Universe, Star Sounds Orchestra and S.U.N. Project. France was also becoming an increasingly important location, with not only Total Eclipse, but the now famous projects like Talamasca and Transwave emerging.

Around 1997, the original [Goa trance](#) scene was undergoing hard times, especially in the UK. Sales dropped and many big labels such as Flying Rhino went bankrupt, while others had to reinvent themselves and emerge under a new name as did TIP World. The death of Goa trance

was "officially" declared by Tsuyoshi Suzuki on his Let it RIP album, where the liner notes read "RIP: Mother Theresa, Princess Diana, William Burroughs, Goa trance."

The new sound of what would become the Psychedelic trance of today emerged at this time. It included elements of [minimalist](#) and progressive trance, [house](#), and [techno](#), while focusing less on the original Goa melodies. Germany became the center of this movement in 1997 and 1998. Many Swedish artists also emerged playing a more progressive sound. The most successful and well known is Tomasz Balicki (Atmos). His track "Klein Aber Doctor" was the most successful release for Flying Rhino yet, which was in the process of restructuring. Even the Dragonfly label stated to switch to this new progressive sound, and Psychedelic trance was once again becoming popular. Debut releases from Atmos, Noma, S-Range and Son Kite only cemented this fact and made Sweden an important producer of psychedelic trance.

Soon Psychedelic trance was expanding rapidly once again, and for the first time differences became apparent in the music being produced in different countries. Parallel scenes also developed in countries like Israel, Germany, South Africa and Japan. There are also smaller, but active scenes in India, New Zealand, Australia, Brazil, Mexico, The Netherlands, Switzerland, Austria, Greece, Portugal, Finland, Russia, Ukraine, Thailand, Denmark, Poland, Canada and even the United States. Development in Israel

In 1988 due to a change of laws and the political situation in Israel, many Israelis were allowed to get Indian travel visas for the first time. Many of them had just completed military service and were looking for a vacation. The beaches of Goa were a natural destination. Many of them returned from the trips bringing back recordings on the new style of music. Developing mostly separately from the scenes elsewhere, Israeli DJs emerged playing their own variations on the sound. Some of them were Avi Nissim and Lior Perlmutter (SFX and later Astral Projection), Har-El Prusky and Miko (California Sunshine), Guy Sebbag, Avi Algranati (Phreaky, Space Cat) and Ofer Dikovsky (Oforia). Naturally, Israeli labels formed, including Melodia Records, Trust In Trance Records, Phonokol and Krembo Records. With the emergence of new innovative artists such as Infected Mushroom, psychedelic trance became a big part of the culture in Israel, more so than in any other country in the world.

## Commercial success

In recent years, sales of psychedelic trance have been falling. The decline was : -2,8% in 2001, and -8,8% in 2002. A typical album usually sells around 2,000 copies, and selling more than 5,000 copies would be considered a success. There are only a handful of artists who sold more than 20,000 copies, including Hallucinogen, G.M.S., Infected Mushroom, Transwave, and Astral Projection. Hallucinogen's Twisted has had the most commercial success to date, selling around 85,000 copies.

The reasons for this decline in public interest include overproduction, copyright infringement, and lack of publicity. In fact, the market has not grown much, however the number of new labels and artists has increased exponentially. Much of psychedelic trance is also channeled through illegal copying by sharing of music, particularly among students and streaming audio on the internet. Although this has opened up the market to newcomers, most of these fans do not have the ability to purchase music since it is not normally distributed in mainstream record stores (mostly internet shops).

## Psychedelic trance scene

Psychedelic trance is often played at outdoor festivals. The festivals often take place over a few days with music being played through the night and well into the next day. These big events usually offer a lot parallel activities, not just music. The Psy Trance scene is very concerned about ecology and nature, and hence it's very usual to find a lot of workshops with educational activities against racism, and promoting love and care for Our Mother Nature.

The big trance festivals often form a small independent city, where some 10,000 people from different places of the world meet to celebrate music and life. During winter many parties take place in clubs in modern suburbia or on the many beaches in foreign climes frequented by travellers.

Some people at these festivals frequently consume psychedelic drugs like LSD and psychedelic mushrooms. The smoking of Cannabis is widespread within the global psy-trance scene. Drugs such as Ecstasy, cocaine and amphetamine are also used to some extent. There is also a large portion of the psytrance community - including many successful artists, dj's, party organizers and party goers - who do not use drugs, or no longer use drugs. Many of these people believe experiencing the music in the intended spirit of the festivals is the high in and of itself.

Whilst psychedelic trance music is a global phenomenon it is particularly popular in Brazil, Japan, Israel, Germany, Mexico, Russia, the UK, South Africa and Australia.

## Psychedelic trance artists and projects

Psychedelic trance is often produced in a collaboration between two or more artists, called a "project". Somewhat different from other genres of music is the fact that one artist could be part of as much as ten or more projects, often simultaneously. Each different combination of artists almost always has a unique name. For example X-Dream (Jan Muller and Marcus Maichel) and Planet B.E.N. (Ben Wierzoch) are two well known projects from Germany. The collaboration between Jan and Ben is called Organic Noise and the collaboration between Marcus and Ben is called Fools and Tools. This partly accounts for the large number of psychedelic trance projects.

As shown above the names of projects made up of the same artists can often be unrelated, although this is not always the case. For example, many projects involving Infected Mushroom are often prefixed with the word "Infected" or postfixed with the word "Mushroom" (Examples: Domestic Mushroom, Infected Astrix).

Making things even more confusing is the fact that the same exact artist(s) or group(s) of artists will sometimes produce music under different project names to showcase different variations of their music. Quasar also known as "Pulsar"(Dance oriented variations) as well as "Trancement" (Lighter trance music),but are really the same artists Quasar and Pulsar VanderHousen.

Very few psychedelic trance artists release albums under their own name (Tim Schuldt & Shanti Matkin are two exceptions). Instead, the name of the project is sometimes chosen to describe the theme of the music being produced. Not surprisingly, Crop Circles and Pleiadians releases are focused on the topic of space travel.

# Psychobilly

**Stylistic origins:** Early [Rock'n'roll](#), [R&B](#), [Rockabilly](#), [Blues](#), [Surf rock](#), [Punk rock](#), [Garage rock](#)

**Cultural origins:** late 1970's United States and England

**Typical instruments:** [Guitar](#) - Bass - [Drums](#) - Some more garage rock influenced acts may incorporate a Farfisa organ

**Mainstream popularity:** Largely underground and popular with [punks](#), [goths](#), Greasers, Scooterboys, indie kids and bikers

Gothabilly, [Punkabilly](#), [Surf rock](#), [Horror punk](#), [Deathcountry](#), [Garage punk](#), [Indie rock](#), [Garage rock](#)

England, Europe, the United States and Japan

[Timeline of alternative rock](#)

**Psychobilly** is a genre of music generally described as a mix between the British [punk rock](#) of the 1970s and the American [rockabilly](#) of the 1950s. The genre is also characterized by lyrical references to horror films, violence, exploitation films, lurid sexuality and other topics generally considered taboo, sometimes presented in a comedic, tongue-in-cheek fashion. Psychobilly music is generally played with an upright bass instead of an [electric bass](#).

## Origins

The term "psychobilly" was first used by Wayne Kemp when he penned the Johnny Cash song "One Piece at a Time," a Top 10 hit in 1976, where he makes reference to a "psychobilly Cadillac", although this song has nothing musically to do with Psychobilly. It came into use as a genre a few years later, when the Cramps described their music as "psychobilly" and "voodoo rockabilly" on flyers advertising their upcoming shows. Although the Cramps rejected the idea of being a part of the psychobilly scene, they, along with artists such as Screamin' Jay Hawkins and the Stray Cats, are considered important precursors to psychobilly. Musically speaking, there are also antecedents in the garage rock scene of the 1960s and the pub rock scene of the 1970s. The very first verifiable psychobilly band is considered to be the Meteors in south London in 1980. With one member being part of the rockabilly subculture, another being part of the punk subculture, and the last being a horror movie fan, their musical ideas overlapped to begin psychobilly as it exists today. The Meteors also invented the concept of psychobilly being apolitical, by encouraging their shows to be a "politics-free" zone in order to avoid disputes among fans, as was becoming common in the punk rock scene of the time.

## International prevalence

In 1982, a nightclub called Klubfoot opened in Hammersmith, west London, creating a home for the UK psychobilly scene. The club was eventually demolished and replaced with offices and a bus station. Because the psychobilly scene has never become very popular, psychobilly fans often organize "Psychobilly Weekenders" where many bands are featured on one bill to attract many attendees from all over. The first weekenders were organized in the UK in the mid-80s. In the U.S., they happen with frequency in Texas , New York and California.

Psychobilly eventually spread throughout most of Europe, (particularly Germany, Italy, and Spain), Canada, parts of the United States, and is gradually spreading to Asia, especially Japan. While the psychobilly of the early 1980s (the Meteors, the Sharks, Batmobile [2]) was similar to punk or 1960s [garage rock](#), with obvious [rockabilly](#) influences, the psychobilly of the later 1980s and 1990s (the Nekromantix, Demented Are Go, the Klingonz, Mad Sin, Asmodeus , Milwaukee Wildmen) had a different sound which was a bit harder. The psychobilly of 2000s is closer to the American psychobilly sound (The Spectres, The Knuckle Draggers , the Koffin Kats , Los Gatos Locos, the Barnyard Ballers , The Young Werewolves, The Beards and The Matadors).

## Some Psychobilly Acts

|                                       |                          |

| Banane Metalik                        | Zombie Ghost Train       |

# Pub rock

**Pub rock** is a style of Australian [rock and roll](#) popular throughout the 1970s and 1980s and still influencing contemporary [Australian music](#) today. The term came from the venues at which most of these bands originally played at: inner-suburban pubs (short for the British term *public house* which is rarely used in Australia in its full form). These often noisy, hot, and crowded establishments were largely frequented by men and women in their 20s.

It could be argued that the very venues many of the bands played in (pubs), had a major influence on the evolution of their music and sound. The venues were more often than not small and the crowds - often alcohol-fueled - were there for the experience rather than to see a "name band". Thus, an emphasis on simple, rhythm-based songs grew. With the sound in many of the rooms far from ideal for live music, an emphasis on a very loud snare- and kick-drum and driving bass-guitar grew. Guitarists tended to rely on simple, repetitive riffs, rather than more complex solos or counter-melodies. This might explain why, even in studios and larger arenas and stadia, many of the bands who cut their teeth in pubs still relied on an exaggerated drum sound and fairly simple musical arrangements.

A band like Hunters & Collectors, for example, saw their sound harden from their arty origins (which included a brass-section, experimental percussion and complex arrangements) to a more straightforward rock sound with emphasis on drums, bass and simple guitar riffs; a sound that more suited the beer barns they were forced to play in over their extensive touring career.

Though Australia has a small population, the sheer number of venues that bands could play in, mainly along the Eastern coast, meant that a band could tour extensively, often playing every night for long periods. This would allow bands such as INXS and Midnight Oil to take their well-honed live skills into large venues in the US and Europe with ease.

Changes to entertainment options - and an audience with a growing musical sophistication - have to an extent seen the end of Aussie Pub Rock as an entity. The advent of dance music and the DJ have taken away the need to squeeze into a pub and see a 4/4 rock band.

Sydney in particular has seen many staple live music venues close, falling victim to increasing rents in gentrified areas; noise restrictions imposed by local governments in response to local residents' demands; the popularity of the DJ and dance music; and the supposedly greater profitability of poker machines. As it turned out, these poker machines were not nearly as popular as expected, and in recent times a number of pubs have resumed hosting live bands.

Melbourne, too, has lost venues, including the Continental in Prahran and the Punters Club in Fitzroy, but is still considered to be the Australian "home" of live music.

The newer generation of bands that could be considered the followers of the Pub Rock tradition includes: Jet, The Living End, Magic Dirt, and You Am I.

Ironically, every few years it's still possible to catch the likes of Cold Chisel or The Angels, as they reform to cash-in on their older and more affluent core of fans, who pay top-dollar to see these former Pub Rock greats in comfortable and usually seated arenas.

## Pub rock (UK)

**Pub rock** was a mid- to late-1970s musical movement, largely centred around North London and South East Essex, particularly Canvey Island and Southend on Sea. Pub rock was largely a reaction to much of the popular music of the era, which tended to be dominated by progressive rock and highly polished, supposedly over-produced American West Coast 'AOR' sounds. Many viewed such music as inaccessible and 'out of touch', whilst pub rock was very much about getting 'back to basics', tending to be based around live performances in small pubs and clubs, playing unpretentious [rhythm and blues](#) influenced hard rock.

Pub rock was viewed by many as being an immediate precursor to the UK [punk rock](#) scene. Indeed, many pub rock acts such as Eddie and the Hot Rods went on to find fame in the first wave of British punk, whilst groups such as the 101er's featured Joe Strummer of The Clash, and Kilburn and the High Roads included Ian Dury amongst their members.

## Venues

In North London, one of the most notable venues for pub rock was the Hope and Anchor pub on Islington's Upper Street, still a venue (right). Other important pub rock venues included the Pegasus Music Hall - a pub in spite of its name - on Green Lanes, the Dublin Castle in Camden Town, The Pied Bull at The Angel (also gone), Bull and Gate in Kentish Town and the George Robey in Finsbury Park (derelict, likely to be demolished). Many of these pub venues, particularly the Hope and Anchor, became notable for hosting punk rock later.

Besides the well-known venues, many other London pubs of the time would hire out the large meeting halls, music halls or ex-billiards rooms they often had available as do-it-yourself gigs for aspiring pub or punk rock musicians.

## Influential pub rock acts

[Music of the United States](#) - [Music of Canada](#)

**Pueblo music** includes the [music](#) of the Hopi, Zuni, Taos Pueblo, San Ildefonso, Santo Domingo, and many other peoples, and according to Bruno Nettl features one of the most complex [Native American musical](#) styles on the continent. Characteristics include common use of hexatonic and heptatonic scales, variety of form, melodic contour, and percussive accompaniment, melodic range averaging between an octave and a twelfth, with rhythmic complexity equal to the Plains Indians musical sub-area. Nettl cites the Kachina dance songs as the most complex songs and the material of **Hopi** and **Zuni musics** as the most complex of the Pueblo, while the Tanoans and Keresans musics are simpler and intermediary between the Plains and western Pueblos. The music of the Pima and Papago is intermediary between the Plains-Pueblo and the California-Yuman music areas, with melodic movement of the Yuman, though including the rise, and the form and rhythm of the Pueblo. (Nettl 1956, p.112-113)

Work songs are found in Pueblo music, but are otherwise mostly unknown among Native American folk music (Nettl, 1965, p. 152).

# Pumpin' house

**Pumpin' house** is a subgenre of [House music](#). Developed in the late 90's and related to [French house](#), it also often samples [disco](#), [rock](#), [jazz](#), and/or [funk](#) loops (sometimes creating dense layered textures) and usually makes extensive use of filters, but gains its appellation from its heavy use of audio level compression, which makes tracks surge and pulse -- important to create physicality in [dance music](#). It is characterized by intense, up-front drum programming, heavy funk influence, and very emphasized basslines, often sampled from live players.

Pumpin' house ranges from the very loopy (2-beat loops being the shortest) à la Joey Beltram, to the almost songlike (8 bar patterns usually being the longest, though these can alternate from section to section, providing momentum through a track) à la Conga Squad. It is characterized by its unusual balance of intensity and funk, and the better examples are generally well tolerated even by audiences outside the electronic music scene, probably due to their heavy reliance on dance musics of past decades. Vocal and instrumental tracks are equally common -- vocal tracks often have a "diva" edge and instrumental tracks can be very melodic and dense.

Pumpin house covers the subgenres known as disco house (post-1997) and hard disco house.

Famous producers include Olav Basoski (Holland), Grant Nelson (UK), and Monkey Bars (US). Typical BPM range is 127-133.

# Punk

**Punk** is a contemporary subculture closely associated with [punk rock](#). The punk subculture has a shared history, culture, lifestyle, and community. Since emerging in the United Kingdom and the United States in the mid-1970s, punk has spread around the globe and undergone a series of tumultuous developments.

Punk culture is based around a shared set of styles distinct from those of popular culture and other subcultures. Punk has its own styles of [music](#), ideology, fashion, visual art, dance, literature and film. An otherwise disparate assortment of mostly young people, members of the subculture, or *punks*, express these cultural elements in the context of punk communities, or *punk scenes*.

Punk is made up of an assortment of smaller subcultures, each distinguished by its own articulation of these cultural elements. Several subcultures developed out of punk to become distinct in their own right, such as [goth](#), and [emo](#). Punk has unique relationships with other subcultures and popular culture as a whole.

## History

Punk has a long and complex history. Since emerging in the United Kingdom and the United States in the mid-1970s, punk has spread across the globe and undergone a series of tumultuous developments.

## Culture

The production, transmission, and consumption of punk culture is something most punks have in common. It is these processes which generate punk scenes. Since punk is made up of a diverse collection of smaller subcultures, punk culture is expressed in a wide variety of ways. As they are described here, not all of the cultural elements of punk are part of all punk subcultures, but they are common to most.

## Music

*Main article: [Punk rock](#)*

Music is the most important aspect of punk, so much so that it forms the basis of the entire subculture. Punk music is called *punk rock*, sometimes shortened to *punk*. Most punk rock is a specific style of the [rock music](#) genre, though punk musicians sometimes incorporate elements from other rock styles, and even other genres. Punk subcultures often distinguish themselves from one another by having a distinct style of punk rock, though not every style of punk rock has its own associated subculture. Punk rock is mostly the domain of the punk subculture, though some styles of it have found wider popularity. Most punk rock has simple arrangements and short [songs](#), and [lyrics](#) typically espouse punk ideology. Punk rock emerged in the mid-1970s from its roots in various rock styles, expanded into a number of different styles, and influenced a number of newer styles. Punk rock is usually played in bands, as opposed to solo artists. Some important punk rock bands include the Ramones, the Sex Pistols, the Dead Kennedys, the Damned, Black Flag, and the Clash.

## Ideology

Punk ideology is concerned most with a belief in an individual's intrinsic right to freedom and how best to encourage, maximize and live a less restricted lifestyle. The devotion to the abstract ideal of freedom leads to a personal combination of ethics, politics and aesthetics that express an individualized pursuit of said freedom. Accordingly punk ethics espouse the role of personal choice in the development of and pursuit of greater freedom. Common punk ethics include a radical rejection of mainstream conformity, living according to the DIY (Do It Yourself) ethic, taking direct action for political change, and not selling out to mainstream interests for personal gain. Subsequently punk politics cover the entire political spectrum, many punks find themselves categorized into left-wing or progressive views, and punks often participate in political protests for local, national or global change. Some common trends in punk politics include anarchism, anti-authoritarianism, anti-militarism, anti-capitalism, anti-racism, anti-nationalism, environmentalism, vegetarianism, veganism, and animal rights. Punk aesthetics determine the type of art punks enjoy, which is usually underground in origin with minimalistic, iconoclastic and satirical sensibilities. Punks tend to enjoy art which makes strong political statements, preferably using humor, irony or sarcasm. Punks are fans of decadence in art because of its strong critique of what would be considered mainstream culture.

## Fashion

Punks seek to outrage propriety with the highly theatrical use of clothing, hairstyles, cosmetics, jewelry and body modification. Punk clothing adapts existing objects for aesthetic effect: previously ripped clothes are held together by safety pins or wrapped with tape, written on with marker or defaced with paint; a black bin liner bag (garbage bag) might become a dress, shirt or skirt. Leather, rubber and vinyl clothing are also common, possibly due to its implied connection with transgressive sexual practices, such as bondage and S&M. Some punks wear tight "drain pipe" jeans, "brothel creepers" shoes, t-shirts with risqué images, or possibly a leather motorcycle jacket and Converse sneakers (à la The Ramones). Punks style their hair to stand in spikes, cut it into "Mohawks" or other dramatic shapes, and color it with vibrant, unnatural hues. Punks will use safety pins and razor blades as jewelry, including using safety pins for piercings. Punks tend to show their love for a certain band or idea by pin-back buttons or patches which they adorn on their jackets. They sometimes flaunt taboo symbols such as the Nazi swastika or Iron Cross, although most punks are staunchly anti-racist and may instead wear a crossed-out swastika patch. With the current trend of many traditionally punk aesthetics being incorporated into mainstream fashion, many punks have taken a more minimalistic approach to fashion. For example, as studded belts and dyed hair became more common, their popularity among punks declined.

## **Dance**

A variety of dances are popular within the punk subculture. Commonly performed at punk shows, these dances often appear chaotic, or even violent. The punk subculture and its immediate predecessors originated many of these dance styles from the 1970s onward. Moshing and the pogo are the types of dance most closely associated with punk. Hardcore dancing is a later development based on these styles. Stage diving and crowd surfing were originally associated with protopunk bands such as the Stooges, but went on to find a place at punk shows, and later metal shows and rock concerts. Ska punk originated the dance style of skanking. Punk shows often appear to the uninitiated to be more like small-scale riots than rock concerts. In some punk circles, fans spit and throw beer bottles at the band and each other. Fights both inside and outside the venue are more common than in many other subcultures, as is damage to sound equipment and the venue itself. The contemporary dances of metalheads borrow much from punk dance. Unlike hip hop dancing and breakdancing, punk dances are intended to be performed in dense crowds.

## Subcultures within punk

Punk is made up of a diverse assortment of smaller subcultures, each with its own take on punk styles. These groups may deliberately distinguish themselves from one another through differences in culture, such as having a unique style of music or dress. Some of these groups are antagonistic towards one another, and there is widespread disagreement within punk whether or not some are even part of the larger subculture. Several of these factions may be active in any given punk scene, though some are tied to particular regional or local scenes. Others, such as hardcore, are prevalent throughout the entire subculture. A single punk may identify with any number of these factions, or none in particular.

One of the oldest factions within punk, [anarcho-punk](#) is as old as the punk movement itself, and has supplied the punk subculture with many elements of its dominant ideology. Anarcho-punk is the part of the punk movement consisting of groups, bands and individuals promoting specifically anarchist ideas, such as animal rights, feminism, anti-authoritarianism, anti-war, anti-capitalism, anti-racism, and many other social agendas. Exemplary bands of the anarcho-punk musical style include Crass, Conflict and the Subhumans. Anarcho-punk fashion ranges across the entire spectrum of punk fashion, with the exception of Nazi punk dress.

Having its origins in the original punk subculture of the UK, [Oi!](#) seeks to align punk with a working-class "street level" following, and often associates itself with football hooliganism. The Oi! subculture promotes unity between punks, skinheads and other working class youths. Major bands include Cock Sparrer, the Cockney Rejects, Angelic Upstarts, and Sham 69.

The UK saw the rise of [ska punk](#) shortly after the genesis of punk. This faction has since spread to North America, where it gained considerable mainstream attention during the early 1990s. Ska punk is a combination of punk and Jamaican culture. The ska punk musical style features wind instruments, making it distinct from most other punk music. Ska punk originated a unique dance step, called skanking. Rude boy and 2 tone are closely related subcultures.

Nazi punk is a punk subculture which espouses Nazism or white supremacy. It grew out of the original punk subculture in the UK during the late 1970s, and later spread to the US. The style of music played by Nazi punk bands is either called Rock Against Communism, hatecore, or simply Nazi punk. Skrewdriver is the archetypical Nazi punk band. The now-defunct Punk Front was a notorious Nazi punk organization in the UK during the late 1970s. Nazi punks often wear Swastikas, or other symbols of hate in combination with more typical punk dress.

[Deathrock](#) is a punk subculture which originated in California in the late 1970s and early 1980s. It focuses on "dark" culture such as horror, occultism, death and depression. Recently, deathrock has largely taken on a more apolitical stance, distinguishing it from the rest of the punk subculture. Deathrock is closely related to [horror punk](#), [goth](#) and positive punk. It was originated by musicians such as Rozz Williams, Eva O and Dinah Cancer.

The now-extinct positive punk subculture, so called because of the lack of violence that characterizes the rest of the subculture, started in late-1970s in the London punk scene around the Batcave nightclub, and quickly developed into the goth subculture. In its brief existence, positive punk had many similarities to the deathrock subculture.

The [hardcore punk](#) subculture originated in North America, and was most popular during the 1980s. Hardcore music is a faster and heavier version of punk rock, usually characterized by short, loud, and often passionate songs with exceptionally fast tempos and chord changes. Major bands include Bad Brains, Black Flag, Minor Threat, the Dead Kennedys and The Misfits. Hardcore fashion differs in several ways from that of the original punk subculture. The UK equivalent of American hardcore is UK82.

The skate punk subculture is a fusion of punk and the skateboarding subculture. It was largely created by a skateboarding team called the Z-boys during the late 1970s in Venice Beach, California. In the 1980s, skate punk music emerged from Californian hardcore punk as a distinct

genre. Over the last decade, the skateboarding subculture has moved away from its punk influences.

[Crust punk](#) is a more extreme version of the hardcore punk subculture. Members of this punk faction are sometimes called *crusties*. Crust punk music fuses elements of anarcho-punk and [grindcore](#) with the harshest aspects of hardcore. Crust punk fashion is generally exaggerated hardcore attire, and crust punk ideology follows the same vein as anarcho-punk.

[Christian punk](#) is affiliated with Christianity, as opposed to the secularism of the punk subculture as a whole. Christian punk grew out of the 1980s American hardcore scene. Christian punk fashion is similar to that of typical punk fashion, though often incorporating Christian-themed symbolism such as the cross, the crown of thorns, the Ichthys, the Labarum, and the newly-created "Alpha is Omega" symbol.

Celtic punk, which began in the early 1980s, fuses punk with the traditional cultures of Scotland, Manx, Ireland, and the Irish diaspora. Celtic punk music combines the rock beats and electric guitars of punk rock with traditional celtic melodies and instruments, such as the bagpipes. A variation of this subculture is Scottish Gaelic punk.

An outgrowth of hardcore punk, straight edge is based around a lifestyle of abstinence from alcohol, tobacco, and recreational drug use. The movement was kickstarted by Washington, D.C.'s Minor Threat in the 1980s.

Riot grrrl is an offshoot of hardcore punk that places strong emphasis on feminism. This segment seeks to create a girl-friendly space within the subculture, accomplishing this task with feminist zines and all-woman bands. Riot grrrl arose from the Seattle, Olympia, and Washington, D.C. hardcore scenes in 1991, and shared significant cultural cross-pollination with the developing grunge subculture. Bratmobile and Bikini Kill are two prime examples of riot grrrl bands.

[Queercore](#) is a branch of hardcore punk that developed alongside riot grrrl based instead on the experiences of lesbians, homosexuals, bisexuals and transsexuals. Queercore music, exemplified by the band Pansy Division, is similar to hardcore, except its lyrics more often than not deal with the issues surrounding marginalized sexuality. Likewise, queercore fashion is similar to hardcore dress, though it incorporates elements from sexuality and gender identity-based subcultures.

[Streetpunk](#) is a working class, inner-city punk subculture with close ties to the Oi! punk subculture, though without placing the same importance on football rivalries. Streetpunk dress places an emphasis on the impoverished look of punk fashion.

Conservative punk is a group within punk which holds conservative political values, as opposed to the much larger progressive element within punk.

Other groups with some relation to punk include [cartoon punk](#), gutter punk, scum punk, cider punk, punk pathetique, and Afro-punk.

## Cultural relations

Punk has unique relationships with other subcultures and popular culture as a whole.

### Subcultures which developed out of punk

The [Goth](#) subculture began in the [gothic rock](#) scene, a music genre that developed from punk rock and [post-punk](#) in the late 1970s. The subculture is noted for its macabre outlook and fascination with dark subjects and fashion.

[Psychobilly](#) incorporates the music and fashions of the [rockabilly](#) subculture with horror themes. Psychobilly music is generally played with an upright bass instead of an [electric bass](#). [Cowpunk](#) and [punkabilly](#) are related subcultures.

Emo developed from the Washington, D.C. punk scene in the late 1980s. Punk and emo have a sometimes antagonistic relationship, since emo as a movement has become increasingly mainstream, and punks generally reject any form of music or subculture that has "sold out".

Hardline is a social movement which originated in the straight edge punk subculture. Hardline is based around extreme politics, mostly derived from the doctrines of deep ecology.

Strait Edge is an offshoot of the original Punk Attitude. Someone who is "Strait Edge" follows the punk lifestyle, but doesn't drink, smoke, or do drugs. Strait Edge was started by several people who saw the Punk Lifestyle, while agreeing with its points on freedom, saw the self-destructive nature of the scene and agreed to stop drinking and doing drugs. One sign that a person is "Strait Edge" is a black X tattoo on the person's hand. This comes from when the only place for bands to play was in bars. Younger fans weren't allowed in even though a large contingency of the bands was under 21. The bar owners, feeling sorry for these kids, let them in but put a big X on their hand so the bar tender would know not to serve them alcohol.

The [indie](#) scene is an offshoot of punk that carries on punk's DIY ethic, though indie music is sonically more diverse. Characterized by independent labels, regional diversity, and grassroots fanbases, the indie scene encompasses a wide variety of underground music genres, most notably [alternative rock](#) and particularly its subgenres such as [indie rock](#), [indie pop](#), and [indietronica](#). A prime example is the Seattle grunge scene that developed in the late 1980s. Grunge had considerable mainstream success in the early 1990s, during which the media placed an emphasis on the bands' working class clothing and indie ethics along with other alternative rock-related tropes such as Lollapalooza in an attempt to define it as a supposed "alternative culture" for Generation X.

### Subcultures with origins separate from punk

Punk has ties to the skinhead subculture, a working class youth subculture which originated in the UK in the 1960s. The original skinhead movement had largely died out by 1972, but in the late 1970s it underwent a revival, partly as a reaction against the commercialization of punk. Punks and skinheads have had both antagonistic and friendly relationships, depending on the situation. There is a hybrid of skinhead and punk called punk-skinhead.

Punk and hip hop emerged around the same time in New York City, and there has been a surprising amount of interaction between the two subcultures. Some of the first hip hop MCs called themselves *punk rockers*, and some punk fashions have found their way into hip hop dress. Malcolm McLaren played roles in introducing both punk and hip hop to the United Kingdom. Recently, hip hop has influenced several punk bands, mostly in the pop punk style,

including The Transplants, and Refused, and punk themes, such as disillusionment with the urban-industrial landscape, have been expressed in the lyrics of many hip hop artists.

The [industrial](#) subculture has several ties to punk.

Additionally, punk and the [heavy metal](#) subculture have shared similarities since punk's inception, and the early 1970s metal scene was instrumental in the development of protopunk. [Glam rockers](#) The New York Dolls, massively influential on early punk fashion, also influenced the look of glam metal. Alice Cooper was a forerunner of the fashion and music of both the punk and metal subcultures. Motörhead, since their first album release in 1977, have had continued popularity in the punk scene, and Lemmy is an anarchist, friend of several punks, and a fan of punk rock in general. Hardcore was a primary influence on thrash metal bands such as Metallica and Slayer and, by proxy, an influence on death metal and black metal. Conversely, punk subgenres like metalcore, grindcore and crossover thrash were greatly influenced by heavy metal. As a result, many punks are fans of heavy metal, and many metalheads find punk rock an acceptable musical style. The grunge subculture resulted in large part from the fusion of punk and metal styles in the late 1980s. However, there have long been tensions between the two groups. In particular, metal's mainstream incarnations have proven anathema to punk. Hardcore and grunge developed in part as reactions against metal music popular during the 1980s.

Other subcultures which have had relationships to punk include:

- Beatniks
  - Hippie
  - Yippie
  - Mods
- Rockers
  - Teddy boy
  - New Romantics
  - Rudeboy
- [Rockabilly](#)
- [Metalhead](#)
- Cyber

## Mainstream and popular culture

Punk has influenced and has been influenced by popular culture in a number of ways.

In punk's original heyday, punks faced harassment and even violent attacks, particularly in the U.K., where brawls with Teddy Boys or fans of rockabilly were often reported. In the U.S. punks sometimes faced abuse from Rednecks and other right-wing groups such as the Nazi-Skinheads. Nowadays it is relatively socially acceptable to present oneself as a fan of punk and to play punk rock music, and it is often merely a fashion statement among youth. Thus some maintain that the punk scene has lost the very heart of its former nature as one of explosive creativity, rebellion, anger and individualism, and that it has become a mere caricature of what once was. Others suggest that little has changed except the popularity of the genre. Disillusioned ex-punks see punk as outdated and obsolescent, especially as mass acceptance means that punk is now even influencing boy bands (albeit in a sanitised form).

Since the beginning of the subculture, major label record labels and fashion houses have attempted to use punk for profit. For the most part, punk has met this cultural appropriation with resistance, because of the punk ethic of musical integrity which punks often feel is threatened by record label profit motivation. Many members of the original punk subculture find the commercialization of punk disillusioning. They argue that punk is by definition unpopular (seeing "pop punk" as a contradiction in terms) and should remain that way because it provides a needed challenge to mainstream culture.

# Punk blues

**Punk blues** is a [Post-punk](#) interpretation of [Blues](#) and [Swamp rock](#).

Bands influenced by [punk](#), roots of early [rock and roll](#) as well as the original Swamp rockers such as Tony Joe White and Creedence Clearwater Revival have also been classified as [Swamp rock](#), although many of these bands have tended to embrace individuality, sensationalism, innovation and musical fashions. At the same time there is a loosely defined genre that emphasises it's commitment to roots music and exploration of American identity, called [Roots rock](#). Punk blues is a sub genre of [Punk](#) and [Swamp rock](#)

Categories: [Post punk](#) | [Punk](#) | [Hardcore punk](#)

# Punk fashion

**Punk fashion** is the styles of clothing, hairstyles, cosmetics, jewelry and body modifications of the punk subculture. Punk fashion varies widely from Vivienne Westwood styles to styles modeled on bands like The Exploited. The distinct social dress of other subcultures and art movements, including glam rock, skinheads, rude boys, art school students, greasers, and mods have influenced punk fashion. Punk fashion has likewise influenced the styles of these groups, as well as those of popular culture.

Coordinating hairstyles, clothing, and accessories for a put-together "punk look" takes a great deal of thought, time, effort, and expense. However, as an integral part of the punk lifestyle (essential to the punk identity) it is dutifully and universally undertaken.

# Original

A classic punk fashion look might consist of: a pair of combat boots, Doc Martens boots, old tattered converse shoes, tapered jeans or tight leather pants worn with a ripped T-shirt and silver bracelets. Hair was cropped and deliberately made to look messy, in reaction to the typical long smooth hair of the 60s and early 70s. It was also often dyed brilliant unnatural colors. Other accouterments worn by punks often included: bondage trousers, ripped fishnets, spike bands and other studded or spiked jewelry, safety pins in clothing and as body piercings, and pants with leopard patterns. Also often worn would be leather motorcycle jackets with words, band names and symbols written on them with paint markers. It is also a common punk style to wear a kutte, a leather jacket or jean jacket or vest adorned with band patches, studs, spikes, safety pins, writing, or any combination of the above. Many punk women rebelled against the image of a stereotypical woman by wearing clothes that were delicate or pretty and clothes that were very 'masculine' at the same time, such as ballerina skirts combined with big, clunky boots.

Punks seek to outrage propriety with the highly theatrical use of style. Punk clothing adapts existing objects for aesthetic effect: previously ripped clothes are held together by safety pins or wrapped with tape, written on with marker or defaced with paint; a black bin liner bag (garbage bag) might become a dress, shirt or skirt. Leather, rubber and vinyl clothing are also common, possibly due to its implied connection with transgressive sexual practices, such as bondage and S&M. Punks wear tight "drain pipe" jeans, "brothel creepers" shoes, t-shirts with risqué images, and possibly a leather motorcycle jacket (à la The Ramones). Punks style their hair to stand in spikes, cut it into "Mohawks" or other dramatic shapes, and color it with vibrant, unnatural hues. Punks use safety pins and razor blades as jewelry, including using safety pins for piercings. Punks sometimes flaunted taboo symbols such as the Nazi swastika or Iron Cross, although most modern punks are staunchly anti-racist and subsequently may wear a crossed-out swastika patch. They may also wear eyeliner (boys and girls). [citation needed] Punk style was influenced by clothes sold in Malcolm McLaren's shop SEX. McLaren has credited this style to his first impressions of Richard Hell while he was in New York managing the The New York Dolls.

Hebidge (1981) considered punk subculture to share the same "radical aesthetic practices" as dada and surrealism: "Like Duchamp's 'ready mades' - manufactured objects which qualified as art because he chose to call them such, the most unremarkable and inappropriate items - a pin, a plastic clothes peg, a television component, a razor blade, a tampon - could be brought within the province of punk (un)fashion...Objects borrowed from the most sordid of contexts found a place in punks' ensembles; lavatory chains were draped in graceful arcs across chests encased in plastic bin liners. Safety pins were taken out of their domestic 'utility' context and worn as gruesome ornaments through the cheek, ear, or lip...fragments of school uniform (white bri-nylon shirts, school ties) were symbolically defiled (the shirts covered in graffiti, or fake blood; the ties left undone) and juxtaposed against leather drains or shocking pink mohair tops." (p.106-12)

## Hardcore

With the advent of the more politically-inclined hard-core punk style in the early and mid-80s, social and political slogans became common adornments. While this was not without precedent (NO-FUTURE, a vaguely political slogan from the song "God Save The Queen" by The Sex Pistols, was commonly seen on punk clothing in the mid and late-70s) the depth and detail of these slogans were not developed until the hardcore punk movement began to gain momentum.

## Anti-fashion

A parallel "anti-fashion" style developed emphasizing minimal adornment, eschewing branding or fashion trends and often even color, favoring muted colors. A typical late-'80s look might include a plain black t-shirt, black hooded sweatshirt, jeans or thrift store work pants, cheap flat soled shoes, and hair cut by a friend. Worn by both men and women, the clothing was asexual. In a Western society where surfaces were emblazoned with logos, advertising, and tagged with company names, and where people strove to express their personalities, ideas, gender, and sexuality through dress, the stark absence and obscuring of these symbols was distinctive. Altering this appearance with a single logo for a band, zine, or art project would heighten the effect.

Many members of punk bands have said that they are against the punk look. Bob Mould of the band Hüsker Dü (which was a hardcore punk band when they started out) said, "Punks today are so concerned about what spikes or boots they're going to wear next weekend that they don't think there can be political implications in music. On the other hand, you see someone wearing a swastika on one shoulder and an anarchy symbol on the other and they don't realize that the two contradict one another". Various punk and hardcore acts (Such as Hüsker Dü, Minor Threat, Black Flag, and others) played hardcore punk music but would wear plain t-shirts and jeans everywhere. Many punks believed that punk itself is not what you're wearing or what you look like but a concept which lies within the music itself which itself should be the definition of what punk really is. For many people the phrase 'punk fashion' is an oxymoron, as they see punk as the antithesis of fashion.

## Contemporary

Contemporary punk fashion has been primarily influenced by [hardcore](#) and [grunge](#), and to a lesser extent [goth](#) and Deathrock, which may be seen as interesting as those cultures' fashion styles were influenced by the original punk fashions. Today, different facets of the punk subculture have different clothing habits. Most, however, incorporate elements from other groups as well as their own fashion. For example, a crust punk might wear a denim kutte, tight torn jeans, military boots and a mohawk, but also sport a flannel shirt which would be common in grungie punks.

### "Straight" punk

In general, modern punks wear leather, denim, spikes, chains, and combat boots. Elements of early punk and hardcore fashion, such as kuttens, bondage pants (often in garish plaid) and torn clothing. There is a large influence by DIY home-created and modified clothing. Their hair is typically dyed and arranged into a mohawk or one of its variations; big hair is also common. Hair can also be cut very short or shaved, but this does not mean that the individual in question is a skinhead. "Bullet belts", belts made to look like chains of bullets, have recently become popular. This style of dress is seen on followers of anarcho-punk, crust punk, straight edge, hardcore (especially "old school" hardcore), street punk, and various other genres.

Leather jackets are usually painted with band logos that express the wearer's personal taste in music, or are covered all over in studs (cone or pyramid) and spikes of various lengths. Denim vests and hooded sweatshirts (or even straitjackets) are usually covered in small band patches, and one big back patch. Denim vests are also often studded, but rarely spiked. Most punks would also combine this fashion with elements from the following types.

### Contemporary hardcore

Common modern hardcore dress generally consists of jeans and a band t-shirt or hoodie. Several different styles of dress, however, exist within the different genres of hardcore. What is fashionable in one branch of the hardcore scene may be frowned upon in another.

Sometimes a hardcore fan will opt to wear athletic shorts so as to be able to perform hardcore dance moves more effectively. These fans are often the ones who wear Nike shoes (preferably Air Max 97:s) and listen to bands such as Bold, Champion, Madball, and the Cro-Mags.

### Crust punk

[Crust punk](#) fashion is an extreme evolution of hardcore fashion and is heavily influenced by past bands such as Doom, Amebix and Crass. Typical crust punk fashion includes either tight black pants or camouflage shorts covered in patches, a torn band shirt and a studded black vest, a bullet belt and may or may not include a flap worn on the front or the back, and at times both.

### Skate punk

Skate punks wear clothing related to and influenced by skateboarding culture. They commonly have shaggy hair, although for practical reasons it is not unusual to see short hair. Baseball caps and trucker caps are also common, and often the bill of the cap is bent upwards, with band, film, project or most commonly skate company logos painted on the bill—this particular item is also found in some other subcultures. Skate punks generally wear straight leg or baggy/sagging jeans. They also often wear hoodies with brand or band logos. Skate punks also generally wear branded skate shoes—such as Fallen shoes, Circa, or eS footwear—and generally avoid the cheap brands—such as Airwalk or Vans—which are seen as poser brands and are not very effective for real skaters

## Grungie

Fans of [grunge](#), known as Grungies or Grungers, wear simple, outdoorsy fashion and "dress down" compared to more expressive clothing of other punks. They generally wear denim jackets, flannel shirts (usually plaid and often over plain, normally gray t-shirts), ripped jeans and Doc Martens or other work boots or street shoes. Hair is normally long and undyed in this style of dress, but is sometimes shorter or dyed in earthy tones.

## Pop punk

Today's pop punk fans are often seen wearing Converse All-Stars or skate shoes for footwear, plaid pants, Dickies pants, pre-worn jeans or tight black stretch jeans and ties with t-shirts. Accessories include studded belts, stretchy gloves with the fingers cut off, blazers, and trilbies and similar hats. Excessive eye make-up in both males and females is common. Hair is usually long for women and short and spiky for men and is often dyed black or extremely blonde, and also with brightly colored patches of stripes. This fashion is a result of the third wave of pop punk—influenced by artists such as Green Day, Good Charlotte, Avril Lavigne and others. This fashion also has considerable crossover with the related emo fashion.

## Emo and scene

Some fans of "emo" or "scene" hardcore opt for the tight black t-shirt effect coupled with skintight girl's jeans, white belt, and a carabiner on the back belt loop. This style is sometimes known as "scenecore" or "hXc" (pronounced "hardcore"). It is often associated with bands such as Some Girls, and Converge. Dyed black hair, ear piercings, lip rings, flesh tunnels and labrets are all quite popular within this particular scene as well. This fashionable hardcore uniform is the object of ridicule by those who feel it is antithetical to the hardcore punk ethos, or those who feel it betrays the roots of hardcore.

## Commercialization

It should be said that contemporary punk fashion is extremely commercialized, as many well-established fashion designers, particularly Jean-Paul Gaultier use punk elements in their production. Punk clothing, which was initially handmade, became mass produced and sold in record stores and some smaller specialty clothing stores by the 1980s. By the late 1990s, the publicly traded corporation Hot Topic established the business of selling what they advertised as "punk style clothing" at American shopping malls. Many fashion magazines and other glamored media are now advertising the classic punk hair-style or suits with as a punk-style touch as the "respectable image." This indicates that punk has become an established mainstream style. Many people from the original punk scene of the 70s have since heavily criticized the subsequent scenes of "conforming to fashion", and lacking the originality and individuality which motivated the original punk fashions.

## Common elements of punk fashion

- Bondage pants
- Chuck Taylor All-Stars shoes
- Dickies pants and shorts
- Dr. Martens boots
- Dyed mohawks
- Kutten
- Leather jackets
- Piercings, stereotypically of the nose
- Safety pins
- Skate shoes
- Spike bands
- Torn clothing

[History](#) – [Cassette culture](#) – [Fashion](#)

**Punk rock** is an anti-establishment [rock music](#) movement which began around 1974-1975 (although transitional forms can be found several years earlier), exemplified by The Ramones, the Sex Pistols, Moderatto, The Damned, and The Clash. The term is also used to describe subsequent music scenes that share key characteristics with those first-generation "punks," and it is often applied loosely to mean any band with "attitude" or "youthful aggression." The term is sometimes also applied to the fashions, ideology, subculture, or irreverent "DIY" ("do it yourself") attitude associated with this musical movement.

## Characteristics

Punk bands often emulate the approach of sixties [garage rock](#) bands. Punk rock emphasizes simple musical structures and arrangements. The early UK punk fanzine Sniffin' Glue in 1977 famously included drawings of three chord shapes captioned, "This is a chord, this is another, this is a third. Now form a band". Most punk songs have a verse-chorus structure and 4/4 time. Short songs are also a staple of punk rock. Songs are normally about two and a half minutes in length, but sometimes are less than thirty seconds, and on very rare occasions, a punk rock band will release a song that exceeds four minutes in length; this is common feature of songs by The Clash and the Dead Kennedys. Punk rock usually has fast tempos, especially hardcore punk.

Typical punk instrumentation includes a drum kit, one or two electric guitars, an electric bass, and vocals. The drums typically sound heavy and dry. The guitar parts are made up of highly distorted power chords similar to Link Wray, though some bands, especially California punk rock bands, take a [surf rock](#) approach, with lighter, "twangier" guitar tones. Punk vocals often sound nasal, gravelly, or throaty. Production is minimalistic, with tracks sometimes laid down on tape recorders in garages. More often than not, the band themselves produce, record, and distribute the album.

In the mid-1970s, punk lyrics introduced a confrontational frankness of expression and social and political relevance that had been missing from contemporary music. Songs like The Clash's "Career Opportunities" and "London's Burning" dealt with unemployment, boredom and other grim realities of urban life; some were openly disparaging of governments and monarchies, as in The Sex Pistols' "God Save the Queen" and "Anarchy in the UK"; and still others were decidedly anti-romantic in depictions of sex and love, such as Dead Kennedys' "Too Drunk to Fuck" and Richard Hell and the Voidoids' "Love Comes in Spurts". Other themes associated with punk rock lyricism include anti-conformity, such as in Bad Religion's "Automatic Man."

# History

## Origins

The phrase "punk rock" (from "[punk](#)", meaning a beginner or novice<sup>[1]</sup>) was originally applied to the untutored [guitar](#)-and-vocals-based [rock and roll](#) of United States bands of the mid-1960s such as The Standells, The Sonics, and The Seeds, bands that now are more often categorized as "[garage rock](#)".

The term was coined by rock critic Dave Marsh, who used it to describe the music of ? and the Mysterians in the May 1971 issue of Creem magazine[2], and it was adopted by many rock music journalists in the early 1970s. For example, in the liner notes of the 1972 anthology album Nuggets, critic and guitarist Lenny Kaye uses the term "punk-rock" to refer to the Sixties "garage rock" groups, as well as some of the darker and more primitive practitioners of 1960s psychedelia. Shortly after the time of those notes, Lenny Kaye formed a band with avant-garde poet Patti Smith. Smith's group, and her first album, Horses, released in 1975, directly inspired many of the mid-1970s punk rockers, so this suggests one path by which the term migrated to the music we now know as punk.

In addition to the inspiration of those "garage bands" of the 1960s, the roots of punk rock draw on the snotty attitude, on-stage and off-stage violence, and aggressive instrumentation of The Who; the snotty attitude of the early Rolling Stones, which can be traced back to Eddie Cochran and Gene Vincent of the late 50's; the abrasive, dissonant style of The Velvet Underground; the sexuality, political confrontation, and on-stage violence of Detroit bands Alice Cooper, The Stooges and MC5; the UK pub rock scene and political UK underground bands such as Mick Farren and the Deviants; the New York Dolls; and some British "glam rock" or "art rock" acts of the early 1970s, including David Bowie, Gary Glitter and Roxy Music. Influence from other musical genres, including [reggae](#), [funk](#), and [rockabilly](#), can also be detected in early punk rock.

Punk rock was also a reaction against tendencies that had overtaken popular music in the 1970s, including what the punks saw as superficial "[disco](#)" music and bombastic forms of [heavy metal](#), [progressive rock](#) and "[arena rock](#)." Punk also rejected the remnants of the hippie counterculture of the 1960s. Bands such as Jefferson Airplane, which had survived the 1960s, were regarded by most punks as having become fatuous and an embarrassment to their former claims of radicality. Eric Clapton's appearance in television beer ads in the mid-1970s was often cited as an example of how the icons of 1960s rock had literally sold themselves to the system they once opposed.

The cultural critique and strategies for revolutionary action offered by the European Situationist movement of the 1950s and 1960s were an influence on the vanguard of the British punk movement, particularly the Sex Pistols. Pistols manager Malcolm McLaren consciously embraced situationist ideas, which are also reflected in the clothing designed for the band by Vivienne Westwood and the visual artwork of the Situationist-affiliated Jamie Reid, who designed many of the band's graphics.

The British punk movement also found a precedent in the "do-it-yourself" attitude of the Skiffle craze that emerged amid the post-World War II austerity of 1950s Britain. Punk rock in Britain coincided with the end of the era of post-war consensus politics that preceded the rise of Thatcherism, and nearly all British punk bands expressed an attitude of angry social alienation.

## Early emergence

The first ongoing music scene that was assigned the "punk" label appeared in New York in 1974-1976 centered around bands that played regularly at the clubs Max's Kansas City and CBGB. This had been preceded by a mini underground rock scene at the Mercer Arts Center, picking up from the demise of the Velvet Underground, starting in 1971 and featuring the New York Dolls and Suicide, which helped to pave the way, but came to an abrupt end in 1973 when the building collapsed[3]. The CBGB and Max's scene included The Ramones, Television, Blondie, Johnny Thunders (a former New York Doll) and the Heartbreakers, Richard Hell and The Voidoids and the Talking Heads. The "punk" title was applied to these groups by early 1976, when Punk Magazine first appeared, featuring these bands alongside articles on some of the immediate role models for the new groups, such as Lou Reed, who was on the cover of the first issue of Punk, and Patti Smith, cover subject on the second issue.

At the same time, a less celebrated, but nonetheless highly influential, scene had appeared in Ohio, including The Electric Eels, Devo and Rocket from the Tombs, who in 1975 split into Pere Ubu and The Dead Boys.

During this same period, bands that would later be recognized as "punk" were formed independently in other locations, such as The Saints in Brisbane, Australia, The Modern Lovers in Boston, and The Stranglers and the Sex Pistols in London. These early bands also operated within small "scenes", often facilitated by enthusiastic impresarios who either operated venues, such as clubs, or organised temporary venues. In other cases, the bands or their managers improvised their own venues, such as a house inhabited by The Saints in an inner suburb of Brisbane. The venues provided a showcase and meeting place for the emerging musicians (the 100 Club in London, CBGB in New York, and The Masque in Hollywood are among the best known early punk clubs).

While the London bands may have played a relatively minor role in determining the early punk sound, the London punk scene would come to define and epitomize the rebellious punk culture. After a brief stint managing the New York Dolls at the end of their career in the US, Englishman Malcolm McLaren returned to London in May 1975. He started a clothing store called SEX that was instrumental in creating the radical punk clothing style. He also began managing The Swankers, who would soon become the Sex Pistols. The Sex Pistols soon created a strong cult following in London, centered on a clique known as the Bromley Contingent (named after the suburb where many of them had grown up), who followed them around the country.

An oft-cited moment in punk rock's history is a July 4, 1976 concert by the Ramones at the Roundhouse in London (The Stranglers were also on the bill). Many of the future leaders of the UK punk rock scene were inspired by this show, and almost immediately after it, the UK punk scene got into full swing. By the end of 1976, many fans of the Sex Pistols had formed their own bands, including The Clash, Siouxsie & the Banshees, The Adverts, Generation X, The Slits and X-Ray Spex. Other UK bands to emerge in this milieu included The Damned (the first to release a single, the classic "New Rose"), The Jam, The Vibrators, Buzzcocks and the appropriately named London.

In December of 1976, the Sex Pistols, The Clash, The Damned and Johnny Thunders & the Heartbreakers united for the Anarchy Tour, a series of gigs throughout the U.K. Many of the gigs were cancelled by venue owners, after tabloid newspapers and other media seized on sensational stories regarding the antics of both the bands and their fans. The notoriety of punk rock in the UK was furthered by a televised incident that was widely publicised in the tabloid press; appearing on a London TV show called Thames Today, guitarist Steve Jones of the Sex Pistols was goaded into a verbal altercation by the host, Bill Grundy, swearing at him on live television in violation of at the time accepted standards of propriety.

One of the first books about punk rock — *The Boy Looked at Johnny* by Julie Burchill and Tony Parsons (December 1977) — declared the punk movement to be already over: the subtitle was *The Obituary of Rock and Roll*. The title echoed a lyric from the title track of Patti Smith's 1975 album *Horses*.

During 1977, a second wave of bands emerged, influenced by those mentioned above. Some, such as The Misfits (from New Jersey), The Exploited (from Scotland), GBH (from England) Black Flag (from Los Angeles), Stiff Little Fingers (from Northern Ireland) and Crass (from Essex) would go on to influence the move away from the original sound of punk rock, that would spawn the [Hardcore](#) subgenre.

In the UK, punk interacted with the Jamaican [reggae](#) and [ska](#) subcultures. The reggae influence is evident in much of the music of The Clash and The Slits, for example. By the end of the 1970s, punk had spawned the 2 Tone ska revival movement, including bands such as The Beat (The English Beat in U.S.), The Specials, Madness and The Selecter.

Gradually punk became more varied and less minimalist with bands such as The Clash incorporating other underground musical influences like [ska](#) and [rockabilly](#), and even [jazz](#) into their music, but the message of the music remained the same; it was subversive, counter-cultural, rebellious, politically incorrect and often anarchist. Punk rock dealt with topics such as problems facing society, oppression of the lower classes, the threat of a nuclear war, etc. Or it delineated the individual's personal problems, such as being unemployed, or having particular emotional and/or mental issues, i.e. depression. Punk rock was a message to society that all was not well and all were not equal.

## Genres of Punk

While it is thought that punk had a decline in the 80s, many sub-genres branched off playing their own interpretation of "punk rock".

The United States saw the emergence of [hardcore punk](#), which is known for fast, aggressive beats and political lyrics. Early hardcore bands include Dead Kennedys, Black Flag, Bad Brains, The Descendents, early Replacements and The Germs and the movement developed via Minor Threat, Minutemen and Hüsker Dü, among others. In New York, there was a large hardcore punk movement led by bands such as Agnostic Front, The Cro-Mags, Murphy's Law, Sick of it All, and Gorilla Biscuits. Other styles emerged from this new genre including skate punk, [emo](#) and straight edge.

In the UK, meanwhile, diverse [post-punk](#) bands emerged, such as Joy Division, Throbbing Gristle, Gang of Four, Siouxsie & the Banshees & Public Image Ltd, the latter two bands featuring people who were part of the original British punk rock movement.

Although most the prominent bands in the genre pre-dated the 1980s by a few years, it wasn't until the 1980s until journalist Garry Bushell gave the sub-genre "Oi!" its name, derived from the Cockney Rejects song "Oi! Oi! Oi!". This movement featured bands such as Cock Sparrer, Cockney Rejects, Blitz, and Sham 69.

Bands sharing the Ramones' [bubblegum pop](#) influences formed their own brand of punk, sporting melodic songs and lyrics more often dealing with relationships and simple fun than most punk rock's nihilism and anti-establishment stance. These bands, the founders of [pop punk](#), included the Ramones, Buzzcocks, The Rezillos and Generation X.

## Legacy and recent developments

The underground punk movement in the United States in the 1980s produced countless bands that either evolved from a punk rock sound or simply applied its spirit and DIY ethics to a completely different sound. By the end of the 1980s these bands had largely eclipsed their punk forebearers and were termed [alternative rock](#). As alternative bands like Sonic Youth and the Pixies were starting to gain larger audiences, major labels sought to capitalize on a market that had been growing underground for the past 10 years.

In 1991, Nirvana achieved huge commercial success with their album, Nevermind. Nirvana cited punk as a key influence on their music. Although they tended to label themselves as punk rock and championed many unknown punk icons (as did many other alternative rock bands), Nirvana's music was equally akin to other forms of garage or [indie rock](#) and [heavy metal](#) that had existed for decades. Nirvana's success kick-started the alternative rock boom that had been underway since the late 1980s, and helped define that segment of the 1990s popular music milieu. The subsequent shift in taste among listeners of rock music was chronicled in a film

entitled *1991: The Year Punk Broke*, which featured Nirvana, Dinosaur Jr, and Sonic Youth; Nirvana also featured in the film *Hype!*

The resurgence of punk's mainstream visibility in the early and mid-1990s was characterized by the scene at 924 Gilman Street, a venue in Berkeley, California, which featured bands such as Green Day, Operation Ivy, Rancid and later bands including AFI, (though clearly not simultaneously, as Rancid included members of the defunct Operation Ivy). This scene emphasized a return to punk's melodic roots with a strong adherence to punk principles in its lyrical messages. Epitaph Records, an independent record label started by Brett Gurewitz of Bad Religion, would become the home of the "skate punk" sound, characterized by bands like The Offspring, Pennywise, NOFX, and The Suicide Machines, many bands arose claiming the mantle of the ever-diverse punk genre -- some playing a more accessible, pop style and achieving commercial success. The late 1990s also saw another ska punk revival. This revival continues into the 2000s with bands like Streetlight Manifesto, Reel Big Fish, and Less Than Jake.

The early commercial success of alternative rock also gave way to another style of punk success in the mainstream called punk pop. Examples of pop punk bands include Simple Plan, Good Charlotte, and Sum 41. By the late 1990s, punk was so ingrained in Western culture that it was often used to sell commercial bands as "rebels", amid complaints from punk rockers that, by being signed to major labels and appearing on MTV, these bands were buying into the system that punk was created to rebel against, and as a result, could not be considered true punk (though clearly, punk's earliest pioneers also released work via the major labels). This debate continues among young punk acolytes (who, as do most new generations, seek a sense of originality or authenticity) amid the popularity of modern punk in the early 2000s, including the [emo](#) trend of recent times, and the Grammy success and superstar status in 2005 of pop-punk band Green Day.

There is still a thriving punk scene in North America, Japan and Europe. The widespread availability of the Internet and file sharing programs enables bands who would otherwise not be heard outside of their local scene to garner larger followings, and is in keeping with the DIY ethic championed by some earlier punk bands. Many punk bands retain the political streak of their forebears. The political ascendancy of George W. Bush and Tony Blair have inspired both songs and political action, such as the Rock Against Bush movement, that can be compared to the original rage at Reagan and Thatcher.

There is a new brand of punk called "Lo-Cash" or "Crack Rock Steady." With bands from New York such as Leftover Crack, the main band, Choking Victim, INDK and No Cash. These bands combine elements of punk, ska, death metal, hardcore and rap into their songs.

# Punta rock

**Punta rock** is a form of the traditional punta rhythm of the Garifuna people of Central America.

In the late 1970s, Penn Cayetano, a Garifuna artist, began to compose songs in the Garifuna language. He added the rhythm of the electric guitar to the traditional punta rhythm and created what is now known as punta-rock, the "rock" being the rhythm of the guitar. Cayetano's creation caught on quickly in Belize and from there spread to the other Central American countries. The Garifuna culture was being weakened at the time as young progressive Garifuna men and women looked more to an American style of existence and did not carry on the traditions as before. The popularity of punta-rock brought back to the surface an inherent Garifuna pride and probably, singlehandedly, is responsible for the resurgence of the culture. As the pride of the Garifuna was given a booster shot by punta rock, more artists began composing Garifuna songs to traditional Garifuna rhythms.

Punta-rock is now a viable world music genre. Punta-rock is the only music created by Central Americans and indigenous to the area. Punta-rock has become the official music of many Central American countries. When Banda Blanca of Honduras sold over 3 million copies of "sopa de caracol" or "conch soup", originally written by Chico Ramos, a Garifuna of Belize, celebrated their success. Punta-rock has grown since the early 1980s to include other electronic instruments such as the synthesizer and electric bass guitar as well as other percussive instruments. The lyrics are also being done in Spanish. The genre is continuing to develop a strong following in the United States, Europe, South America and even Asia. It is believed to be only a matter of time before the Central American immigrants in the United States do for punta-rock what Mexican immigrants of the west and south have done for Tejano music.

# Quartet

A **quartet** is a group of four identical or similar objects, or a grouping of four persons for a common purpose.

# Music

In [music](#), a **quartet** is a method of instrumentation (or a medium), used to perform a musical composition, and consisting of four parts. The most popular instrumentation is the [string quartet](#).

Quartet also refers to a musical composition written for such a group.

A **string quartet** is a form of instrumentation, in Western music tradition, that consists of two [violins](#), a [viola](#), and a [cello](#) playing a multi-movement musical composition utilizing the [sonata form](#). Another common instrumentation is the [piano quartet](#), consisting of violin, viola, cello, and [piano](#). The 'quartet' is a type of [chamber music](#), which began in the 18th century when public concert-giving began, and has continued to the present day. It is considered the most important form in chamber music. One of the first contributors, Luigi Boccherini, wrote 100 **string quartets**. Other important contributors have been Joseph Haydn, Wolfgang Amadeus Mozart, and Ludwig van Beethoven.

The particular choice and number of instruments derives from the registers of the human voice: [soprano](#), [alto](#), [tenor](#) and [bass](#). In the **string quartet**, two violins play the soprano and alto vocal registers, the viola plays the tenor register and the cello plays the bass register. In [opera](#), a quartet refers to the use of four voices.

Many believe the four instrument arrangement to be one of the most difficult for which to compose, compared with a trio or [quintet](#), for instance. It is suggested that the difficulty arises from the complex interplay of four distinct voices performing under large temporal and tonal contrasts. Many performers find it one of the most enjoyable of performance arrangements, allowing each player to perform their own distinct part, rarely playing a "background" or "blending" part, which is important only in connection to the larger whole.

Later, in musical styles outside of the [classical](#) forms, many artists have used the four part instrumentation such as in [jazz saxophone](#) quartets, [guitar](#) quartets, [horn](#) quartets, and barbershop quartets. The quartet form is constantly maturing and being experimented with, and is still in popular use.

## Queercore

**Queercore** is a cultural and social movement which arose in the mid 1980s. It is distinguished by discontent with society in general and a disavowal of the mainstream gay and lesbian community in particular, expressing itself through zines, [music](#), writing, art and film.

## The early years

J.D.s, created by G.B. Jones and Bruce LaBruce, is widely acknowledged as being the zine which launched the movement. At first the editors of J.D.s had chosen the appellation "homocore" to describe the movement but replaced the word homo with queer to better reflect the diversity of the scene as well as to position themselves firmly outside of gay and lesbian orthodoxy. The first issue was released in 1985, with a manifesto entitled "Don't Be Gay" published in the fanzine Maximum RocknRoll following soon after; inspiring, among many other zines, Holy Titclamps, edited by Larry-bob, Homocore by Tom Jennings and Deke Nihilson, Donna Dresch's Chainsaw, and Outpunk by Matt Wobensmith, these last two later functioning as music labels. These zines, and the movement, are characterized by sexual and gender diversity; dissatisfaction with a consumerist culture, proposing a DIY ethos in its place; and opposition to religious and political repression.

## 1990s

In 1990, the J.D.s editors released the first queercore compilation, J.D.s Top Ten Homocore Hit Parade Tape, a cassette which included bands from Canada, such as Fifth Column; Nikki Parasite and Bomb from the U.S.; from England, The Apostles, Academy 23 and No Brain Cells; and, from New Zealand, Gorse. During this period of queercore, during the late 1980s to the early 1990s, many of the punk rock bands involved were not necessarily queer but their ethics were motivation for supporting this movement. Other bands, such as Los Crudos, had one queer and outspoken member. The sexuality of band members has never been an issue in the choice to align oneself with the Queercore movement or not. Other early queercore bands included Anti-Scrunti Faction, who appeared in J.D.s and Comrades In Arms, Homocore editor Deke Nihilson's band. Shortly after the release of the tape J.D.s ceased publication and a new crop of zines arose, such as Jane and Frankie by Klaus and Jena von Brücker, Shrimp by Vaginal Davis and Fanorama by REB. The first queer zine gathering occurred at this time; "Spew", held in Chicago in 1991, offered an opportunity for all those involved in the scene to meet. Although organizer Steve LaFreniere was stabbed outside the venue at the end of the night, he quickly recovered and the event was deemed a success. The next Spew took place in Los Angeles in 1992, and Spew III in Toronto in 1993. These Spew events also included musical performances by queercore bands.

Among the better known bands from the early 1990s are Fifth Column, God Is My Co-Pilot, Pansy Division, Sister George, Team Dresch, Tribe 8 and Mukilteo Fairies. During this time, there were dozens of zines being produced as awareness of the movement grew worldwide; The Burning Times from Australia, Speeddemon from Italy, and Brazilian e-zine Queercore, to offer just a few examples. In Miami, Marilyn Medusa, a zine by Gregory Gajus, was one of the early attempts to merge queercore with a pagan sensibility.

In Chicago, Mark Freitas and Joanna Brown organized a monthly "Homocore" night that featured queercore bands performing live, offering a stable venue for the scene to proliferate; most of the bands mentioned played at *Homocore Chicago*. As well, as Amy Spencer notes in *DIY: The Rise of Lo-Fi Culture*, "Through Homocore events, they aimed to create a space for men and women to be together, as opposed to the sense of gender segregation which was the norm in mainstream gay culture - They attacked the idea that due to your sexuality you should be offered only one choice of social scene..."

It was in the early 1990s that Matt Wobensmith's zine *Outpunk* also became a record label, and began to release its own queercore compilations, singles, and albums, and was crucial to the development of queercore. The first recordings by Tribe 8 and Pansy Division were released by the label. Some of the bands appearing later in the mid-1990s on the label include Sta-Prest, Cypher In The Snow and Behead The Prophet, No Lord Shall Live.

It was also at this time in the early 1990's that Riot Grrrl emerged and, as queercore was one of its inspirations, some of the zines, participants and bands like Excuse 17 were involved in both movements.

Independent record labels such as Alternative Tentacles, K Records, Kill Rock Stars and Lookout! Records supported and released material by queercore artists also, but in the late 1990's, after Outpunk had ceased, several other small labels sprung up solely devoted to queercore. Chainsaw Records, which had begun in the mid-90's, now began to release many recordings of newer bands such as The Need, The Third Sex and Longstocking. Heartcore Records is another label, whose bands have included The Little Deaths, Addicted2Fiction, Crowns On 45 and Ninja Death Squad. These bands, many of whom are no longer together, constituted the 'second wave' of queercore bands which also included Subtonix, Best Revenge and Fagatron. Both labels are still active and are still releasing new material.

As a [musical genre](#), it may be distinguished by lyrics exploring themes of prejudice and dealing with issues such as sexual identity, gender identity and the rights of the individual; more

generally bands offer a critique of society endemic to their position within it, sometimes in a light-hearted way, sometimes seriously. Musically, many queercore bands originated in the [punk](#) scene but the [industrial music culture](#) has been influential as well. Queercore groups encompass many genres such as [hardcore punk](#), [synthpunk](#), [indie rock](#), [power pop](#), no wave, [noise](#), [experimental](#), [industrial](#) and others.

In 1996 in San Francisco, the Dirtybird 96 Queercore Festival presaged other queer music gatherings which occurred in the following decade.

## 2000s

In the 2000s, Queercore club nights and events continued to take place throughout Europe and North America. The festival Queer Panic was organized by Gordon Gordon of the zine Teen Fag in Seattle, Washington in June of 2000. Scutterfest was organized by Rudy Bleu of the zine Scutter in Los Angeles, California in 2000, 2001, and 2003. The Bent Festival was held in Seattle in 2002 and 2003. The festival Homo-a-go-go was held the summers of 2002 and 2004 in Olympia, Washington, featuring queer films, zines, performance and musical groups during the week-long event; another is planned for the summer of 2006. Queeruption, which takes place in a different city each year, has been hosted by Berlin, Rome, New York and London in the past. In 2004 and 2005, a group of queercore bands toured throughout the U.S.; the tour was called Queercore Blitz and was yet another way to connect the like-minded. Queer groups that are flourishing now in the UK are Queers Without Borders, Queer Mutiny North and Cardiff Queer Mutiny.

16 records is a new queercore label that has been releasing albums by such Pacific Northwest bands as Shemo, The Haggard, and Swan Island, as well as the Brazilian band Dominatrix.

Representing a more contemporary breed of [hardcore punk](#) are the straight edge band Limp Wrist from the United States. From Germany come Low End Models, an all-women band. Beyond Pink are from Sweden and Kids Like Us out of Norway. Three Dollar Bill from Chicago are more eclectic, ranging from punk to indie rock to metal. Kids On TV, from Toronto, with an industrial background, offer a new, more electronic direction for queercore as do Lesbians On Ecstasy, from Montreal. The Hidden Cameras are an anti-folk band from Toronto. ASSACRE is a one man fantasy metal/spazz noise act from Austin, Texas. With each new band the range of musical genres expands the definition of Queercore.

## Influences

Influences vary for each musician, zine editor and filmmaker involved, but it is doubtful that queercore would have come into existence without the atmosphere surrounding the early punk years. Performers at that time either conspicuously played with conceptions of gender, such as Wayne County of Wayne County & the Electric Chairs and Phranc from the aptly named Nervous Gender or, like, Pete Shelley of Buzzcocks, Darby Crash of The Germs, members of The Screamers, The Leather Nun, Malaria and other bands, were not interested in hiding their sexuality. In 1979, members of Nervous Gender told *Slash* magazine, "...people think we're weird cause we're queer." The early punk scene with its connections to artists had an inherent diversity of sexualities; Vivienne Westwood used homoerotic Tom of Finland imagery for her now iconic punk t-shirts and punk style incorporated fetish wear that, while employed to shock, also signalled acceptance to those in the know. Many artists who later came to be known as 'Industrial' such as Throbbing Gristle and Coil, employing similar shock tactics, also had queer members and were equally influential. In the seminal punk film *Jubilee*, Derek Jarman captured the ambivalent and ambiguous sexuality of punk's early years.

Later, in the U.S. during the eighties when the [Hardcore punk](#) scene arose, The Dicks' Gary Floyd was writing queer-themed songs, as were many hardcore bands, except that he, along with Randy Turner of Big Boys were both open about being homosexuals. In England, in the [anarcho-punk](#) scene, Andy Martin of The Apostles was equally forthright. Politically motivated bands such as MDC in the U.S. were also introducing anti-homophobia messages into their songs at this time. However, it was the confrontational attitude and shock tactics of the punk and industrial scenes that Queercore employed, rather than activism, or politics, or the mainstream approval and major label deals that gay and lesbian musicians of that time courted, since those

involved in the queercore scene weren't seeking the acceptance of society, be it homosexual or heterosexual, but rather to condemn it.

Filmmakers such as Kenneth Anger, Jack Smith, early Andy Warhol and John Waters, Vivienne Dick and the aforementioned Derek Jarman were influential also, with their depictions of queer subcultures. In 1990 the editors of J.D.s began presenting J.D.s movie nights in various cities and, after the demise of J.D.s, each made films exploring the queercore milieu; Bruce LaBruce released *No Skin off My Ass* in 1991; G.B. Jones *The Troublemakers* was released in 1990 followed by *The Yo-Yo Gang* in 1992. In 1996, J.D.s contributor Anonymous Boy completed the first animated queercore film, *Green Pubes*. Documentary films about Queercore include Lucy Thane's 1996 release *She's Real, Worse Than Queer*; *Queercore: A Punk-umentary* by Scott Treleaven; *Gay Shame '98* by Scott Berry and Tracy Flanagan's *Rise Above: The Tribe 8 Documentary* released in 2003. All these films impacted the scene and broadened the scope of Queercore to include film as another of its mediums of expression.

As with punk, queercore culture existed outside of the mainstream so zines were crucial to its development. Hundreds of zines formed an intercontinental network that enabled queercore to spread and allow those in smaller, more repressive communities to participate. The DIY attitude of punk was integral to queercore as well. In the 1990s, as the availability of the internet increased, many queercore zines, such as *Noise Queen* could be found online as well as in print. Even zine distributors such as *Xerox Revolutionaries* can be found on the internet, making queercore zines easy to find.

All these developments allowed queercore to become a self-sustaining and self-determined subculture, expressing itself through a variety of mediums independent from the straight and gay establishment.

# Quiet storm

**Quiet storm** is a late-night radio format, featuring soulful slow jams, pioneered in the mid 1970s by then station intern Melvin Lindsey at Howard University Radio, WHUR-FM, in Washington, D.C. Smokey Robinson's like-titled hit single, released in 1975 as the title track to his third solo album, lent its name to the format and to the radio program that introduced it to the public, as well.

When Lindsey's "The Quiet Storm" debuted in 1976, the first tune on the turntable was the seven-minute-long Robinson hit, which introduced the slot every night thereafter. For many, when Robinson's trademark tenor voice wafted out over the airwaves, it signalled the end of the stresses of the workday. "The Quiet Storm" was four hours of melodically soulful music that provided an intimate, laid-back mood tailor-made for late-night listening, and that was the key to its tremendous appeal among adult audiences.

The format was an immediate success, becoming so popular that within a few years, virtually every station in the U.S. with a core black, urban listenership adopted a similar format for its graveyard slot.

Melvin Lindsey died of AIDS in 1992, but the "Quiet Storm" format he originated remains a staple in radio programming today, almost 30 years after its inception.

Today, **quiet storm** is also a broad term given to an array of mellow, slow-groove [rhythm and blues/soul music](#) and smooth jazz offerings of the type featured on Melvin Lindsey's WHUR program, and on myriad other stations that followed his lead.

Encompassing a mix of African American music genres, quiet storm music is distinguished by understated, mellow dynamics and relaxed tempos and rhythms. It can be soothingly pensive, or express romantic sentiment. Quiet storm music is similar to soft rock and adult contemporary styles, but it is more closely and unmistakably rooted in R&B, often with jazz extensions. At its best, the style features an urbane sophistication and subdued soulfulness.

Quiet storm programming is credited with launching the careers of Luther Vandross and Anita Baker, and with introducing Sade to U.S. audiences. Classic quiet storm recordings include Frankie Beverly and Maze (band)'s "Golden Time of Day," Marvin Gaye's "Let's Get It On," the orchestrations of Philadelphia soul, the recordings of Al Green, Barry White, and Bill Withers, much of jazz guitarist Wes Montgomery's work during his CTI (Creed Taylor, Incorporated) years, and the work of jazz-funk saxophonist Grover Washington, Jr. Quiet storm was most popular as a programming niche with baby boomers from the mid-'70s to the early '90s, after which time much of mainstream R&B took on a harder, hip-hop influenced approach.

WHUR radio still has a "Quiet Storm" show; and many urban, black radio stations still reserve their late-night programming slots for quiet storm music, as well. Now included in the genre is music with a hip-hop infusion, known as [neo soul](#). Neo soul artists today include Brian McKnight, Joe, Jaheim, D'Angelo, Maxwell, Mary J. Blige, India Arie, Jill Scott, Lauryn Hill, Erykah Badu and Alicia Keys. Quiet storm music is also the more mellow, soulful side of smooth and contemporary jazz.

# Quintet

A **quintet** is a formation containing five members. It is commonly associated with musical groups, such as a [string quintet](#), or a group of five singers, but can be applied to any situation where five similar or related objects are considered a single unit.

In [classical instrumental music](#), any additional instrument (such as a [piano](#), [clarinet](#), [oboe](#), etc.) joined to the usual [string quartet](#) (two [violins](#), a [viola](#), and a [cello](#)), gives the resulting ensemble its name, such as "[piano quintet](#)", "clarinet quintet", etc. A piece of music written for such a group is similarly named.

In [jazz music](#) a quintet is any group of five players, usually containing a drum set (pedal bass, snaredrum sometimes brushed, and top hat and brushed [cymbals](#)), string bass or [electric bass](#), and groups of one or two of the following instruments, [guitar](#), [trumpet](#), [saxophone](#), [clarinet](#), or [trombone](#).

In some modern bands there are quintets formed from the same family of instruments with various voices, as an all [brass](#) ensemble, or all [saxophones](#), in [soprano](#), alto, [baritone](#), and [bass](#), and sometimes double bass. The standard [woodwind quintet](#), for example, consists of one player each on [flute](#), [oboe](#), [clarinet](#), [bassoon](#), and French horn, while the standard [brass](#) quintet has two [trumpets](#), French horn, [trombone](#), and [tuba](#). Any combination, however, is possible.

## Notable quintets

Mozart: quintet for piano and winds K. 452 (oboe, clarinet, bassoon and horn) (1784)  
Reicha: wind quintets, among the first for the medium (starting in 1811)  
Schubert: piano quintet in A major, D.667 (1819), popularly known as the 'Trout Quintet', based on his Lied "Die Forelle" ("the trout"); this piece in part inspired future efforts in the composition of piano quintets, especially those of Schumann and Dvorak. The piece is scored for violin, viola, cello, bass instead of an additional violin, and piano, unlike the usual arrangement of the piano quintet.  
Schubert: string quintet in C-major, op.163 (D.956, 1828).  
Schumann: piano quintet in E-flat, op.44 (1842)  
Brahms: piano quintet in F minor, op.34 (1862)  
Dvorak: piano quintets in A, op.5 (1872), and op. 81 (1887), heavily influenced by both the Schubert and Schumann pieces of the same name.  
Bizet: opera Carmen contains a particularly engaging quintet (not always performed), by singers playing some of the smugglers. (1873–4)  
Bruckner: string quintet in F major (1879)  
Brahms: string quintet in F, op.88 (1882)  
Shostakovich: piano quintet in G minor, op.57 (1940)  
'The Greatest Concert Ever.' Jazz quintet. Charlie Parker, saxophone; Dizzy Gillespie, trumpet; Bud Powell, piano; Charles Mingus, bass; and Max Roach, drums. Massey Hall, Toronto, Canada. (May 15, 1953) This concert took place against all odds: Bud Powell was drunk; Charlie Parker, identified as "Charlie Chan" in the original notes, played on a plastic alto saxophone; and Dizzy Gillespie would disappear offstage to check on the status of the first Rocky Marciano-Jersey Joe Walcott heavyweight championship match.

## Qur'an reading

**Qur'an reading** is the reading (*tartil*, *tajwid*, or *taghbir*) aloud, reciting, chanting, or singing of portions of the Qur'an. Though not considered [music](#) by Muslims, when sung the style is of its own [musical genre](#) and structurally similar to secular [Arab music](#). Even if what he or she produces sounds more like a song than a recital, the performer is called *muqri'*, *tl+*, *murattil*, or *mujawwid*, or "reciter" (Touma 1996, p.153-154).

Reading and even singing must be done according to rules of pronunciation, intonation, and caesuras established by Muhammad, though first recorded in the eight century CE, the most popular reading being that of Ibn Hafs. As in secular Arabic music, musical performance may include the presentation of a full maqam, however qur'an reading may be based on one to three tones only. Similarly, each melodic passage centers on a single tone level, but the melodic contour and melodic passages are largely shaped by the reading rules, creating passages of different lengths whose temporal expansion is defined through caesuras. Skilled readers may read professionally for mosques in cities. The mandatory introductory and final phrases are always restricted to the first tone of the maqam row. (ibid, p.154-155)

The Qur'an is marked with twenty-six symbols, circles, rectangles, dashes and letters, some in color, written above, below, or beside the letters of the alphabet and that do not resemble cantillation marks. These indicate the pronunciation of consonants, whether the blending of neighboring or adjacent consonants is allowed, and where recitation pauses and caesuras are forbidden and possible. (ibid, p.155)

# Radio edit

A **radio edit** is a [remix](#) of a musical performance to make it more suitable for broadcast to the general public via radio. It is synonymous with terms such as *radio version*, *radio mix*, *single version*, *single mix*, *7" mix*, *7" edit*, *hit version*, and so on.

A radio edit is often just a slightly different arrangement that makes a song conform to a more traditional pop structure, with a duration of 3 to 4 minutes. Some radio edits are just "early fades," being shorter only by virtue of not being allowed to play to completion. Since it is usually shorter than the original version, a radio edit is more cost-effective for commercial radio stations, allowing more time for commercials and other content to be programmed. Radio edits are often released as singles. An example of a song that is simply shorter than the LP version is Depeche Mode's "Enjoy the Silence".

On rare occasions, however, very long songs do not have a radio edit, despite sometimes being six or seven minutes in length. The most famous example of this would be "Bohemian Rhapsody" by Queen, which is just under six minutes in length but never radio edited (despite still receiving reasonable radio airplay today).

Radio edits are also created to conform to decency standards imposed by government agencies, such as the Federal Communications Commission in the United States. As some popular songs would violate these standards in their original consumer form, music publishers often provide radio stations with censored versions intended for broadcast. In such edits, vulgar or very explicit lyrics are replaced with either silence, sound effects or a constant "bleep" tone, which is usually 1 kHz. Since the editing is often performed by studio mixing engineers, usually only the vocal track is affected.

In cases where the song's subject matter may also be deemed inappropriate, an entirely new version of the song may be recorded for radio. An example of this is D12 and Eminem's "Purple Pills", which was recorded as *Purple Hills* featuring greatly altered lyrics which removed many references to drugs and sex.

Some songs are also released to radio stations with more than one radio edit. Examples of this include Eminem's "Ass Like That", which had a radio edit censoring "Ass" and a more lenient one leaving it intact, and Vanilla Ninja's "Cool Vibes", which had a 04:38 radio edit and a shorter, three-minute version for use in the build-up to the Eurovision Song Contest 2005.

Radio edits which shorten the song but do not censor 'bad language' are sometimes referred to as "dirty edits".

# Raga

**Raga** (*rag* /rɑːɡ/ (Hindi), *raga* (Anglicised from *ragā* /rɑːɡɑː/ (Sanskrit)) or *ragam* /rɑːɡɑːm/ (Tamil)) are the [melodic modes](#) used in [Indian classical music](#). "Raag" is the modern Hindi pronunciation used by Hindustani musicians; "Ragam" the Tamil form used by Karnatak ([Carnatic music](#)) musicians.

## Description

A raga functions both as description and prescription. It describes a generalized form of melodic practice; it prescribes a set of rules for how to build a [melody](#). It specifies rules for movements up (*aarohanam* [0K9#.M]) and down (*avarohanam* [50K9#.M]) the [scale](#), which [notes](#) should figure more and which notes should be used more sparingly, which notes may be sung with *gamaka*, phrases to be used, phrases to be avoided, and so on.<sup>[1]</sup>The result is a framework that can be used to [compose](#) or [improvise](#) melodies, allowing for endless variation within the set of notes.

Although notes are an important part of raga practice, it by no means exhausts what a raga is. A raga is more than a scale. Many ragas share the same scale.

The underlying scale may have five, six or seven tones made up of swaras. This provides one method of classifying ragas. Ragas that have five swaras are called *audava* (15) ragas; those with six, *shaadava* (7>15); and with seven, *sampoorna* (8\*B0M#) (Sanskrit for 'complete'). Those ragas that do not follow the strict ascending or descending order of swaras are called *vakra* (5M0) ('crooked') ragas. (*To see the order of notes, check the article on swara.*)

The basic mode of reference is that which is equivalent to the Western Ionian mode (this is called Bilawal thaata in Hindustani music and shankarabharanam in Carnatic music). All relationships between pitches follow from this basic arrangement of intervals. In any given seven-tone mode, the second, third, sixth, and seventh notes can be natural (shuddha, lit. 'pure') or flat (komal, 'soft') but never sharpened, and the fourth note can be natural or sharp (tivra) but never flatted, making up the twelve notes in the Western equal tempered [chromatic scale](#) (but without Western pitch equivalencies like, for example, A# and Bb). A Western-style C scale could therefore theoretically have the notes C, Db, D, Eb, E, F, F#, G, Ab, A, Bb, B. Ragas can also specify microtonal changes to this scale: a flatter second, a sharper seventh, and so forth. Treatises from the first millennium report that the octave used to be divided theoretically into 22 microtones ("shrutis"), but by the 16th century, this practice seems to have died out. Furthermore, individual performers treat pitches quite differently, and the precise intonation of a given note depends on melodic context. There is no absolute pitch; instead, each performance simply picks a ground note, which also serves as the drone, and the other scale degrees follow relative to the ground note.

Some Hindustani (North Indian) ragas are prescribed a time of day or a season. During the rains, for example, many of the Malhar group of ragas--associated with the monsoon--are performed. Some musicians take these prescriptions very seriously. However, since the majority of concert hall performances take place in the evening and night, musicians often have to make concessions for the sake of public performance.

The two streams of Indian classical music, [Carnatic music](#) and Hindustani music, have independent sets of ragas. There is some overlap, but more "false friendship" (where raga names overlap, but raga form does not). In north India, the ragas have recently been categorised into ten thaats or parent scales (by Vishnu Narayan Bhatkhande, 1860-1936); South India uses a somewhat older, more systematic classification scheme called the melakarta classification, with 72 parent (*melakarta*) ragas. Overall there is a greater identification of raga with scale in the south than in the north, where such an identification is impossible.

Note that the term "parent scale" is a metaphor, and is potentially misleading. It might seem to imply that scales came before ragas, or that ragas are made from scales. In fact, it's the other way round--parent scales (both melas and thaats) were induced from raga practice. Again we stress that ragas are not scales.

As ragas were transmitted orally from teacher to student, some ragas can vary greatly across regions, traditions and styles. There have been efforts to codify and standardize raga performance in theory from their first mention in Matanga's *Brhaddesi* (~10th c.) Some people approach raga performance from the Vedic philosophy of sound; others from a Sufi perspective;

still others approach raga primarily as an aesthetic entity; others approach it as a kind of combinatorics.

Indian classical music is always set in raga, but all raga music is not necessarily classical. Songs range from being clearly in one raga or another to being in a sort of generalized scale. Many popular [Indian film songs](#) resemble ragas closely. Again, it is important to stress that just even if song shares a scale with a raga, it isn't necessarily "in" the raga.

# Ragam

"Yat Ranjayiti iti ragam" is how ragam is defined in one of the earliest texts in Indian music. This means that Ragam is a part of music which can make a man's mind happy. Broadly, it means that Ragam is the part of music which can bring about a tirade of emotions in us. Each ragam has a definite collection and orders of Swarams (the basic [notes](#)). In [Carnatic music](#), there are 7 basic notes of which there are 12 varieties.

The seven basic swarams of carnatic music are: Sa, Ri, Ga, Ma, Pa, Dha, Ni.

**Ragas** are classified as Janaka ragas and Janya ragas.

Janaka ragas are the ragas from which the Janya ragas are created. Janaka ragas are grouped together very beautifully using a scheme called *katapayadi sutra* and are organised as *Melakarta* ragas.

Janya ragas are derived from the Janaka ragas using a combination of the swarams in the parent raga.

## Footnotes

Nothing other than the *aarohanam* and *avarohanam* (and, in Hindustani music, the pakad--melodic catch phrases) is ever actually written down; if such things are written, they are mostly neglected. The subtle rules of where to give gamakas to notes, what phrases are correct, and so on are usually codified in special songs called *varnams*. These songs show the characteristics of the ragam in practice and are transmitted orally.

# Ragga

**Raggamuffin music** (usually abbreviated as **ragga**) is a subgenre of dancehall [reggae](#) in which the instrumentation primarily consists of [electronic music](#); sampling often serves a prominent role in raggamuffin music as well.

Wayne Smith's "(Under Me) Sleng Teng"—produced by King Jammy in 1985 on a Casio CZ-series synthesizer—is generally recognized as the seminal ragga [song](#). "Sleng Teng" boosted Jammy's popularity immensely, and other producers quickly released their own versions of the [riddim](#), accompanied by dozens of different vocalists.

The birth of ragga in Jamaica occurred contemporaneously with the ascension of electronic dance music in the Western world at large. Electronic music proliferated rapidly throughout the 1990s, and ragga was no exception: it revolutionized reggae music. One of the essential reasons for ragga's swift propagation is that it is generally easier and less expensive to produce than reggae performed on traditional [musical instruments](#).

Ragga evolved first in Jamaica, and later in Europe, North America, and Africa, eventually spreading to Japan, India, and the rest of the world. Ragga heavily influenced early drum and bass music, and also spawned the syncretistic bhangragga style when fused with bhangra. Drum and bass is heavily influenced by ragga motives and artists, with many ragga vocalists appearing on its tracks, not surprising as early jungle/drum&bass had definite roots in the basslines and vocals of ragga. In the 90s, Ragga and [breakcore](#) music started to clash in the underground scene creating a style known as [Raggacore](#).

Ragga continues to flourish and evolve, constituting the bulk of contemporary reggae music production.

## Ragga and hip hop music

In the late 1980s, influential Jamaican rapper Daddy Freddy's pioneering efforts in fusing ragga with hip hop music earned him international acclaim while helping to publicize and popularize ragga. (In 1987, Daddy Freddy and Asher D's "Raggamuffin Hip Hop" became the first multinational [single](#) to feature the word *ragga* in its title.) As ragga matured, an increasing number of dancehall artists began to appropriate stylistic elements of hip hop music, while ragga music, in turn, influenced more and more hip hop artists.

Some ragga artists believe that the assimilation of hip hop sensibilities is crucial to the international marketability of dancehall music. Indeed, appeals to the contemporary rhythm and blues and hip hop music audiences in the English-speaking world contributed substantially to the multinational commercial success of such dancehall artists as Beenie Man, Shaggy, Snow, and Vybz Kartel.

## Etymology

The term *raggamuffin* is an intentional misspelling of *ragamuffin*, a word that entered the Jamaican Creole lexicon after the British Empire colonized Jamaica in the 17th century. Despite the British colonialists' pejorative application of the term, Jamaican youth appropriated the term as an ingroup designation. Raggamuffin music is, therefore, the music of the Jamaican "raggamuffins".

# Raggacore

**Raggacore** is a genre of music resembling a faster version of [jungle](#), or [breakcore](#) with [ragga](#) or [reggae](#) style basslines and vocals.

Some artists that have produced raggacore tracks include Knifehandchop, General Malice, Bong-Ra, DJ Scud, Zombieflesheater, Enduser, Venetian Snares, Shitmat, DJ K, Red Ruler, Kid 606 and Bloodclaat Gangsta Youth.

## Noteworthy Releases

- Snares Man (aka Venetian Snares) - *Breakbeat Malaria*
- Shitmat - *Killababylonkutz*
- FFF - *Junglist/Murder*
- Aaron Spectre - *Evil Most Foul*
- Enduser - *Bounty Drilla*
- Bloodclaat Gangsta Youth - *Kill or Be Killed*
- Zombieflesheater - *Dead By Dread* and "s/t 7inch"
- VA - "Speedhall" and "Speedhall - the rewind"

# Raggare

**Raggare** (from the Swedish word "raggare" which means roughly "to seek sexual contact with someone") is a subculture found mostly in Sweden and parts of Norway and Finland, mostly in rural environments and smaller villages.

Raggare have existed since the 1950s and haven't changed much since then. Their culture is based on American popular culture of the 1950s, and typically centers on a "rebel" image. James Dean's *Rebel Without a Cause* and *American Graffiti* are a popular sources of influence.

Cars are very important to Raggare; they like large US cars from the 1950s and beyond. Although cars from the '50s cars are preferred, any large American V8-powered car will do. If one is not available some substitutes are used, for instance, the Volvo Amazon, fintail Mercedes or some other car with US styling, but never a Japanese car. If that too fails, an older Volvo may be used (usually in the 200-series).

The [music](#) of choice is [rockabilly](#). The clothes and hairstyle are that of 1950s rockabilly. Blue jeans, cowboy boots, white t-shirts, sometimes with print (also used to store your pack of cigarettes by folding the sleeve), leather or jeans jacket. The hair is styled using Brylcreem or some other pomade.

One of the most popular artists among raggare is Eddie Meduza.

Raggare often use the confederate flag (possibly inspired by *The Dukes of Hazzard*) and the peckerwood, but are often oblivious to their meanings and are not necessarily racists. In the late 1990s the skinhead neonazi culture intermixed with the raggare culture and even their old sworn enemies: the [punks](#). In Sweden today the raggarculture tends to be more racist and xenophobic than it was before.

## Raggare History

When Raggare first appeared, they caused a moral panic with concerns about the use of alcohol, violence, high speed driving and having sex in the back seat. These concerns usually had little merit and most raggare were actually quite peaceful. In 1959 the movie *Raggare!* covered the issue.

Later on, Raggare often got into fights with hippies and in the 1970s, and also with punks, something described in the punk song "Raggare Is A Bunch Of Motherfuckers" by Rude Kids (and later re-recorded by Turbonegro). When The Sex Pistols played in Sweden July 28, 1977 a bunch of raggare waited outside and cornered some young girls who came out from the show. The girls had safety pins through their cheeks and the raggare ripped them right through their faces. The band was upstairs drinking beer when they heard about it. Sid Vicious wanted to go down and fight and someone else suggested that they should get the limousine and run them over. In the end the gig organizer simply called the police. Nowadays the hostility between Raggare and other subcultures is much lower.

## Raggare In Present Day

No longer considered a menace to society, the raggare-culture very much lives on in Sweden but in many ways it is still viewed in a negative light. Because of its mostly rural roots, Retro-aesthetics, and unusual (for Swedes) pro-American stance, Raggare are often (in urban areas and in pop-culture) seen as uneducated white trash with poor taste and a low-brow attitude towards sex. This is how they are normally depicted on film and television with the most famous modern example being the cult-characters "Ronny & Ragge", a pair of complete idiots who cruise around in their beat-up Ford Taunus.

There are several meetings for raggare around Sweden. The Power Big Meet is the most famous one, and is also the biggest car show in the world.

# Ragtime

**Ragtime** is an American musical genre, enjoying its peak popularity around the years 1900–1918. Ragtime is a dance form written in 2/4 or 4/4 time, with bass notes played on the odd-numbered beats and chords played on the even-numbered beats. Many ragtime pieces contain four distinct themes. Ragtime music is syncopated, with rhythmic accents on the weak beats.

The etymology of the word *ragtime* is not known with certainty. Many believe the origination to be from the words "ragged time" referencing the characteristic syncopations which "tear up" the then normal accentuations of previous popular music. Another theory suggests these words to be associated with the walking bass set against the melodic line.

## Historical context

Ragtime originated in African American musical communities, in the late 19th century, and descended from the jigs and marches played by all-black bands common in all Northern cities with black populations (van der Merwe 1989, p.63). By the start of the 20th century it became widely popular throughout North America and was listened and danced to, performed, and written by people of many different subcultures. A distinctly American musical style, ragtime may be considered a synthesis of African-American syncopation and European classical music, though this description is oversimplified.

Some early piano rags are entitled marches, and "jig" and "rag" were used interchangeably in the mid 1890s (ibid.) and ragtime was also preceded by its close relative the Cakewalk. However, the emergence of mature ragtime is usually dated to 1897, the year in which several important early rags were published. In 1899 Scott Joplin's *Maple Leaf Rag* was published, which became a great hit and demonstrated more depth and sophistication than earlier ragtime. Ragtime was one of the main influences on the early development of jazz (along with the blues). Some artists, like Jelly Roll Morton, were present and performed both ragtime and jazz styles during the period the two genres overlapped. Jazz largely surpassed ragtime in mainstream popularity in the early 1920s, although ragtime compositions continue to be written up to the present, and periodic revivals of popular interest in ragtime occurred in the 1950s and the 1970s.

Some authorities consider ragtime to be a form of [classical music](#). The heyday of ragtime predated the widespread availability of [sound recording](#). Like classical music, and unlike jazz, classical ragtime was and is primarily a written tradition, being distributed in [sheet music](#) rather than through recordings or by imitation of live performances. Ragtime music was also distributed via piano rolls for player pianos. A folk ragtime tradition also existed before and during the period of classical ragtime (a designation largely created by Scott Joplin's publisher John Stark), manifesting itself mostly through string bands, banjo and mandolin clubs (which experienced a burst of popularity during the early 20th Century), and the like.

A form known as novelty piano (or novelty ragtime) emerged as the traditional rag was fading in popularity. Where traditional ragtime depended on amateur pianists and sheet music sales, the novelty rag took advantage of new advances in piano-roll technology and the phonograph record to permit a more complex, pyrotechnic, performance-oriented style of rag to be heard. Chief among the novelty rag composers is Zez Confrey, whose "Kitten on the Keys" popularized the style in 1921.

Ragtime also served as the roots for [stride piano](#), a more improvisational piano style popular in the 1920s and 1930s. Elements of ragtime found their way into much of the American popular music of the early 20th century.

Although most ragtime was composed for [piano](#), transcriptions for other instruments and ensembles are common, notably including Gunther Schuller's arrangements of Joplin's rags. Occasionally ragtime was originally scored for ensembles (particularly dance bands and [brass bands](#)), or as songs. Joplin had long-standing ambitions for a synthesis of the worlds of ragtime and [opera](#), to which end the ragtime opera *Treemonisha* was written; it is still performed today. An earlier opera by Joplin, *A Guest of Honor*, has been lost.

## Styles of ragtime

Ragtime pieces came in a number of different styles during the years of its popularity and appeared under a number of different descriptive names. It is related to several earlier styles of music, has close ties with later styles of music, and was associated with a few musical "fads" of the period such as the foxtrot. Many of the terms associated with ragtime have inexact definitions, and are defined differently by different experts; the definitions are muddled further by the fact that publishers often labelled pieces for the fad of the moment rather than the true style of the composition. There is even disagreement about the term "ragtime" itself; experts such as David Jasen and Trebor Tichenor choose to exclude ragtime songs from the definition but include novelty piano and stride piano (a modern perspective), while Edward A. Berlin includes ragtime songs and excludes the later styles (which is closer to how ragtime was viewed originally). Many ragtime pianists, Eubie Blake and Mark Birnbaum among them, include the songs and the later styles as ragtime. The terms below should not be considered exact, but merely an attempt to pin down the general meaning of the concept.

- *Cakewalk* - A pre-ragtime dance form popular until about 1904. The music is intended to be representative of an African-American dance contest in which the prize is a cake. Many early rags are cakewalks.
- *Characteristic March* - A pre-ragtime dance form popular until about 1908. A march incorporating idiomatic touches (such as syncopation) supposedly characteristic of the race of their subject, which is usually African-Americans. Many early rags are characteristic marches.
- *Two-Step* - A pre-ragtime dance form popular until about 1911. A large number of rags are two-steps.
- *Slow Drag* - Another dance form associated with early ragtime. A modest number of rags are slow drags.
- *Coon Song* - A pre-ragtime vocal form popular until about 1901. A song with crude, racist lyrics often sung by white performers in blackface. Gradually died out in favor of the ragtime song. Strongly associated with ragtime in its day, it is one of the things that gave ragtime a bad name.
- *Ragtime Song* - The vocal form of ragtime, more generic in theme than the coon song. Though this was the form of music most commonly considered "ragtime" in its day, many people today prefer to put it in the "popular music" category. Irving Berlin was a famous composer and Gene Greene was a famous singer in this style.
- *Folk Rag* - A name often used to describe ragtime that originated from small towns or assembled from folk strains, or at least sounded as if they did. Folk rags often have unusual chromatic features typical of composers with non-standard training.
- *Classic Rag* - A name used to describe the Missouri-style ragtime popularized by Scott Joplin, Tom Turpin, and others.
- *Fox-Trot* - A dance fad which began in 1913. Fox-trots contain a dotted-note rhythm different from that of ragtime, but which nonetheless was incorporated into many late rags.
- *Novelty Piano* - A piano composition emphasizing speed and complexity which emerged after World War I. It is almost exclusively the domain of white composers.
- *Stride Piano* - A style of piano which emerged after World War I, developed by and dominated by black East coast pianists

(James P. Johnson, Fats Waller and Willie 'The Lion' Smith). Together with novelty piano, it may be considered a successor to ragtime, but is not considered by all to be "genuine" ragtime.

## Ragtime revivals

In the early 1940s many [jazz](#) bands began to include ragtime in their repertoire and put out ragtime recordings on 78 RPM records. Old numbers written for piano were rescored for jazz instruments by jazz musicians, which gave the old style a new sound. The most famous recording of this period is Pee Wee Hunt's version of Euday L. Bowman's *Twelfth Street Rag*.

A more significant revival occurred in the 1950s. A wider variety of ragtime styles of the past were made available on records, and new rags were composed, published, and recorded. Much of the ragtime recorded in this period is presented in a light-hearted novelty style, looked to with nostalgia as the product of a supposedly more innocent time. A number of popular recordings featured "prepared pianos," playing rags on pianos with tacks on the keys and the instrument deliberately somewhat out of tune, supposedly to simulate the sound of a piano in an old honky tonk.

Three events brought forward a different kind of ragtime revival in the 1970s. First, pianist Joshua Rifkin brought out a compilation of Scott Joplin's work on Nonesuch records, winning a Grammy in the classical music category. This reintroduced Joplin's music to the public in the manner the composer had intended, not as a nostalgic stereotype but as serious, respectable music. Second, the New York Public Library released a two-volume set of "The Collected Works of Scott Joplin," which renewed interest in Joplin among musicians and prompted new stagings of Joplin's opera *Treemonisha*. Finally, with the release of the motion picture *The Sting* in 1974, which had a Marvin Hamlisch soundtrack of Joplin tunes, ragtime was brought to a wide audience. Hamlisch's rendering of Joplin's 1902 rag *The Entertainer* was a top 40 hit in 1974.

## Ragtime composers

The most famous ragtime composer was Scott Joplin. Joseph Lamb and James Scott are, together with Joplin, acknowledged as the three most sophisticated ragtime composers. Some rank Artie Matthews as belonging with this distinguished company. Other notable ragtime composers included May Aufderheide, Eubie Blake, George Botsford, Zez Confrey, Ben Harney, Charles L. Johnson, Luckey Roberts, Paul Sarebresole, Wilber Sweatman, and Tom Turpin. Modern ragtime composers include William Bolcom, David Thomas Roberts, Frank French, Trebor Tichenor, Mark Birnbaum and Reginald R. Robinson.

# Rapcore

**Stylistic origins:** [Rock](#), [Hip hop](#), [Punk](#), [Heavy metal](#) and [Funk](#).

**Cultural origins:** Mid-to-late 1980s, United States

**Typical instruments:** [Sampler](#) - [Bass guitar](#) - [Electric guitar](#) - [Drums](#) - [Keyboard](#) - [Turntables](#) - [Rapping](#) - Vocals

**Mainstream popularity:** Has gained some mainstream popularity through crossover artists such as Rage Against the Machine.

**Derivative forms:** [Nu metal](#)

Rap-rock, Rap-metal

[Hip hop music](#) - [History of hip hop music](#) - [Timeline of hip hop](#) - [Timeline of heavy metal](#)

**Rapcore** is a [musical genre](#) that fuses many elements of [hip hop music](#) with the instrumentation and some of the vocal elements of [punk](#) and/or [heavy metal](#), and sometimes with [funk](#)-style beats. The term is also used to refer to the substyles of **rap-rock** and **rap-metal**.

## History

Rapcore developed in the mid to late 1980s alongside similar [crossover](#) music genre [funk metal](#). The roots of the style can be found in albums by bands such as Anthrax, Run DMC, the Beastie Boys, Red Hot Chili Peppers, 311 and Faith No More, but the first dedicated rapcore band was probably the little-known Dutch group Urban Dance Squad who inspired the founders of Rage Against the Machine.

Typical in rapcore is either the use of political themes, employed by bands such as Rage Against the Machine, Inner Surge, End7, Senser, and Aztlan Underground, or fun/aggression-oriented artists like Kid Rock, Limp Bizkit, Crazy Town, Linkin Park and The Bloodhound Gang. The band Zebrahead was recently popularized for their mixture of rapcore and funk/[techno](#) elements.

# Rapping

**Rapping**, the [rhythmic](#) delivery of rhymes, is one of the central elements of hip hop culture and music. It can be delivered over a beat or a cappella — without accompaniment. Stylistically, rap occupies a gray area between speech, poetry, prose, and song.

Derived from African, Jamaican, and American roots, rap has developed both inside and outside of hip hop since the early 1970s. Modern rappers deliver stylized, rhythmic raps with complex rhymes and wordplay. To showcase their skills rappers often compete in freestyle battles in which they ridicule their opponents with improvised rhymes. Although rap has become an international phenomenon through hip hop culture and music, issues concerning racial, class, and sexual identity remain among rappers and their listeners.

## Semantics

The definition of *rap* in the hip hop sense originates from its earlier meaning— "to discuss or debate informally"—a usage well established among African-Americans by the 1960s. The first people to rap in the hip hop style were the DJs of the 1970s, such as Hollywood and Kool Herc, who rapped shout-outs to their friends as they DJ'd behind the turntables. Although rapping in hip hop began with the DJs, most rappers today don't DJ; Coke La Rock, a member of Kool Herc's Herculoids, is often cited as the first example of such a rapper.

With the popularization of hip hop, words like rap and chill took on new meanings outside of the African-American community.[1] With the popularization of hip hop slang, several words have lost their original meanings in their usage outside of hip hop. For example, a fact often unrecognized outside of hip hop culture is that not all rappers are MCs. While the former includes anyone who raps, the latter requires that one performs for crowds.

# History

See also: [Roots of hip hop](#) and [History of hip hop music](#)

Rapping in [hip hop music](#) can be traced back in many ways to its African roots. Centuries before the United States existed, the griots (folk poets) of West Africa were rhythmically delivering stories over [drums](#) and sparse instrumentation. Because of the time that has passed since the griots of old, the connections between rap and the African griots are widely recognized, but not clear-cut. However, such connections have been acknowledged by rappers, modern day "griots", spoken-word artists, mainstream news sources, and academics.

[Blues music](#), rooted in the work songs and [spirituals](#) of slavery, was created by Blacks (and some Whites) in the Mississippi Delta region of the United States around the time of the Emancipation Proclamation. According to several musical historians, the blues were being rapped as early as the 1920s. In fact, Grammy-winning blues musician/historian Elijah Wald has referred to hip hop as "the living blues." Music critics and historians have observed similarities between the delivery and lyrical content of blues and modern rap lyrics.

[Jazz](#), largely developed from the blues, originated around the beginning of the 20th century. Improvised jazz singing, called vocalese, is often compared by musicians and music critics to the freestyling of rappers within hip hop. Freestyling has also been said to derive from the art of improvising songs that often distinguishes jazz. Jazz has influenced hip hop greatly throughout its entire history; the scat singing of jazz could be heard in the seminal 1979 old school hip hop song "Rapper's Delight" by the Sugarhill Gang. To this day, jazz musicians such as Miles Davis and Herbie Hancock collaborate with rappers, creating a sound that blurs genre lines.

During the mid-20th century, the musical culture of Jamaica was constantly influenced by the concurrent changes in [American music](#). In the 1950s, the descendants of Jamaican slaves were mixing their traditional folk music styles of calypso, mento, and soca with the jazz, soul, and rock of America. This fusion led to the creation of ska and eventually reggae. As early as 1969, Deejays were toasting (an African tradition of "rapped out" tales of heroism) over dubbed Jamaican beats.

The dubbed dancehall toasts of Jamaica, as well as the disco-rapping and jazz-based spoken word beat poetry of the United States set the template for the rapping in hip hop music. One of the first rappers in hip hop was also hip hop's first DJ— Kool Herc. Herc, a Jamaican immigrant, started delivering simple raps at his parties in the early 1970s. As Herc would explain in a 1989 interview, "[t]he whole chemistry came from Jamaica. I was listening to American music in Jamaica, and my favorite artist was James Brown. When I came over here I just had to put it in the American style."

By the end of the 1970s, hip hop had spread throughout New York, and was getting some radio play. Rappers were increasingly writing songs that fit [pop music](#) structures and featured continuous rhymes. Melle Mel (of The Furious Five) stands out as one of the earliest rap innovators. From the 1970s to the early 1980s, Melle Mel set the way for future rappers through his sociopolitical content as well as his creative wordplay.

Hip hop lyricism saw its biggest change with the popularity of Run-DMC's *Raising Hell* in the mid-1980s. This album helped set the tone of toughness and lyrical prowess in hip hop; Run-DMC were almost yelling their aggressive lyrics. Run-DMC exerted an enormous influence on the greatly experimental golden age of hip hop, which would last until 1993. In golden age rap, internal rhyme schemes and varying cadences were commonplace. Rhyme styles continue to develop throughout the world to this day.

# Writing

## Rhyme styles

Aside from a rhythmic delivery, the only other central element of rapping is rhyme. In classical poetry, rhymes that span many syllables are often considered whimsical, but in hip hop the ability to construct raps with large sets of rhyming syllables is valued. Rap can contain any and all forms of rhyme found in classical poetry such as consonance, assonance, half rhyme, or internal rhyme. Rappers are known for their style of rhyming. Juelz Santana often avoids full rhymes in favor of assonance, consonance, half rhymes, and internal rhymes. Eminem, on the other hand, often focuses on complex and lengthy rhyme schemes.

## Literary devices

Rappers use double entendres, alliteration, and all other forms of wordplay that are also found in classical poetry. Similes and metaphors are used extensively in rap lyrics; rappers such as Paul Wall have written entire songs wherein every line contains a simile or metaphor.

Hip hop lyrics often make passing references to popular culture and other topics. Such allusions serve to illustrate or exaggerate a song's message. Some of these reference are overtly political, while others simply acknowledge, credit, or show dismay about towards aspect of the rapper's culture and life.

Use of "metaphor" to refer to all imagery is widespread among rappers. Common acknowledges this on "1-9-9-9", rapping:

Hold the mic like a memory  
Niggas say I'm nice with metaphors but these are similes

## Word choice and slang

Many hip hop listeners believe that a rapper's lyrics are enhanced by a complex vocabulary. Kool Moe Dee claims that he appealed to older audiences by using a complex vocabulary in his raps.[2] Rap is famous, however, for having its own vocabulary— from international hip hop slang to local/regional slang. Some artists, like the Wu-Tang Clan, develop an entire lexicon among their clique. African American Vernacular English has always had a significant effect on hip hop slang, and vice-versa. Certain regions have introduced their unique regional slang to hip hop culture, such as the Bay Area (Mac Dre, E-40), Atlanta (OutKast, Lil Jon), and Kentucky (Nappy Roots). The Nation of Gods and Earths, a religious/spiritual group spun off from the Nation of Islam, has influenced mainstream hip hop slang with the introduction of phrases such as "word is bond" that have since lost much of their original spiritual meaning.

## Subject matter

See also: [Concept rap](#)

[Hip hop music](#) originated in New York City in the 1970s, and continues to focus largely on metropolitan centers in the East and West coasts of America. Many rappers use urbanity as the backdrop for their raps, focusing on the hardships of inner-city life. One element that has always existed in rapped rhymes, dating back to hip hop's inception, is "the struggle". This struggle was originally financial or personal in nature; getting a girlfriend, or paying the rent. With "The Message," a concept rap written by Melle Mel and performed by Grandmaster Flash and the Furious Five, the idea of "the struggle" was put in another context: the shared hardships of the ghetto.

The roots of these sociopolitical raps are in the beat poetry of The Last Poets and Gil Scott Heron. "The Message" pioneered the inclusion of political content in hip hop rhymes, expanding beyond basic personal issues and party raps. In the golden age of hip hop, Public Enemy emerged, with a focus on political and social issues. Modern East Coast hip hop artists such as Mos Def, Talib Kweli, Nas, and Dead Prez are known for their sociopolitical subject matter.

Other rappers take a less critical approach to urbanity, sometimes even embracing such aspects as crime. Schoolly D was the first notable MC to rap about crime.[11]. Several years later, he would go on to influence Ice T, who had more overtly "gangsta" lyrics. Gangsta rap, made popular largely because of N.W.A. and "proto-gangsta rapper" KRS-ONE, celebrates crime and a hedonistic "gangsta" lifestyle. With the death of his DJ, Scott la Rock, KRS-ONE went on to speak out against violence in hip hop. Several gangsta rappers also laud the use of drugs such as marijuana, which occupies a significant place in the subject matter of modern hip hop. West-coast rappers such as Snoop Dogg and Cypress Hill, for instance, helped popularize drug-related songs in the early 1990s.

In contrast to the hedonistic approach of the gangsta rappers, some rappers have a spiritual or religious focus. Christian rap is currently the most commercially successful form of religious rap. Aside from Christianity, the Five Percent Nation, a gnostic religious/spiritual group, has been represented more than any religious group in popular hip hop. Hip-hop artists such as Rakim, the members of the Wu-Tang Clan, Brand Nubian, X Clan, Busta Rhymes, and Nas, have had success in spreading the theology of the Five Percenters.

"Party rhymes," meant to pump up the crowd at a party, were nearly the exclusive focus of old school hip hop (with the exception of The Furious Five). Party raps remain a staple of hip hop music to this day. In addition to Party raps, rappers also tend to make references to love and sex. Love raps were first popularized by Spoonie Gee of the Treacherous Three, and later, in the golden age of hip hop, Big Daddy Kane, Heavy D, and LL Cool J would continue this tradition. 2 Live Crew, a Miami bass group, were among the first hip hop act to be temporarily banned in the United States for the overtly sexual and profane content of their raps.

# Performance

## Flow

Rap delivery, or *flow*, is defined by prosody, cadence, and speed. Cadence deals with the dynamics and patterns of the rhythm. In addition to rubato (changes in tempo for the purpose of expression), cadence can also serve to reinforce song structure through ritardando (the gradual slowing down of tempo). Old school rappers generally maintained a simple cadence, without much deviation,[12] while golden age rappers such as Rakim experimented extensively with cadence.[2] Present day popular rapper Snoop Dogg is considered to have a versatile cadence because of his ability to rap over disparate beats equally well.

A rap's prosody, which exists in classical poetry, is its meter and foot. The hardcore rapping style pioneered by Run-DMC and KRS-ONE is an inverse of iambic pentameter, in other words, trochaic pentameter. Iambic pentameter, which was Shakespeare's meter of choice, is known for its resemblance to natural, conversational speech. For this reason, rapping often sounds like talking "turned upside down."

Speed is sometimes regarded as an important sign of skill. In certain hip hop subgenres such as chopped and screwed, slow-paced rapping is often considered optimal. The current record for fastest rapper is held by MC Ricky Brown, who rapped 723 syllables in 51.27 seconds (14.1 syllables per second) on his track "No Clue" at B&G Studios on January 15, 2005.

To successfully deliver a nicely *flowing* rap, a rapper must also develop vocal presence, enunciation, and breath control. Vocal presence is the distinctiveness of a rapper's voice on record. Enunciation is essential to a flowing rap; some rappers choose also to exaggerate it for comic and artistic effect. Breath control, taking in air without interrupting one's delivery, is an important skill for a rapper to master, and a must for any MC. An MC with poor breath control can't deliver difficult verses without making unintentional pauses.

Raps are sometimes delivered with melody. West-coast rapper Egyptian Lover was the first notable MC to deliver "sing-raps." [11] Popular rappers such as 50 Cent add a slight melody to their otherwise purely percussive raps. Some rappers, such as Cee-Lo, are able to harmonize their raps with the beat.

Synchronization is common among rap groups. Synchronization refers to the organization of several rappers into one song either by overlapping or through call and response. Grandmaster Flash's MCs, the Furious Five, were the first to make five rappers sound as one through synchronization. Some rappers take the role of two different characters that are talking to each other in the song. Examples include "Warning" by Notorious BIG and "Stan" by Eminem.

## Freestyle rapping

See also: [Freestyle rap](#)

Freestyle rapping, typically referred to as *freestyling* or *spitting*, is the improvisation of rapped lyrics. When freestyling, some rappers inadvertently reuse old lines, or even "cheat" by preparing segments or entire verses in advance. Therefore, freestyles with proven spontaneity are valued above generic, always usable lines. Rappers will often reference places, objects in their immediate setting, or specific (usually demeaning) characteristics of opponents, to prove their authenticity and originality.

## **Battle rapping**

Battle rapping, which can be freestyled, is the competition between two or more rappers in front of an audience. The tradition of insulting one's friends or acquaintances in rhyme goes back to the dozens, and was portrayed famously by Mohammed Ali in his boxing matches. The winner of a battle is decided by the crowd and/or preselected judges. According to Kool Moe Dee, a successful battle rap focuses on an opponents weaknesses, rather than one's own strengths.[2] Television shows such as BET's 106 and Park and MTV's DFX host weekly freestyle battles live on the air. Battle rapping gained widespread public recognition outside of the African-American community with Eminem's movie, 8 Mile. Eminem, like many other rappers, also releases "diss tracks" on his albums, meant to insult his enemies.

## Identity

By the United States 2000 Census, three-fourths of the United States' population is white, while one-eighth is black. According to musicologist Arthur Kempton, 70 percent of hip hop listeners are white. Mainstream artists such as Eminem sometimes have a larger percentage of black concert-goers than their underground counterparts. According to political rapper Zion I, it's because "...so many Black people don't want to hear it. They want that thug shit." In addition to Zion, several other underground rappers, such as Boots Riley of The Coup, report nearly all-white audiences.

Despite so many hip hop fans being white, most popular rappers are not. Many believe this is a good thing; popular rapper Kanye West has said: "I hate music where white people are trying to sound black. The white music I like [sounds] white." [15] Unlike Kanye West, who came from a middle-class background[16], the majority of popular American rappers to date have come from a poor, often inner-city life. Vanilla Ice, a white pop rapper, went so far as to lie about his place of origin, claiming that he came from a poorer area than he did. According to Vanilla Ice, he was encouraged to lie by his record company, to increase their profits. [17] The Beastie Boys, an exception to all of these patterns, are notable for being a white, Jewish, middle-class rap group that was able to gain street credibility despite the race and class stigma involved.

Almost all popular rappers identify themselves as heterosexual. Homophobia is both prevalent and blatant throughout hip hop culture, although a small number of MCs have explored GLBT issues. There is an underground culture of gay hip hop, which was profiled in the 2005 documentary film *Pick Up the Mic*, although to date only Queen Pen, an openly bisexual female MC, and Caushun, an openly gay male rapper, have had significant mainstream success.

## Derivatives and influence

Throughout hip hop's history, new musical styles and genres have developed that contain rapping. Entire genres, such as rapcore ([rock](#)/metal/punk with rapped vocals) and hip house have resulted from the fusion of rap and other styles. All popular music genres with a focus on percussion have contained rapping at some point— be it disco (DJ Hollywood), jazz (Gangstarr), new wave (Blondie), funk (Fatback Band), contemporary R&B (Mary J. Blige), reggaeton (Daddy Yankee), or even Japanese dance music. UK garage music has begun to focus increasingly on rappers in a new subgenre called grime, pioneered and popularized by the MC, Dizzee Rascal.

# Rave music

## Type of illegal party

Free party / Squat Party

[Freetekno](#)

Teknival

Sound system

## Music Played at the Parties

*Also see Rave music*

[breakcore](#) - [free tekno](#) - [gabba](#) - [jungle](#) - [psychedelic trance](#) - [speedcore](#) - [terrorcore](#) - [acid techno](#) and [techno](#)

**Rave music** consists of forms of [electronic music](#) for dancing that are associated with the rave scene. Most often, it is used to describe [music](#) that depends heavily on samples and is high energy.

Rave music got its start in Belgium in the early 1980s, and continued on to Britain later in the decade. Rave music closely followed the acid house phenomenon. Initially "rave music" was considered a particular style that was a combination of fast breakbeat and more hardcore forms of techno. Early 1990s efforts by Nebula 2, Brainstorm Crew, The Prodigy (The Prodigy Experience), Utah Saints and The Shamen (En-Tact) were quintessential "rave music".

By the early 2000s, the term was used more generically to mean any one of a number of different styles (or combinations thereof) that might be played at a rave party. In this sense, rave music is more associated with an event than a particular genre, per se. At a rave there can be different "arenas" or areas which play different styles of rave music. Very large raves called **massives** may include ten or more separate arenas, each with their own music style.

Raver styles of music continue to grow and evolve. Some genres and an iconic artist include (not an exhaustive list):

- [Breakbeat hardcore](#) - Brainstorm Crew
- [House](#) styles: Progressive house - John Digweed, Bad Boy Bill
- [Trance](#) - Armin van Buuren, Ferry Corsten, DJ Tiësto, Paul van Dyk
- [Goa trance](#) - Hallucinogen, Astral Projection
- [Drum and Bass/jungle](#) - Andy C, Goldie, Dieselboy
- [Breaks](#) - The Chemical Brothers, The Prodigy, Adam Freeland, Baby Anne
- [Hardcore Techno](#) styles: [Happy Hardcore](#), Hardcore Trance, [Gabba](#) - Luke Slater, Dave Clarke

Non-dance styles which might be heard in a rave "chill-out" room include:

- [Ambient music](#) - Brian Eno, Harold Budd, The Orb
- [IDM](#) - Aphex Twin, Autechre

Some ravers are selective between genres, showing little or no interest in one area while finding great satisfaction and joy in another. House often has roots in [funk](#) and [disco](#) while trance has its roots in [new age](#) and symphonic music. Many DJs mix genres, remix existing sounds, or leave [electronic music](#) entirely.

A new form of rave is appearing based on the genre "Makina" mainly produced in Spain but also in Italy, Germany and France, it has exploded in the North East of England with many clubs and all night raves.

# Recapitulation

In [music theory](#), the **recapitulation** is the third major [section](#) of a [movement](#) written in [sonata form](#). The recapitulation re-presents the [thematic](#) material that originally appeared in the exposition section, placing it all in the tonic [key](#) (that is, the overall key of the movement).

The recapitulation is not always a straightforward image of the exposition; it usually contains a secondary development section, and also sometimes rearranges the order of the musical material.

# Recitative

**Recitative**, a form of composition often used in [operas](#), [oratorios](#), [cantatas](#) and similar works, is described as a melodic speech set to music, or a descriptive narrative song in which the music follows the words.

Recitative is easily distinguished from more florid and melismatic [arias](#), as the [rhythms](#) and [melodic](#) contours of recitative often approximate to those of normal speech, often including repeating pitches. It is used where dialogue or monologue is sung in between the arias, choruses or other numbers, and is intended to help move the story along quickly.

Recitative often has very simple accompaniment, sometimes nothing more than a continuo instrument (for example, a single harpsichord) playing occasional chords. The terms *recitativo secco* and *recitativo accompagnato* (or *recitativo stromentato*) are sometimes used to distinguish recitative accompanied only by continuo and recitative accompanied by the [orchestra](#).

Historically, the recitativo, in the religious composition tradition, specifically the passions, derived from [gregorian chant](#) (hence their monotonous reciting manner): for special occasions like Easter, the gospel text would be sung in a reciting (gregorian) style, alternating with [hymns](#) or other song-like texts not quoted literally from the gospel story. The latter would develop in arias and choruses, while the former set the standard for the recitativo.

The "recitativo" style of singing was not abandoned completely in pop culture: in fact [raps](#), when using the ancient musical terminology, could be correctly described as "recitativo accompagnato".

The word has sometimes been used in relation to parts of purely instrumental works which resemble vocal recitatives (passages in Ludwig van Beethoven's Piano Sonata No. 17 (The Tempest) and Piano Sonata No. 31 are examples).

# Record chart

A **record chart**, also known as a **music chart**, is a method of ranking [music](#) according to popularity during a given period of time. Examples of record charts are the Hit parade, Hot 100 or Top 40. Although primarily a marketing or supermarketing tool like any other sales statistic, they have become a form of popular media culture in their own right.

Record charts are compiled using a variety of criteria. These commonly include sales of records, cassettes and compact discs; amount of radio airplay; requests to radio disk jockeys; and, recently, number of downloads.

Some charts are specific to a particular [musical genre](#) and most to a particular geographical location (although download charts are not easily pinned down in this way). The most common period of time covered by a chart is one week, with the chart being printed or broadcast at the end of this time. Summary charts for years and decades are then calculated from their component weekly charts. Component charts have become an increasingly important way to measure the commercial success of individual songs.

# Record industry

The **record industry** is the part of the [music industry](#) that earns profit by selling [sound recordings](#) of [music](#). In the early years of the phonograph in the late 19th century, the music industry was dominated by the publishers of sheet music. With the start of the 20th century the importance of recorded sound grew in the business, and about the end of the first World War records supplanted sheet music as the largest player in the music business. The business has largely been dominated and controlled by the record industry, as the economics of mass-production of copies allow the manufacture of valuable music recordings for a tiny fraction of their sale price. There have been repeated allegations of illegal price fixing by the record industry.

The Recording Artists' Coalition exists to represent the interests of members of the music industry, in their fight against what they see as inequitable treatment by the record industry.

There is a fundamental tension between the two industries – they have been in an uneasy symbiotic / parasitic relationship since this time, which is threatened by the advent of new technologies. Critics of the record industry today have compared it to the buggy whip industry, fighting the disruptive technology of file sharing by all possible means. It is worth remembering though that the sheet music industry were resistant to original phonographic industries, who in turn were initially resistant to radio, television, home taping and so forth.

## **List of record industry organizations**

Australian Record Industry Association (ARIA)  
British Phonographic Industry (BPI)  
Canadian Recording Industry Association (CRIA)  
International Federation of the Phonographic Industry (IFPI)  
Irish Recorded Music Association (IRMA)  
National Association of Record Merchandisers (NARM)  
Recording Industry Association of America (RIAA)

## Record label

In the [music industry](#), a **record label** is a brand and a trademark associated with the marketing of sound recordings and [music videos](#). A record label is also a company that manages such brands and trademarks; coordinates the production, manufacture, distribution, promotion, and copyright protection of sound recordings and music videos; conducts [A&R](#); and maintains contracts with recording artists and their managers. The term derives from and describes the round paper labels affixed to the center of gramophone records; such labels typically contain a trademarked logo and information about the sound recording and the companies involved in creating the product.

## Terminology and business structure

Record labels are often under the control of a corporate umbrella organization called a *music group*. A music group is typically owned by international conglomerate *holding company*, which often has non-music divisions as well. A music group controls and consists of music publishing companies, record (sound recording) manufacturers, record distributors, and record labels. As of 2005, the "big four" music groups control about 70% of the [world music market](#), and about 80% of the United States music market. Record companies (manufacturers, distributors, and labels) may also comprise a *record group* which is, in turn, controlled by a music group.

Record companies and music publishers that are not under the control of the big four are generally considered to be *independent*, even if they are large corporations with complex structures. Some prefer to use the term *indie label* to refer to only those independent labels that adhere to an arbitrary, ill-defined criteria of corporate structure and size, and some consider an indie label to be almost any label that releases non-mainstream music, regardless of its corporate structure.

## Miscellaneous

Recording companies often invest a lot of time and money in discovering new talent or developing the talent of artists already under contract. The association of the brand with the artists helps define the image of both the brand and the artist.

Although both parties need each other to survive, the relationship between record labels and artists can be a difficult one. Many artists have had albums altered or censored in some way by the labels before they are released—songs being edited, artwork or titles being changed, etc. Record labels generally do this because they believe that the album will sell better if the changes are made. Often the record label's decisions are correct ones from a commercial perspective, but this typically frustrates the artist who feels that their artwork is being destroyed.

In the early days of the recording industry, record labels were absolutely necessary for the success of any artist. The first goal of any new artist or band was to get signed to a contract as soon as possible. In the 1940s, 1950s and 1960s, many artists were so desperate to sign a contract with a record company that they usually ended up signing a bad contract, sometimes giving away the rights to their music in the process. Entertainment lawyers are used by some to look over any contract before it is signed.

## Industry consolidation

Due to lawyers gaining control of the music industry in the 1970s and 1980s, there was a phase of consolidation in the record industry that led to almost all major labels being owned by a very few multinational companies, who in turn were members of the RIAA.

## The resurgence of independent labels

In the 1990s, due to the widespread use of home studios, consumer CD recorders, and the Internet, independent labels began to become more commonplace. Independent labels are typically artist-owned (although not always), with a focus usually on making good music and not necessarily on the business aspects of the industry or making lots of money. Because of this, independent artists usually receive less radio play and sell fewer CDs than artists signed to major labels. Though at a fraction of the production cost of the "major" records they are able to recoup their initial advance at much lower sales numbers, sometimes as low as low thousands. They also tend to have more control over the music and packaging of the released product.

On occasion established artists, once their record contract has finished, move to an independent label. This often gives the combined advantage of name recognition and more control over one's music (not to mention a bigger slice of the royalty pie). Singers Dolly Parton, Aimee Mann and Prince, among others, have achieved this.

While there are many independent labels, folk singer Ani DiFranco's Righteous Babe Records is often cited as an ideal example. The singer turned down lucrative contracts from several top-name labels in order to establish her own New-York-based company. Constant touring resulted in noteworthy success for an act without significant major funding. Ani and others from the company have spoken on several occasions about their business model in hopes of encouraging others.

Some independent labels become successful enough that major record companies negotiate contracts to either distribute music for the label or in some cases, purchase the label completely.

On the [punk rock](#) scene, the DIY punk ethic encourages bands to self-publish and self-distribute. This approach has been around since the early 1980s, in an attempt to stay true to the punk ideals of doing it yourself and not [selling out](#) to corporate profits and control. Such labels have a reputation for being fiercely uncompromising and especially unwilling to cooperate with the Big Four record labels at all. Perhaps the most important and influential labels of the Do-It-Yourself attitude was SST Records, created by the band Black Flag. No labels wanted to release their material, so they simply created their own label to release not only their own material but the material of many other influential underground bands all over the country.

## **Internet & digital labels**

With the Internet now being a viable source for obtaining music, net labels have emerged. Depending on the ideals of the net label, music files from the artists may be downloaded free of charge or for a fee that is paid via paypal or an online payment system. Some of these labels also offer hard copy CDs in addition to direct download (for example, Baltimore's Schismatik record label ships CDs for a nominal charge). Most net labels acknowledge the Creative Commons licensing system thus reserving certain rights for the artist. Digital Labels are the latest version of a 'net' label. As where 'net' labels were started as a free site or just a hobby point, digital labels seek to give the major record industry a real run for their money. One of the pioneers of the major digital label is Fiberlineaudio.

## **Open-source labels**

The new century brings the phenomenon of *open-source* or *open-content* record label. These are inspired by the free software and open source movements and the success of [GNU/Linux](#).

# Recording contract

A **recording contract** (commonly called a **record deal**) is a legal agreement between a [record label](#) and a recording artist (or group), where the artist makes a record (or series of records) for the label to sell and promote. Artists under contract are normally only allowed to record for that label exclusively; guest appearances on other artists' records will carry a notice "By courtesy of (the name of the label)", and that label may receive a percentage of sales.

Labels typically own the copyright in the records their artists make, and also the master copies of those records. An exception is when a label makes a distribution deal with an artist; in this case, the artist, their manager, or another party may own the copyright (and masters), while the record is licensed exclusively to the label for a set period of time. Promotion is a key factor in the success of a record, and is largely the label's responsibility, as is proper distribution of records.

While initial recording deals usually yield a relatively small percentage of royalties to artists, subsequent (or renegotiated) deals can result in much greater profit, or profit potential. A few performers, such as Michael Jackson, have signed multimillion-dollar contracts. (As a rule, though, for the millions to become tangible, hit records meeting or exceeding their previous sales records must follow; Michael Jackson's proposed "billion-dollar deal" would have required all his records following *Bad* to have sold as well as his watermark album *Thriller*; none have come close.) Recording contracts may include opt-out clauses, in the event an artist's popularity dips or they release one or more non-hits under the deal; Mariah Carey was bought out of her Virgin Records contract after her one album release with the label sold poorly.

Unless worded otherwise, any advances or upfront money paid to a recording artist is owed back to the label, whether the recordings to follow sell well or not. Capitol Records suspended Linda Ronstadt's contract in the early 1970s, but she continued to tour partly to pay Capitol back for her 1960s deal, which cost Capitol more than it had yielded. (Her string of hits in the mid-1970s allowed her to finally clear the debt.) Labels expect to make a profit, and little concern themselves with a given performer's lack of business or financial savvy, as artists such as George Michael have discovered. "Walking out" on a deal is very difficult, as is attempting to strike a new deal without completing an old one; recordings released by Donna Summer and by members of Boston (calling themselves "Orion the Hunter") were pulled from distribution after their former labels took legal action. The Mamas and the Papas were forced into a reunion years after their 1968 breakup, by the letter of their Dunhill Records contract, which required one more album to be completed (1971's *People Like Us*).

When recordings go out of print, this typically happens because either the label has decided that continuing to sell (or distribute) the record will not be profitable, or the licensing agreement with the artist has expired. (Labels may also stop distribution as a punitive measure, if an artist fails to comply with their contract, or as a strategic measure if negotiations for a new one prove difficult.) Record labels can also become bankrupt like any business, and their masters and copyrights sold or traded as part of their assets. (Occasionally these are purchased by the artists themselves.)

Recording artists signed to a failed label can find themselves in limbo, unable to record for anyone but a company that is out of business (and thus cannot sell or distribute their records), and with their existing works unavailable for sale. When one label "buys out" another (or a label is purchased by an outside party), any existing copyrights and contracts held (and masters, if owned by the label) normally go with the sale. This often benefits recording artists, but not always.

Distribution deals are often renewed, but occasionally the label and whoever owns the copyright cannot come to terms for a renewal. The reason is usually that one party expects too much money, or too large a percentage of profits, to suit the other.

Categories: [Music industry](#).

# Recoupment

**Recoupment** is the practice, common in the [music industry](#), of claiming an advance provided to an artist back *from that artist* rather than (or, as well as) from related sources. Many [record labels](#) practice recoupment, and most new artists have little choice but to accept it since they lack the negotiating power to obtain a better contract.

## Example

Suppose that a label gives a band \$250,000 to record an album. They agree to do so in return for 90% of the sales. The album is recorded, and sells 200,000 copies at \$10 each, yielding \$2m. The record company takes 90% of this as agreed, leaving the band with \$200,000 of their own. This is the situation without recoupment.

With recoupment, the label gives the band \$250,000 as before. The album again sells 200,000 copies at \$10 each, yielding \$2m. The record company takes 90% of this as before, leaving the band with \$200,000 - but the record company no longer considers the 90% of sales as repayment of the advance. Instead, the band is required to pay the record company back the advance from their own cut, leaving them in \$50,000 debt to the record company - even though the record company have gained \$1.8m from the sales percentage.

Category: [Music industry](#).

## Red Dirt

**Red Dirt**, based in and around Stillwater, Oklahoma, is a rising genre of music that can best be likened to the [Indie](#) genre of [Rock 'n' Roll](#); there is no definitive sound that can be attributed to all the bands in the movement. It can be described as a mix of [Southern Rock](#), [Outlaw country](#), and Texas Honky Tonk, with even a few Mexican influences. Although Stillwater is the Nashville of Red Dirt music, bands hail from both Oklahoma and Texas; most are not based out of Stillwater in the way that their mainstream counterparts are based in Nashville.

The name Red Dirt comes from the soil in Oklahoma and Texas. It is an outstanding feature of the region and comes from the large amounts of iron oxide found in the soil, which give it the classic red tint.

# Refrain

A **refrain** (from the Old French *refraindre* "to repeat," likely from Vulgar Latin *refringere*) is the line or lines that are repeated in music or in verse; the "chorus" of a song. Poetic fixed forms that feature refrains include the [villanelle](#), the *virelay*, and the *sestina*.

The use of refrains is particularly associated with [popular music](#), especially [rock and roll](#), where the verse-chorus-verse song structure typically places a refrain in almost every song. The refrain or chorus often sharply contrasts the verse melodically, rhythmically, and harmonically, and assumes a higher level of dynamics and activity, often with added instrumentation. Chorus form, or strophic form, is a sectional and/or additive way of structuring a piece of music based on the repetition of one formal section or block played repeatedly.

In [music](#), a refrain has two parts: the [lyrics](#) of the song, and the [melody](#). Sometimes refrains vary their words slightly when repeated; recognisability is given to the refrain by the fact that it is always sung to the same tune, and the rhymes, if present, are preserved despite the variations of the words. Such a refrain is featured in "The Star-Spangled Banner," which contains a refrain which is introduced by a different phrase in each verse, but which always ends:

*O'er the land of the free, and the home of the brave.*

A similar refrain is found in the "Battle Hymn of the Republic," which affirms in successive verses that "Our God," or "His Truth," is "marching on."

Refrains usually, but do not always, come at the end of the verse. Some songs, especially [ballads](#), incorporate refrains into each verse. For example, one version of the traditional ballad *The Cruel Sister* includes a refrain mid-verse:

There lived a lady by the North Sea shore,  
*Lay the bent to the bonny broom*  
Two daughters were the babes she bore.  
*Fa la la la la la la la.*

As one grew bright as is the sun,  
*Lay the bent to the bonny broom*  
So coal black grew the other one.  
*Fa la la la la la la la.*

...

Here, the refrain is syntactically independent of the narrative poem in the song, and has no obvious relationship to its subject, and indeed little inherent meaning at all. The device can also convey material which relates to the subject of the poem. Such a refrain is found in Dante Gabriel Rossetti's *Troy Town*:

Heavenborn Helen, Sparta's queen,  
*O Troy Town!*  
Had two breasts of heavenly sheen,  
The sun and moon of the heart's desire:  
All Love's lordship lay between,  
*O Troy's down,*  
*Tall Troy's on fire!*

...

Phrases of apparent nonsense in refrains (*Lay the bent to the bonny broom?*), and solfege syllables such as *fa la la*, familiar from the Christmas carol *Deck the Halls with Boughs of Holly*,

have given rise to much speculation. Some believe that the traditional refrain Hob a derry down O encountered in some English folksongs is in fact an ancient Celtic phrase meaning "dance around the oak tree." These suggestions remain controversial.

## Popular Examples

Two popular examples of refrain are in the songs "Hey Jude" by The Beatles and "The Boxer" by Simon and Garfunkel.

# Reggae

**Stylistic origins:** [R&B](#), [Jazz](#), Mento, Calypso, [Ska](#), Rocksteady  
**Cultural origins:** 1960s onwards, Jamaica, especially Kingston  
**Typical instruments:** [Bass](#) - [Drums](#) - [Guitar](#) - [Organ](#) - Brass - Melodica  
**Mainstream popularity:** 1970s onwards, worldwide  
**Derivative forms:** [Trip hop](#) - [Drum and bass](#)

[Roots reggae](#) - [Dub](#) - Dub poetry - Toasting - Lovers rock - Dancehall - [Ragga](#)

Reggaeton - Saggae - [Ska punk](#) - [Trip hop](#) - [Drum and bass](#)

[African](#) - UK - Japanese - Dutch - Fijian - Hawaii - New Zealand - Slovenia - Spain

**Reggae** is a [music genre](#) developed in Jamaica. Reggae may be used in a broad sense to refer to most types of Jamaican music, including [ska](#), rocksteady, [dub](#), dancehall and [ragga](#). The term may also be used to distinguish a particular style that originated in the late 1960s. Reggae is founded upon a rhythm style which is characterized by regular chops on the back beat, known as the "skank", played by a rhythm guitarist, and a bass drum hitting on the third beat of each measure, known as "one drop." Characteristically, this beat is slower than in reggae's precursors, ska and rocksteady. Reggae is often associated with the Rastafari movement, which influenced many prominent reggae musicians in the 1970s and 1980s. However, the subject matter of reggae songs deals with many subjects other than Rastafari, with love songs, sexual themes and broad social commentary being particularly well-represented.

## Origins

Its origins can be found in traditional African Caribbean music as well as US R&B. Ska and rocksteady are 1960s precursors of reggae. In 1963, Jackie Mittoo, pianist with the ska band The Skatalites was asked to run sessions and compose original music by record producer Coxsone Dodd at his Studio One record studio. Mittoo, with the help of drummer Lloyd Knibbs, turned the traditional ska beat into reggae, slowing the rhythm down in the process. Bob Marley, who popularized reggae worldwide, also recorded rocksteady records early in his career. By the late 1960s reggae was already getting radio play in the UK on John Peel's radio show.

It is thought that the word "Reggae" was first used by the [Ska](#) group Toots and the Maytals, who coined the phrase in the title of their hit *Do the Reggay* in the early sixties.

## Styles

*Main article:* [List of genres of reggae](#)

In Jamaica however, new styles are nowadays becoming more popular, among them, dancehall and [ragga](#) (also known as raggamuffin). Mixing techniques employed in [dub](#), an instrumental sub-style of reggae, influenced [hip hop](#), [drum and bass](#) and other styles. The toasting or dee jaying first used by artists such as U-Roy and Dillinger had a world-wide impact because Jamaican DJ Kool Herc used them as he pioneered a new style that subsequently became hip hop or [rap music](#). In the Jamaican sense of the word, a "DJ" is an "MC" or rapper, whereas the term "DJ" describes the music selector in the U.S.. Therefore what is called *dee jaying*, *toasting* or *chatting* in Jamaica is called [rapping](#) in most other parts of the world.

# Roots

*Main article:* [Roots reggae](#)

Roots is the name given to specifically Rastafarian reggae music. It is a spiritual type of music, whose lyrics are predominantly in praise of Jah (God).

Recurrent lyrical themes include poverty and resistance to government oppression. The creative pinnacle of roots reggae is arguably in the late 1970s, with singers such as Johnny Clarke, Horace Andy, Barrington Levy, and Lincoln Thompson teaming up with studio producers including Lee 'Scratch' Perry, King Tubby, and Coxsone Dodd. The experimental pioneering of such producers within often restricted technological parameters gave birth to [dub music](#), and is seen by some music historians as one of the earliest (albeit analogue) contributions to the development of [techno](#).

Roots reggae was an important part of Jamaican culture, and whilst other forms of reggae have replaced it in terms of popularity in Jamaica (Dancehall for instance), roots reggae has found a small, but growing, niche globally.

## **Social issues**

One of the main themes of reggae music has been social liberation. This has both political and religious aspects.

### **Political awakening**

The music attempts to raise the political consciousness of the audience:

*The American dream*

*Is not what it seem.*

*Why do you slumber?* (Jimmy Cliff, "American Dream" 1983)

### **Alternatives to orthodox religious dogma**

It also militates for freedom from religious delusion:

*Most people think*

*Great God will come from the sky*

*Take away everything*

*And make everybody feel high*

*But if you know what life is worth*

*You would look for yours on earth*

*And now you see the light*

*So stand up for your right.* (Bob Marley, Peter Tosh, "Get Up, Stand Up")

### **Freedom of religious expression**

Repression of many kinds, and especially repression linked with the prohibition of ganja (marijuana), which is considered a sacrament by Rastafarians, is another recurring theme in the music.

## Controversy

Quite a few of the most common themes found in reggae music have been viewed as controversial by many members of the public at various times. The most controversial of these themes have traditionally been the promotion of marijuana / cannabis usage , and the promotion of homophobic views. Other views prevalent in reggae music which have been the source of controversy at various times include black/african militancy, misogyny , criticism of colonialisation, anti-poverty, criticism of political systems, criticism of racism and criticism of the colonial education system. Some of these themes like marijuana usage have been prevalent in reggae music throughout the recorded and un-recorded history of the music, whilst others such as homophobia are a more recent phenomenon relative to the history of reggae.

## Cannabis

The promotion of the use of cannabis through both lyrics, images and lifestyle has been a staple of reggae since its inception. The prominence of marijuana usage in reggae primarily stems from reggae music's origin as music derived from the musical tradition of the rastafarian religion, a religion within which marijuana usage is considered a sacrament. The controversy surrounding marijuana in Reggae has increased in proportion to the increased unacceptability of marijuana in general society. For example Bob Marley's famous *Catch a Fire* album cover showing him smoking a spliff was controversial at the time the album was first issued primarily for its novelty. That the album cover was issued at all indicates some difference in society's views at the time, and such an album cover would never be issued by a major record label today. Peter Tosh was also renowned for his promotion of cannabis usage and lobbied for the decriminalization of marijuana. His most famous song is titled "Legalize It". Tosh was imprisoned multiple times in Jamaica for marijuana possession (Jamaica, incidentally, has some of the harshest anti-marijuana laws in the world) and often performed with a spliff in hand.

## Homophobia

Reggae in general and the sub-genre of Reggae called Dancehall in particular has come under increased criticism from both Jamaican and International organisations for homophobic themes and lyrics. Many believe reggae music has prompted or incited instances of gay bashing.

Anti-homosexual or homophobic themes have been associated with dancehall music throughout its history. To a significant degree these themes stem from the anti-homosexual, though not necessarily violent, sentiment towards homosexuality of Jamaicans in general. A similar strong anti-homosexual sentiment is present in most English-speaking Caribbean nations. Homosexuality is illegal in Jamaica as well as in most former British colonies in the Caribbean.

Homophobic lyrics have been described by J-FLAG, a Jamaican gay rights organization, as one aspect of "widespread [Jamaican] cultural bias against homosexuals and bisexuals." Artists whose music features homophobic lyrics have had concerts cancelled. Various artists have had international travel restrictions placed on them and have been investigated by international agencies including Scotland Yard on the accusation that the lyrics incite the audience to assault homosexuals. Many of the affected artists hold the opinion that such legal or commercial sanctions are essentially an attack against the artists freedom of speech.

The increased criticism of dancehall music by international organisations is often attributed to the increased international exposure of the music, especially with regards to international media and the Internet. Dancehall has always included themes of not only homophobia, but of violence, sexism, and misogyny as well, which have come under their share of criticism, as in this Village Voice review: "Whether the homophobia and misogyny (that also blight almost all current reggae) are carryovers from tight-assed, purse-mouthed, colonial-era Brit sexual fear or personal limitation, the result was lyrical statements too stupid to be spoken."

# Remix

A **remix** is an alternate mix of a song different from the original version, made using the techniques of audio editing. It may incorporate elements of [dance](#) music. It is often used to create an upbeat version of a song for playing by [disc jockeys](#) in [nightclubs](#). Normally it is based on a [musical theme](#) of the original song, but often introduces new themes, adding complexity, though some follow the opposite path by removing many elements, leaving a piece that is stripped down and simplified.

## Roots of the remix

Since the beginnings of [recorded sound](#) in the late 19th century, certain people have enjoyed the ability to rearrange the normal listening experience with technology. With the advent of easily editable magnetic tape in the 1940s and 1950s, such alterations became more common. In those decades the experimental genre of [musique concrète](#) used tape loops of music and environmental sounds to create sound compositions that were the forerunners of [electronic music](#). Less artistically lofty edits produced medleys or novelty recordings of various types.

Modern remixing had its roots in the dance hall culture of late-1960s/early-1970s Jamaica. The fluid evolution of music that encompassed [ska](#), rocksteady, [reggae](#) and [dub](#) was embraced by local mixing wizards who deconstructed and rebuilt tracks to suit the tastes of their audience. In particular, producers and DJs like Ruddy Redwood, King Tubby and Scientist, and Lee "Scratch" Perry popularized stripped-down [instrumental](#) mixes (which they called "versions") of ska tunes using simple four-track mixing machines. At first they simply dropped the vocal tracks, but soon more sophisticated effects were created, dropping separate instrumental tracks in and out of the mix, isolating and repeating hooks, and adding echo effects.

At the same time, DJs in New York City were performing similar tricks with [disco](#) songs (using loops and tape edits) to get dancers on the floor and keep them there. Tom Moulton invented the 12-inch single vinyl format to allow for punchier sound and greater length. Walter Gibbons remixed the first commercial 12-inch single ("10 Percent", by Double Exposure), and one of the most successful early American remixes, "Doin' the Best That I Can" by Betty Lavette.

In the mid-1970s, the Jamaican and Bronx remix cultures met, energizing both. Key figures included Kool DJ Herc and DJ Grandmaster Flash. Cutting (alternating between duplicate copies of the same record) and scratching (manually moving the vinyl record beneath the turntable needle) became part of the culture, creating what Slate magazine called "real-time, live-action collage". One of the first mainstream successes of this style of remix was the 1983 track "Rockit" by Herbie Hancock, as remixed by Grand Mixer D.ST.

## Remix Services

With the proliferation of 12" singles, many of which were not friendly to beatmix with, DJ's started to laboriously edit songs by splicing reel-to-reel tape, making their own exclusive versions. Beginning in 1977 with Disconet, the remix service was born. These companies gathered DJs and producers together to create monthly subscription only compilation albums containing re-edits, remixes, or medleys to give DJ's an advantage. Over the years the mixes have varied from simple edits, adding a mixable intro and outro to a song, to full fledged digital multi-track remixes that barely resemble the original track. Some remix services have focused on a specific style of music (say hip-hop or rock) or type of remix (such as house mixes of pop hits). As of 2005 there have been over 50 official remix services worldwide with at least as many spinoffs, although most of these companies (including Disconet) have long since folded due to financial or legal reasons. All remix services are required to get the original record label or artists permission to edit and release a track, but many bootleg services exist that do not (On-USound, Go Girl!, Blank, Select Mix).

As most of these companies required a DJ subscription agreement to buy the records or CD's and each issue is usually limited in quantity from 100 to several thousand, many of these compilations have become sought after collectors items. Once in awhile a remix service version of a song is released commercially by the artist's record label, hence the occasional Ultimix on an CD or CD single, but 99% of remix service mixes are sold only to DJ's on the compilations.

Some of these companies helped launch the careers of well known remixers/producers. Chris Cox (formerly of Thunderpuss) worked for Hot Tracks, Armand Van Helden did mixes for Mega-Mixx and X-Mix, and Ben Liebrand did tons of work for DMC. A few companies have also developed their own commercial record labels to release new tracks. It should also be noted that the UK based DMC remix service probably has the most members in the world, with offices in nearly every country, and that they sponsor the yearly World DJ Championships as well as releasing many commercial compilations.

Some of the better known remix services (all US based unless stated):

- Ace DJ -- Australia, closed
- Art Of Mix -- closed
- Disconet -- closed
- Discotech -- closed
- DMC (Disco Mix Club) -- UK, 1983 to present
- Future Mix -- closed
- Hot Tracks and spinoffs (Street Tracks, NRG for the 90's, Roadkill, Hot Classics, etc)-- 1982 to present
- M -- closed
- Mixx-It -- closed
- Method Mix -- (Method Mix, Country Rhythm) 2000 to present
- Monster Mix -- closed
- Music Factory Mastermix -- UK, 1985 to present
- Powerhouse -- closed
- Prime Cuts -- closed
- Razormaid and many spinoffs -- 1983 to present
- Remixed Records -- Sweden, mid 80's to present
- Remixmydemo.com -- Online, present
- Rock N Beat -- closed
- Rhythm Stick -- closed
- Turbo Beat -- closed

- Ultimix and spinoffs (Funkymix, Looking Back, Rampage) -- 1985 to present
- X-Mix and spinoffs (X-Mix Urban, Club Classics, etc) -- early 90's to present

## Megamixes

A *megamix* is a remix containing multiple songs, often in rapid succession. They can consist of single artist megamixes (just Madonna songs, etc) or multiple artists. Some may follow a theme as well (Christmas, only songs that have "queen" in the title, only David Morales mixes, etc). Often megamixes are also called *medleys*.

Ultimix is the most well-known for these, producing several megamixes every year based on popular songs of the year ("flashback medleys") as well as some single artists megamixes. The UK based DMC and Music Factory Mastermix remix services also do a lot of megamixes.

Megamixes are also commonly found on commercial releases, sometimes using the same mix previously released to DJ's on a remix service. Duran Duran even created a "megamix" single called "Burning The Ground" using snippets from their own hits for the 1990 greatest-hits album *Decade: Greatest Hits*.

## Pop and dance music

Early pop remixes were fairly simple; in the 1980s, "extended mixes" of songs were released to clubs and commercial outlets on 12-inch vinyl singles. These typically had a duration of 6 to 7 minutes, and often consisted of the original song with 8 or 16 bars of instruments inserted, often after the second chorus; some were as simplistic as two copies of the song stitched end to end. As the cost and availability of new technologies allowed, many of the bands who were involved in their own production (such as Depeche Mode and Duran Duran) experimented with more intricate versions of the extended mix. Madonna began her career writing music for dance clubs and used remixes extensively to propel her career; one of her early boyfriends was noted DJ John Jellybean Benitez, who created several memorable mixes of her work. The Art of Noise took the remix styles to an extreme -- creating new music entirely using samples.

After the rise of dance music in the late 1980s, a new form of remix was popularised, where the vocals would be kept and the instruments would be replaced, often with matching backing in the [house music](#) or [Hi-NRG](#) idiom. The art of the remix gradually evolved, and soon avant-garde artists such as Aphex Twin were creating more experimental remixes of songs, which varied radically from their original sound and yet were not guided by pragmatic considerations such as sales or danceability.

In the 1990s, with the rise of powerful home computers with audio capabilities came the mash-up, an unsolicited, unofficial (and often legally dubious) remix created by editing two or more recordings (often of wildly different songs) together. This method is more difficult to work with, because clean copies of separated tracks such as vocals or individual instruments are usually not available to the public. Some artists (such as Björk and Public Enemy) embraced this trend and outspokenly sanctioned fan remixing of their work; there was once a web site which hosted dozens of unofficial remixes of Björk's songs, all made using only various officially-sanctioned mixes.

Also in the early 1990s, Mariah Carey became one of the first mainstream artists who re-recorded vocals for a remix, and by 1993 most of her major dance and urban remixes had been re-sung, e.g. Dreamlover as remixed by David Morales for the clubs. This trend would be the norm up to the 2000s, as many major artist would contribute new vocals for the different versions of their songs. Carey also spearheaded the norm of including guest appearances on her urban remixes.

## Industrial music

Remixing has become very prevalent in heavily synthesized electronic and experimental music circles. Many of the people who create cutting edge music in such genres as [darkwave](#), [synthpop](#), elektro, and [EBM](#) are solo artists or pairs. They will often use remixers to help them with skills or equipment that they do not have. Artists such as Delobbo and DJ Ram are sought out for their remixing skill and have impressive lists of collaborations, yet no solo albums. It is not uncommon for industrial bands to release albums which have half the songs as remixes. Indeed, there have been popular singles that have been expanded to an entire album of remixes by other well-known artists.

Some industrial groups allow, and oftentimes, encourage their fans to remix their music, notably Nine Inch Nails, whose website contains a list of downloadable songs that can be remixed using Apple Computer's GarageBand software.

# Hip-hop and rap

In addition to dance remixes, many [R&B](#), [pop](#), and [rap](#) artists use remixes and alternate versions of songs with "featured" guest stars, in order to give them new life, or to make them a hit if they're failing.

On January 5, 2002, J To Tha L-O! by Jennifer Lopez became the first remix album to debut at the #1 spot on Billboard's Top 200 albums chart.

## Influential 1990s and 2000s Remix Producers (Remixers)

AMX  
Axwell  
9th Wonder (hip-hop, motown, Jazz)

Pete Rock (primarily in the hiphop genre)  
Roger Sanchez  
Shep Pettibone  
Spen & Karizma  
Stonebridge  
The Trackmasters  
Thunderpuss  
Timbaland  
Victor Calderone

## Examples of Popular Hip-Hop and R&B Remixes

Eric B. & Rakim - Paid in Full - remixed by Coldcut (In the history of Hip-Hop Remix, THE Classic)  
Beyonce - "Naughty Girl" (featuring Lil' Flip)  
Busta Rhymes - "Make It Clap" (featuring Sean Paul)  
Busta Rhymes - "Pass The Courvoisier" (Part II) (featuring P. Diddy and Pharrell)  
Busta rhymes - "Touch It" (featuring Mary J. Blige, Rah Digga, and Missy Elliott)  
Chingy - "Right Thurr" (featuring Trina and Jermaine Dupri)  
Craig Mack- "Flava in ya Ear" (featuring Notorious B.I.G, Rampage, LL Cool J,& Busta Rhymes)  
Destiny's Child - "Bootylicious" (featuring Missy Elliott & Timbaland)  
Destiny's Child - "Survivor" (featuring Da Brat)  
Jennifer Lopez - "Ain't It Funny" (featuring Ja Rule)  
Jennifer Lopez - "Baby I Luv U" (featuring R. Kelly)  
Jennifer Lopez - "I'm Real" (featuring Ja Rule)  
Jessica Simpson - "Irresistible" (featuring Lil' Bow Wow)  
Joe - "Stutter" (featuring Mystikal)  
Lil' Jon & the Eastside Boyz - "Get Low" (featuring Busta Rhymes & Elephant Man)  
Lil Kim - "Not Tonight (Ladies Night)" (featuring Angie Martinez, Da Brat, Left Eye, and Missy Elliott)  
Mariah Carey - "Fantasy" (featuring ODB)  
Mariah Carey - "Heartbreaker" (featuring Da Brat & Missy Elliott)  
Mariah Carey - "Honey" (featuring P. Diddy, Mase, & The Lox)  
Mariah Carey - "Thank God I Found You/Make It Last Forever" (featuring Joe & Nas)  
Mariah Carey - "We Belong Together" (featuring Jadakiss & Styles P)  
Michael Jackson - "Butterflies" (featuring Eve)  
Missy Elliott- "Get Ur Freak On" (featuring Nelly Furtado)  
Notorious B.I.G. - "One More Chance" (featuring P. Diddy, Total, Aaliyah, Mary J. Blige, Faith Evans)  
R. Kelly - "Fiesta" (featuring Jay-Z)

Beyonce's "Naughty Girl" is the newest on the list. As it's currently receiving heavy radio play, urban stations favor the remix while pop and dance stations favor the original, Lil' Flip-less version. The rest of the songs received more radio play in their remixed form than in the original. The most obvious example of this is in "I'm Real" and "Ain't It Funny"; both songs only managed very minor success, and only on mainstream radio stations, in their original forms. Once the remixes were released, the songs both fared extremely well not only on mainstream radio but also on rhythmic and urban contemporary stations. Each song became a multiple-week number one at radio, based almost entirely on the strength of its remix. The videos for the original versions of "I'm Real" and "Ain't It Funny" each briefly registered on MTV and VH1 in America. But the remix videos brought them into heavy rotation on MTV, as well as major play on MTV2, BET, and MTV Jams.

There is no music video for the original versions of "Fiesta", "Not Tonight", "One More Chance", or "Pass The Courvoissier". On the other hand, no video exists for the remix versions of "Baby I Luv U" or "Naughty Girl". No video exists for "Butterflies" at all. However, all other listed songs have videos for both their original and remix versions.

## Examples of Popular Dance Remixes

Amber - "Sexual (Lidadi)" Thunderpuss 2000 Club Mix]  
Deborah Cox - "I Never Knew"  
Deborah Cox - "Nobody's Supposed To Be Here"  
Deborah Cox - "It's Over Now"  
Deborah Cox - "Something Happened On The Way To Heaven"  
Deborah Cox - "Things Just Ain't The Same"  
Dalida - "Salma Ya Salama"  
DNA - "Tom's Diner" (featuring Suzanne Vega)  
Enrique Iglesias - "Hero"  
Everything but the Girl - "Missing"  
Jennifer Lopez - "Waiting For Tonight" [ Hex Hector Remix]  
Madonna - "Beautiful Stranger" [ Victor Calderone Club Mix]  
Madonna - "Deeper & Deeper" [ David Morales Klub Mix]\*  
Madonna - "Don't Cry For Me Argentina" [Miami Mix]  
Madonna - "Express Yourself" [ Shep Pettibone Non-stop Express Mix]\*\*Madonna -  
"Frozen" [ Extended Club Mix]  
Madonna - "Holiday" [ Stardust Music Sounds Better With Holiday Mix]  
Madonna - "Hung Up" [ Extended Vocal Mix Mix]  
Madonna - "Like A Prayer" [ 12" Dance Mix AKA Shep Pettibone's Club Mix Mix]  
Madonna - "Music" [ HQ2 Club Mix]  
Madonna - "Ray Of Light" [ Calderone Club Mix]  
Madonna - "Secret" [ Junior Vasquez Luscious Club Mix]  
Madonna - "What It Feels Like For A Girl" [ Above & Beyond Mix]  
Michael Jackson - "HIStory" [Tony Moran HIStory Lesson Mix]  
Tania - "Stranger In My House" [ Thunderpuss Mix]  
Toni Braxton - "Unbreak My Heart" (Hex-Soul Anthem)  
Whitney Houston - "It's Not Right, But It's OK" [ Thunderpuss Mix]  
Whitney Houston - "My Love Is Your Love" [ Jonathan Peters Mix]

Most of the above hip-hop and dance remixes received far more radio airplay than their original versions did. All of the rap remixes that have music videos outperformed the original videos (if they existed at all) on MTV, MTV2, and BET. Several of the dance remixes that had videos also performed as well if not better than their original versions, especially on MTV2, which has had dance-themed programs and video blocks. The video remix for "Missing" was the one most often seen, even on MTV and VH1, since it was the version most often heard on the radio. The remixes of "Hero" and "Waiting For Tonight" got substantial play on MTV2's dance-themed programs, whereas their original videos did not receive much play from the channel. Even regular MTV gave both remix videos about equal attention as their originals, which were more successful at radio. VH1 stuck with the original, pop versions of both. The "Southside" and "What It Feels Like For A Girl" videos were released only in remixed form. On the other hand, "Don't Cry For Me Argentina" exist as video only in its slower, original form, even despite the fact that the song's dance remix far outperformed its originals on American radio. "I Never Knew" and "Something Happened On The Way To Heaven" do not have music videos in any version. "Tom's Diner" has videos in both versions, but neither received substantial play.

Most of the above hip-hop remixes arose either from the need for a poppy R&B singer to add more of an urban, rap edge to one of their slower R&B songs, or from the need for a rapper to gain more pop appeal by getting an R&B singer to sing some lines here and there. When a

song by a solo artist does not take off, the hip-hop crowd understands that the majority of successful hip-hop songs include a combination of rapping and singing, usually being done by at least two different artists. So, when a song by a solo artist, whether a popular rapper or a singer, fails to catch on, the remix is usually relied on to give the song a second chance.

In the case of the above dance remixes, many are slow ballads and R&B songs that were remixed by techno producers and DJ's in order to give the song appeal to the club scene and to rhythmic radio. Up-tempo, dance-oriented songs tend to perform better than slow songs on mainstream American radio as well.

So, whether a slower R&B song is remixed as a dance song or a hip-hop song (or, as in the case of Mariah Carey's "I Still Believe", both), it usually increases the song's chances for success on not just one but usually on multiple radio formats and with multiple audiences.

Madonna Remains The Most Successful Dance Artist Of All Time with an unprecedented 36 (and going full-speed ahead for more) #1 Dance hits which is more than double than the runner up (Janet Jackson) who has 16.

## Broader context

In a larger sense, remixing can be seen as a major conceptual leap: making music on a meta-structural level, drawing together and making sense of a much larger body of information by threading a continuous narrative through it. This is what begins to emerge very early in the hip-hop tradition in works such as Grandmaster Flash's pioneering mix recording *Adventures on the Wheels of Steel*. The importance of this cannot be overstated: in an era of information overload, the art of remixing and sampling as practiced by hip-hop DJs and producers points to ways of working with information on higher levels of organization, pulling together the efforts of others into a multilayered multireferential whole which is much more than the sum of its parts.

A remix may also refer to a non-linear re-interpretation of a given work or media other than audio. Such as a hybridizing process combining fragments of various works. The process of combining and re-contextualizing will often produce unique results independent of the intentions and vision of the original designer/artist. Thus the concept of a remix can be applied to visual or video arts, and even things farther afield. The disjointed novel *House of Leaves* has been compared by some to the remix concept.

In recent years the concept of the remix has been applied analogously to other media and products. In 2000, the British Channel 4 television program *Jaaaaam* was produced as a remix of the sketches from the comedy show *Jam*. In 2003 the Coca-Cola Corporation released a new version of their soft drink Sprite with tropical flavors under the name *Sprite Remix*. In 2004, the O'Reilly Emerging Technology Conference took *Remix* as its theme, and used it to provide context for the software phenomenon now more widely known as mashups.

## **Underground remixers**

"Underground remixers" are a group of people born mostly in the information age; as opposed to an officially sanctioned remix done with the permission of artist/label by a professional, underground remixers do less-professional mixes that are distributed freely on the internet. For example doing a search in most filesharing programs for DJ Yeager (a popular underground remixer), or DJ River, will return dozens to hundreds of remixes of popular songs.

## Opinion

Opinion of remixes vary. Some people support these songs, for clubbing music and [dance music](#), making them often faster and longer, thus more fun to dance to. Others oppose them, saying it removes the spirit of the original that the artist worked so hard to achieve.

# Remix album

A **remix album** is an [album](#) consisting mostly of [remixes](#) or re-recorded versions of a music artists' earlier released material.

Remix albums have been around since the early 1980's and the earliest one to appear is often noted as Soft Cell's 1982 release, Non-Stop Ecstatic Dancing, (containing the track "A Man Could Get Lost" which is notable as one of the precursors to house music). A month after the Soft Cell album, The Human League's, Love And Dancing was released, and just under a year later Imagination's Nightdubbing was released.

The format was later popularised by the Pet Shop Boys' 1986 release, Disco, and then the band-wagon was jumped on further by popular artists such as Madonna with her 1987 EP, You Can Dance and in 1990 by Paula Abdul's Shut Up And Dance.

Since the format was popularised in the late 80s and early 90s, remix albums have become a way of cashing-in on an artist's popularity, taking advantage of an artists existing fanbase, and often by collecting already released remixes (available on another format such as [singles](#) and rushing out a remix album to capitalise on the popularity of a performer, during a lull in their album releases, whilst touring, or to further prolong/exploit the popularity of a successful album.

Although they had existed for years, remix albums still eluded a sense of mainstream acceptance. That would all change in recent years with releases from acts such as Destiny's Child, Mariah Carey, Jermaine Dupri, P. Diddy, Jessica Simpson, Britney Spears, and Jennifer Lopez, whose 2002 remix album J to tha L-O!: The Remixes was the first remix album to ever debut at Number One on the Billboard 200 Albums Chart, have all taken advantage of the format.

# Renaissance music

## History of European art music

|                     |               |
|---------------------|---------------|
| <u>Medieval</u>     | (476 – 1400)  |
| <b>Renaissance</b>  | (1400 – 1600) |
| <u>Baroque</u>      | (1600 – 1760) |
| <u>Classical</u>    | (1730 – 1820) |
| <u>Romantic</u>     | (1815 – 1910) |
| <u>20th century</u> | (1900 – 2000) |

## Contemporary classical music

**Renaissance music** is European classical music written during the Renaissance, approximately 1400 to 1600. Defining the beginning of the era is difficult, given the lack of abrupt shifts in musical thinking during the 15th century. Additionally, the process by which music acquired "Renaissance" characteristics was a gradual one, but 1400 is used here.

# Overview

## Style and trends

The increasing reliance on the interval of the third as a consonance is one of the most pronounced features of early Renaissance European art music (in the Middle Ages, thirds had been considered dissonances: see [interval](#)). Polyphony, in use since the 12th century, became increasingly elaborate with highly independent voices throughout the 14th century; the beginning of the 15th century showed simplification, with the voices often striving for smoothness. This was possible because of a greatly increased vocal range in music—in the Middle Ages, the narrow range made necessary frequent crossing of parts, thus requiring a greater contrast between them.

The modal (as opposed to tonal) characteristics of Renaissance music began to break down towards the end of the period with the increased use of root motions of fifths. This has since developed into one of the defining characteristics of tonality.

## Genres

Principal liturgical forms which endured throughout the entire Renaissance period were masses and motets, with some other developments towards the end, especially as composers of sacred music began to adopt secular forms (such as the [madrigal](#)) for their own designs.

Common sacred genres were the [mass](#), the [motet](#), the [madrigale spirituale](#), and the [laude](#).

During the period, secular music had an increasingly wide distribution, with a wide variety of forms, but one must be cautious about assuming an explosion in variety: since printing made music more widely available, much more has survived from this era than from the preceding Medieval era, and probably a rich store of popular music of the late Middle Ages is irretrievably lost. Secular music included songs for one or many voices, forms such as the [frottola](#), chanson and madrigal.

Secular vocal genres included the [madrigal](#), the [frottola](#), the caccia, the [chanson](#) in several forms (rondeau, [virelai](#), bergerette, [ballade](#), musique mesurée), the [canzonetta](#), the [villancico](#), the [villanella](#), the villotta, and the [lute song](#).

Purely instrumental music included consort music for recorder or viol and other instruments, and dances for various ensembles. Common genres were the toccata, the prelude, the ricercar, the [canzona](#), and intabulation (*intavolatura*, *intabulierung*). Instrumental ensembles for dances might play a basse danse (or *bassedanza*, a pavane, a galliard, an allemande, or a courante.

Towards the end of the period, the early dramatic precursors of opera such as monody, the [madrigal comedy](#), and the [intermedio](#) are seen.

## Theory and notation

According to Margaret Bent (1998), "Renaissance notation is under-prescriptive by our standards; when translated into modern form it acquires a prescriptive weight that overspecifies and distorts its original openness."

Renaissance compositions were notated only in individual parts; scores were extremely rare, and barlines were not used. [Note values](#) were generally larger than are in use today; the primary unit of beat was the semibreve, or whole note. As had been the case since the [Ars Nova](#) (see [Medieval music](#)), there could be either two or three of these for each breve (a

double-whole note), which may be looked on as equivalent to the modern "measure," though it was itself a note-value and a measure is not. The situation can be considered this way: it is the same as the rule by which in modern music a quarter-note may equal either two eighth-notes or three, which would be written as a "triplet." By the same reckoning, there could so two or three of the next-smaller note, the "minim," (equivalent to the modern "half note") to each semi-breve. These different permutations were called "perfect/imperfect tempus" at the level of the breve-semibreve relationship, "perfect/imperfect prolation" at the level of the semibreve-minim, and existed in all possible combinations with each other. Three-to-one was called "perfect," and two-to-one "imperfect." Rules existed also whereby single notes could be halved or doubled in value ("imperfected" or "altered," respectively) when preceded or followed by other certain notes. Notes with black noteheads (such as quarter notes) occurred less often. This development of white mensural notation may be a result of the increased use of paper (rather than vellum), as the weaker paper was less able to withstand the scratching required to fill in solid noteheads; notation of previous times, written on vellum, had been black. Other colors, and later, filled-in notes, were used routinely as well, mainly to enforce the aforementioned imperfections or alterations and to call for other temporary rhythmical changes.

Accidentals were not always specified, somewhat as in certain fingering notations (tablatures) today. However, Renaissance musicians would have been highly trained in dyadic counterpoint and thus possessed this and other information necessary to read a score, "what modern notation requires [accidentals] would then have been perfectly apparent without notation to a singer versed in counterpoint." See [musica ficta](#). A singer would interpret his or her part by figuring cadential formulas with other parts in mind, and when singing together musicians would avoid parallel octaves and fifths or alter their cadential parts in light of decisions by other musicians (Bent, 1998).

Interestingly, it is through contemporary tablatures for various plucked instruments that we have gained much information about what accidentals were performed by the original practitioners.

For information on specific theorists, see Johannes Tinctoris, Franchinus Gaffurius, Heinrich Glarean, Pietro Aron, Nicola Vicentino, Tomás de Santa María, Gioseffo Zarlino, Vicente Lusitano, Vincenzo Galilei, Giovanni Artusi, Johannes Nucius, and Pietro Cerone.

## Early Renaissance music (1400 - 1467)

The [Burgundian School](#) of composers, led by Guillaume Dufay, demonstrated characteristics of both the late Medieval era and the early Renaissance (see [Medieval music](#)). This group gradually dropped the late Medieval period's complex devices of isorhythm and extreme syncopation, resulting in a more limpid and flowing style. What their music "lost" in rhythmic complexity, however, it gained in rhythmic vitality, as a "drive to the cadence" became a prominent feature around mid-century.

## Middle Renaissance music (1467 - 1534)

Towards the end of the 15th century, polyphonic sacred music (as exemplified in the masses of Johannes Ockeghem and Jacob Obrecht) had once again become more complex, in a manner that can perhaps be seen as correlating to the stunning detail in the painting at the time. Ockeghem, particularly, was fond of canon, both contrapuntal and mensural. He even composed a mass in which all the parts are derived canonically from one musical line.

It was in the opening decades of the next century that music felt in a tactus (think of the modern time signature) of two semibreves-to-a-breve began to be as common as that with three semibreves-to-a-breve, as had prevailed prior to that time.

In the early 16th century, there is another trend towards simplification, as can be seen to some degree in the work of Josquin des Prez and his contemporaries in the Franco-Flemish school, then later in that of G. P. Palestrina, who was partially reacting to the strictures of the Council of Trent, which discouraged excessively complex polyphony as inhibiting understanding the text. Early 16th-century Franco-Flemmings moved away from the complex systems of canonic and other mensural play of Ockeghem's generation, tending toward points of imitation and duet or trio sections within an overall texture that grew to five and six voices. They also began, even before the Tridentine reforms, to insert ever-lengthening passages of homophony, to underline important text or points of articulation. Palestrina, on the other hand, came to cultivate a freely flowing style of counterpoint in a thick, rich texture within which consonance followed dissonance on a nearly beat-by-beat basis, and suspensions ruled the day (see [counterpoint](#)). By now, tactus was generally two semibreves per breve with three per breve used for special effects and climactic sections; this was a nearly exact reversal of the prevailing technique a century before.

## Late Renaissance music (1534 - 1600)

In Venice, from about 1534 until around 1600, an impressive polychoral style developed, which gave Europe some of the grandest, most sonorous music composed up until that time, with multiple choirs of singers, brass and strings in different spatial locations in the Basilica San Marco di Venezia (see [Venetian School](#)). These multiple revolutions spread over Europe in the next several decades, beginning in Germany and then moving to Spain, France and England somewhat later, demarcating the beginning of what we now know as the [Baroque](#) musical era.

The [Roman School](#) was a group of composers of predominantly church music, in Rome, spanning the late Renaissance into early Baroque eras. Many of the composers had a direct connection to the Vatican and the papal chapel, though they worked at several churches; stylistically they are often contrasted with the Venetian School of composers, a concurrent movement which was much more progressive. By far the most famous composer of the Roman School is Giovanni Pierluigi da Palestrina, whose name has been associated for four hundred years with smooth, clear, polyphonic perfection.

The brief but intense flowering of the musical madrigal in England, mostly from 1588 to 1627, along with the composers who produced them, is known as the [English Madrigal School](#). The English madrigals were a cappella, predominantly light in style, and generally began as either copies or direct translations of Italian models. Most were for three to six voices.

[Musica reservata](#) is a term referring to either a style or a performance practice in a cappella vocal music of the latter, mainly in Italy and southern Germany, involving refinement, exclusivity, and intense emotional expression of sung text.

In addition, many composers observed a division in their own works between a [prima pratica](#) (music in the Renaissance polyphonic style) and a [seconda pratica](#) (music in the new style) during the first part of the 17th century.

## Mannerism

In the late 16th century, as the Renaissance era closes, an extremely manneristic style develops. In secular music, especially in the madrigal, there was a trend towards complexity and even extreme chromaticism (as exemplified in madrigals of Luzzaschi, Marenzio, and Gesualdo). The term "mannerism" derives from art history.

## Transition to the Baroque

Beginning in Florence, there was an attempt to revive the dramatic and musical forms of Ancient Greece, through the means of monody, a form of declaimed music over a simple accompaniment; a more extreme contrast with the preceding polyphonic style would be hard to find; this was also, at least at the outset, a secular trend. These musicians were known as the Florentine Camerata.

We have already noted some of the musical developments that helped to usher in the Baroque, but for further explanation of this transition, see polychoral, [concertato](#), monody, [madrigal](#), and [opera](#), as well as the works given under "Sources and further reading."

# Rhapsode

In classical antiquity, a **rhapsode** was a professional reciter of poetry, especially the epics of Homer, but also the wisdom-verse of Hesiod and the satires of Archilochus, among others. Plato's dialogue *Ion*, wherein Socrates confronts a star rhapsode, remains our richest source of information on these artists.

Often, rhapsodes are depicted in Greek art, wearing their signature cloaks. Such a cloak is also characteristic of travellers in general, implying that rhapsodes moved from town to town singing their stories.

The recitation of epic poetry was called in historical times **rhapsody**. The word is post-Homeric, but was known to Pindar, who gives two different explanations of it, "singer of stitched verse", and "singer with the wand". Of these the first is etymologically correct (except that it should rather be "stitcher of verse"); the second was suggested by the fact, for which there is early evidence, that the reciter was accustomed to hold a wand in his hand, perhaps, like the sceptre in the Homeric assembly, as a symbol of the right to a hearing.

The first notice of rhapsody meets us at Sicyon, in the reign of Cleisthenes (600-560 BC), who put down the rhapsodists on account of the poems of Homer, because they are all about Argos and the Argives (*Hdt.* 5.67). This description applies very well to the *Iliad*, in which Argos and Argives occur on almost every page. It may have suited the *Thebaid* still better. The incident shows that the poems of the Ionic Homer had gained in the 6th century BC, and in the Done parts of the Peloponnesus, the ascendancy, the national importance and the almost canonical character which they ever afterwards retained.

At Athens, there was a law that the Homeric poems should be recited on every occasion of the Panathenaea. This law is appealed to as an especial glory of Athens by the orator Lycurgus (*Lcocr.* 102). Perhaps therefore the custom of public recitation was exceptional, and unfortunately we do not know when or by whom it was introduced. The Platonic dialogue *Hipparchus* attributes it to Hipparchus, son of Peisistratus. This, however, is part of the historical romance of *Conipare* the branch of myrtle at an Athenian feast (*Aristoph.*, *Nub.*, 1364). The *Iliad* was also recited at the festival of the Brauronia, at Brauron in Attica (*Hesych.* s.v. Brauronia) The author makes (perhaps wilfully) all the mistakes about the family of Peisistratus which Thucydides notices in a well-known passage (6.54-59). In one point, however, the writers testimony is valuable. He tells us that the law required the rhapsodists to recite taking each other up in order, as they still do. This recurs in a different form in the statement of Diogenes Laertius (1.2.57) that Solon made a law that the poems should be recited with prompting. The question as between Solon and Hipparchus cannot be settled; but it is at least clear that a due order of recitation was secured by the presence of a person charged to give the rhapsodists their cue. It was necessary, of course, to divide the poem to be recited into parts, and to compel each contending rhapsodist to take the part assigned to him. Otherwise they would have chosen favorite or show passages.

The practice of poets or rhapsodists contending for the prize at the great religious festivals is of considerable antiquity. It is brought vividly before us in the Hymn to Apollo (see the passage mentioned above), and in two Hymns to Aphrodite (v. and ix.). The latter of these may evidently be taken to belong to Salamis in Cyprus and the festival of the Cyprian Aphrodite, in the same way that the Hymn to Apollo belongs to Delos and the Delian gathering. The earliest trace of such contests is to be found in the story of Thamyris, the Thracian singer, who boasted that he could conquer even the Muses in song.

Much has been made in this part of the subject of a family or clan of Homeridae in the island of Chios. On the one hand, it seemed to follow from the existence of such a family that Homer was a mere eponymus, or mythical ancestor; on the other hand, it became easy to imagine the Homeric poems handed down orally in a family whose hereditary occupation it was to recite them, possibly to add new episodes from time to time, or to combine their materials in new ways, as their poetical gifts permitted. But, although there is no reason to doubt the existence of a family of Homeridae, it is far from certain that they had anything to do with Homeric poetry. The

word occurs first in Pindar (Nem. 2. 2), who applies it to the rhapsodists. On this a scholiast says that the name Homeridae denoted originally descendants of Homer, who sang his poems in succession, but afterwards was applied to rhapsodists who did not claim descent from him. He adds that there was a famous rhapsodist, Cynaethus of Chios, who was said to be the author of the Hymn to Apollo, and to have first recited Homer at Syracuse about the 69th Olympiad. Nothing here connects the Homeridae with Chios. The statement of the scholiast is evidently a mere inference from the patronymic form of the word. If it proves anything, it proves that Cynactus, who was a Chian and a rhapsodist, made no claim to Homeric descent. On the other hand our knowledge of Chian Homeridae comes chiefly from the lexicon of Harpocration, where we are told that Acusilaus and Hellanicus said that they were so called from the poet; whereas Seleucus pronounced this to be an error. Strabo also says that the Chians put forward the Homeridae as an argument in support of their claim to Homer. These Homeridae, then, belonged to Chios, but there is no indication of their being rhapsodists. On the contrary, Plato and other Attic writers use the word to include interpreters and admirers, in short, the whole spiritual kindred of Homer. And although we bear of descendants of Creophylus as in possession of the Homeric poems, there is no similar story about descendants of Homer himself. Such is the evidence on which so many inferences are based.

The result of the notices now collected is to show that the early history of epic recitation consists of (1) passages in the Homeric hymns showing that poets contended for the prize at the great festivals, (2) the passing mention in Herodotus of rhapsodists at Sicyon, and (3) a law at Athens, of unknown date, regulating the recitation at the Panathenaea. Let us now compare these data with the account given in the Homeric poems. The word rhapsode does not yet exist; we hear only of the singer, who does not carry a wand of laurel-branch, but the *lyre*, with which he accompanies his song. In the Iliad even the epic singer is not met with. It is Achilles himself who sings the stories of heroes in his tent, and Patroclus is waiting (*respondere paratus*), to take up the song in his turn (Il. 9.191). Again we do not hear of poetical contests (except in the story of Thamyris already mentioned) or of recitation of epic poetry at festivals. The Odyssey gives us pictures of two great houses, and each has its singer. The song is on a subject taken from the Trojan war, at some point chosen by the singer himself, or by his hearers. Phemius pleases the suitors by singing of the calamitous return of the Greeks; Demodocus sings of a quarrel between Ulysses and Achilles, and afterwards of the wooden horse and the capture of Troy.

It may be granted that the author of the Odyssey can hardly have been just such a singer as he himself describes. The songs of Phemius and Demodocus are too short, and have too much the character of improvisations. Nor is it necessary to suppose that epic poetry, at the time to which the picture in the Odyssey belongs, was confined to the one type represented. Yet in several respects the conditions under which the singer finds himself in the house of a chieftain like Odysseus or Alcinous are more in harmony with the character of Homeric poetry than those of the later rhapsodic contests. The subdivision of a poem like the Iliad or Odyssey among different and necessarily unequal performers must have been injurious to the effect. The highly theatrical manner of recitation which was fostered by the spirit of competition, and by the example of the stage, cannot have done justice to the even movement of the epic style. It is not certain indeed that the practice of reciting a long poem by the agency of several competitors was ancient, or that it prevailed elsewhere than at Athens; but as rhapsodists were numerous, and popular favor throughout Greece became more and more confined to one or two great works, it must have become almost a necessity. That it was the mode of recitation contemplated by the author of the Iliad or Odyssey it is impossible to believe.

The difference made by substituting the wand or branch of laurel for the lyre of the Homeric singer is a slighter one, though not without significance. The recitation of the Hesiodic poems was from the first unaccompanied by the lyre, i.e. they were confessedly said, not sung; and it was natural that the example should be extended to Homer. For it is difficult to believe that the Homeric poems were ever sung in the strict sense of the word. We can only suppose that the lyre in the hands of the epic poet or reciter was in reality a piece of convention, a survival from the stage in which narrative poetry had a lyrical character. Probably the poets of the Homeric school, that which dealt with war and adventure, were the genuine descendants of minstrels whose lays or ballads were the amusement of the feasts in an earlier heroic age; whereas the

Hesiodic compositions were non-lyrical from the first, and were only in verse because that was the universal form of literature.

It seems, then, that if we imagine Homer as a singer in a royal house of the Homeric age, but with more freedom regarding the limits of his subject, and a more tranquil audience than is allowed him in the rapid movement of the *Odyssey*, we shall probably not be far from the truth.

# Rhythm

**Rhythm** (Greek ῥῆμα, ῥῆμα = flow) is the variation of the accentuation of sounds or other events over time. "Rhythm involves patterns of duration that are phenomenally present in the music" with duration perceived by interonset interval (London 2004, p.4). When governed by rule, it is called [meter](#). It is inherent in any time-dependent medium, but it is most associated with [music](#), [dance](#), and the majority of poetry. The study of rhythm, stress, and [pitch](#) in speech is called prosody; it is a topic in linguistics. All musicians, instrumentalists and vocalists, work with rhythm, but it is often considered the primary domain of drummers and percussionists.

In Western music, rhythms are usually arranged with respect to a time signature, partially signifying a meter. The speed of the underlying pulse, called the beat, is the tempo. The tempo is usually measured in 'beats per minute' (bpm); 60 bpm means a speed of one beat per second. The length of the meter, or metric unit (usually corresponding with measure length), is usually grouped into either two or three beats, being called duple meter and triple meter, respectively. If each beat is grouped in two, it is simple meter, if in three compound meter.

Some [genres of music](#) make different use of rhythm than others. Most Western music is based on divisive rhythm, while non-Western music uses more additive rhythm. African music makes heavy use of polyrhythms, and Indian music uses complex cycles such as 7 and 13, while Balinese music often uses complex interlocking rhythms. By comparison, a lot of Western classical music is fairly rhythmically simple; it stays in a simple meter such as 4/4 or 3/4 and makes little use of syncopation. In the 20th century, composers like Igor Stravinsky, Philip Glass, and Steve Reich wrote more rhythmically complex music using odd meters, and techniques such as phasing and additive rhythm. At the same time, modernists such as Olivier Messiaen and his pupils used increased complexity to disrupt the sense of a regular beat, leading eventually to the widespread use of irrational rhythms in New Complexity. This use may be explained by a comment of John Cage's where he notes that regular rhythms cause sounds to be heard as a group rather than individually; the irregular rhythms highlight the rapidly changing pitch relationships that would otherwise be subsumed into irrelevant rhythmic groupings (Sandow 2004, p.257). LaMonte Young also wrote music in which the sense of a regular beat is absent because the music consists only of long sustained tones (drones). In the 1930s, Henry Cowell wrote music involving multiple simultaneous periodic rhythms and collaborated with Léon Theremin to invent the Rhythmicon, the first electronic [rhythm machine](#), in order to perform them.

Clave is a common underlying rhythm in African, Cuban music, and Brazilian music.

A [rhythm section](#) generally consists of [percussion instruments](#), and possibly chordal instruments (e.g., [guitar](#), [banjo](#)) and [keyboard instruments](#), such as [piano](#) (which, by the way, may be classified as any of these three types of instruments).

"Rhythm," wrote Tom Robbins in *Another Roadside Attraction*, "is everything pertaining to the duration of energy."

Narmour (1980, p.147-53) describes three categories of prosodic rules which create rhythmic successions which are additive (same duration repeated), cumulative (short-long), or countercumulative (long-short). Cumulation is associated with closure or relaxation, countercumulation with openness or tension, while additive rhythms are open-ended and repetitive. Richard Middleton points out this method cannot account for syncopation and suggests the concept of transformation.

A rhythmic unit is a durational pattern which occupies a period of time equivalent to a pulse or pulses on an underlying metric level, as opposed to a rhythmic gesture which does not (DeLone et. al. (Eds.), 1975, chap. 3).

In recent years, music theorists have attempted to explain connections between rhythm, meter, and the broad structure and organization of sound events in music. Some have suggested that rhythm (and its essential relationship to the temporal aspect of sound) may in fact be the most fundamental aspect of music. Hasty (1997, p. 3), for example, notes that "Among the attributes of rhythm we might include continuity or flow, articulation, regularity,

proportion, repetition, pattern, alluring form or shape, expressive gesture, animation, and motion (or at least the semblance of motion). Indeed, so intimate is the connection of the rhythmic and the musical, we could perhaps most concisely and ecumenically define music as the 'rhythmization' of sound."

Also in modern times, a more contemporary definition for "Rhythm" purports one whose got "[soul](#)".

# R&B

**Rhythm and blues** (or **R&B** or even **Runub**) was coined as a musical marketing term introduced in the United States in the late 1940s by Jerry Wexler at Billboard magazine, used to designate upbeat [popular music](#) performed by African American artists that combined [jazz](#) and [blues](#). It replaced the term [race music](#), which was deemed offensive, and was initially used to identify the style of music that later developed into [rock and roll](#). By the 1970s, rhythm and blues was being used as a blanket term to describe [soul](#) and [funk](#) as well. Today, the acronym "R&B" is almost always used instead of "rhythm and blues", and defines the modern version of the [soul](#) and [funk](#) influenced African-American pop music that originated with the demise of [disco](#) in 1980.

## Original rhythm and blues

In its first manifestation, rhythm and blues was the predecessor to [rockabilly](#), and rock and roll. It was strongly influenced by jazz and [jump music](#) as well as black [gospel music](#), and influenced jazz in return ([hard bop](#) was the product of the influence of rhythm and blues, [blues](#), and [gospel music](#) on [bebop](#)) and African tribal beats.

The first rock and roll consisted of rhythm and blues songs like "Rocket 88" and "Shake, Rattle and Roll" making an appearance on the popular music charts as well as the R&B charts. "Whole Lotta Shakin' Goin' On", the first hit by Jerry Lee Lewis was an R&B cover song that made #1 on pop, R&B and country and western charts.

Musicians paid little attention to the distinction between jazz and rhythm and blues, and frequently recorded in both genres. Numerous swing bands (for example, Jay McShann's, Tiny Bradshaw's, and Johnny Otis's) also recorded rhythm and blues. Count Basie had a weekly live rhythm and blues broadcast from Harlem. Even a bebop icon like arranger Tadd Dameron also arranged for Bull Moose Jackson and spent two years as Jackson's pianist after establishing himself in bebop. Most of the studio musicians in R&B were jazz musicians. And it worked in the other direction as well. Many of the musicians on Charlie Mingus's breakthrough jazz recordings were R&B veterans. Lionel Hampton's big band of the early 1940s, which produced the classic recording "Flying Home" (tenor sax solo by Illinois Jacquet) was the breeding ground for many of the bebop legends of the 1950s. Eddie "Cleanhead" Vinson was a one-man fusion, a bebop saxophonist and a blues shouter.

The 1950s was the premier decade for classic rhythm and blues. Overlapping with other genres such as jazz and rock and roll, R&B also developed regional variations. A strong, distinct style straddling the border with blues came out of New Orleans and was based on a rolling piano style first made famous by Professor Longhair. In the late 1950s, Fats Domino hit the national charts with "Blueberry Hill" and "Ain't That a Shame". Other artists who popularized this Louisiana flavor of R&B included Clarence "Frogman" Henry, Frankie Ford, Irma Thomas, The Neville Brothers, and Dr. John.

# Contemporary R&B

**Stylistic origins:** [Funk](#), [soul music](#), and [pop music](#)  
**Cultural origins:** Early 1980s US  
**Typical instruments:** [synthesizers](#) - [Keyboard](#) - [Drum machine](#)  
**Mainstream popularity:** Moderate since 1980s around the world, especially in recent years in the United States

Quiet Storm

[New Jack Swing](#) - [Hip-hop soul](#) - [Neo soul](#) - 2Step

**Stylistic origins:** Upbeat [blues](#), [hard bop](#), and [gospel](#)  
**Cultural origins:** 1940s US  
**Typical instruments:** [Guitar](#) - [Bass](#) - [Saxophone](#) - [Drum kit](#) - [Keyboard](#)  
**Mainstream popularity:** Significant from 1940s to 1960s  
**Derivative forms:** [Rock and Roll](#) - [Soul music](#) - [Funk](#)

Doo wop

It was not until the 1980s that the term "R&B" regained ordinary usage. During that time, the soul music of James Brown and Sly & the Family Stone had adapted elements from [psychedelic music](#) and other styles through the work of performers like George Clinton. Funk also became a major part of [disco](#), a kind of dance pop [electronic music](#). By the early 1980s, however, funk and soul had become sultry and sexually-charged with the work of Prince and others. At that time, the modern style of *contemporary R&B* came to be a major part of American popular music.

R&B today defines a style of African-American music, originating after the demise of [disco](#) in 1980, that combines elements of [soul music](#), [funk music](#), [pop music](#), and (after 1986) [hip hop](#) in the form known as *contemporary R&B*. In this context only the abbreviation "R&B" is used, not the full expression.

Sometimes referred to as "urban contemporary" (the name of the radio format that plays hip hop and R&B music) or "urban pop", contemporary R&B is distinguished by a slick, electronic record production style, [drum machine](#)-backed rhythms, and a smooth, lush style of vocal arrangement. Uses of hip hop inspired beats are typical, although the roughness and grit inherent in hip hop are usually reduced and smoothed out.

## History

With the transition from soul to R&B in the early to mid 1980s, solo singer Luther Vandross and new stars like Prince (Purple Rain) and Michael Jackson (Off the Wall, Thriller) took over, and dominated the primary schools throughout the 1980s. Jackson's *Thriller*, which repopularized black music with pop audiences after a post-disco backlash among United States mainstream audiences, is the best-selling album of all time worldwide.

Female R&B singers like Whitney Houston and Janet Jackson gained great popularity during the last half of the decade; and Tina Turner, then in her 50s, came back with a series of hits with crossover appeal. Also popular was New Edition, a group of teenagers who served as the prototype for later [boy bands](#) such as the New Kids on the Block, The Backstreet Boys, and others.

In 1986, Teddy Riley began producing R&B recordings that included influences from the increasingly popular genre of hip hop music. This combination of R&B style and hip-hop rhythms was termed [new jack swing](#), and artists such as Keith Sweat, Guy, Jodeci, and BellBivDeVoe (featuring former members of New Edition). Another popular, but short-lived group, with more pronounced R&B roots was Levert, whose lead singer, Gerald Levert, was the son of O'Jays lead vocalist Eddie Levert.

In the early 1990s, R&B group Boyz II Men repopularized classic-soul inspired vocal harmony, and several similar groups (among them Shai, Soul for Real, and Dru Hill) would follow in their footsteps. Boyz II Men, and several of their competitors, benefited from lush ballads from producers such as Babyface and Jimmy Jam and Terry Lewis, who brought Michael Jackson's sister Janet Jackson to fame during the late 1980s and early 1990s. As a solo artist, Babyface and contemporaries such as Brian McKnight eschewed prominent hip hop influences, and recorded in a smooth, soft style of R&B termed quiet storm.

In the early 1990s, [alternative rock](#), adult contemporary, and [gangsta rap](#) ruled the charts, and R&B artists began adding even more of a rap/hip hop sound to their work. New jack swing had its synthesizer-heavy rhythm tracks replaced by grittier [East Coast hip hop](#) inspired backing tracks, resulting in a genre labeled "[hip hop soul](#)" by Sean "Puffy" Combs, producer for Mary J. Blige. Blige and other hip hop soul artists such as R. Kelly, Montell Jordan, Brandy, and Aaliyah, more than their slicker new jack swing predecessors, brought hip hop slang, style, and attitudes to R&B music. The subgenre also includes a heavy gospel influence with vocal inflections and sounds. The style became less popular by the end of the 1990s, but later experienced a resurgence. The hip hop soul sound continues to be heard in the work of artists such as Jaheim, Ashanti, Amerie, and Keisha Cole.

During the mid-1990s, highly successful artists such as Mariah Carey, girl group TLC and the aforementioned Boyz II Men brought contemporary R&B to the mainstream. Boyz II Men and Mariah Carey recorded several Billboard Hot 100 number-one hits, including "One Sweet Day", a collaboration between both acts which became the longest-running number-one hit in Hot 100 history. In addition, both Boyz II Men and TLC released albums in 1994, *II* and *CrazySexyCool*, respectively, that sold over ten million copies, earning them diamond certification from the Recording Industry Association of America. Other top-selling R&B artists from this era included singer Toni Braxton, singer/songwriter/producer R. Kelly, and girl group En Vogue.

During the later part of the decade, [neo soul](#), which added a 1970s soul music influence to the hip hop soul blend, arose, led by artists such as D'Angelo, Lauryn Hill, and Maxwell. Several artists, most notably Missy Elliott, further blurred the line between R&B and hip hop by recording in both genres simultaneously.

During the late-1990s and early 2000s, the influence of pop on R&B could be heard in the work of several pop musicians, most notably Jennifer Lopez and the later recordings of \*NSYNC and the early recordings of 98 Degrees. \*NSYNC's lead singer Justin Timberlake went on to make several solo recordings that showed heavy influences from both R&B and hip hop music. Other pop stars who perform heavily R&B influenced pop music (sometimes referred to as "dirty pop", "urban pop", or a modern definition of "hip pop") include Britney Spears, Gwen Stefani, and Pink.

In the United Kingdom, R&B found its way into the UK garage subgenre of 2Step, typified by R&B-style singing accompanied by [breakbeat/jungle](#) rhythms. Among the most notable 2Step artists is Craig David, who crossed over to American R&B audiences in the early 2000s.

## Present day

By the 2000s, the cross-pollination between R&B and hip hop had increased to the point where, in most cases, the only prominent difference between a hip hop record or an R&B record is whether its vocals are rapped or sung. This type of R&B is referred to as Slick R&B. However R&B continues to have its own identity. Mainstream modern R&B has a sound more based on rhythm than hip hop soul had, and lacks the [hardcore](#) and soulful urban "grinding" feel on which hip-hop soul relied. That rhythmic element descends from new jack swing. R&B began to focus more on solo artists rather than groups as the 2000s progressed. As of 2005, the most prominent R&B artists include Usher, Beyoncé (formerly of Destiny's Child), and Mariah Carey, whose music often blurs the line between contemporary R&B and pop.

Soulful R&B continues to be popular, with artists such as Alicia Keys, John Legend, and American Idol winner Fantasia showcasing classic influences in their work. Some R&B singers have used elements of Caribbean music in their work, especially dancehall and reggaeton.

Quiet storm, while still existent, is no longer a dominant presence on the pop charts, and is generally confined to urban adult contemporary radio. Most of the prominent quiet storm artists, including Babyface and Gerald Levert, began their careers in the 1980s and 1990s, although newer artists such as Kem also record in the quiet storm style. Its influence can still be seen in singles such as Mariah Carey's "We Belong Together", Usher's "Confessions, Pt. 2" and Destiny's Child's "Cater 2 U".

In addition, several producers have developed specialized styles of song production. Timbaland, for example, became notable for his hip hop and jungle based syncopated productions in the late-1990s, during which time he produced R&B hits for Aaliyah, Ginuwine, and singer/rapper Missy Elliott. By the end of the decade, Timbaland's influences had shifted R&B songs towards a sound that approximated his own, with slightly less of a hip hop feel. Lil' Jon became famous for a style he termed "crunk & B", deriving its influences from the Southern hip hop subclassification of crunk music. Jon gave his main R&B artist, Ciara, the title of "the Princess of Crunk & B", and Brooke Valentine and Usher have also recorded R&B songs with strong crunk influences.

# Contemporary R&B subgenres

These are the major subgenres of *contemporary R&B*, roughly in chronological order of popularity.

## Quiet storm

Quiet storm is a broad category of R&B and jazz-based music that is mellow, laid-back and often romantic. Its name comes from an innovative radio show that originated at WHUR at Howard University in the mid-1970s, named after Smokey Robinson's hit 1975 single "Quiet Storm". Unlike contemporary R&B, quiet storm shows little influence from hip hop, and generally plays to the urban adult contemporary crowd. The genre achieved great mainstream success during the 1980s with artists like Luther Vandross, Anita Baker, and Sade. Among other notable quiet storm musicians are Lionel Richie, Gerald Levert, Joe, and Brian McKnight.

## New jack swing

*For more details on this topic, see [new jack swing](#).*

A fusion of hip hop music and R&B, new jack swing was distinguished by significant use of [rapped](#) choruses or bridges and prominent use of drum machines such as the Roland TR-808. Teddy Riley and his group Guy are credited with being the inventor of the genre; other notable figures include Bobby Brown, Jimmy Jam & Terry Lewis, Jodeci, and Boyz II Men. A female alternative, new jill swing, was championed by acts such as Janet Jackson, Total, Shanice, TLC, and SWV.

## Hip hop soul

*For more details on this topic, see [hip hop soul](#).*

Essentially new jack swing for the 1990s, hip hop soul took the style further towards a pure hip hop sound, usually accompanied by a nervy, [gangsta rap](#)-esque image. The sound was reminiscent of funk with the inclusion of relatively darker baselines with elongated groove notes. Among its most notable figures were Montell Jordan, BLACKstreet, Groove Theory, and the "Queen of Hip Hop Soul", Mary J. Blige.

## Neo soul

*For more details on this topic, see [neo soul](#).*

Neo soul blends a hip hop influenced R&B sound with the classic soul of the 1970s. True neo soul is characterized by an earthy feel, accented by soul-styled harmonies, and accompanied by [alternative hip hop](#) beats. It generally has a much less mainstream sound than general R&B music. Some artists of this genre include Tony! Toni! Toné!, Angie Stone, Maxwell, D'Angelo,

Erykah Badu, Lauryn Hill, and Jill Scott. Boy bands, such as, One Chance, also performed neo-soul as well.

## **Funk**

*Main article: [Funk music](#)*

Funk was pioneered by James Brown in the 1950's, and wasn't mainstream until the 1970's

## **Disco**

*Main article: [Disco](#)*

Disco has been a 1970's fad. The BeeGees were the one of the most famous example of disco musicians.

## **Hip hop**

*Main article: [Hip hop](#)*

Hip hop has been recorded by sampling older songs to reduce the work in producing the rhythm.

## What Radio DJs say

Often times, radio stations that play funk, disco, new jack swing, golden age hip hop, and others are often claiming the radio station's playlist convention with a more ambiguous claim (e.g. Today's soul and the best RNB, Today's hip hop and RNB, Classic soul and RNB).

[Quiet storm](#) - [New Jack Swing](#) - [Hip-hop soul](#) - [Neo soul](#)

# Rhythm section

**Rhythm section** refers to the [musicians](#) whose primary jobs in a [jazz](#) or [popular music band](#) or [ensemble](#) is to establish the [rhythm](#) of a [song](#) or musical piece, often via repeated riffs or ostinati. "Rhythm Section" may also refer to the [instruments](#) in this group.

A non-musician might call the rhythm section 'background music'. However, their importance is much greater than that.

In theory (and sometimes in practice) *any* instrument or instruments can provide a steady rhythm (listen to Jimmy Giuffre's clarinet-valve trombone-guitar trio of the late 1950s for example), and "rhythm" instruments often take featured solos, especially in [jazz](#).

However, certain instruments are generally part of a rhythm section: The drum set and [bass guitar](#) (or sometimes double bass) are usually the critical. [Chordal](#) instruments such as rhythm guitar, (sometimes [Banjo](#)), [piano](#) or other [keyboard instruments](#), (such as the electric piano) and [vibraphone](#) are often used, as well as auxiliary [percussion](#) and/or other instruments. These other instruments are usually not prime contributors to the rhythm section.

In some relatively uncommon instances, the lower octaves of a piano, [organ](#), or electronic keyboard may substitute for bass guitar or double bass. One of the best known examples of this was keyboardist Ray Manzarek of The Doors. In the absence of a bassist, a keyboardist can also use a keyboard bass, or bass pedals that can be played with the feet.

Some jazz bands use [tuba](#) or other low-pitched instruments in place of the more common double bass, either due to practical considerations (no bassist is available) or due to a preference for the alternative instrument. These substitute instruments sound different from a double bass or bass guitar, and can offer a unique quality. The tuba may be used as a means of evoking [brass band](#) sounds reminiscent of early jazz, such as New Orleans or [Dixieland](#) Swing.

Another suggested origin of the term is that it refers to the ubiquity in [jazz](#) of *rhythm changes*, the chord progression of George and Ira Gershwin's "I've Got Rhythm" (1930), the claim being that backing musicians were so frequently called upon to improvise against these chord changes that they were eventually referred to as a "rhythm section". (This information putatively from a Keyboard magazine article from the mid-nineties.)

Categories: [Popular music](#) | [Jazz](#) | [Rhythm](#)

# Riddim

A **riddim** is a [rhythm](#) pattern, basically consisting of a [drum](#) pattern and a prominent bassline. This Patois or Jamaican-English term originates from the English word "rhythm".

Riddims are the instrumental backgrounds of [reggae](#), lovers rock, [dub](#), raggamuffin and dancehall compositions. In other musical contexts a riddim would be called a groove or beat. In most cases the term "riddim" is used to reference the whole background track or [rhythm section](#), but in older, roots riddims, riddim is used to reference a certain bassline and drum pattern. Often a [melody](#) is associated with the riddim.

Riddims can generally be categorized into three types. The oldest type of riddim is the classical riddim providing [roots reggae](#) dub and lovers rock with instrumentals (Example: "Bam Bam" produced by Sly & Robbie). The second type is the ragga riddim backing raggamuffin and dancehall tunes (Example: "Juice" produced by Richard "Shams" Brown). The third type is the digital riddim (Example: "Sleng Teng" produced by King Jammy).

Different producers often have their own versions of the same riddim, and different artists often perform on top of the same riddims with different lyrics and different vocal styles, ranging from singing to toasting. As an example, Beenie Man's song "My Wish", Mr. Vegas' tune "Go Up", and TOK's "Man A Bad Man" are all based on the "Juice" riddim. Most riddims are named by the tune sung on that instrumental track for the first time. For example, the "Satta-A-Masagana" riddim is named from The Abyssinians' song "Satta-A-Masagana".

Washington State Washington, D.C.

## [Grunge](#)

**Riot Grrrl** (or **Riot Grrl**) is a feminist musical and political movement beginning in the early 1990s. Riot Grrrl can also refer to the genre of music produced by that movement. Many perceive the movement as a response to sexist attitudes within [punk rock](#) culture and the world at large. Riot Grrrl is characterized by the creation of a woman-friendly subculture within punk rock that embraced the formation of female [punk rock](#) bands, self-publication via zines, female-centric music festivals, meetings, and the DIY ethic. The movement is largely associated with the Washington D.C. and Olympia, Washington areas. Riot Grrrl arose after the Queercore movement, although the distinction between the two movements is at times blurred, given bands such as Team Dresch who embraced both genres.

## **Feminism and Riot Grrrl**

Riot Grrrl can be seen as one embodiment of third wave feminism. Riot Grrrl lyrics often address issues such as rape, domestic abuse, sexuality and female empowerment. As summarized by The Guardian in its April 15, 1995 supplement:

When the Riot Grrrl movement began in America in 1991, its intention was to redress the balance of power via the punk rock underground using slogans (words like 'rape' and 'slut' written in black marker pens on exposed stomachs or bare arms), fanzines, meetings and women-only shows.

## **Riot Grrrl bands**

The groups Bikini Kill and Bratmobile are considered two of the prime instigators of Riot Grrrl. With the rallying cry of "revolution girl style now," they and other bands such as Heavens to Betsy, Sleater-Kinney, Cheesecake, Excuse 17, Huggy Bear, Team Dresch, Tattle Tale, and others, helped form the Riot Grrrl movement.

Riot Grrrl musicians largely shunned the major record labels, signing instead with indie labels such as Kill Rock Stars, K Records, and Chainsaw Records.

# History

Like its contemporary, [grunge music](#), Riot Grrrl arose in the fertile music scene of Seattle and Olympia as well as in Washington D.C, although it was not limited to these cities. Other scenes arose across the United States, and in the United Kingdom, represented by such groups as Huggy Bear and Voodoo Queens.

Uses and meanings of the term Riot Grrrl developed slowly over time, but its origins can be traced to racially charged riots in Washington D.C.'s Mount Pleasant neighborhood during the spring of 1991. Writing in *Dance of Days: Two Decades of Punk in the Nation's Capital*, Mark Andersen reports early Bratmobile member Jen Smith (later of The Quails) reacting to the riots by writing, "This summer's going to be a girl riot." Soon afterwards, Tobi Vail collaborated with Kathleen Hannah to create a new zine and called it *Riot Grrrl*.

Breaking out from the music, Riot Grrrl activities included national conventions in D.C., the Pussystock festival in New York City, and a slew of zines, notably *Girl Germs*, *Jigsaw*, *Fantastic Fanzine*, *Satan Wears A Bra* and *Quit Whining*. Riot Grrrl's momentum was supported by an explosion of self-published zines that covered a variety of feminist topics, frequently attempting to draw out the political implications of intensely personal experiences with sexism, mental illness, body image, sexual abuse, and homosexuality. These zines were archived for many years by Riot Grrrl Press, started in Washington DC in 1992 by Erika Reinstein & May Summer. Due to financial hardships, Riot Grrrl Press disbanded in the late '90s.

Much to their chagrin, Riot Grrrls found themselves in the media spotlight during 1992, featured for dragging feminism into the mosh pit in magazines from *Seventeen* to *Newsweek*. This increased press coverage led to conflict within the Riot Grrrl community as many felt that Riot Grrrl was being appropriated by the media against the movement's will and its radical message marginalized. Fallout from the media coverage led to resignations of people like Jessica Hopper, who was at the center of the *Newsweek* article. Lead singer Kathleen Hanna of Bikini Kill called that year for "a press block".

In an essay from January 1994, included in the CD version of Bikini Kill's first two records, Tobi Vail responded to media simplifications and mis-characterization of Riot Grrrl:

"one huge misconception for instance that has been repeated over and over again in magazines we have never spoken to and also by those who believe these sources without checking things out themselves is that Bikini Kill is the definitive 'riot girl band' ... We are not in anyway 'leaders of' or authorities on the 'Riot Girl' movement. In fact, as individuals we have each had different experiences with, feelings on, opinions of and varying degrees of involvement with 'Riot Girl' and though we totally respect those who still feel that label is important and meaningful to them, we have never used that term to describe ourselves AS A BAND. As individuals we respect and utilize and subscribe to a variety of different aesthetics, strategies, and beliefs, both political and punk-wise, some of which are probably considered 'riot girl.'"

## Legacy

By the mid-nineties, Riot Grrrl had severely splintered. Many within the movement felt that the mainstream media had completely marginalized their message, and that the politically radical aspects of Riot Grrrl had been appropriated by the likes of the Spice Girls and their encouraging but non-political "girl power" message.

However, the influence of Riot Grrrl can still be felt in many aspects of indie and punk rock culture. Kaia Wilson of Team Dresch and multimedia artist Tammy Rae Carland went on to form the now-defunct Mr. Lady Records which released albums by The Butchies and Le Tigre. Many of the women involved in Riot Grrrl are still active in creating politically-charged music. Notably, Kathleen Hanna of Bikini Kill went on to found the influential electronic feminist group Le Tigre. Corin Tucker of Heavens to Betsy and Carrie Brownstein of Excuse 17 co-founded Sleater-Kinney at the tail end of Riot Grrrl and in 2005 left Olympia-based Kill Rock Stars to release The Woods on Sub Pop records. Kathi Wilcox joined the Casual Dots, and Bratmobile reunited in 2000 to release two albums. In addition, girl-positive independent music festivals such as Ladyfest continue to thrive.

## [Rock band](#)

**Rock and roll** (also spelled **rock 'n' roll**, especially in its first decade), is a genre of [music](#) that emerged as a defined musical style in the Southern United States in the 1950s, and quickly spread to the rest of the country, and the world. It later evolved into the various sub-genres of what is now called simply '[rock](#)'. As a result, "rock and roll" now has two distinct meanings: either traditional rock and roll in the 1950s style, or later rock and even pop music which may be very far from traditional rock and roll (rhythm sample). From the late 1950s to the mid 1990s rock was perhaps the most popular form of music in the western world. Rock 'n' roll is played with an electric guitar, a bass guitar, with a drum set, and often a piano (or keyboard). In the early style of rock and roll, early 1950's, saxophone was the lead instrument, replaced by guitar in the late 50's.

# Precursors and origins

*Main article: [Origins of rock and roll](#)*

**Rock** and roll emerged as a defined musical style in America in the 1950s, though elements of rock and roll can be heard in [rhythm and blues](#) records as far back as the 1920s. Early rock and roll combined elements of [blues](#), boogie woogie, [jazz](#), [rhythm and blues](#), and is also influenced by traditional Appalachian folk music, [gospel](#), as well as [country and western](#). Going back even further, rock and roll can trace a foundational lineage to the old Five Points district of mid-19th century New York City, the scene of the first fusion of heavily rhythmic African shuffles and sand dances with melody driven European genres, particularly the Irish jig. Rocking was a term first used by black gospel singers in the American South to mean something akin to spiritual rapture. By the 1940s, however, the term was used as a double entendre, ostensibly referring to dancing, but with the hidden subtextual meaning of sex; an example of this is Roy Brown's "Good Rocking Tonight". This type of song was usually relegated to "race music" (the music industry code name for rhythm and blues) outlets and was rarely heard by mainstream white audiences. In 1951, Cleveland, Ohio [disc jockey](#) Alan Freed began playing this type of music for his white audience, and it is Freed who is credited with coining the phrase "rock and roll" to describe the rollicking R&B music that he brought to the airwaves. Rock "n" Roll Also was known as music that was created with R&B and Boogy Woogie mixed it was originally black music until white musicians liked it and made it popular with white teens

There is much debate as to what should be considered the first rock and roll record. Candidates include the 1951 "Rocket 88" by Jackie Brenston & His Delta Cats, or later and more widely-known hits like Chuck Berry's "Maybelline" or "Johnny B. Goode" or Bo Diddley's "Bo Diddley" or Bill Haley & His Comets' "Rock Around the Clock" or, as Rolling Stone magazine pointed out, to some controversy, in 2005, "That's all right", Elvis Presley's first single for SUN records, in Memphis. Some historians go further back, pointing to musicians like Fats Domino, who were recording in the 40s in styles largely indistinguishable from rock and roll; these include Louis Jordan's "Caldonia" (1945), Jack Guthrie's "The Oakie Bookie" (1947) and Benny Carter and Paul Vandervoort II's "Rock Me to Sleep" (1950). Even Benny Goodman made recordings in the early 1940s with the pioneering [electric guitarist](#) Charlie Christian which use many techniques later utilized by rock and rollers. If we agree with Huey Lewis that "The heart of rock and roll is the beat," and we examine the beat and set out to define it, we immediately find that the rock and roll beat is almost the same as the boogie woogie beat. Both are 8 to the bar, 12 bar blues, and the essential difference is that rock and roll has a greater emphasis on the back beat than boogie woogie...if you take any boogie woogie record of the 30's or 40's, and sit a drummer down to play snare on the backbeat, then you have turned it into rock and roll.

Main artists starting to score in the main hit charts from 1955 onward included the influential and pioneering: Bill Haley, Elvis Presley, Fats Domino, Little Richard, Chuck Berry, Jerry Lee Lewis, and Buddy Holly.

## Early North American rock and roll (1953-1963)

Whatever the beginning, it is clear that rock appeared at a time when racial tensions in the United States were coming to the surface. African Americans were protesting segregation of schools and public facilities. The "separate but equal" doctrine was nominally overturned by the Supreme Court in 1954. It can hardly be a coincidence, then, that a musical form combining elements of white and [black music](#) should arise, and that this music should provoke strong reactions, of all types, in all Americans.

The phrase was heard on Louis Jordan and His Tympany Five's version of Tamburitzza Boogie recorded on August 18, 1950, in New York City. However, there are earlier usages of the term, such as the 1949 record, "Rock And Roll Blues," by Erline Harris, and the 1948 record by Wild Bill Moore, "Rock And Roll," as well as a record by Paul Bascomb with the same title, though a completely different song, in 1947. Even as early as 1922, Trixie Smith had a song titled "My Man Rocks Me with One Steady Roll," but the phrase was first recorded in 1916, on the Little Wonder record label, in a song called The Camp Meeting Jubilee, where the singers say "We've been rocking and rolling in your arms, in the arms of Moses."

On March 21, 1952 in Cleveland, Alan Freed (also known as Moondog) organized the first rock and roll concert, titled "The Moondog Coronation Ball" The audience and the performers were mixed in race and the evening ended after one song in a near-riot as thousands of fans tried to get into the sold-out venue.

The culture industry soon understood that there was a white market for black music that was beyond the stylistic boundaries of [rhythm and blues](#) and so social prejudice and racial barriers could do nothing against market forces. Rock and roll was an overnight success in the U.S. making ripples across the Atlantic, culminating in 1964 with the British Invasion. By the end of the decade, rock had spread throughout the world. In Australia, for example, Johnny O'Keefe became perhaps the first modern rock star of that country, and beginning a long history of [Australian rock](#).

## Rockabilly

*Main article:* [Rockabilly](#)

In 1954, Elvis Presley recorded at Sam Phillips' Sun studios in Memphis, the regional hit "That's All Right, Mama." Elvis played a rock and country & western fusion called rockabilly, which was characterized by hiccupping vocals, slapping bass and a spastic guitar style. He became the first superstar rock musician.

It was the following year's "Rock Around the Clock" by Bill Haley & The Comets that really set the rock boom in motion, though. The song was one of the biggest hits in history, and frenzied teens flocked to see Haley and the Comets perform it, even causing riots in some places; "Rock Around the Clock" was a breakthrough for both the group and for all of rock and roll music. If everything that came before laid the groundwork, "Clock" certainly set the mold for everything else that came after. With its combined rockabilly and R & B influences, "Clock" topped the U.S. charts for several weeks, and became wildly popular in places like Australia and Germany. The single, released by independent label Festival Records in Australia, was the biggest-selling recording in the country at the time. In 1957, Jerry Lee Lewis and Buddy Holly became the first rock musicians to tour Australia, marking the expansion of the genre into a worldwide phenomenon. That same year, Bill Haley & The Comets toured Europe bringing rock 'n' roll to that continent for the first time. His Rock Around the Clock was recorded in 1954 with limited sales, but sales of the record exploded in 1955 after the release of the Movie "Blackboard Jungle," which used it in the opening sequence.

## Covers

*Main article:* [Cover version](#)

Through the late 1940s and early 1950s, R&B music had been gaining a stronger beat and a wilder style, with artists such as Fats Domino and Johnny Otis speeding up the tempos and increasing the backbeat to great popularity on the juke joint circuit. Before the efforts of Freed and others, black music was taboo on many white-owned radio outlets. However, savvy artists and producers quickly recognized the potential of rock, and raced to cash in with white versions of this black music. White musicians also fell in love with the music and played it everywhere they could.

Covering was customary in the music industry at the time. One of the first successful rock and roll covers was Wynonie Harris's transformation of Roy Brown's "Good Rocking Tonight" from a [jump blues](#) to a showy rocker. The most notable trend, however, was white pop covers of black R&B numbers. Exceptions to this rule were found, such as Wynonie Harris covering the Louis Prima rocker, "Oh Babe," in 1950, and Amos Milburn covering what may have been the first white rock and roll record, Hardrock Gunter's "Birmingham Bounce," in 1949.

Black performers saw their songs recorded by white performers, an important step in the dissemination of the music, but often at the cost of feeling and authenticity. Most famously, Pat Boone recorded sanitized versions of Little Richard songs, though Boone found "Long Tall Sally" so intense that he couldn't cover it. Later, as those songs became popular, the original artists' recordings received radio play as well. Little Richard once called Pat Boone from the audience and introduced him as "the man who made me a millionaire".

The cover versions were not necessarily straightforward imitations. For example, Bill Haley's incompletely bowdlerized cover of "Shake, Rattle and Roll" transformed Big Joe Turner's humorous and racy tale of adult love into an energetic teen dance number, while Georgia Gibbs replaced Etta James's tough, sarcastic vocal in "Roll With Me, Henry" (covered as "Dance With Me, Henry") with a perkier vocal more appropriate for an audience unfamiliar with the song to which James's song was an [answer](#), Hank Ballard's "Work With Me, Annie".

## British rock and roll

The [Trad jazz](#) movement brought blues artists to Britain, and in 1955 Lonnie Donegan's version of "Rock Island Line" began Skiffle music which inspired many young people to have a go, including John Lennon whose "The Quarrymen", formed in March 1957, would gradually change and develop into The Beatles. This primed the United Kingdom to respond creatively to American rock and roll which had an impact across the globe. In Britain, skiffle groups, record collecting and trend-watching were in full bloom among the youth culture prior to the rock era, and color barriers were less of an issue with the idea of separate "race records" seeming almost unimaginable. Countless British youths listened to R&B and rock pioneers and began forming their own bands. Britain quickly became a new center of rock and roll.

In 1958 three British teenagers formed a good rock and roll group, Cliff Richard and the Drifters (later renamed Cliff Richard and the Shadows). The group recorded a hit, "Move It", marking not only what is held to be the very first true British rock 'n' roll single, but also the beginning of a different sound — British rock. Richard and his band introduced many important changes, such as using a "lead guitarist" (virtuoso Hank Marvin) and an [electric bass](#).

The British scene developed, with others including Tommy Steele and Adam Faith vying to emulate the stars from the U.S.. Some touring acts attracted particular popularity in Britain, an example being Gene Vincent. This inspired many British teens to begin buying records and follow the music scene, thus laying the groundwork for Beatlemania.

At the start of the '60s instrumental dance music was very popular, with hits including Apache by The Shadows and Telstar by The Tornados from a British branch of [Surf instrumental](#) music.

In the 1970s Britain was subject to three major musical renovations - "glam rock" (largely influenced by the "sexual revolution" and lasting roughly from 1971 to 1975), the influential punk rock movement from 1976 to 1980, and "epic" rock (combining blues, heavy metal, classical music and psychedelia), popularized by the likes of Led Zeppelin, Black Sabbath, and Pink Floyd.

## Books

The Fifties by Pulitzer Prize winning author David Halberstam (1996) Random House (ISBN 0517156075) provides information and analysis on Fifties popular culture exploring major social and cultural changes including television, transistor radios, the phenomenon of Elvis Presley and the rise of rock-and-roll.

The Rolling Stone Illustrated History of Rock and Roll : The Definitive History of the Most Important Artists and Their Music by editors James Henke, Holly George-Warren, Anthony Decurtis, Jim Miller. (1992) Random House (ISBN 0679737286)

The Rolling Stone Encyclopedia of Rock & Roll by Holly George-Warren, Patricia Romanowski, Jon Pareles (2001) Fireside Press (ISBN 0743201205)

# Rock band

**Rock group** (or later **rock band**) is a generic name to describe a group of [musicians](#) specializing in a particular form of electronically amplified [music](#). Deriving its name from the musical style which was its immediate progenitor, [rock and roll](#), the type of music played by [rock](#) groups has its roots deeply steeped in both rock and roll, and its immediate forbear, [rhythm and blues](#). In Britain of the early 1960s the term **rock group** was in universal use, but as psychedelia approached the name band came into vogue, typified by The Band. A rock group or band tends to have a heavy focus on certain instruments principally [electric guitar](#), [bass guitar](#), and [drums](#) (prime examples of this are The Who, Cream, The Jimi Hendrix Experience, or more recently Alice in Chains), with [keyboard instruments](#) such as [electronic organs](#) being featured from the outset by groups such as Manfred Mann and The Animals. Later in the 1960s, rock bands such as The Who, Pink Floyd and Hawkwind experimented with electric organs and [synthesizers](#). Other instruments deployed within the context of a rock band include the [electric violin](#), as used by Curved Air and the [flute](#) played by Ian Anderson of Jethro Tull, among others.

# Structure

A rock group or band usually consists of at least four musical roles:

- lead singer.
- guitarist.
- bass guitarist.
- drummer or/and percussionist.

Sometimes however a lead singer can be replaced or joined by a lead guitarist, who plays counter melodies and performs most of the solos. In many instances, the singer may play an instrument, creating a trio.

Many bands also include a rhythm guitarist and keyboardist, who work with the Bassist and the Drummer in the [rhythm section](#). The role of these instruments is to identify and play chords and chordal accompaniment for the soloist and to merge with the overall groove of the rhythm section.

The lead singer may also play an instrument while singing, most commonly the guitar or bass guitar. When the lead singer role is taken by one of the other primary musical roles, the group is termed a [power trio](#) (for example Cream or more recently, Green Day). Some bands may have multiple lead singers (such as Pink Floyd and The Beatles, as well as more modern bands such as blink-182). Still others will add background vocals, sung by other instrumentalists or dedicated singers.

If there is an addition of instruments from other areas of music, such as stringed instruments like a [violin](#) or [cello](#), or horns like [trumpets](#) or [trombones](#), the band is seen as diverging too far from the main four roles, this creates a tendency to classify the group not as a rock band, but with a genre seen as more specific than "rock" (e.g. [ska](#) or [progressive rock](#)).

While some rock bands may add several additional singers and instrumentalists, they hardly ever lose the four primary roles.

# Rock concert

The term **rock concert** refers to a musical performance in the style of any one of many genres inspired by "[rock and roll](#)" [music](#). While a variety of vocal and instrumental styles can constitute a rock concert, this phenomenon is typically characterized by [bands](#) playing at least one [electric guitar](#), an electric [bass guitar](#), and [drums](#). Often, two guitar players share the tasks of [rhythm](#) and lead guitar playing. But rock concerts also have a social history which greatly informs the perception of the linguistic term and the activity itself.

During the 1950s, several American musical groups experimented with new musical forms that fused [country music](#), [blues](#), and [swing genre](#) to produce the earliest examples of "rock and roll." The coining of the phrase, "rock and roll," is often attributed to Alan Freed, a disk jockey and concert promoter who organized many of the first major rock concerts. Since then, the rock concert has become a staple of entertainment not only in the United States, but around the world.

Rock concerts are often associated with certain kinds of behavior. Dancing, shouting, [singing](#) along with the band, and ostentatious displays by the [musicians](#) are common, though some very successful [rock bands](#) have avoided gratuitous flash in favor of understated performances focusing on the music itself. Even so, rock concerts often have a playful atmosphere both for the band and the audience.

Like rock music in general, rock concerts are emblematic of American culture's waning formality. Such concerts were crucial to the formation of youth identity in the U.S. during a time of social revolution, and have continued to represent elements of society frequently seen as "rebellious," especially against the strictures of mid-twentieth-century social normativities. One of the most well-known rock concerts was undoubtedly Woodstock, and millions of much smaller rock concerts go on every year.

## Health concerns

- Many parents fear that their teenagers will be introduced to drugs or alcohol at rock concerts. During the 1970s and the 1980s, the use of marijuana at rock concerts was common. However, with tighter security measures in recent years, drug use at concerts has declined dramatically.
- Rock bands play at very high decibel levels. Prolonged exposure to noise at these levels can permanently damage the bones of the middle ear. Thus health officials recommend that concertgoers use earplugs.

# Rock in Opposition

**Rock in Opposition** or **RIO** was a movement representing a collective of "[progressive](#)" bands in the late 1970s united in their opposition to the [music industry](#) that refused to recognise their music. It was initiated by Henry Cow in March 1978 when they invited four European groups to come to London and perform in a festival called "Rock in Opposition". The groups that performed in the inaugural event were:

- Henry Cow (England)
- Stormy Six (Italy)
- Samla Mammas Manna (Sweden)
- Univers Zéro (Belgium)
- Etron Fou Leloublan (France)

After the festival, RIO was formalised as an organisation with a charter whose aim was to represent and promote its members. Three more bands were also added to the collective: Art Bears, Art Zoyd and Aksak Maboul, and further festivals were held later in France, Italy and Sweden. Chris Cutler of Henry Cow established the ReR label in the UK, as a model for a non-profit music company.

RIO as a movement did not last long, but its legacy still persists. While RIO never referred to a type of music (the original RIO bands were quite diverse musically), it is still often used by listeners, musicians, and distributors to classify bands (generally bands that appeared at the RIO festivals or bands related to or derived from the RIO bands).

Bands familiarized with the RIO movement and genre today include: Thinking Plague (USA), Present (Belgium), Miriodor (Canada), Ahvak (Israel), Neblenest (France), 5uu's (USA), Guapo (UK) and U Totem (USA). The term "RIO" today is almost synonymous with [Avant-progressive rock](#) or Experimental Rock.

## [Rock band](#)

**Rock** is a form of [popular music](#), usually featuring vocals (often with vocal harmony), [electric guitars](#), a [bass guitar](#), and a strong back beat; other instruments, such as the [saxophone](#), [trumpet](#), and [trombone](#) are common in some styles, however, horns have been omitted from newer subgenres of rock music since the 1990s. The genre of rock is broad, and its boundaries loosely-defined, with distantly related genres such as [soul](#) sometimes being included.

A major formative influence on rock was [rock and roll](#), and the terms are sometimes used interchangeably. 1950s rock and roll artist Bo Diddley claims that the term *rock and roll* came from an Australian radio interview in which disc jockey Alan Freed described Diddley as "the man with the original sound that's going to *rock and roll* you out of your seat."

In the early 1960s *rock 'n' roll* was seen as being out of fashion, and at the outset of '60s British rock there was an insistence on using the term rock music. With the "British Invasion" this reinvigorated musical style spread back to the United States, and became a lasting international cultural phenomenon with considerable social impact on the world. Competing claims have credited it with ending wars and spreading peace and tolerance, as well as corrupting the innocent and spreading moral rot. Rock has become popular across the globe, and has evolved into a multitude of highly-varying styles with widespread popularity in most countries today. Overall in terms of album sales, rock is the most popular form of music since the advent of sound recording.

# Origins

*Main article: [Origins of rock and roll](#)*

Rock and Roll in its various guises came from a fusion of musical cultures, and in turn its influence fed back to these cultures, a process of borrowings, influences and new ideas that continues to develop rock music.

## Rock 'n' Roll diversifies

*Main article: [Rock and Roll](#)*

*Rock 'n' Roll* had runaway success in the U.S. and quickly brought sanitised [rhythm and blues](#) influenced music to an international audience. Its success led to a dilution, as promoters were quick to attach the label to other commercial pop, and original stars such as Elvis Presley were diverted into ballads more in keeping with previous ideas of pop. The excitement and drive of the music was not forgotten, and there was a widening diversification

# Early Rock 'n' Roll

Main article: [Rock 'n' Roll](#)

**Rock 'n' Roll** started off in the early-to-mid 1950s in the United States of America. African-American artists such as Chuck Berry, Little Richard, Bo Diddley and Fats Domino played predominantly to African American crowds. While these key early rockers were indisposed to racism, local authorities and dance halls were very much divided upon racial lines. Mainstream acceptance of rock and roll in the mid-1950s when what Bo Diddley describes as 'au fait dudes' (or Caucasians) signed to major labels and started covering their material. Elvis Presley and Bill Haley and the Comets are the biggest examples of such stars to achieve early mainstream success. Buddy Holly, Ritchie Valens, The Big Bopper, Jerry Lee Lewis and the more rockabilly Johnny Cash are also early innovators of the genre. These artists were 'tight' and often toured and played together in dance halls and clubs across America and Britain.

Arguably, Chuck Berry and Bo Diddley are two of the most influential guitarists in Rock and Roll history, particularly to British group *the Rolling Stones*. Berry was known for his guitar riff orientated style and soloing, and Diddley for his experimentation with tremolo and rhythm.

Towards the end of the 1950s "chessboard" crowds (both black and white patrons) would emerge at Rock and Roll concerts as fans discovered the original artists of the songs they knew from television and the radio, such as Little Richard's *Tutti Frutti*.

The genre ignited British enthusiasm for [rhythm and blues](#) and the development of British rock. The 1960 name The Fabulous Silver Beatles was partly a tribute to Buddy Holly and the Crickets, and was later shortened to The Beatles.

## Surf music

Main article: [Surf music](#)

The rockabilly sound influenced the West Coast development of a wild, mostly instrumental sound called [surf music](#), though *surf culture* saw itself as a competing youth culture to Rock and Roll. This style, exemplified by Dick Dale and The Surfaris, featured faster tempos, innovative percussion, and processed [electric guitar](#) sounds with a British equivalent at the same time from groups like The Shadows, which would be highly influential upon future rock guitarists. Other West Coast bands, notably The Beach Boys, Mr. Shears and the Wavettes, and Jan and Dean, would capitalize on the surf craze, slowing the tempos back down and adding harmony vocals to create the "California Sound."

## British rock

In the United Kingdom the [Trad jazz](#) movement brought visiting [blues music](#) artists and Lonnie Donegan's 1955 hit "Rock Island Line" began Skiffle music groups throughout the country, including John Lennon's "The Quarry Men" formed in March 1957 as a precursor to The Beatles. Britain was quick to become a new centre of rock and roll, without the colour barriers which kept "race records" or [Rhythm and Blues](#) separate in the U.S.. Cliff Richard had the first British rock 'n' roll hit with "Move It", beginning the different sound of British rock.

At the start of the 1960s his backing group The Shadows was one of a number of groups having success with [Surf music](#) instrumentals. *Rock 'n' Roll* was fading into lightweight pop and schmaltzy ballads, but at clubs and local dances British rock groups were starting to play with an intensity and drive seldom found in white American acts, heavily influenced by [Blues-rock](#) pioneers like Alexis Korner. By the end of 1962 the British rock scene had started, with groups drawing on a wide range of American influences including [Soul music](#), [Rhythm and Blues](#) and [Surf music](#), playing for dancers doing the Twist. The music quickly evolved and developed to dominate pop music world-wide. First reinterpreting standard American tunes, these groups then infused their original rock compositions with an industrial-class sensibility and increasingly complex musical ideas.

The Beatles rose to the fore, bringing together an appealing mix of image, songwriting, and personality. In late 1963 the Rolling Stones started, as one of a number of groups increasingly showing blues influence such as The Animals and The Yardbirds, and in late 1964 The Kinks, followed by The Who, represented the new Mod style. The increasing musical adventurousness of the groups is exemplified by the Beatles' *Rubber Soul* of 1965. Drug references increased as music moved towards the birth of Psychedelia.

## British invasion

After their initial success in the UK, The Beatles launched a large-scale US tour to ecstatic reaction, a phenomenon quickly dubbed Beatlemania. Although they were not the first British band to come to America, The Beatles spearheaded the Invasion, triumphing in the US on their first visit in 1964 (including historic appearances on the Ed Sullivan Show). In the wake of Beatlemania other British bands headed to the U.S., notably the Rolling Stones (who disdained the Beatles' clean-cut image and presented a darker, more aggressive image), and other acts like The Animals and The Yardbirds. Throughout the early and mid-'60s Americans seemed to have an insatiable appetite for British rock. Other British bands, including The Who, had some success during this period but saved their peak of popularity for the second wave of British invasion in the late 1960s.

## 1960s garage rock

*Main article:* [Garage rock](#)

The British Invasion spawned a wave of imitators in the U.S. and across the globe. Many of these bands were cruder than the bands they tried to emulate. Playing mainly to local audiences and recording cheaply, very few of these bands broke through to a higher level of success. This movement, later known as [Punk rock](#) or [Garage Rock](#), later gained a new audience when record labels started re-issuing compilations of the original singles; the best

known of these is a series called Nuggets. Some of the better known band of this genre include The Sonics, ? & the Mysterians, and The Standells.

## Development of a counterculture (1963-1974)

In the late 1950s the U.S. Beatnik counterculture was associated with the wider anti-war movement building against the threat of the atomic bomb, notably CND in Britain. Both were associated with [jazz](#) and with the growing [folk song](#) movement, which attracted idealistic communists and left-wingers working for an egalitarian overthrow of race discrimination in the U.S. and of the class structure in Britain.

Rock and roll was seen as commercial pop, but subverted the race barriers in the U.S., and with the British invasion the reverence of groups for black [Rhythm and blues](#) stars brought these stars a wider public. The Beatles era brought outrage at longer hair styles, with unsmiling or sullen groups on record covers in contrast to the previous standard of clean-cut, smiling musicians. The Rolling Stones took this further and are credited with being the first band to dispense with band uniforms; band members simply wore whatever clothes they wished, and these clothes were often outlandish or controversial. Such seemingly trivial rebelliousness led to bigger shifts.

### Bob Dylan and folk-rock

*Main article:* [Folk-rock](#)

The folk scene had strong links between Britain and America, and in both countries a puritanical opposition to electric instruments and revival of traditional songs combined with enthusiasm for acoustic [blues music](#) and promotion of new songs with a social message, a genre pioneered by Woody Guthrie. Despite his adolescent musical forays into electric rock 'n' roll, Bob Dylan came to the fore in this movement, and his hits with Blowin' in the Wind and Masters of War brought "[protest songs](#)" to a wider public. Like others on the folk circuit, he viewed The Beatles at first as tritely commercial [bubblegum pop](#), but just as they drew inspiration from his The Times They Are A-Changin album, he in turn was influenced by them to bring in electric rock instrumentation in his March 1965 album Bringing It All Back Home.

Before the album came out, The Byrds beat him to it with a jangling electric hit single version of Mr. Tambourine Man taken from a preview of an acoustic track on the album. This effectively started [Folk-rock](#), as well as setting off [Psychedelic rock](#). Dylan's own contribution continued, with his "Like a Rolling Stone" becoming a U.S. hit single. Among his many disciples, Neil Young's lyrical inventiveness and often wailing electric guitar attack further widened Folk-rock's audience and presaged [grunge](#). Others including Simon & Garfunkel, The Mamas & the Papas, Joni Mitchell and The Band developed the genre in America.

In Britain, Fairport Convention began applying rock techniques to traditional British folk songs, followed by groups such as Steeleye Span, Lindisfarne and Pentangle in an approach which is still going strong today. The same approach was made (and is made) in Brittany by Alan Stivell .

### Psychedelic rock

*Main article:* [Psychedelic music](#)

Psychedelia began in the folk scene, with the Holy Modal Rounders introducing the term in 1964. With a background including folk and jug band music, The Grateful Dead fell in with Ken Kesey's LSD fuelled Merry Pranksters, playing at their *Acid Tests* then providing an electric [Acid rock](#) soundtrack to their Trips Festival of January 1966 , together with Big Brother & the Holding

Company. Within a fortnight the Fillmore Stadium was providing a regular venue for groups like another former jug band, Country Joe and the Fish, and the Jefferson Airplane whose debut album, recorded at the end of 1965, would have widespread influence that year. Elsewhere, The Byrds had a hit with Eight Miles High and the 13th Floor Elevators titled their album The Psychedelic Sounds of the 13th Floor Elevators. The music increasingly became involved in opposition to the Vietnam War.

In Britain, Pink Floyd had been developing psychedelic rock since 1965 in the underground culture scene, and in 1966 the Soft Machine formed. From the folk music side, Donovan had a hit with Sunshine Superman, one of the very first overtly psychedelic pop records. In August 1966 The Beatles joined in the fun with their Revolver featuring psychedelia in Tomorrow Never Knows and in Yellow Submarine which combined these references with appeal to children and nostalgia, a formula which would keep their music widely popular. The Beach Boys responded in the U.S. with Pet Sounds. From a [blues rock](#) background, the British supergroup Cream debuted in December, and Jimi Hendrix became popular in Britain before returning to storm America.

January 1967 brought the first album from The Doors. As the year went by many other pioneering groups got records out, with Pink Floyd's Arnold Layne in March only hinting at their live sound. The Beatles' groundbreaking album Sgt. Pepper's Lonely Hearts Club Band was released in June, and by the end of the year Pink Floyd's The Piper at the Gates of Dawn and Cream's Disraeli Gears.

The culmination of rock and roll as a socially-unifying force was seen in the rock festivals of the late '60s, the most famous of which was Woodstock which began as a three-day arts and music festival and turned into a "happening", as hundreds of thousands of youthful fans converged on the site.

## Progressive rock

*Main article: [Progressive rock](#)*

The music itself broadened past the [guitar-bass-drum](#) format; while some bands had used saxophones and keyboards before, now acts like The Beach Boys and The Beatles (and others following their lead) experimented with new instruments including wind sections, string sections, and full orchestration. Many bands moved well beyond three-minute tunes into new and diverse forms; increasingly sophisticated chord structures, previously limited to jazz and orchestrated pop music, were heard.

Dabbling heavily in classical, jazz, electronic, and experimental music resulted in what would be called [progressive rock](#) (or, in its German wing, [krautrock](#)). Progressive rock could be lush and beautiful or atonal and dissonant, highly complex or minimalistic, sometimes all within the same song. At times it was hardly recognizable as rock at all. Some notable practitioners include Pavlov's Dog, King Crimson, Caravan, Jethro Tull, Genesis, Gentle Giant, The Nice, Yes, Gong, Emerson, Lake & Palmer, Soft Machine, Steve Hillage, Barclay James Harvest, Magma, Can, Pink Floyd, Rush, Queen and Faust.

## German prog

*Main article: [Krautrock](#)*

In the mid-1960s, American and British rock entered Germany, especially British progressive rock bands. At the time, the musical avant-garde in Germany were playing a kind of [electronic classical music](#), and they adapted the then-revolutionary electronic instruments for a progressive-psychedelic rock sound. By the early 1970s, the scene, now known as *krautrock*, had begun to peak with the incorporation of jazz (Can) and Asian music (Popol Vuh). This

sound, and later pioneers like Neu! and Kraftwerk, were to prove enormously influential in the development of [techno](#) and other genres later in the century.

## Italian prog

In Italy progressive rock had a great success in the 1970s and some bands played prog at the same level of the more famous American groups and went in tour in the States.

Some Italian progressive rock bands were Premiata Forneria Marconi, Le Orme, Banco del Mutuo Soccorso and Area International Popular Group.

## Birth of heavy metal

*Main article: [Heavy metal music](#)*

A second wave of British bands and artists gained great popularity during this period. These bands typically were more directly steeped in American blues music than their more pop-oriented predecessors, but their performances took a highly amplified, often spectacular form. Guitar-driven acts such as Cream and Led Zeppelin were early examples of this [blues-rock](#) form, but heavier rock bands including Blue Cheer, Deep Purple, and most notably Black Sabbath are all believed to have had greater influence on metal music. This more aggressive style of rock would come to be known as [heavy metal](#).

# Corporate movements out of the counterculture (the 1970s)

## Arena rock

*Main article:* [Arena rock](#)

The Beatles and the Rolling Stones had set the table for massive live performances in stadiums and arenas. The growing popularity of metal and progressive rock led to more bands selling out large venues. The corporate world saw the chance for huge profits and began marketing a series of what came to be called [arena rock](#) bands. Bands whose roots were in other genres, like Queen, Pink Floyd and Genesis, paved the way by putting on extravagant live shows drawing a large number of fans. Following in their wake, Boston, Styx, Foreigner, Journey, and many other bands began playing similar music, often less progressive and metal-like. This movement became a precursor to the [power pop](#) of future decades, and set the mold for live performances by popular artists

## Soft rock/Pop

*Main article:* [Pop music](#)

Even rock music would get soft, or at least in between soft and hard. Out of the short-lived "bubble gum pop" era came such groups as The Partridge Family, The Cowsills, The Osmonds, and The Archies (the last "group" was actually one person, Ron Dante, who would go on to help manage the career of Barry Manilow).

With the demise of The Beatles as a group, other bands and artists would take this emerging soft rock format and add a touch of orchestration to partially form some of the first "power ballads". Solo artists such as Manilow, Olivia Newton-John, and Eric Carmen, and groups such as Bread, The Carpenters, and England Dan & John Ford Coley would make popular the format we know today as Soft rock.

Other well-known artists, not specifically rock stars, from the 1960s such as Neil Diamond and Barbra Streisand were continuing to chart.

## Classic rock emerging

*Main article:* [Classic rock](#)

Meanwhile, groups such as Queen, Led Zeppelin, Black Sabbath, AC/DC, Aerosmith, REO Speedwagon, ZZ Top, Van Halen, Golden Earring and The Rolling Stones as well as such solo artists as Peter Frampton were being heard mainly on AM radio and sharing the charts with their soft rock counterparts.

For example, Frampton's 1976 live album *Frampton Comes Alive*, rapidly becoming the best-selling live album of all time, had spawned a number of singles that hit the Top Ten charts, such as "Show Me The Way" and "Baby, I Love Your Way". Aerosmith's rock anthem "Walk This Way", among others, were becoming popular with junior high and high school students. It was an era where both soft and hard rock mixed together. Extremely popular recordings, such as

Led Zeppelin's "Stairway to Heaven" and Queen's "Bohemian Rhapsody," actually put the two together.

## **Rock crosses borders**

In the early 1970s Mexican singer Rigo Tovar took not only the musical elements of rock melody and [blues](#) and fused it with [cumbia](#), and tropical music. He was the first to also use the rock and roll image; sporting long black shaggy hair, ray ban aviator glasses, glam outfits, and tattoos. He also started the use of electric guitars, synthesizers and electronic effects previously unused in Mexican music. In his live performances he would cover songs by Ray Charles and the Beatles. His fame and influence were not limited to Mexico and Latin America but eventually went world wide reaching Europe. Many of today's Mexican "rockeros" cite Rigo as an influence.

# Disco, punk and New Wave (1973-1981)

## Disco

*Main article: [Disco](#)*

While [Funk music](#) had been part of the rock and roll scene in the early 1970s, it would eventually give way to more accessible songs with a danceable beat. The Disco format was propelled by such groups as K.C. and the Sunshine Band, MFSB, The Three Degrees, The O'Jays, Barry White, Gloria Gaynor, CHIC, and The Trammps. Suddenly, many popular hits featured the danceable disco beat, and [discotheques](#) -- previously a European phenomenon - began to open in the U.S., notably Studio 54 in New York, which became the model for dozens of disco clubs nationwide.

The group most associated with the Disco era was The Bee Gees, whose music for the 1977 Paramount film Saturday Night Fever marked the pinnacle of the era. Many mainstream rock acts, including the Rolling Stones, Rod Stewart, Queen and even the Grateful Dead, incorporated disco beats into their releases in attempts to keep up with the trend; many rock radio stations began to adopt all-disco formats.

But by the end of the 1970s an anti-disco backlash occurred as, in the rush to capitalize on the popular format, the overall quality of disco music began to fall and as rock fans reacted to the perceived loss of traditional rock outlets in favor of disco. The anti-disco movement culminated in the disco demolition riot in Chicago during the summer of 1979.

While much of the cachet of disco as a genre had dissipated by the end of the '70s, danceable sounds persisted; disco, in its own way, would spin off [hip hop music](#) (or "rap music") as we know today, when The Sugarhill Gang took portions of Chic's hit "Good Times" and transformed them into "Rapper's Delight", the first hip-hop recording to become a Billboard Top 40 hit single.

## Punk Rock

*Main article: [Punk rock](#)*

[Punk rock](#) started off as a reaction to the lush, producer-driven sounds of disco, and against the perceived commercialism of [progressive rock](#) that had become arena rock. Early punk borrowed heavily from the garage band ethic: played by bands for which expert musicianship was not a requirement, punk was stripped-down, three-chord music that could be played easily. Many of these bands also intended to shock mainstream society, rejecting the "peace and love" image of the prior musical rebellion of the 1960s which had degenerated, punks thought, into mellow disco culture.

Punk developed as more than an aesthetic movement in America, with artists Richard Hell, Television, whom Richard briefly played, Patti Smith, The Ramones, Talking Heads and others of CBGB's taking the stage and changing music for years. The Ramones were the "safer" brand of punk: equally aggressive but mostly apolitical. Richard Hell was the flip side: he was a poet, his band could play their instruments as well, and usually better, than any corporate band. The Punk movement was born out of an intellectual movement, but The Ramones took a "dumbed down" sound to the mainstream. However, Punk spread to England where it became a more violent form of expression with the proto-typical band The Sex Pistols.

The Sex Pistols chose aggressive stage names (including "Johnny Rotten" and "Sid Vicious") and did their best to live up to them, deliberately rejecting anything that symbolized the

establishment in England when they toured. They were most well represented on their first two singles "Anarchy in the U.K." and "God Save the Queen". Despite an airplay ban on the BBC, the record rose to the top chart position in the UK. The Sex Pistols paved the way for many other political bands like The Clash, whose approach was less nihilistic but more overtly political and idealistic. More artier bands like Wire and The Fall gave Punk another side.

As the Pistols toured America, they spread their music as the first wave of Punk had been spread in theirs. Punk was mostly an East-coast phenomenon in the US until the late 1970s when Los Angeles-based bands such as X and Black Flag broke through.

It was also through punk, and to an extent, new wave, that Australia made its first major impacts on the global popular music scene. After Johnny O'Keefe's last major hit in 1961, Australian popular music was dominated by clean-cut family bands. Bubbling beneath the surface, however, was a group of pioneering bands like the [surf](#) band The Atlantics, but it was not until the late 1970s, with acts like The Birthday Party, INXS, SPK, and Midnight Oil offering an energetic experimentalism that the country's role in pop music became manifest.

## New Wave

*Main article: [New Wave music](#)*

Punk rock attracted devotees from the art and collegiate world and soon bands sporting a more literate, arty approach, such as the Talking Heads and Devo began to infiltrate the punk scene; in some quarters the description [New Wave](#) began to be used to differentiate these less overtly punk bands.

If punk rock was a social and musical phenomenon, it garnered little in the way of record sales (small specialty labels such as Stiff Records had released much of the punk music to date) or American radio airplay, as the radio scene continued to be dominated by mainstream formats such as [disco](#) and album-oriented rock. Record executives, who had been mostly mystified by the punk movement, recognized the potential of the more accessible New Wave acts and began aggressively signing and marketing any band that could claim a remote connection to punk or New Wave. Many of these bands, such as The Cars and The Go-Go's were essentially pop bands dressed up in New Wave regalia; others, including The Police and The Pretenders managed to parlay the boost of the New Wave movement into long-lived and artistically lauded careers.

Between 1982 and 1985, influenced by Kraftwerk and Gary Numan, New Wave went in the direction of such New Romantics as Duran Duran, A Flock of Seagulls, Psychedelic Furs, Talk Talk and the Eurythmics, sometimes using the synthesizer entirely in place of guitar. This period coincided with the rise of MTV and led to a great deal of exposure for this brand of [synth-pop](#). Although many "Greatest of New Wave" collections feature popular songs from this era, New Wave more properly refers to the earlier "skinny tie" rock bands such as The Knack or Blondie.

Punk and [post-punk](#) bands would continue to appear sporadically, but as a musical scene, punk had largely self-destructed and been subsumed into mainstream New Wave pop by the mid-1980s, but the influence of punk has been substantial. The [grunge](#) movement of the late 1980s owes much to punk, and many current mainstream bands claim punk rock as their stylistic heritage. Punk also bred other genres, including [hardcore](#), [industrial music](#), and [goth](#).

## Rock diversifies in the 1980s

In the 1980s, popular rock diversified. The early part of the decade saw Eddie Van Halen achieve musical innovations in rock guitar, while vocalists David Lee Roth (of Van Halen) and Freddie Mercury (of Queen) raised the role of frontman to near performance art standards. Concurrently, pop-New Wave bands remained popular, while [pop-punk](#) performers, like Billy Idol and The Go-Go's, gained fame. American [heartland rock](#) gained a strong following, exemplified by Bruce Springsteen, Bob Seger, and others. Led by the American folk [singer-songwriter](#) Paul Simon and the British former prog rock star Peter Dinklage, rock and roll fused with a variety of folk music styles from around the world; this fusion came to be known as "[world music](#)", and included fusions like Aboriginal rock.

## Hard rock, glam metal and Instrumental rock

*Main article:* [Glam metal](#)

*See also:* [Hard rock](#), [Heavy metal music](#), and [Instrumental rock](#)

Heavy metal languished in obscurity until the mid- or late 1970s. A few hard rock bands maintained large followings, like Queen, AC/DC, Led Zeppelin and Aerosmith, and there were occasional mainstream hits, like Blue Öyster Cult's "Don't Fear the Reaper". Music critics overwhelmingly hated the genre, and mainstream listeners generally avoided it because of its strangeness. However this changed in 1978 with the release of the [hard rock](#) band Van Halen's eponymous debut, which ushered in an era of widely popular, high-energy rock and roll, based out of Los Angeles, California.

While bands like Van Halen, Metallica and Megadeth innovated in the genre, and the New Wave of British Heavy Metal (spearheaded by bands such as Judas Priest and Iron Maiden) found fans, a group of musicians formulated what later became known as [glam metal](#). Taking cues from Van Halen, but without their humor, Mötley Crüe, Bon Jovi, and Ratt are often regarded as the first glam metal bands to gain popularity. They became known for their debauched lifestyles, teased hair, feminized use of make-up, clothing (usually spandex,) and over-the-top posturing. Their songs were bombastic, aggressive, and often defiantly macho, with lyrics focused on sex, drinking, drugs, and the occult. After Def Leppard's wildly popular *Pyromania*, and Van Halen's seminal 1984, glam metal became ubiquitous. Many glam metal bands became [one-hit wonders](#), or as David Lee Roth once said of them, "here today, gone later today," (for example, Winger and Slaughter.)

By the middle of the 1980s, a formula developed in which a glam metal band had two hits -- one a soft ballad, and the other a hard-rocking anthem. The original line-up of Van Halen broke up in 1985, creating something of a quality vacuum in the genre; however, in 1987, Guns N' Roses released *Appetite for Destruction*, which became phenomenally successful. Until glam metal's demise in the early-1990s, Guns N' Roses were hard rock's standard-bearers, and influenced its sound by incorporating influences from punk rock, and [thrash metal](#).

[Instrumental Rock](#) was also popularised during this period with Joe Satriani's release of "Surfing with the Alien". With many heavy metal guitarists being virtuosos, many of them felt constrained by their bands and were releasing solo albums. Guitarists such as George Lynch, Yngwie Malmsteen and Steve Morse have all greatly contributed to the genre.

## Alternative music and the indie movement

*Main article:* [Alternative rock](#)

The term *alternative music* (also often known as [alternative rock](#)) was coined in the early 1980s to describe bands which didn't fit into the mainstream genres of the time. Bands dubbed "alternative" could be most any style not typically heard on the radio; however, most alternative bands were unified by their collective debt to [punk](#). Important bands of the '80s alternative movement included R.E.M., Sonic Youth, The Smiths, Pixies, Hüsker Dü, The Cure, and countless others. Artists largely were confined to [indie](#) record labels, building an extensive underground music scene based around college radio, fanzines, touring, and word-of-mouth. Although these groups never generated spectacular album sales, they exerted a considerable influence on the generation of musicians who came of age in the 80s and ended up breaking through to mainstream success in the 1990s. Notable styles of alternative rock during the 80s include jangle pop, [gothic rock](#), college rock, and [indie rock](#). The next decade would see the success of [grunge](#) in the US and [Britpop](#) in the UK, bringing alternative rock into the mainstream.

# Alternative goes mainstream (the 1990s)

## Grunge and the anti-corporate rock movement

*Main article: [Grunge music](#)*

By the late 1980s rock radio was dominated by aging rock artists, slick [corporate rock](#), and hair metal; MTV had arrived and brought with it a perception that style was more important than substance. Any remaining traces of rock and roll rebelliousness or the punk ethic seemed to have been subsumed into corporate-sponsored and mass-marketed musical product. Disaffected by this trend, some young musicians began to reject the polished, glamor-oriented posturing of hair metal, and created crude, sometimes angry music. The American Pacific Northwest region, especially Seattle, became a hotbed of this style, dubbed grunge.

Early grunge bands, particularly Alice in Chains and Soundgarden, took much of their sound from early heavy metal and much of their approach from punk, though they eschewed punk's ambitions towards political and social commentary to proceed in a more nihilistic direction. Grunge remained a mostly local phenomenon until the breakthrough of Nirvana in 1991 with their album *Nevermind*. A slightly more melodic, more completely produced variation on their predecessors, Nirvana was an instant sensation worldwide and made much of the competing music seem stale and dated by comparison, after Guns N' Roses' successful 1991 double-album *Use Your Illusion I and II* experimental hard-rock faded almost completely from the mainstream.

Nirvana whetted the public's appetite for more direct, less polished rock music, leading to the success of bands like Pearl Jam and Soundgarden who took a somewhat more traditional rock approach than other grunge bands but shared their passion and rawness. Pearl Jam were a major commercial success from their debut but, beginning with their second album, refused to buy in to the corporate promotion and marketing mechanisms of MTV and Ticketmaster, with whom they famously engaged in legal skirmishes over ticket service fees.

While grunge itself can be seen as somewhat limited in range, its influence was felt across many geographic and musical boundaries; many artists who were similarly disaffected with commercial rock music suddenly found record companies and audiences willing to listen, and dozens of disparate acts positioned themselves as alternatives to mainstream music; thus [alternative rock](#) emerged from the underground.

## Britpop

*Main article: [Britpop](#)*

While America was full of grunge, post-grunge, and hip hop, Britain launched a 1960s revival in the mid-90s, often called [Britpop](#), with bands like Suede, Oasis, The Verve, Radiohead, Pulp and Blur. These bands drew on myriad styles from the 80s British rock underground, including [twee pop](#), [shoegazing](#) and [space rock](#) as well as traditional British guitar influences like the Beatles and glam rock. For a time, the Oasis-Blur rivalry was similar to the Beatles-Rolling Stones rivalry. While bands like Blur tended to follow on from the Small Faces and The Kinks, Oasis mixed the attitude of the Rolling Stones with the melody of the Beatles. The Verve and Radiohead took inspiration from performers like Elvis Costello, Pink Floyd and R.E.M. with their progressive rock music, manifested in Radiohead's most famous album, *OK Computer*. These bands became very successful, and for a time Oasis was given the title "the biggest band in the world" thanks to an album selling some 14 million copies worldwide but slowed down after band

breakups, publicity disasters in the United States and slightly less popular support. The Verve disbanded after on-going turmoil in the band, but on the other hand Radiohead threw themselves into electronic experimentation in their latest records and have stood the test of time in both the U.K and the USA as a major act.

## Indie rock

*Main article: [Indie rock](#)*

By the mid-90s, the term "alternative music" had lost much of its original meaning as rock radio and record buyers embraced increasingly slick, commercialized, and highly marketed forms of the genre. At the end of the decade, [hip hop music](#) had pushed much of alternative rock out of the mainstream, and most of what was left played [pop-punk](#) and highly polished versions of a grunge/rock mishmash.

Many acts who, by choice or fate, remained outside the commercial mainstream, became part of the [indie rock](#) movement. Indie rock acts placed a premium on maintaining complete control of their music and careers, often releasing albums on their own independent record labels and relying on touring, word-of-mouth, and airplay on independent or college radio stations for promotion. Linked by an ethos more than a musical approach, the indie rock movement encompasses a wide range of styles, from hard-edged, grunge influenced bands like Superchunk to punk-folk singers such as Ani DiFranco.

Currently, many countries have an extensive local [indie](#) scene, flourishing with bands with much less popularity than commercial bands, just enough of it to survive inside the respective country, but virtually unknown outside them.

## Stoner rock

*Main article: [Stoner rock](#)*

With some influences of Psychedelic Rock and riff orientated structure of early Heavy Metal, stoner rock emerged in the late 1980s. Bands such as the Melvins, Kyuss, Fu Manchu, Nebula and Queens of the Stone Age. Characterised by sludgy sounding, heavily distorted amps and detuned guitars, stoner rock tries to simulate the experience of an LSD trip or smoking marijuana. Many stoner rock bands can often play one song for up to 20 minutes with incredible variation in emotion, speed and genre.

Stoner rock remains the cornerstone of the independent recording industry, with few mainstream exceptions. Most notably Josh Homme who was the songwriter for both Kyuss and Queens of the Stone Age.

## Post-grunge and pop punk (1995-2000)

With the death of Kurt Cobain, rock and roll music searched for a new face, sound, and trend. A second wave of alternative rock bands began to become popular, with grunge declining in the mid-90s. Green Day, Foo Fighters, Radiohead, and Creed spearheaded rock radio, and 311 and Rage Against the Machine brought a fresh rap/rock hybrid sound. In 1995, a Canadian pop star, Alanis Morissette, arose, and released *Jagged Little Pill*, a major hit that featured blunt, personally-revealing lyrics. It succeeded in moving the introspection that had become so common in grunge to the mainstream. The success of *Jagged Little Pill* spawned a wave of popularity in the late 90s of confessional rock releases by female artists including Jewel, Tori Amos, Fiona Apple, and Liz Phair. Many of these artists drew on their own alternative rock heroes from the 1980s and early 90s, including the folksy Tracy Chapman and various Riot Grrl bands. The use of introspective lyrics bled into other styles of rock, including those dubbed *alternative*.

The late 1990s brought about a wave of mergers and consolidations among US media companies and radio stations such as the Clear Channel Communications conglomerate. This has resulted in a homogenization of music available. Bands like Green Day and Blink 182 defined pop punk at the end of the 90s. At this time, "nu metal" began to take popular form, it contained a mix of grunge, metal, and hip-hop. Using downtuned 7 string guitars, KoRn first created their heavy crushing riffs in 1994 with their first self-titled album. This then helped spawn a wave of nu metal bands such as Linkin Park, Slipknot, Static-X, Disturbed, and Limp Bizkit.

## Present day (2000-Present)

In the early 2000s the entire music industry was shaken by claims of massive theft of music rights using file-sharing tools such as Napster, resulting in lawsuits against private file-sharers by the recording industry group the RIAA.

After existing in the musical underground, garage rock saw a resurgence of popularity in the early 2000s, with bands like The White Stripes, The Strokes, Jet, The Vines, and The Hives all releasing successful singles and albums. This wave is often referred to as back-to-basics rock because of its raw sound. Currently popular rock trends include pop-punk, often times wrongly referred to as emo which draws its style from softer punk and alternative rock styles from the 1980s. Many new bands have become well-known since 2001, including Jimmy Eat World, Hawthorne Heights, Dashboard Confessional and Taking Back Sunday; however, this subgenre has come to be frequently maligned by many rock enthusiasts. Additionally, the retro trend has led to the revitalization of dance-rock. Bands like Franz Ferdinand, Hot Hot Heat, The Killers and The Bravery mix post-punk sensibilities with electronic beats. The most recent pop-rock successes have been acts such as Fall Out Boy, Relient K, Simple Plan, and Good Charlotte.

The biggest factor that has contributed to the resurgence of rock music is the rise of paid digital downloads in the 2000s. During the 90s, the importance of the buyable music single faded when Billboard allowed singles without buyable, album-separate versions to enter its Hot 100 chart (charting only with radio airplay). The vast majority of songs bought on paid download sites are singles bought from their albums; songs that are bought on a song-by-song basis off artist's albums are considered sales of singles, even though they have no official buyable single.

Meanwhile, "Top 40" music today is dependent on either synthesizer orchestration or sampling, prominent in such pop artists like Gwen Stefani, Ashlee Simpson, Lindsay Lohan, Jessica Simpson, and Kelly Clarkson.

Rap/[hip hop music](#) dominates the US charts pop charts, with artists like 50 cent, Snoop Dogg, Kanye West, Nelly, Eminem and Jay Z selling millions of records since the turn of the millennium. R&B acts like Mariah Carey, Usher and Alicia Keys are very popular on the pop charts, although none of these acts, rap or R&B, sell as many albums as rock did. Nearly all of the best selling albums of all time are still rock.

In many other nations, such as the UK and Australia, rock figures much more prominently in album sales than in the US. Rap and hip hop, although popular in those nations, are not as dominant as in the USA. American Bands such as The White Stripes, The Killers and The Strokes have more success in the UK than in the USA, and British bands such as The Libertines, Franz Ferdinand, Coldplay, Oasis, Kaiser Chiefs and Arctic Monkeys are still the UK's biggest selling artists. Emo remains a marginal genre, although it is arguably growing in popularity in the UK.

## **Social impacts**

The influence of rock and roll is far-reaching, and has had significant impact worldwide on fashion, film styles, and attitudes towards sex and sexuality and use of drugs and alcohol. This impact is broad enough that "rock and roll" may also be considered a life style in addition to a form of music.

## Trivia

- The first record released in Britain to feature the words *Rock and Roll* was "Bloodnock's Rock And Roll Call", a 1956 record from The Goon Show.
- There have been many songs with the title "Rock and Roll" from The Treniers in the 1950s to Led Zeppelin, The Velvet Underground, and Gary Glitter in the 1970s as well as Rainbow and Rolling Stones. However, Trixie Smith is possibly the first artist to incorporate the words in the 1922 record "My Baby Rocks with One Steady Roll".

# Rockabilly

**Rockabilly** is the earliest form of [rock and roll](#) as a distinct style of music. It is a fusion of [blues](#), hillbilly boogie, [bluegrass music](#) and [country music](#), and its origins lie in the American South. As Peter Guralnick writes, "Its rhythm was nervously uptempo, accented on the offbeat, and propelled by a distinctively slapping bass....The sound was further bolstered by generous use of echo, a homemade technique refined independently by Sam Phillips and Leonard Chess in Chicago with sewer pipes and bathroom acoustics." While recording artists such as Bill Haley were playing music that fused [rhythm and blues](#), [western swing](#) and country music in the early 1950s, and Tennessee Ernie Ford performed in a somewhat similar style on songs such as "Smokey Mountain Boogie," they were not playing rockabilly. As Nick Tosches writes, "By the early 1950s, it was not uncommon to encounter simultaneous country and rhythm-and-blues recordings of the same song." And he points out that the Delmore Brothers and Hank Williams were performing, in the late 1940s, music that could be called rock and roll. But rockabilly was a stripped-down version of its various sources, and thus a specific stylistic moment in the evolution of music that before had existed in many forms.

Bill Flagg was the first to name the music when he recorded for Tetra Records in 1955 - 1956. His song "Go Cat Go" went into the National Billboard charts in 1956. He is a member of the Rockabilly Hall Of Fame.

Elvis Presley's 1954 Memphis sessions for Sam Phillips's Sun Records produced arguably the first rockabilly recordings. "That's All Right," first performed by Arthur Crudup, was a reworking of a blues tune, done with overtones of country music. "Blue Moon of Kentucky," by Bill Monroe, was a bluegrass standard, done with overtones of blues.

During roughly the same period of time, a young singer/songwriter down in Lubbock, Texas named Buddy Holly was busy taking elements of various musical styles (blues, country, gospel, south of the border, etc...) and melding them into what later became the "Tex-Mex" sound. Holly's pioneering efforts are legendary, and the rockabilly sound was a strong element in much of his work.

Carl Perkins, who also recorded for Sun, is another performer whose recordings helped to define the genre. "Blue Suede Shoes", written by Carl, is considered a classic of the style. The early recordings of Jerry Lee Lewis, Johnny Cash, Dale Hawkins, Charlie Feathers, Hasil Adkins, Gene Vincent, Billy Lee Riley and Roy Orbison are also considered essential, although Cash, Vincent, Lewis and Orbison each went on to perform in other styles. Eddie Cochran and Ricky Nelson also are considered rockabilly performers; they were not, however, from the South, although Nelson's guitarist, James Burton, grew up in Shreveport.

Although the influence of rockabilly, both as a musical style and as a set of attitudes and gestures, has never waned, Holly's death in a plane crash in 1959 tended to mark the end of the classic rockabilly era. In the 1980s, The Stray Cats led a brief revival of interest in rockabilly, while another revival followed in the 1990s with bands like High Noon, Big Sandy and the Fly-Rite Boys, the Dave and Deke Combo, The Racketeers, and many others. And bands like The Cramps, Tav Falco's Panther Burns, Reverend Horton Heat, Southern Culture on the Skids, Batmobile and more importantly The Meteors merged the music with Punk rock/Horror, forming a distinct sub-genre referred to as [psychobilly](#). Dire Straits did a rockabilly track, The Bug, on their 1991 album On Every Street.

Guralnick writes, "Rockabilly is the purest of all rock 'n' roll genres. That is because it never went anywhere. It is preserved in perfect isolation within an indistinct time period....".

In 1997, the Rockabilly Hall of Fame was founded by Bob Timmers to present early rock and roll history and information relative to the artists and personalities involved in this pioneering American music genre.

## Some Rockabilly Acts

More recent rockabilly performers have merged the style with western swing and [jump blues](#) to produce a music that combines elements of music common to the late 1940s and 1950s, without adhering to the strict practices of rockabilly itself.

## The Fashion Sub-Culture

Worthy of mentioning is the fact that devoted followers of Rockabilly music and its fashion are known as Rockabillys, or "Billys" within the "scene." The hairstyle is usually a tame or more exaggerated "pomp" or pompadour hairstyle as was popular with 1950s artists like Buddy Holly, Jerry Lee Lewis and revivalists stars from the '80s, The Stray Cats. This hair style is usually maintained with large amounts of pomade hair wax from traditional brand names like Brylcreem, Black & White Pluko, Murrays, and Layrite. It was rumored that Elvis Presley and Johnny Cash both used Genuine B&W Pomade to hold up their hair with a thick and shiny look.

The clothing is largely reflective of the popular styles worn by the musicians in the 1950s themselves; slacks, pastel colored and Daddy-O styled shirts, baggy coats with the shirt collars worn over the coat collar, creeper shoes in every colour of the spectrum, with black and white being the most popular. Of course Levi jeans (501 or 505) and more casual items are also part of the wardrobe, to include t-shirts and motorcycle jackets. In regard to fashion, Rockabillys look very similar to other music/fashion subcultures like Greasers, Teds (Teddy Boys) and [Rockers](#) of the same era. All have a love and respect of classic American cars, British motorcycles, Rock and Roll, and vintage clothing. And all have a steady and popular revivalist following all over the world.

# Rocker

**Rocker** was a term originally applied in a derogatory manner to British motorcycle riding youths in the 1960s, but was later taken by riders, and their pillions. Rockers were almost entirely defined in opposition to their famous antitheses of the same time, the Italian motorscooter riding Mods, or Modernists. Mods and Rockers rocketed to fame in 1964 by the sensationalistic media reporting of what by today's standards was very mild youth behaviour; the famous Bank Holiday clashes between both parties on the English South Coast holiday resorts of Clacton, Margate and Brighton. Before this time, young motorcyclists had not been grouped together and labelled in such a manner.

## Music and Fashion

**Rockers** are generally associated with 1950s and early 1960s-era Rock and Roll by artists like Gene Vincent, Eddie Cochran, Chuck Berry and the early Elvis Presley but a Rocker was a motorcyclist first and foremost not a mere fashion or youth music trend. Theirs was a style born out of necessity and practicality and they will generally be seen riding their motorcycles wearing a classic open face style of helmet and aviator goggles, especially the "pudding-basin" short style of helmet such as those still made by Davida.

The real **Rocker's** dress style is dominated by the wearing of leather jackets - especially the traditional design but heavily badged, studded and hand painted or decorated "Brando-style" lancer front motorcycle leather jacket design. Blue or black denim jeans, biker boots and the ubiquitous James Dean quiff are also worn. Central to the Rocker Movement in its 60s heydays was The 59 Club of Paddington. Also known as The Fifty Nine Club, a church based youth club that opened its doors to the young tearaway bikers, the folk devils of their day, in 1962 and which grew to have over 20,000 members under the leadership of Fathers Graham Hullett and Bill Shergold. By far the image and character that epitomises the look and spirit of the rocker, is Marlon Brando portraying " Johnny " in the 1954 Columbia Pictures movie, "The Wild One".

## Cultural Background

The Rocker Movement came about through a number of unique influences; the end of Post-WWII rationing in the UK and a general rise in prosperity for working class youth, the availability of credit and finance for young people, the influence of American popular music & cinema, the building of race track-like new arterial ring roads about British cities and the transport cafes which became their natural haunts. All of these coinciding at the same time as British motor engineering, and motorcycle industry, was still at the centre of world. Indeed, 1959 was the year that the most British motorcycles were ever made.

Whilst the **Rockers'** attitude may have been born from Cowboy movies and Rock and Roll heroes, as far as their motorcycle were concerned, they associated themselves with their European race track heroes and the trend of motorcycles know as Cafe Racers were born. Standard factory designed motorcycles striped down, tuned up and modified to appear like a racing bike but used only to race on public roads between cafes [ pronounced "caffs" ] the Rockers were known to frequent, such as The Ace Cafe, Chelsea Bridge tea stall, Ace of Spades, Busy Bee, Johnsons and others.

Largely due to their sense of dress and dirtiness, in an age when conservative public decorum still existed, the **Rockers** were not widely welcomed by other venues such as pubs and dance halls. This remained true right through out their history until the recent "Born Again Biker" or "Yuppie Biker" age. **Rockers** were also reviled by the British Motorcycle industry and general enthusiasts as being bad for the industry and the sport. Cafe Racers were a particularly European style of motorcycle, common also in Italy - the then other great motorcycle manufacturer and racing nation - in contrast to American cruiser style.

## Cafe Racers

The term Cafe Racer is still used to describe motorcycles of a certain style and some motorcyclists still use this term in self-description. A cafe racer is a motorcycle that has been modified for speed and good handling rather than comfort; single racing seats, low handle bars such as ace bars or even one-sided "clip-ons" mounted directly onto the front forks for control and aerodynamics, half or full race fairings, large racing petrol tanks often left unpainted, swept back exhausts and rearset footpegs in order to give better clearance whilst cornering at speed. These motorcycles were lean, light and handled road surfaces well. The most defining machine of the Rocker heyday was the homemade Norton Featherbed framed and Triumph Bonneville engined machine called "The Triton ". It used the most common and fastest racing engine combined with the best handling frame of its day.

## Rocker Reunion

In the early 70s, as the British **Rocker** and hard core motorcycle scene fractured and evolved under new influences coming in from California, both Hippy and Hells Angels. The remaining **Rockers** became known as Greasers, not to be confused with the American usage of "greaser", and the scene had all but died out in form but not spirit. However, in the early '80s though, The Rocker Reunion Club was started by Len Paterson and a handful of original Chelsea Bridge Boys who held nostalgic Rocker Reunion Pissups [ dances ] and Rocker Reunion Runs to historic destination such as Brighton Beach. Within a few years these attracted 10 - 12,000 like minded revivalists, widespread media attention and neo-converts.

The successes of these Runs and Pissups were later capitalised by ex-police officer Mark Wilsmore. Wilsmore, having spent many, many hours with original rockers such as Len Paterson, Derek Fox and experts in crucial items such as Lewis Leather motorcycle jackets, was directly encouraged and inspired by them to buy and redeveloped The Ace Cafe transport cafe but went on to, controversially, market the Rockers-style commercially by trademarking the word "Rocker" for his own exclusive use, threatening original rockers and their suppliers with legal action and using police contacts to shut down rocker events.

The **Rocker's** look was later adopted by many Punk bands and is today an influence on the [Rockabilly](#) revival and [Psychobilly](#) scenes. Today, the revival continues to grow, the modern day Rocker-style having followings all over the world, especially in Japan where it was originally lead by Koji Baba who attended the original Rocker Reunions, but also in the USA and Australia. Now as a cafe racer riding scene, it often exists now as a counterpoint to the crass, bloated, heavily corporate and often violent Harley-Davidson club biking scene.

The emphasis of the **Rocker** fashion is rooted in a simple nostalgic look, born of practicality, that began in the 1950s and 1960s; turned-up Levi Jeans and leather motorcycle jacket, often handpainted brands or personal logos. This fashion has minute details such as the wearing of Esso Man key chain, 59 club and other motorcycle brand patches adorning the motorcycle jacket, the use of motorcycle tank badges as belt buckles, white silk scarf and long white socks folded over the top of motorcycle boots which have all been adopted by Fashion designers on a regular basis for their collection. Indeed the leather jacket, such as the Aviakit by brand leader Lewis Leathers have been accepted as Fashion classics and original models highly collectible and prized.

## Rocker Jackets

***" Very little has come out of the whole teen-aged development that has more beauty than decorated Rocker jackets. They show the creative impulse at its most pure and inventive. Without any sentimentality, it is possible to say that they constitute an art of high degree, symmetrical, ritualistic, with a bizarre metallic brilliance and a high fetishistic power. " src : Jeff Nutall, Bomb Culture***

## Modern Day

The Rocker of the 21st century has evolved from its humble working-class British beginnings more than 40 years ago and so has the fashion ; Full length motorcycle boots such as the classic Lewis Leather styles are still used, but Winkle Pickers, sharp pointed shoes are no longer so common. Engineer boots and Doc Martens being the norm. Brothel Creepers, thick crepe soled shoes, have worked themselves back into fashion, as originally worn by the " Teds " or Teddy Boys. Rockers continue to wear motorcycle jackets with leather trousers and the ubiquitous white silk scarf while riding their bikes. Also the use of Levi 501 or 505's has always maintained as part of Rocker fashion.

To complete the look, Rockers would tend to ride a classic British motorcycle, preferably but not exclusively a Cafe racer, usually Triumph or Norton or the Triton Motorcycle hybrid of the two, but sometimes a BSA, Royal Enfield or Matchless from the 1960s, as this was the heyday of the British motorcycle industry. These bikes now lovingly restored. Classically styled European cafe racers are now also seen, interpretations of the theme but using Moto Guzzi or Ducati, and also Classic Japanese engines albeit in British made frames such as those by Rickman.

## Sub-cultural references

**Rockers** are a sub-culture, even within motorcycling, that persists to this day and should not be confused with the similar looking Greasers, as in the American usage of the term, Psychobillys or [punks](#) such as The Clash, The Ramones, etc., who have taken style elements from the Rockers. The British use of the terms Greasers/Rockers are fairly interchangeable. Strictly speaking, British Greasers being a short-lived development in the early 1970s somewhere between the original Rockers and the long haired bikers of the Hippy or Hells Angels era.

Latterly, the term Rocker has also been used more generically in the USA to describe fans of Heavy Metal or Hard Rock music, and in Germany to define a completely different type of motorcyclist. Namely those in cult-like backpatch motorcycle clubs, as in "Rockerbanden", to which they should not be confused with. Rocker is currently, or was recently, quite erroneously the code name of widescale investigation by Interpol into such outlaw biker gang activity. As the defining element for Rockers is having or riding pillion on a motorcycle, "Wot no bike?" or "N.C.N.R." (No Cunt, No Ride) were mottos famously painted onto jackets of that age. Interesting, many of the original Punk Rocker generation also rode motorcycles and even, such as Dave Vanian of The Damned, attended the 59 Club / Fifty Nine Club.

Particularly unique, **Rockers** as a group found drugs of any kind totally abhorrent. This was because they valued physical prowess so highly. In their book, taking drugs - which by this time was widespread amongst Mods and Beatniks was unmanly. It was cheating. In a kind of street Bushido spirit, if you had to resort to drugs to give you nerves or confidence then you couldn't be much of a man. According to Johnny Stuart in *Rockers! Kings of the Road*,

[t]hey had no knowledge of the different sorts of drugs. To them amphetamines, cannabis, heroin were all drugs - something to be hated. Their ritual hatred of Mods and other sub-cultures was based in part on the fact that these people were believed to take drugs and were therefore regarded as sissies. Their dislike of anyone connected with drugs was intense.

As pop culture developed into the late 1960s, and lost its focus on reality, the rockers provided a counterpoint with their allegiance to a purer, more basic musical and lifestyle tradition. Until the explosion of Punk in the mid 1970s, it was the leather boys that kept this style of music alive. Rising out of a largely underground scene, the Rocker revival scene gathers worldwide media attention which has brought in an influx of both new younger converts as well as returning original middle aged riders, internationally. Finally, it has also gained the acceptance of the motorcycling industry who have started to make Retro or Cafe Racer bikes for individuals to buy - especially in Japan where the market leaders have their factories - thereby ensured that as a motorcycling tradition, **Rocker** Movement was not going to die. It might just have to suffer being re-marketed as a Paul "Mod" Smith designed handbag by Triumph motorcycles instead.

# Roman School

In music history, the **Roman School** was a group of composers of predominantly church music, in Rome, during the 16th and 17th centuries, therefore spanning the late [Renaissance](#) and early [Baroque](#) eras. The term also refers to the music they produced. Many of the composers had a direct connection to the Vatican and the papal chapel, though they worked at several churches; stylistically they are often contrasted with the [Venetian School](#) of composers, a concurrent movement which was much more progressive. By far the most famous composer of the Roman School is Giovanni Pierluigi da Palestrina, whose name has been associated for four hundred years with smooth, clear, polyphonic perfection. However, there were other composers working in Rome, and in a variety of styles and forms.

## History and Characteristics

While composers had almost certainly been working in Rome continuously for the thousand years since the time of Gregory the Great, the development of a consistent style around the middle of the 16th century, due in part to the musical requirements of the Counter-Reformation, led to their being grouped together by music historians under this single label.

The music of the Roman School can be seen as the culmination of a development of polyphony through the infusion of music of the Franco-Netherlandish school during the last hundred years. Franco-Netherlandish composers had long been coming to Italy to live and work—Josquin, Obrecht, Arcadelt, and many others made the long journey, and their musical style was decisive on the formation of the Italian styles. Under the guidance of the Vatican, and with the choir of the Sistine Chapel being one of the finest of the time, it was perhaps inevitable that the stylistic center of sacred polyphony would turn out to be Rome.

The Council of Trent, which met from 1543 to 1563, had a significant impact on the music of the Roman School: indeed it can be argued that these reforms in the Catholic Church, which were part of the Counter-Reformation, *defined* the music of the Roman School. The Council of Trent recommended that sacred music, especially for use in church, be written in a dignified, serious style. The Council allowed polyphony—a common misconception is that they banned it outright, but this is false—however they did require that text which was sung be clearly understandable. In addition, while they did not ban the use of secular melodies as source material for [masses](#) and [motets](#), such use was discouraged.

The combination of the reforms of the Council of Trent with the presence of the extremely talented composers inheriting the Franco-Netherlandish style, was the production of a body of music which has sometimes been held to represent the peak of perfection of [Renaissance](#) polyphonic clarity. The subject matter of "16th Century Counterpoint" or "Renaissance Polyphony" as taught in contemporary college music curricula is invariably the codified style of the Roman school, as it was understood by Johann Fux in the early 18th century. It is important to recognize, though, that the "Palestrina style" was not the only polyphonic style of the time, though it may have been the most internally consistent. The polyphonic style of Palestrina may have been the culmination of a hundred years of development of the Franco-Netherlandish style, but it was one of many streams in the late 16th century, and significantly contrasts with the music of the Venetian school to the north, as well as the music being produced in France and England at the same time.

Other composers living and working in Rome, while not considered members of the Roman School, certainly influenced them. The most famous of these is probably Luca Marenzio, whose madrigals were wildly popular in Italy and elsewhere in Europe; some of the composers of the Roman School borrowed his expressive techniques, for instance word-painting, for occasional use in a liturgical setting.

While the Roman School is considered to be a conservative musical movement, there are important exceptions. Rome was the birthplace of the [oratorio](#), in the work of Giovanni Francesco Anerio and Emilio de' Cavalieri; the score for Cavalieri's *Rappresentazione di Anima et di Corpo* is the earliest printed score which uses a figured bass. The style is similar to the style of monody being developed in Florence at approximately the same time; indeed there was considerable competition between composers in those two musical centers. The success of *Rappresentazione* was such that the monodic style became common in much Roman music in the first several decades of the 17th century.

Later composers of the Roman School included Gregorio Allegri, composer of the famous *Miserere* (c.1630). This piece was guarded closely by the papal chapel; it was considered so beautiful that copies were not allowed to circulate. A favorite story involves the 14-year-old Mozart, who made the first illegal copy by transcribing it from memory after hearing it only twice. Many of the later composers of the Roman School continued to write in the polyphonic

style of the 16th century, known then as the *stile antico*, or the [prima pratica](#), in distinction to the newer styles of monody and [concertato](#) writing which defined the beginning of the [Baroque](#) era.

## Composers

Members of the Roman School, including some who were active in Rome for only part of their careers, are as follows:

Giovanni Pierluigi da Palestrina (c1525–1594)  
Giovanni Animuccia (c1520-1571)  
Felice Anerio (c1564–1614)  
Giovanni Francesco Anerio (c1567–1630) (Younger brother of Felice)  
Gregorio Allegri (1582–1652) (Composer of the famous Miserere)  
Paolo Bellasio  
Antonio Cifra (1584–1629)  
Domenico Allegri (c1585–1629)  
Marc Antonio Ingegneri (c1545–1592)  
Giovanni Maria Nanino (1543–1607)  
Emilio de' Cavalieri (c1560–1602)  
Annibale Stabile (c1535–1595)  
Giovanni Dragoni (c1540–1598)  
Francesco Soriano (c1548–1621)  
Paolo Quagliati (c1555–1628)  
Ruggiero Giovannelli (c1560–1625)  
Giovanni Bernardino Nanino (1560–1623)  
Stefano Landi (1586 or 1587–1639)  
Virgilio Mazzocchi (1597–1646)  
Francesco Foggia (1604–1688)  
Annibale Zoilo  
Bartolomeo Roy  
Giovanni de Macque  
J. Matelart  
René de Mel

## Contemporary classical music

The era of **Romantic music** is defined as the period of European classical music that runs roughly from the early 1800s to the first decade of the 20th century, as well as music written according to the norms and styles of that period. The Romantic period was preceded by the classical period, and was followed by the modern period.

Romantic music is related to Romantic movements in literature, art, and philosophy, though the conventional periods used in musicology are now very different from their counterparts in the other arts, which define "romantic" as running from the 1780s to the 1840s. The Romanticism movement held that not all truth could be deduced from axioms, that there were inescapable realities in the world which could only be reached through emotion, feeling and intuition. Romantic music struggled to increase emotional expression and power to describe these deeper truths, while preserving or even extending the formal structures from the classical period.

The vernacular use of the term **romantic music** applies to music which is thought to evoke a soft or dreamy atmosphere. This usage is rooted in the connotations of the word "romantic" that were established during the period, but not all "Romantic" pieces fit this description. Conversely, music that is "romantic" in the vernacular sense is not necessarily linked to the Romantic period.

# Trends of the Romantic period

## Musical language

The Romantic era established the concept of tonality to describe the [harmonic](#) vocabulary inherited from the [baroque](#) and [classical](#) periods. Romantic composers sought to fuse the large structural harmonic planning demonstrated by Bach, Haydn, Mozart, and Beethoven with their own chromatic innovations, in order to achieve greater fluidity of movement, greater contrast, and to meet the needs of longer works. [Chromaticism](#) grew more frequent and varied in use, as did dissonance. Composers modulated to increasingly remote keys, and modulations were often less extensively prepared than in the classical era; sometimes, instead of a pivot chord, a pivot note was used. Franz Liszt and others sometimes enharmonically "spelled" this note in a special way (for example, changing a C sharp into a D flat) to modulate into even more distant keys. The properties of the diminished seventh [chords](#), which enables modulation to almost any key, were also extensively exploited. Composers such as Beethoven (who is often regarded as the first Romantic composer) and later Richard Wagner expanded their harmonic language to include previously-unused [chords](#), or to treat existing chords in different ways. Wagner's Tristan chord, found in *Tristan and Isolde*, has had much written about it attempting to explain exactly what harmonic function it serves.

Romantic music analogized music to poetry and to rhapsodic and narrative structures, and at the same time created a more systematic basis for the composing and performing of concert music. The Romantic era codified previous practices, such as the [sonata form](#), and then almost immediately began to extend them. There was an increasing focus on [melodies](#) and [themes](#), as well as an explosion in the composition of [songs](#). The emphasis on melody found expression in the more and more extensive use of [cyclic form](#), which turned out to be an important unifying device for the much longer pieces that became common during the period.

All these trends — greater harmonic elusiveness and fluidity, longer and more powerfully-placed melodies, poesis as the basis of expression, the mixing of literature and music — were present to one degree or another prior to the Romantic period. However, the Romantic period adopted them as the central pursuit of music itself. Romantic composers were aided by improvements in technology, which provided significant changes in the language of music, ranging from an increase in the range and power of the [piano](#) to improvements in the sound and reach of the [symphony orchestra](#).

## Non-musical influences

One of the controversies that raged through the Romantic period was the relationship of music to external texts or sources. While music with a point or a program ([program music](#)) was common prior to the 19th century, the conflict between formal and external inspiration became an important aesthetic issue during Romantic era.

The controversy began during the 1830s with Hector Berlioz's *Symphonie Fantastique*, which was presented with an extensive program text, causing critics and professors to pick up their pens. Prominent among the detractors was François-Joseph Fétis, the head of the newly-founded Brussels Conservatory, who declared that the work was "not music". Robert Schumann defended the work, but not the program itself, saying that good music would not be hurt by bad titles, but good titles would not save a bad work. It was left to Franz Liszt to defend the idea of extra-musical inspiration.

This rift grew more pronounced as time progressed, with polemics delivered from both sides. For the believers in "absolute" music, formal perfection rested on musical expression obeying the schematics laid down in previous works, most notably the [sonata form](#) then being codified. To the adherents of program music, the rhapsodic expression of poetry or some other external text was, itself, a form. They argued that bringing the artist's life into a work required the form to follow the narrative. Both sides pointed back to Beethoven as their inspiration and justification. This rift would become codified by the conflict between followers of Johannes Brahms and Richard Wagner: Brahms was taken to be the pinnacle of absolute music, without a text or other outside reference, and Wagner the believer in the poetic "substance" shaping the harmonic and melodic flow of the music.

The forces that brought this controversy about are complex. The rise in importance of Romantic Poetry is certainly one of them, as was the increasing market for songs which could be sung in [concerts](#), or played in the home. Another is the changing nature of concerts themselves: as concerts moved from presentations of a wide variety of works to being more specialized, there was increasing demand for instrumental works possessing greater expressiveness and specificity.

Examples of extra-musical inspiration include Liszt's Faust Symphony, Dante Symphony, and various symphonic poems, Tchaikovsky's Manfred Symphony, Mahler's First Symphony (based on the novel Titan), and Saint-Saëns' The Carnival of the Animals (from which the popular The Swan is drawn.) Composers such as Schubert used song melodies in their extended works, and others, such as Liszt, transcribed opera arias and songs into purely instrumental works.

## Romantic opera

In opera, there was a tendency for the forms established in classical and baroque opera to be loosened, broken, and merged into each other. This reached its climax in Wagner's operas, in which [arias](#), [choruses](#), recitatives and ensemble pieces cannot easily be distinguished from each other. Instead there is a continuous flow of music.

Other changes occurred as well. The decline of castrati led to [tenors](#) being given the heroic lead in operas as a rule, and the [chorus](#) took on a more important role. Towards the end of the Romantic period, verismo opera, depicting realistic, rather than historical or mythological, subjects became popular in Italy. France followed with operas such as Bizet's Carmen.

## Nationalism

A number of romantic composers wrote nationalist music, music which had a particular connection to a particular country. This manifested itself in a number of ways. The subjects of Mikhail Glinka's [operas](#), for example, are specifically Russian, while Bedřich Smetana and Antonin Dvorak both used rhythms and themes from Czech folk dances and songs. Late in the 19th century, Jean Sibelius wrote music based on the Finnish epic, the Kalevala and his piece 'Finlandia' became a symbol of Finnish nationalism.

## Instrumentation and scale

As in other periods, instrumentation continued to improve during the romantic era. Composers such as Hector Berlioz orchestrated their works in a way hitherto unheard, giving a new prominence to [wind instruments](#). The size of the "standard" orchestra grew, and began to include instruments, such as the [piccolo](#) and cor anglais, that were previously rarely-used. Mahler's *Symphony No. 8* is known as the *Symphony of a Thousand* because of the massive choral and orchestral forces required to perform it.

In addition to using larger orchestral forces, works in the Romantic era tended to become longer. A typical symphony by Haydn or Mozart lasts twenty to twenty-five minutes. In contrast, Beethoven's Third Symphony, generally considered the beginning of Romanticism, lasts at least forty-five minutes. The trend towards long, large scale works requiring substantial orchestral forces was expanded through the symphonies of, among others, Anton Bruckner, finally reaching its peak in Mahler's symphonies, with his works ranging from roughly an hour in length (the First and Fourth symphonies), to an hour and a half and longer (the Second, Third, and the Ninth).

The Romantic period also saw the rise of the instrumental virtuoso. The violinist Niccolò Paganini was one of the musical stars of the early 19th century, though his fame was usually put down as much to his charisma as his technique. Liszt, in addition to his skills as a composer, was also a very popular virtuoso pianist. The presence of such virtuosos on a concert program was more likely to attract a large audience than the composers of the music.

# Brief Chronology of Musical Romanticism

## Classical roots of Romanticism (1780-1815)

In literature, the Romantic period is often said to begin in the 1770s or 1780s with a movement known as "storm and struggle" in Germany. It was attended by a greater influence of Shakespeare and of folk sagas, whether real or created, as well as the poetry of Homer. Writers such as Goethe and Schiller radically altered their practices, while in Scotland Robert Burns began setting down folk music. This literary movement is reflected in the music of the "classical" era composers in a variety of ways, including Mozart's work in German opera, the choice of songs and melodies to set for commercial works, and a gradually increasing violence in artistic expression. However, as long as most composers worked in court, and for royal patronage, their ability to engage in "romanticism and revolt" was strictly limited. Mozart's troubles in staging *The Marriage of Figaro*, which was banned as revolutionary, are a case in point.

Even in purely musical terms, romanticism drew its fundamental substance from the structure of classical practice. The classical era saw an increase in compositional and playing standards, and the creation of standardized forms and bodies of musicians. It was not without reason that E.T.A. Hoffmann called Mozart, Beethoven and Haydn the "three Romantic composers". One of the most crucial undercurrents in the classical era is the role of chromaticism and harmonic ambiguity. All of the major classical composers used harmonic ambiguity and the technique of moving rapidly across keys without establishing a true key. One of the most famous examples is the "harmonic chaos" at the opening of Haydn's *The Creation*. However, for all of these excursions, the tension in the music was based on articulated sections, movement towards the dominant or relative major, and a transparency of texture.

By the 1810s, the use of chromaticism and the minor key, and the desire to move through more keys for a deeper range to music, had been combined with a need for greater operatic reach. While Beethoven would later be regarded as the central figure in this movement, it was composers such as Clementi and Spohr who represented the contemporary taste in incorporating more chromatic notes into their thematic material. The tension between the desire for more "color" and the classical desire for structure led a musical crisis. One response was to move to opera, where text could provide structure even where there were no formal models. ETA Hoffmann is principally known as a critic nowadays, but his opera *Undine* of 1814 was a radical innovation in music. Another response to the crisis was to move to shorter forms, including some novel ones such as the nocturne, where the intensity of the harmony itself was enough to carry the music forward.

## Early Romantic (1815-1850)

By the second decade of the 19th century, the shift towards new sources for music, along with an increasing chromaticism in melody and the desire for more expressive harmony, became a palpable stylistic shift. The forces underlying this shift were not only musical, but economic, political and social. The stage was set for a generation of composers who could speak to the new environment of post-Napoleonic Europe.

The first wave of these composers is generally regarded to be Ludwig Spohr, ETA Hoffman, Carl Maria von Weber and Franz Schubert. These composers grew up amidst the dramatic expansion of concert life during the late 18th and early 19th centuries, and this shaped their subsequent styles and expectations. Many regarded Beethoven as the example to follow, or at

least aspire to. The chromatic melodies of Muzio Clementi and the stirring operatic works of Rossini, Cherubini and Mehul, also had an influence. At the same time, the setting of folk poetry and songs for voice and piano, to serve a growing market of middle-class homes where private music-making was becoming an essential part of domestic life, was a new and important source of income for composers.

The crucial works of this wave of Romantics were the song cycles and symphonies of Franz Schubert, and the operas of Weber, particularly *Oberon*, *Der Freischütz* and *Euryanthe*. Schubert's work was only played before limited audiences at the time, and would only gradually produce a wider impact. In contrast, the compositions of John Field quickly became well-known, partly because he had a gift for creating small "characteristic" piano forms and dances.

The next cohort of Romantic composers includes Franz Liszt, Felix Mendelssohn, Frédéric Chopin, and Hector Berlioz. All were born in the 19th century, and began producing works of lasting value early in their careers. Mendelssohn was particularly precocious, having written two string quartets, a string octet and orchestral music before even leaving his teens. Chopin would focus on compositions for the piano, including his etudes and two piano concerti. Berlioz would produce the first important post-Beethoven symphony with his programmatic *Symphonie Fantastique*.

At the same time, what is now labelled "Romantic Opera" became established with a strong connection between Paris and northern Italy. The combination of French orchestral virtuosity, Italianate vocal lines and dramatic flare, along with texts drawn from increasingly popular literature, established a norm of emotional expression which continues to dominate the operatic stage. The work of Bellini and Donizetti was immensely popular at this time.

An important aspect of this phase of Romanticism was the wide popularity of piano concerts (or "recitals", as they were called by Franz Liszt), which included improvisations on popular themes, short works, and the performance of longer works such as the sonatas of Beethoven and Mozart. One of the most prominent exponents of Beethoven was Clara Wieck, who would later marry Robert Schumann. The increase in travel, facilitated by rail and later by steamship, created international audiences for piano virtuosos such as Liszt, Chopin and Thalberg. Concerts became events in themselves. This phenomenon was pioneered by Niccolò Paganini, the famous violin virtuoso.

During the late 1830s and 1840s, the full flowering of this musical generation was presented to the public, including the music of Robert Schumann, Giacomo Meyerbeer and the young Giuseppe Verdi. It should be noted that "Romanticism" was not the only, or even the dominant style of music making at the time - a post-classical style exemplified by the Paris Conservatoire, as well as court music, still dominated concert programs. This began to change with the rise of institutions, such as symphony orchestras with regular seasons, a trend promoted by Felix Mendelssohn himself. Music was regarded as a quasi-religious experience, and the "Philharmonic" society became part of a concert as a time for deep engagement in the music, in contrast to the less formal manners of previous concert life.

It was at this point that Richard Wagner produced his first successful operas, and began arguing for a radically expanded conception of "musical drama". A self-described revolutionary, in constant trouble with both creditors and the authorities, he began gathering around him a body of like-minded musicians, including Franz Liszt, who would dedicate themselves to making the "Music of the Future".

Literary Romanticism is generally regarded to have ended in 1848, with the revolutions of that year marking a turning point in the mood of Europe, or at least the perception of where the cutting edge in music and art lay. With the rise of a self-described "realist" ideology, as well as the deaths of such figures as Paganini, Mendelssohn and Schumann, along with Liszt's retirement from concert performance, a new wave of music making had arrived. Some have argued that, like poetry and painting, this new wave should be identified as Victorian rather than Romantic, but this is at present a minority position. Instead, the late 19th century is described as being the "High Romantic".

## **Late Romantic Era (1850-1910)**

As the 19th century moved into its second half, many of the social, political and economic changes set in motion in the post-Napoleonic period became entrenched. Telegraph and railway bound the European world ever closer together. The nationalism that was an important strain of early 19th century Romantic music became formalized by political and linguistic means. Literature for the middle class audience became the fixture of publishing, including the rise of the novel as the primary literary form.

Many of the figures of the first half of the 19th century had retired, died, or reached the end of their careers. Many others struck out in new directions, taking advantage of the greater regularity of concert life, and the greater financial and technical resources that were available. In the previous 50 years numerous innovations in instrumentation, including the double escarpment piano action, the valved wind instrument, and the chin rest for violins and violas, had gone from novelty to standard. The dramatic increase in musical education meant a wider public for piano music and sophisticated concert music. The establishment of conservatories and universities created centers where musicians could make stable careers teaching others to play, rather than being entrepreneurs relying on their own resources. The sum of these changes can be seen in the titanic wave of symphonies, concerti and "tone poems" which were created, and the expansion of the opera seasons in Paris, London and Italy.

The late Romantic period saw the rise of national "styles" which were associated with the folk music and poetry of particular countries, and with the important composers from that country. The notion that there were "German" and "Italian" styles had long been established in writing on music, but the late 19th century saw the rise of a "Russian" style: Glinka, Mussorgski, Rimsky-Korsakov, Tchaikovski and Borodin; and also Czech, Finnish and French "styles" of composition. Many composers were expressly nationalistic in their objectives, seeking to write opera or music associated with their native lands language and culture.

## Romanticism in the 20th century (1901-present)

Many composers born in the 19th century continued to compose well into the 20th century, in styles which were recognizably connected to the previous musical era, including Sergei Rachmaninoff, Richard Strauss and Kurt Atterberg. In addition, many composers who would later be identified as [musical modernists](#) composed works in Romantic styles early in their career, such as Igor Stravinsky with his Firebird ballet, Arnold Schoenberg with Gurrelieder, and Béla Bartók with Bluebeard's Castle. However, the vocabulary and structure of the late 19th century was not merely a holdover; Ralph Vaughan Williams, Erich Korngold, Berthold Goldschmidt and Sergei Prokofiev continued to compose works in recognizably Romantic styles after 1950.

While new tendencies such as [neo-classicism](#) and atonal music challenged the preeminence of the romantic style, the desire to compose in tonally centered chromatic vocabularies remained present in major works. Samuel Barber, Benjamin Britten, Gustav Holst, Dmitri Shostakovich, Malcolm Arnold and Arnold Bax while considering themselves modern and contemporary composers, drew frequently from musical Romanticism in their works.

Musical romanticism reached a rhetorical and artistic nadir around 1960: it seemed as if the future lay with avant garde styles of composition, or with [neo-classicism](#) of some kind. While Hindemith moved back to a style more recognizably rooted in romanticism, most composers moved in the other direction. Only in the conservative academic hierarchy of the USSR and China did it seem that musical romanticism had a place. However, by the late 1960s, a revival of music using the surface of musical romanticism had begun. Composers such as George Rochberg switched from serialism to models drawn from Gustav Mahler, a project which found him the company of Nicholas Maw and David Del Tredici. This movement is described as [Neo-Romanticism](#), and includes works such as John Corigliano's First Symphony.

Another area where the Romantic style has survived, and even flourished, is in [film scoring](#). Many of the early émigrés escaping from Nazi Germany were Jewish composers who had studied, or even studied under, Gustav Mahler's disciples in Vienna. Max Steiner's lush score for *Gone with the Wind* provides an example of the use of Wagnerian [leitmotifs](#) and Mahlerian

orchestration. The "Golden Age of Hollywood" film music rested heavily on the work of composers such as Korngold and Steiner as well as Franz Waxman and Alfred Newman. The next generation of film composers, Alexander North, John Williams, and Elmer Bernstein drew on this tradition to write some of the most familiar orchestral music of the late 20th century.

## Roots of hip hop

Hip hop culture, including [rapping](#), scratching, graffiti, and breakdancing, emerged from 1970s block parties in New York City, specifically The Bronx (Toop, 1991). In the 1930s more than a fifth of Harlem residents were from the West Indies, and the block parties of the 80's were closely similar to sound systems in Jamaica (Toop, 1991). These were large parties, originally outdoors, thrown by owners of loud and expensive stereo equipment, which they could share with the community or use to compete among themselves, who began speaking lyrics or toasting.

Rap music emerged from block parties after ultra-competitive DJs isolated percussion [breaks](#), those being the favorites among dancers, and MCs began speaking over the beats (Toop, 1991); in Jamaica, a similar musical style called [dub](#) developed from the same isolated and elongated percussion breaks. However, "most rappers will tell you that they either disliked reggae or were only vaguely aware of it in the early and middle '70s." (Toop, 1991)

Lastly, most existing hip hop acts were shocked when King Tim III's throwback to radio DJs rhyming jive and the Sugarhill Gang's appropriation of rap on their remake, not sample, of CHIC's "Good Times" were released, as most DJs and MCs knew each other and many had been attempting to record (Toop, 1991). Early rap records are a mix bag of quality material by party veterans and poorer material quickly produced for a profit.

Lil Rodney Cee, of Funky Four Plus One More and Double Trouble, cites Cowboy, of Grandmaster Flash and the Furious Five, as, "the first MC that I know of...He was the first MC to talk about the DJ." (Toop, 1991)

# The historical conditions contributing to the origin of hip hop

The reasons for the rise of hip hop are complex. Perhaps most important was the low cost involved in getting started: the equipment was relatively inexpensive, and virtually anyone could MC along with the popular beats of the day. MCs could be creative, pairing nonsense rhymes and teasing friends and enemies alike in the style of Jamaican toasting at blues parties or playing the dozens in an exchange of wit. MCs would play at block parties, with no expectation of recording, thus making hip hop a form of [folk music](#) (as long as electronic music is not excluded from being *folk*). The skills necessary to create hip hop music were passed informally from musician to musician, rather than being taught in expensive music lessons.

In Washington, D.C., go go also emerged as a reaction against disco, and eventually mixed with hip hop during the early 1980s, while [electronic music](#) did the same, developing as [house music](#) in Chicago and [techno music](#) in Detroit.

## Disco

Hip-hop was both rooted in disco, and a backlash against it. According to Kurtis Blow, the early days of hip-hop were characterized by divisions between fans and detractors of disco music. Either way, it is indisputable that disco had an effect on hip-hop music and culture, due to the fact that the first commercial rap hit "Rapper's Delight" by Sugarhill Gang in 1979, was flush with tenants of disco, from the funk laden beat to the televised exploitation involving the clothes, dancing, and corny special effects, all associated with disco.

## Punk

Originally a multiethnic effort, [Punk rock](#)'s honesty and concision was naturally inclined to shelter against Disco and its Rock counterparts: [Soft](#), [Progressive](#) and [Arena](#) Rock.

## Minimalism

Minimalism --and more significantly Electronic Minimalism-- resorted to calmly, methodically --and sometimes even organically-- remove the extensive mess of ornamentation existent in both Popular and Classical Music; cleaning the palate and paving the autobahn for the discovery of new rhythms.

From 1977 to 1982 on WGPR, followed by three years at WJLB; a black Detroit FM DJ named Charles Johnson --better known by his on-air name, the Electrifying Mojo-- presided over the Midnight Funk Association, broadcasting a diverse anti-format with special attention given to the German minimalist electronic group Kraftwerk. Having fished Autobahn out of the "discarded" bin at a previous station, and soon after having acquired a copy of Trans Europe Express, when the 1981 album Computer World came out, Mojo played the entirely virtually every night, making a lasting impact on impressionable young listeners.

## Ghetto DJs

Librarians of lunacy and analog alchemy, Ghetto DJs found solace in experimentation. A generation that refused to be silenced by urban poverty, teenagers with little cash but plenty of imagination began to forge new styles from spare parts.

In an interview for David Toop's book 'Rap Attack 3', Afrika Bambaataa said that

"The Bronx wasn't really into radio music no more. It was an anti-disco movement. Like you had a lot of new wavers and other people coming out and saying, 'Disco Sucks'. Well, the same thing with hip hop, 'cause they was against the disco that was being played on the radio."

and in a reference plastered countless time on the internet, known as 'The History Of Rap' by Kurtis Blow, he writes

"You have to understand that disco music was the hottest thing out -- it was a craze that infiltrated all of American society. We were the rebels who couldn't relate. We weren't going for it. The B-Boys were from the ghetto, while disco was for the middle class and the rich. But there was hip-hop in both worlds. It was the hip-hop tug-o'-war -- disco rappers versus the B-Boys."

Doug Wimblish (bass), who together with Keith LeBlanc (drums) and Skip McDonald (guitar) took over the Sugarhill Records production and arrangement responsibilities from Positive Force and label arranger Jiggs Chase, says

"Jiggs had done an arrangement that was pretty slick but it wasn't the raw stuff they wanted. One of them was almost in tears, 'cause they thought they were going to have to do it. And then Rodney [Cee] was just, 'Man, this sounds like it's for an older crowd. What is this shit?' So then we cut 'That's the Joint' and they liked that much better. You couldn't do those boring disco tracks -- everything was four-on-the-floor all the way through. The rappers, they wouldn't have that shit."

Punks, minimalists and DJs; all suppressing the fear of ridicule, all mindful of the delicate balance between challenging and alienating listeners, and all proud of their ability to understand increasing amounts of technical knowledge in light of the creative independence it reaped; have crosspollinated with and from each other since their infancy.

## **Urban Socioeconomics**

Along with the low expense and the demise of other forms of popular music, social and political events further accelerated the rise of hip hop. In 1959, the Cross-Bronx Expressway was built through the heart of the Bronx, displacing many of the middle-class white communities and causing widespread unemployment among the remaining blacks as stores and factories fled the area. By the 1970s, poverty was rampant. When a 15,000+ apartment Co-op City was built at the northern edge of the Bronx in 1968, the last of the middle-class fled the area and the area's black and Latino gangs began to grow in power.

## Earlier styles that contributed to hip-hop music

West African griots, wandering poets and "praise-singers"  
spirituals and other forms of Christian music, as well as certain Protestant preachers' sermons  
Voice instrumental, long-standing tradition in world music of many varieties and across peoples  
scat singing, using the voice to imitate a musical instrument.  
toasting, traditional African-American and Afro-Caribbean entertainment, long, rhymed tales of great heroes, Stagger Lee and Jack Johnson among others (see dub)  
Dirty Dozens, stylized exchange of insults.  
"Signifying Monkey", long series of rhymed tales in which the weaker monkey triumphs through tricks over the more powerful beasts of the jungle, a ruder version of the Brer Rabbit stories.  
talking blues, popularized by Woody Guthrie, John Lee Hooker, and others, featuring rhyming talking with ironic asides to the audience.  
Late 1960s and early 70s at least proto-rap poets such as Gil Scott-Heron and the Last Poets  
jump rope and schoolyard rhymes, such as the following:

One bright day in the middle of the night,  
Two dead boys got up to fight.  
Back to back they faced each other,  
drew their swords and shot each other.

Jazz vocalese and pop/R&B Doo wop, using voices to imitate an entire band (dating back at least to the Mills Brothers).  
U.S. Male, a song recorded by Elvis Presley in 1967, can be considered a prototype to rap.

# Roots reggae

**Roots reggae** is the name given to Rastafari movement [reggae](#) music from Jamaica which evolved from [Ska](#) and Rocksteady and was made famous outside the Caribbean by the legendary singer/songwriter Bob Marley. Roots reggae is an inherently 'spiritual' type of reggae music, the lyrics of which are predominantly in praise of Jah Ras Tafari Makonnen — Haile Selassie (1892–1975) the Emperor of Ethiopia (1930–1974).

Recurrent lyrical themes include poverty and resistance to the oppression of government. The creative pinnacle of roots reggae is arguably in the late 1970s, with singers such as Johnny Clarke, Horace Andy, Barrington Levy, and Lincoln Thompson, teaming up with studio producers including Lee 'Scratch' Perry, King Tubby, and Coxsone Dodd. The experimental pioneering of such producers within often restricted technological parameters gave birth to [dub](#), and is seen by some music historians as one of the earliest (albeit analogue) contributions to modern [dance music](#) production techniques.

Roots reggae is an important part of Jamaican culture, and whilst other forms of reggae have replaced it in terms of popularity in Jamaica (dancehall for instance), roots reggae has found a small, but growing, niche globally

# Roots revival

A **roots revival (folk revival)** is a trend which includes young performers popularizing the traditional musical styles of their ancestors. Often, roots revivals include an addition of newly-composed songs with socially and politically aware lyrics, as well as a general modernization of the folk sound. A wave of roots revival swept the world in the 1960s and 70s. In most cases, the [folk music](#) being revived were not quite extinct, though some hadn't been played for years or were moribund; such cases include the [Celtic music](#) of Cornwall and the Isle of Man, for example. In other cases, such as Cameroon and the Dominican Republic, no revival was necessary as the music remained common, and was merely popularized and adapted for mainstream audiences at home and abroad.

The term *roots revival* is vague, and may not always refer to identical events. Characteristics associated with a roots revival include:

- Popularization of previously non-mainstream folk music
- Adaptation of folk styles to pop (or rock) structures
- Invention of new formats like bands where only solo acts had existed before
- Introduction of new instruments
- Composition of works by those who perform them, as opposed to folk tunes mostly passed down orally (see [singer-songwriter](#))
- Incorporation of politically aware lyrics, often critical of a government, religion or other authority, or society in general.
- Lyrics are the first from the nation to express more than simple desires and problems, and are often seen as the embodiment of a national character or literary tradition (in comparison to the legendary American songwriter, such composers are often said to be the "XXX Bob Dylan", as in Wannes Van de Velde *is the Belgian Bob Dylan*)

With such a vague and variable definition, *roots revival* could be seen as referring to the creation of any kind of [pop music](#) industry, though there are countries with well-developed pop traditions that have not had a period referred to as a roots revival (such as Jamaica, India, Cuba and Kenya). For example, homogenized pop has long had its fans in most every country in the world, but many of these nations have created their own indigenous pop styles out of folk music; this process could be called a *roots revival*, though in some cases the folk musics in question were still widespread and did not need to be revived.

## Roots revivals

**Algerian music:** Beginning as early as 1964, gaining steam in the 70s and continuing through the 1980s, a mainstream raï revival occurred, and pop-raï stars like Khaled and Chaba Fadela gained worldwide audiences; the same period saw similar trends occur among Kabyle musicians like Idir, Ferhat and Aït Menguellet, who popularized the native sounds of their people

**Argentinian music:** In the 1960s, Andean nationalism was spreading across Argentina, Chile, Bolivia and Peru. Argentina's nativist scene includes landmark performers like Mercedes Sosa and Atahualpa Yupanqui, who helped spawn the nueva canción scene.

**Australian music:** Beginning in the 1980s, Australian Aborigines began turning to their native styles of folk music, which were updated, creating popular bands and styles like Aboriginal rock

**Belgian music:** Starting early in the 1960s, a wave of popular folk-based performers emerged, led by Wannes Van de Velde, who drew primarily on Flemish traditions. By the 1980s, popular bands included Brabants Volksorkest and the [folk-rock](#) band Kadriil.

**Beninese music:** Artists like Tohon Stan have created a popular version of Benin's numerous styles of indigenous folk music, such as tchink-system, a derivative of the funeral genre of tchinkoumé

**Bolivian music:** The 1950s saw an increase in nationalist identity surrounding the Quechua and Aymara peoples, and a number of intellectuals began associating themselves with folk music, clothing, cuisine and other elements. By the mid-1960s, a folk revival was blossoming, led by Edgar Jofré.

**Brazilian music:** Beginning in the 1950s and continuing for several decades, a multitude of Brazilian styles (most importantly samba) and imported American [jazz](#) combined to create the wildly popular bossa nova scene. This soon evolved into the politically-charged Tropicalia genre, which starred controversial and acclaimed singer-songwriters Caetano Veloso and Gilberto Gil.

**Cambodian music:** The early 1960s saw a revival of classical music and dance, inspired by Princess Norophom Buppha Devi and led by Sinn Sisamouth, though the rise of the Khmer Rouge largely ended this trend.

**Cameroonian music:** Beginning with bikutsi in the 1950s and continuing with makossa into the end of the 20th century, Cameroon's popularized folk musics have become among the most prominent in Africa. Messi Me Nkonda Martin undoubtedly did the most to evolve bikutsi from its folk origins into a popular style using electric guitars and other importations, while Manu Dibango brought makossa to new audiences around the world.

**Canadian music:** Though some artists, like The Band, Neil Young and Joni Mitchell, had been integral parts of the 1960s American folk-rock scene, Canada has seen its own distinctive revival of styles. This includes the late 1970s scene in Maritime Canada, which glorified the area's Celtic heritage and was led by regional legends Figgy Duff and Stan Rogers, as well as the mid-1960s Quebecois revival led by Gilles Vigneault. More limited revivals of Acadian, Inuit and other folk styles have also occurred.

**Chinese music:** Partially as a reaction against attempts by the Communist government to subvert traditional styles to drum up patriotism and loyalty, the 1970s saw the creation of Chinese rock and Cantopop (in Hong Kong), both of which made some use of native folk styles, especially in vocal techniques. The leader of Chinese rock is undoubtedly Cui Jian.

**Chilean music:** In the early to mid-1960s, the burgeoning nueva canción movement spread throughout Chile, Argentina, Bolivia and Peru, featuring a wave of singer-songwriters who incorporated folk elements and nationalist lyrics, often critical of governmental authorities, and achieved great acclaim. Violeta Parra is sometimes viewed as the founder of the scene, for she

popularized Quechua and Aymara songs and provided an outlet for performances by future luminaries like Victor Jara.

**Ivorian music:** Ernesto Djédjé's ziglibithy style incorporates a number of folk genres from across Côte d'Ivoire, a diverse country with hundred of ethnic groups; Djédjé's most immediate influence was the folk rhythms of the Bété.

**Croatian music:** By the 1980s, Croatian pop-folk had seen some mainstream success, and a wave of bands appeared, inspired by Vještice, who combined Meimurje folk music with rock in an innovative fusion of sounds.

**Cuban music:** By the 1960s, Cuban music had seen international success in the form of pop-[mambo](#), chachacha and other genres, and many artists were disillusioned with these styles, which were seen as watered-down. A vanguard of singer-songwriters like Silvio Rodríguez and Pablo Milanés arose, composing politically-aware songs in a style that came to be called Nueva Trova.

**Czech music:** In 1966, the Porta Festival was held, and a wave of singer-songwriters inspired by the likes of American Pete Seeger arose.

**Danish music:** In contrast to its neighbors, Denmark did not see a roots revival until to the late 1990s, when performers like Morten Alfred Høirup gained a widespread following in the country.

**Dominican music:** Merengue had been popular in the Dominican Republic for decades since evolving out of confusing folk origins, but did not truly become a form of pop music until the early 1960s, when legends like Johnny Ventura brought the music to new audiences at home and abroad.

**Egyptian music:** The city of Cairo is the most important center for Egyptian music, which includes a variety of popularized folk styles, including northern sawahii and southern sayidi.

**Finnish music:** Finland's folk styles include a variety of national genres and ballads, while the traditional rhyming sleigh songs rekilaulu have become an integral part of many pop singers. In 1967, the Savonlinna Opera Festival, the first of several similar festivals, contributed to a revival of Finnish opera and other more traditional styles.

**French music:** Though many of France's regional styles have seen popularization, the most vibrant scene is undoubtedly the traditional music of Brittany. The region boasts a uniquely Celtic heritage, which has been emphasized by the revival since its beginnings in the early 1970s, led by Alan Stivell. Corsican music has also seen a revival, though with little popular success, concurrent with the rise of Corsican nationalism in the 1970s.

**Gambian music:** By the 1970s, Gambian musicians were mostly playing popular merengue or other styles. A visit by pop band The Super Eagles to London to record saw a change, as they were encouraged to continue their practice of Gambian folk. The band became known as Ifang Bondi, and their music was called Afro-Manding blues.

**Garifuna music:** Starting in the 1970s and continuing into the following decades, the Garifunas, an Afro-Caribbean people found throughout Central America, began turning to their native punta sound and creating popular styles like punta rock, which found an audience across the area. Pen Cayetano was the most important figure in this scene.

**German music:** Following the 1968 student revolution in West Germany, singer-songwriters playing a kind of expressive, melancholy music with traditional influences became popular. Due to governmental interference, East Germany did not see much of this influence until the mid-1970s.

**Ghanaian music:** Ghana is best-known for the highlife style of music, which has been popular throughout the 20th century. By the late 1960s, however, the pop scene was dominated by generic guitar bands that imitated Western acts. The 1971 Soul to Soul festival, however, featured a number of African American musicians (like Wilson Pickett and Tina Turner), which had the effect of legitimizing African culture, thus causing a major roots revival that brought highlife to international audiences.

**Greek music:** The late 1960s and early 70s coup repressed rembétika, a style which had developed earlier in the century. This oppression ironically created a major boom in popularity for the genre, which became associated with political resistance and rebellion. Singer-songwriters like Dhionysis Savvopoulos also became wildly popular, and were seen as voices of the Greek nation.

**Irish music:** There was a revival of Irish folk music that began in the early 20th century, based both in Dublin and Ireland, though the longer-lasting and more famous revival began in the 1960s. At the time, performers like Christy Moore and Ceoltóirí Chualann were inspired by American popular folk singers, and they took to modernizing and adapting Irish music for modern audiences. The result was a dramatic change from folk traditions, including the introduction of the [bouzouki](#) and influences including [soul](#) and [rock](#).

**Israeli music:** Israel has produced a number of folksy singer-songwriters and bands, though the country's recent creation and the diverse cultural origins of its people means that there is no "Israeli" folk tradition to revive. Instead, performers like Chava Alberstein and Habrera Hativeet drew on Jewish, American, British, Russian and Slavic influences.

**Italian music:** The diverse regions of Italy are home to dozens of varieties of folk music. By the 1950s, their popularity was declining rapidly and a group of musicians and musicologists founded organizations like Istituto de Martino and Nuova Canzonere Italiano to help preserve folk cultures. The following decade saw a revival of a number of traditions, including Ciccio Busacca's fusions of Sicilian folk styles, central Italy's jazzy modern folk, pioneered by Canzoniere del Lasio, the re-appearance of the lira through the work of Re Niliu, the popularization of diverse genres of northern Italian music and some of the work of world-famous tenor Enrico Caruso, who revitalized Naples' canzone napoletana tradition. In contrast to many country's, Italy's roots revival has resulted in very little mainstream success.

**Japanese music:** Though elements of traditional Japanese music can be found in some rock and pop from the country, the only major roots revival was Okinawan, and began in the late 1980s. Popularized Okinawan folk music includes genres like kawachi ondo and goshu ondo.

**Korean music:** In the early 1970s, a genre called t'ong guitar developed, performed by singer-songwriters inspired by the likes of American Bob Dylan and Joan Baez. Korean folk has seen little popular success, though there has been some for the pansori, nongak and sanjo styles.

**Latvian music:** Its traditional long suppressed or appropriated by the Soviet Union, Latvia's kokle (an instrument similar to a [zither](#)) was revived and popular in the 1970s, led by Jnis Porikis.

**Lithuanian music:** The Soviet Union had sponsored some [music festivals](#), such as the Dainu Sventes, but did not allow for much lyrical or musical innovation, and kept all songwriters from experimenting with politically-aware and dissident lyrics. An active cultural rebellion occurred in the 1960s, based around a series of national music festivals and concerts.

**Malian music:** Cuban music had become extremely popular in Mali by the 1960s, and little folk music could compete. The country's second president, however, Moussa Traoré, encouraged the growth of a Malian music industry, resulting in a revival of some kinds of folk music, and a popularization led by Salif Keita. Later Fanto Sacko's bajourou music and wassoulou music also became popularized. However, by the 1980s, Malian pop had lost most traces of its folk origins and was simply dance music, even topping the European charts; another roots revival occurred, led by acoustic singer and kora player Jali Musa Jawara.

**Mozambiquan music:** Music was used in the 1960s by the independence movement in Mozambique. Leaders in this movement encouraged the growth of a national music industry. By the 1970s, native forms of music, such as marrabenta, had been popularized.

**Dutch music:** The late 1960s saw a revival of Dutch folk music, led by performers like Gerard van Maasakkers; popularity was limited, and soon ended, though region of Friesland has maintained a strong traditional music scene.

**Portuguese music:** In the 1960s and 70s, José Afonso led a return to more traditionally styled fado music, which later evolved into a number of new song forms that incorporated socio-political lyrics and foreign influences.

**Russian music:** Starting in about 1966, a group of bards arose, most prominently including Vladimir Vysotsky, and Vyacheslav Shchurov organized a number of concerts for folk singers. This led to a revival and revitalization of Russian folk songs, a trend which continued in ensuing decades.

**Sami music:** The Sami, an indigenous population found in northern Scandinavia and Russia, have a tradition of folk songs called joiks, which have been popularized by the likes of Mari

Boine, who remains a legend in the field.

**US music:** In the 1950s and 1960s, a loose network of folk and blues enthusiasts/musicians instigated a renaissance of Appalachian folk music and [blues](#) (poor black) music in America. Inspired by the rare records they were able to unearth from the pre-war period (before radio and records began to homogenize American culture), they searched out these musicians and revived the music themselves, influencing American musical culture and thereby the decades' effect on international popular music. Pop-folk stars had seen some previous fame, like the Almanac Trio, but it was not until the 1960s that popular musicians like Joan Baez and Bob Dylan entered the spotlight. The 21st century saw another revival of Appalachian folk music with the release of the 2000 motion picture soundtrack to "O Brother, Where Art Thou?". Singers such as Gillian Welch and Alison Krauss and the bluegrass performer Ralph Stanley were featured on the album.

# Roots rock

**Roots rock** is a sometimes vaguely-defined genre of Americana music that draws on early [rock and roll](#), [blues](#), [country music](#), [country rock](#), and other related forms.

## Media Coverage

Excellent roots rock commentary can be found in No Depression, and Uncut, a British magazine.

PBS's Austin City Limits series often feature excellent [alt.country](#), americana, or **roots rock** acts, and the city of Austin, Texas, hosts an annual Austin City Limits music festival.

# Round

A **round** is a musical composition in which two or more voices sing exactly the same melody, beginning at different times. "Row, Row, Row Your Boat" is a well known children's round for 4 voices.

When the voices enter at different pitches, the composition is a canon, and still more complicated pieces are fugues. A **catch** is a round where a catch phrase appears split among several voices.

## History

The oldest surviving canon in English is "Sumer Is Icumen In", which is for 4 voices, plus 2 bass voices singing a ground (that is a never changing repeating part). The first published rounds in English were printed by Thomas Ravenscroft in 1609; "Three Blind Mice" appears in this collection, although in a somewhat different form from today's children's round:

*Three Blinde Mice,*

*three Blinde Mice,*

*Dame Iulian,*

*Dame Iulian,*

*The Miller and his merry olde Wife,*

*shee scrapte her tripe licke thou the knife.*

Many of the rounds printed by Ravenscroft also appear in a 1580 manuscript (KC 1), and several are mentioned in Shakespeare's plays, so these little ditties seem to have been quite popular.

## Mechanics

What makes a round work is that after the work is divided into equal-sized blocks of a few measures each, corresponding notes in each block either are the same, or are different notes in the same chord. This is easiest with one chord, as in "Row, Row, Row Your Boat":

A new part can join the singing by starting at the beginning whenever another part reaches any asterisk in the above music. If one ignores the sixteenth notes that pass between the main chords, every single note is in the tonic triad—in this case, a C, E, or G.

Many rounds involve more than one chord, as in Frère Jacques:

The texture is simpler, but it uses a few more notes; this can perhaps be more easily seen if all four parts are run together into the same two measures:

The second beat of each measure does not sketch out a tonic triad, it outlines a dominant seventh chord (or "V7 chord").

Many different chord progressions are theoretically possible in a round, but it can be very challenging to keep each part sounding different and yet still melodic as they trace out the appropriate chords.

# Royal anthem

A **royal anthem** is a patriotic song, much like a [national anthem](#) that recognizes the nation's monarch. It is usually performed during events of royal importance, such as a public appearance by the monarch.

## Examples

"God Save the Queen" is the royal anthem in the United Kingdom, Canada, Australia and the other Commonwealth Realms. In the United Kingdom it also serves as the national anthem. In New Zealand, both "God Save the Queen" and "God Defend New Zealand" are official national anthems, although "God Save the Queen" is only used when the Queen or a member of the Royal Family is present.

"Kungssången", literally The King's Song, is the Swedish royal anthem.

"Kong Kristian", King Kristian, is the Danish royal anthem.

"Marcha Real", literally Royal March, is the national anthem of Spain

"Phleng Sansoen Phra Barami", the royal anthem of Thailand

"Kongesangen", literally The King's Song is Norway's royal anthem. It is actually a Norwegian translation of "God Save the Queen" and uses the same music.

"Боже, Царя храни", God Save the Tsar, literally God, Keep the Tsar, was the national anthem of the Russian Empire until 1917. It is still used in some circles of the Russian diaspora.

## Drum rudiments

A **rudiment** is one of a set of basic patterns used in rudimental drumming. These patterns form the basic building blocks or "vocabulary" of drumming, and can be combined in a more-or-less infinite variety of ways to create drumming music.

There have been many attempts to formalise a standard list of snare drum rudiments. The National Association of Rudimental Drummers (NARD), an organization established to promote rudimental drumming, put forward a list of 13 "essential" rudiments, and later a second set of thirteen to form the original 26. Finally, the Percussive Arts Society (PAS) reorganized the first 26 and added another 14 to form the current "40 international drum rudiments".

# **The 40 P.A.S. International Drum Rudiments**

## **Single Stroke Roll Rudiments**

1. Single Stroke Roll
2. Single Stroke Four
3. Single Stroke Seven

## **Multiple Bounce Roll Rudiments**

4. Multiple Bounce Roll
5. Triple Stroke Roll

## **Double Stroke Rudiments**

6. Double Stroke Open Roll
7. Five Stroke Roll
8. Six Stroke Roll
9. Seven Stroke Roll
10. Nine Stroke Roll
11. Ten Stroke Roll
12. Eleven Stroke Roll
13. Thirteen Stroke Roll
14. Fifteen Stroke Roll
15. Seventeen Stroke Roll

## **Diddle Rudiments**

16. Single Paradiddle
17. Double Paradiddle
18. Triple Paradiddle
19. Paradiddle-Diddle

## **Flam Rudiments**

20. Flam
21. Flam Accent

22. Flam Tap
23. Flamacue
24. Flam Paradiddle
25. Single Flammed Mill
26. Flam Paradiddle-Diddle
27. PataFlaFla
28. Swiss Army Triplet
29. Inverted Flam Tap
30. Flam Drag

## **Drag Rudiments**

31. Drag
32. Single Drag Tap
33. Double Drag Tap
34. Lesson 25
35. Single Dragadiggle
36. Drag Paradiddle #1
37. Drag Paradiddle #2
38. Single Ratamacue
39. Double Ratamacue
40. Triple Ratamacue

# Historical Organization

## The Thirteen "Essential" Rudiments

1. The Long Roll
2. The Five Stroke Roll
3. The Seven Stroke Roll
4. The Flam
5. The Flam Accent
6. The Flam Paradiddle
7. The Flamacue
8. The Ruff
9. The Single Drag
10. The Double Drag
11. The Double Paradiddle
12. The Single Ratamacue
13. The Triple Ratamacue

## The Second Thirteen Rudiments

1. The Single Stroke Roll
2. The Nine Stroke Roll
3. The Ten Stroke Roll
4. The Eleven Stroke Roll
5. The Thirteen Stroke Roll
6. The Fifteen Stroke Roll
7. The Flam Tap
8. The Single Paradiddle
9. The Drag Paradiddle #1
10. The Drag Paradiddle #2
11. The Flam Paradiddle-diddle
12. The Lesson 25
13. The Double Ratamacue

## The Last Fourteen Rudiments

More recently, the Percussive Arts Society added 14 more rudiments to extended the list to the current "40 International Drum Rudiments". Note that the ordering was completely changed during this last re-organization, so these numbers won't match those above.

1. The Single Stroke Four
2. The Single Stroke Seven
3. The Multiple Bounce Roll
4. The Triple Stroke Roll

5. The Six Stroke Roll
6. The Seventeen Stroke Roll
7. The Triple Paradiddle
8. The Single Paradiddle-Diddle
9. The Single Flammed Mill
10. The Pataflafla
11. The Swiss Army Triplet
12. The Inverted Flam Tap
13. The Flam Drag
14. The Single Dragadiddle

## Hybrid Rudiments

Over the years, many other rudimental patterns have been informally identified and given creative names, although most of these are based upon the original 40. They are commonly known as "hybrids".

Categories: [Drum Rudiments](#)

# Rumba

- Stylistic origins:** African, native and Spanish music  
**Cultural origins:** African slaves in Havana and Matanzas  
**Typical [instruments](#):** Quinto and tumbadoras drums and palitos  
**Mainstream popularity:** Significant in Latin America and Africa, rare elsewhere

Guaguanco, columbia, and yambú

Chachacha - Salsa music

**Rumba** is both a family of [music](#) rhythms and a [dance](#) style that originated in Africa and traveled via the slave trade to Cuba and the New World. The so-called **rumba rhythm**, a variation of the African standard pattern or clave rhythm, is the additive grouping of an eight pulse bar (one 4/4 measure) into 3+3+2 or, less often, 3+5 (van der Merwe 1989, p.321). Its variants include the bossa nova rhythm. Original Cuban rumba is highly polyrhythmic, and as such is often far more complex than the examples cited above.

## Ballroom Rumba and Rhumba

There is a [ballroom dance](#), also called Rumba, based on Cuban Rumba and Son. Also, still another variant of Rumba music and dance was popularized in the United States in 1930s, which was almost twice as fast, as exemplified by the popular tune, *The Peanut Vendor*. This type of "[Big Band](#) Rumba" was also known as **Rhumba**. The latter term still survives, with no clearly agreed upon meaning; one may find it applied to Ballroom, Big Band, and Cuban rumbas. Rumba is also called as "woman's dance", because it absolutely presents women's body line beautifully. Besides, the interaction, emotion and the soft rhythm between the partners make another apposite name called "Love dance."

## Gypsy Rumba

In the 1990s the French group Gypsy Kings of Spanish descent became a popular [New Flamenco](#) group by playing *Rumba Flamenca* (or rumba gitana, Catalan rumba) music.

## African Rumba

Rumba, like salsa and some other Caribbean and South American sounds have their rhythmic roots to varying degrees in [African musical](#) traditions, having been brought there by African slaves. In the late 1930s and early 1940s in the Congos, musicians developed a music known as rumba, based on West and Central African, and Caribbean and South American rhythms.

This brand of African rumba became popular in Africa in 1950s. Some of the most notable bands were Franco Luambo's OK Jazz and Grand Kalle's African Jazz. These bands spawned well known rumba artists such as Sam Mangwana, Dr Nico Kasanda and Tabu Ley Rochereau, who pioneered Soukous, the genre into which African rumba evolved in the 1960s. Soukous is still sometimes referred to as rumba.

# Cuban Rumba

Rumba arose in Havana in the 1890s. As a sexually-charged Afro-Cuban dance, rumba was often suppressed and restricted because it was viewed as dangerous and lewd.

Later, Prohibition in the United States caused a flourishing of the relatively-tolerated [cabaret](#) rumba, as American tourists flocked to see crude *sainetes* (short plays) which featured racial stereotypes and generally, though not always, rumba.

Perhaps because of the mainstream and middle-class dislike for rumba, danzón and (unofficially) son montuno became seen as "the" national music for Cuba, and the expression of Cubanismo. Rumberos reacted by mixing the two genres in the 1930s, 40s and 50s; by the mid-40s, the genre had regained respect, especially the guaguanco style.

Rumba is sometimes confused with salsa, with which it shares origins and essential movements.

There are several rhythms of the Rumba family, and associated styles of dance:

- Yambú (slow; the dance often involving mimicking old men and women walking bent)
- Guaguancó (medium-fast, often flirtatious, involving pelvic thrusts by the male dancers, the *vacunao*)
- Columbia (fast, aggressive and competitive, generally danced by men only, occasionally mimicking combat or dancing with knives)
- Columbia del Monte (very fast)

All of these share the instrumentation (3 conga drums or cajones, claves, palitos and / or guagua, lead singer and coro; optionally chekeré and cowbells), the heavy polyrhythms, and the importance of clave.

## Rumba rhythm

The rhythm which is known now as "rumba rhythm" was popular in European music beginning in the 1500s until the later [Baroque](#), with [classical music era](#) composers preferring syncopations such as 3+2+3. It reappeared in the nineteenth century. (ibid, p.272) Examples include:

# Rumba Flamenca

**Rumba Flamenca, Flamenco Rumba, or Gypsy Rumba** is a style of [Rumba music](#) from Southern Spain. Its style derives from the influence of Afro-Cuban [Rumba](#) brought back from Cuba to Spain in the 19th century.

A characteristic difference from Cuban Rumba is that the rhythm is played with [guitars](#) and hand clapping, while the Cuban one uses [drums](#) and claves.

## Runaway hit

**Runaway hit** is a term used to describe a [single](#) which has not formally been released, which becomes a hit on its own. As singles before 1998 were not allowed to chart unless they had been formally released commercially, runaway hits did not exist before 1998. The most successful runaway hit is The Black Eyed Peas' "My Humps", which became the first unsolicited song to hit the Top 10 of the Billboard Hot 100. Another example of a runaway hit is Beyonce's "Dangerously in Love 2". The term is generally applied to unsolicited songs which show a relative overall chart performance, not songs which chart, but don't perform that well. Nevertheless, the term has been applied to songs of this caliber too, like Mariah Carey's "Mine Again", from *The Emancipation of Mimi* (2005)

# Sadcore

**Sadcore** is a subgenre of [alternative rock](#) that developed from the downbeat melodies and slower tempos of late 1980s [indie rock](#).

Sadcore is a loose definition and does not describe a specific movement or scene. Many artists that have acquired the tag might better be classified as [alternative country](#) or as [singer/songwriters](#). The term "sadcore" is a soft parody of [hardcore](#) and is sometimes used interchangeably with slowcore.

Sadcore is best characterised by the bleak themes of its lyrics, slow tempos and minor-key melodies. Individual tracks range from minimal acoustic outings to complex studio numbers with pronounced elements of dissonance in later compositions.

Early exponents like the Red House Painters, and American Music Club drew on the nihilism, loneliness and isolation found in the lyrics of The Cure and The Smiths. This trend continues. Currently, the leading exponents of Sadcore are female singer-songwriters such as Cat Power and Shannon Wright.

Categoricists might also consider Death Cab for Cutie's early (pre-Transatlanticism) albums as slowcore/sadcore.

## List of sadcore artists

American Music Club  
Arab Strap  
Cat Power  
Codeine  
Ida  
Idaho  
Julie Doiron  
Lambchop (band)  
Low

# Salsa music

## Salsa

- Stylistic origins:** Primarily Cuban son, [mambo](#), rumba and Puerto Rican music
- Cultural origins:** 1960s and 70s New York City Latin melting pot
- Typical instruments:** [piano](#), [conga](#), [trumpet](#), [trombone](#), [bass guitar](#), claves, cowbell, timbales, [guitar](#)
- Mainstream popularity:** Very popular in Latin America, Japan and United States
- Derivative forms:** Timba

## Subgenres

Salsa erotica - Salsa gorda - Salsa romantica

## Fusion genres

Charanga-vallenata - Mereng-house - Salsa-merengue - Songo-salsa - rock-salsa - vallenato-salsa

## Regional scenes

Colombia - Cuba - Japan - Mexico - Panama - Puerto Rico - United States - Venezuela

**Salsa music** is a diverse and predominantly Caribbean and Latin genre that is popular across Latin America and among Latinos abroad. Salsa incorporates multiple styles and variations; the term can be used to describe most any form of popular Cuban-derived genre, such as chachachá and mambo. Most specifically, however, salsa refers to a particular style developed by the 1960s and '70s Cuban and Puerto Rican immigrants to the New York City area, and stylistic descendants like 1980s salsa romantica. The style is now practiced throughout Latin America, and abroad; in some countries it may be referred to as música tropical.[1] Salsa's closest relatives are Cuban mambo and the son orchestras of the early 20th century, as well as Latin jazz. The terms *Latin jazz* and *salsa* are sometimes used interchangeably; many musicians are considered a part of either, or both, fields, especially performers from prior to the 1970s.<sup>21</sup>

Salsa is essentially Cuban in stylistic origin, though it is also a hybrid of various Latin styles mixed with [pop](#), [jazz](#), [rock](#), and [R&B](#). Salsa is the primary music played at Latin dance clubs and is the "essential pulse of Latin music", according to author Ed Morales, while music author Peter Manuel called it the "most popular dance (music) among Puerto Rican and Cuban communities, (and in) Central and South America", and "one of the most dynamic and significant pan-American musical phenomena of the 1970s and 1980s". Modern salsa remains a dance-oriented genre and is closely associated with a style of salsa dancing.

## The word *salsa*

*Salsa* means

*sauce* in the Spanish language and has more recently acquired a musical meaning in both English and Spanish. In this sense *salsa* has been described as a word with "vivid associations but no absolute definitions, a tag that encompasses a rainbow assortment of Latin rhythms and styles, taking on a different hue wherever you stand in the Spanish-speaking world". The precise scope of *salsa* is highly debatable. The term has been used by Cuban and Puerto Rican immigrants in New York analogously to *swing* or *soul*, which refer to a quality of emotionally and culturally genuine music in the African American community. In this usage *salsa* connotes a frenzied, "spicy" and wild musical experience that draws upon or reflects elements of Latin culture, regardless of the specific style.

Various music writers and historians have traced the use of *salsa* to different periods of the 20th century. World music author Sue Steward has claimed that *salsa* was originally used in music as a "cry of appreciation for a particularly piquant or flashy solo". She cites the first use in this manner to an unnamed Venezuelan radio DJ. Max Salazar traced the word back to the early 1930s, when Ignacio Piñero composed "Échale Salsita", a dance song protesting tasteless food. Though Salazar describes this song as the origin of *salsa* meaning "danceable Latin music", author Ed Morales has described the usage in the same song as a cry from Piñero to his band, telling them to increase the tempo to "put the dancers into high gear". Morales claims that later in the 1930s, vocalist Beny Moré

would shout *salsa* during a performance "to acknowledge a musical moment's heat, to express a kind of cultural nationalist sloganeering [and to celebrate the] 'hotness' or 'spiciness' of Latin American cultures".

Some people object to the term *salsa* on the basis that it is vague or misleading; for example, the style of musicians such as Tito Puente evolved several decades before *salsa* was a recognized genre, leading Puente to once claim that "the only salsa I know comes in a bottle. I play Cuban music". Because *salsa* can refer to numerous styles of music, some observers perceive the word as a marketing term designed to superficially categorize music in a way that appeals to non-aficionados. For a time the Cuban state media officially claimed that the term *salsa music* was a euphemism for authentic Cuban music stolen by American imperialists, though the media has since abandoned this theory.

Some doubt that the term *salsa* has any precise and unambiguous meaning, with Peter Manuel, for example, describing it as "nothing more than a new spin on the traditional rhythms of Cuban music" and "at once (both) a modern marketing concept and the cultural voice of a new generation", representative of a "crystallization of a Latino identity in New York in the early 1960s". Peter Manuel also recognizes the commercial and cultural dichotomy to *salsa*, noting that the term's broad use for many styles of Latin pop music has served the development of "pan-Latin solidarity", while also noting that the "recycling of Cuban music under an artificial, obscurantist label is but one more example of North American exploitation and commodification of third world primary products; for Latinos, *salsa* bridges the gap between "tradition and modernity, between the impoverished homeland and the dominant United States, between street life and the chic night club, and between grassroots culture and the corporate media".

The singer Rubén Blades once claimed that *salsa* is merely "a concept", as opposed to a definite style or rhythm. Some musicians are doubtful that the term *salsa* has any useful meaning at all, with the bandleader Machito claiming that *salsa* was more or less what he had been playing for forty years before the style was invented, while Tito Puente once responded to a question about *salsa* by saying "I'm a musician, not a cook" (referring to *salsa*'s original use to mean *sauce*). Celia Cruz, a well-known *salsa* singer, has said, "[s]alsa is Cuban music with another name. It's mambo, chachachá, rumba, son ... all the Cuban rhythms under one name".

Music writer Peter Manuel claims that *sa/sa* came to describe a specific style of music in the mid-1970s "when a group of New York-based Latin musicians began overhauling the classic big-band arrangements popular since the [mambo](#) era of the 1940s and '50s", and that the term was "popularized" in the late 1960s by a Venezuelan radio station and Jerry Masucci of Fania Records.[15] In contrast, Ed Morales cites the use of salsa for a specific style to a New York-based editor and graphic designer named Izzy Sanabria. Morales also mentions an early use of the term by Johnny Pacheco, a Dominican performer who released a 1962 album called *Salsa Na' Ma*, which Morales translates as "it just needs a little salsa, or spice".

## Characteristics

Though the term *salsa music* is not necessarily precise in scope, most authors use the term to refer specifically to a style created in the late 1960s and early 1970s. Author Ed Morales has said the obvious, most common perception of salsa is an "extravagant, clave-driven, Afro-Cuban-derived songs anchored by piano, horns, and rhythm section and sung by a velvety voiced crooner in a sharkskin suit".

At its root, however, salsa is a mixture of Spanish and African music, filtered through the music histories of Cuba and Puerto Rico, and adapted by Latin jazz and Latin popular musicians for Latino populations with diverse musical tastes. The basic structure of a salsa song is based on the Cuban son, beginning with a simple melody and followed by a *coro* section in which the performers improvise. Ed Morales has claimed that the "key staples" of salsa's origins were the use of the trombone as a counterpoint to the vocalist and a more aggressive sound than is typical in Cuban music; the trombone also carries the melody, while the rhythm is most generally provided by bongos, congas and timbales. Peter Manuel claims that the term *salsa* is so vague as to be meaningless; however, the style that evolved along with the word can be characterized as using timbales and trombones in greater numbers, and use of Puerto Rican elements like the declamatory exclamation *le-lo-lai*.

## Songs and instrumentation

Salsa bands play a wide variety of songs, including pieces based on *plenas* and *bombas*, *cumbia*, *vallenato* and *merengue*; most songs, however, are modern versions of the Cuban son. Like the son, salsa songs begin with a songlike section followed by a *montuno* break with call-and-response vocals, instrumental breaks and jazzy solos.

The most important instrumentation in salsa is the percussion, which is played by a wide variety of instruments, including claves, cowbells, timbales and conga.[20] Apart from percussion, a variety of melodic instruments are commonly used as accompaniment, such as a guitar, trumpets, trombones, the [piano](#), and many others, all depending on the performing artists. Bands typically consist of up to a dozen people, one of whom serves as band leader, directing the music as it is played. Two to four players generally specialize in horns, while there are generally a one or two choral singers and players of the bongo, conga, bass guitar, piano and *timbales*. The maracas, clave or güiro may also be played, typically by a vocalist. The bongocero will usually switch to a kind of bell called a *campana* (or *bongo bell*) for the *montuno* section of a song. Horns are typically either two trumpets or four trumpets or, most commonly, two trumpets with at least one saxophone or trombone.

Salsa essentially remains a form of [dance music](#); thus many songs have little in the way of lyrics beyond exhortations to dance or other simple words. Modern pop-salsa is often *romantica*, defined partially by the sentimental, lovelorn lyrics, or *erotica*, defined largely by the sexually explicit lyrics. Salsa also has a long tradition of lyrical experimentation, with singer-songwriters like Ruben Blades using incisive lyrics about everything from imperialism to disarmament and environmentalism.[22] Vocalists are expected to be able to improvise during verses and instrumental solos. References to Afro-Catholic religions, such as Santería, are also a major part of salsa's lyrics throughout Latin America, even among those artists who are not themselves practitioners of any Afro-Catholic religion.

## Rhythm

Salsa music is traditionally based on a 4/4 time signature, and is mostly phrased in groups of two bars (eight beats), such as recurring rhythmic patterns and main phrases of the chorus. Typically, the overall rhythmic patterns played on the percussion instruments are rather complicated, with several different patterns played simultaneously. The clave rhythm is an important foundation of salsa; all salsa music and dance is governed by the clave rhythm. The most common clave rhythm in salsa is the so called *son* clave, which is eight beats long and can be played either in 2-3 or 3-2 style. The 2-3 version contains two clave strikes in the first half of the eight beats and three in the second, while the 3-2 has the halves reversed.

Instrumentalists do not generally play out the exact clave rhythm, except when using the percussion instrument also known as claves. In most other cases, the clave rhythm simply functions as a basis for the instrumentalists and singers to use as a common rhythmic ground for their own musical phrases. The instrumentalists emphasize the differences of the two halves of the eight beat clave rhythm; for example, in an eight beat long phrase used in a 2-3 clave context, the first half of the phrase is given more straight notes that are played directly on beat, while the second half instead contains notes with longer durations and with a more off-beat feeling. This emphasizes that the first four beats of the 2-3 son clave contain two "short" strikes that are directly on beat, while the last four beats contain three "long" clave strikes with the second strike placed off-beat between beats two and three. Salsa songs commonly start with one clave and then switch to the reverse partway through the song, without restarting the clave rhythm; instead, the rhythm is shifted four beats using breaks and stop-time.

Some percussion instruments have standardized patterns that reoccur in most salsa music with only minor variations. For example, this is a common rhythmic pattern called the *cáscara* based on the 2-3 clave, and is played on the shells of the timbales during the verses and less energetic parts of a song:

1.2.3.4.5.6.7.8. (beats) \*.\*\*.\*\*.\*\*.\*\*.\* (\* = cáscara strikes)

During the chorus and solo parts, the *timbalero* often switches to the following rhythm, which is normally played on a cowbell mounted on the timbales set:

1.2.3.4.5.6.7.8. (beats) +.\*.+++\*.+++\*.+\* (+/\* = weak/accented cowbell strikes)

The timbales pattern above is often accompanied by a handheld cowbell (bongo bell) also played during the chorus but by another person, using this simpler rhythm (in this example also based on the 2-3 clave):

1.2.3.4.5.6.7.8. (beats) +.\*.+\*\*\*.\*\*\*.\*\* (+/\* = low/high-pitched cowbell strikes)

The bass pattern often follows a distinct salsa rhythm pattern known as the *tumbao* which alternates between the fifth and the root of a chord. One side of the tumbao will be in near unison with the clave, while the other side is syncopated against the clave:

1.2.3.4.5.6.7.8. (beats) ...5..8....5..1. (5 = fifth of chord, 8 = high octave of chord, 1 = low octave of chord)

## Lyricism

Salsa lyrics range from simple dance numbers with little lyrical innovation and sentimental romantic songs to risqué and politically-radical lyrics. Music author Isabelle Leymarie notes that salsa performers often incorporate machoistic bravado (*guapería*) in their lyrics, in a manner reminiscent of calypso and samba, a theme she ascribes to the performers' "humble backgrounds" and subsequent need to compensate for their origins. Leymarie claims that salsa is "essentially virile, an affirmation of the Latin man's pride and identity". As an extension of salsa's macho stance, manly taunts and challenges (*desafío*) are also a traditional part of salsa

Politically and socially activist composers have long been an important part of salsa, and some of their works, like Eddie Palmieri's "La libertad - lógico", became Latin and especially

Puerto Rican anthems. Many salsa songs use a nationalist theme, centered around a sense of pride in black Latino identity, and may be in Spanish, English or a mixture of the two called *Spanglish*.

## History

In the 1930s, '40s and '50s, Cuban music within Cuba was evolving into new styles derived primarily from son and rumba, while the Cubans in New York, living among many Latinos from Puerto Rico and elsewhere, began playing their own distinctive styles, influenced most importantly by [African American music](#). Their music included son and guarachas, as well as tango, bolero and danza, with prominent influences from jazz. While the New York scene continued evolving, Cuban popular music, especially [mambo](#), became very famous across the United States. This was followed by a series of other genres of Cuban music, which especially affected the Latin scene in New York. The result, by the mid-1970s, was what is now known as *salsa music*.

Salsa evolved steadily through the later 1970s and into the '80s and '90s. New instruments were adopted and new national styles, like the music of Brazil, were adapted to salsa. New subgenres appeared, such as the sweet love songs called salsa romantica, while salsa became a major part of the music scene in Venezuela, Mexico and as far away as Japan. Diverse influences, including most prominently [hip hop music](#), came to shape the evolving genre. By the turn of the century, salsa was one of the major fields of popular music in the world, and salsa stars were international celebrities.

## Origins

Salsa's roots can be traced back to the African ancestors that were brought to the Caribbean by the Spanish as slaves. In Africa it is very common to find people playing music with instruments like the conga and la pandereta, instruments commonly used in salsa. Salsa's most direct antecedent is Cuban son, which itself is a combination of African and European influences. Large son bands were very popular in Cuba beginning in the 1930s; these were largely septetos and sextetos, and they quickly spread to the United States.[27] In the 1940s Cuban dance bands grew much larger, becoming mambo and charanga orchestras led by bandleaders like Arsenio Rodriguez and Felix Chappotin. In New York City in the '40s, at the center for mambo in the United States, the Palladium Dancehall, and in Mexico City, where a burgeoning film industry attracted Latin musicians, Cuban-style big bands were formed by Cubans and Puerto Ricans like Machito, Perez Prado, Tito Puente and Tito Rodriguez.[28] New York began developing its own Cuban-derived sound, spurred by large-scale Latino immigration, the rise of local record labels due to the early 1940s musicians strike and the spread of the jukebox industry, and the craze for [big band](#) dance music.

Mambo was very jazz-influenced, and it was the mambo big bands that kept alive the large jazz band tradition while the mainstream current of jazz was moving on to the smaller bands of the bebop era. Throughout the 1950s Latin dance music, such as mambo, rumba and chachachá, was mainstream popular music in the United States and Europe. The '50s also saw a decline in popularity for mambo big bands, followed by the Cuban Revolution of 1959, which greatly inhibited contact between New York and Cuba. The result was a scene more dominated by Puerto Ricans than Cubans.

## 1960s

The Latin music scene of early 1960s New York was dominated by bands led by musicians such as Ray Barretto and Eddie Palmieri, whose style was influenced by imported Cuban fads

such as pachanga and charanga; after the Cuban Missile Crisis of 1962, however, Cuban-American contact declined precipitously, and Puerto Ricans became a larger part of the New York Latin music scene. During this time a hybrid Nuyorican cultural identity emerged, primarily Puerto Rican but influenced by many Latin cultures as well as the close contact with African Americans.

The growth of modern salsa, however, is said to have begun in the streets of New York in the late 1960s. By this time Latin pop was no longer a major force in American music, having lost ground to doo wop, R&B and rock and roll; there were a few youth fads for Latin dances, such as the soul and mambo fusion boogaloo, but Latin music ceased to be a major part of American popular music.<sup>[31]</sup> Few Latin record labels had any significant distribution, the two exceptions being Tico and Alegre. Though East Harlem had long been a center for Latin music in New York, during the 1960s many of the venues there shut down, and Brooklyn Heights' Saint George Hotel became "salsa's first stronghold". Performers there included Joe Bataan and the Lebron Brothers.

The late 1960s also saw white youth joining a counterculture heavily associated with political activism, while black youth formed radical organizations like the Black Panthers. Inspired by these movements, Latinos in New York formed the Young Lords, rejected assimilation and "made the barrio a cauldron of militant assertiveness and artistic creativity". The musical aspect of this social change was based on the Cuban son, which had long been the favored musical form for urbanites in both Puerto Rico and New York.<sup>[33]</sup> By the early 1970s, salsa's center moved to Manhattan and the Cheetah, where promoter Ralph Mercado introduced many future stars to an ever-growing and diverse crowd of Latino audiences.

The Manhattan-based recording company, Fania Records, introduced many of the first-generation salsa singers and musicians to the world. Founded by Dominican flautist and band-leader Johnny Pacheco and impresario Jerry Masucci, Fania's illustrious career began with Willie Colón and Héctor Lavoe's *El Malo* in 1967. This was followed by a series of updated son montuno and plena tunes that evolved into modern salsa by 1973. Pacheco put together a team that included percussionist Louie Ramirez, bassist Bobby Valentin and arranger Larry Harlow. The Fania team released a string of successful singles, mostly son and plena, performing live after forming the Fania All Stars in 1971; just two years later, the All Stars sold out Yankee Stadium.<sup>[28]</sup> One of their 1971 performances at the Cheetah nightclub, was a historic concert that drew several thousand people and helped to spark a salsa boom.<sup>[32]</sup>

## 1970s

From New York salsa quickly expanded to Cuba, Puerto Rico, the Dominican Republic, Colombia, Mexico, Venezuela, and other Latin countries, while the new style became a symbol of "pride and cultural identity" for Latinos, especially Puerto Ricans.<sup>[34]</sup> The number of salsa bands, both in New York and elsewhere, increased dramatically in the 70s, as did salsa-oriented radio stations and record labels.<sup>[35]</sup> Popular performers like Eddie Palmieri and Celia Cruz adapted to the salsa format, joined by more authentically traditional singers like Willie Colón and Ruben Blades. Colón and Blades worked together for much of the 1970s and '80s, becoming some of the most critically and popularly acclaimed salsa performers in the world. Their lyricism set them apart from others; Blades became a "mouthpiece for oppressed Latin America", while Colón composed "potent", "socio-political vignettes". Their 1978 album *Siembra* was, at that time, the best-selling Latin album in history.

The 1970s saw a number of musical innovations among salsa musicians. The bandleader Willie Colón introduced the cuatro, a rural Puerto Rican guitar, as well as jazz, rock, and Panamanian and Brazilian music.<sup>[38]</sup> Larry Harlow, the arranger for Fania Records, modernized salsa by adding an electric piano. By the end of the decade, Fania Records' longtime leadership of salsa was weakened by the arrival of the labels TH-Rodven and RMM. Salsa had come to be perceived as "contaminated by fusion and disco", and took elements from disaptare styles like go go, while many young Latinos turned to hip hop, techno or other styles.<sup>[39]</sup> Salsa began spreading throughout Latin America in the 1970s, especially to

Colombia, where a new generation of performers began to combine salsa with elements of cumbia and vallenato; this fusion tradition can be traced back to the 1960s work of Peregoya y su Combo Vacano. However, it was Joe Arroyo and La Verdad, his band, that popularized Colombian salsa beginning in the 1980s.

## 1980s

The 1980s was a time of diversification, as popular salsa evolved into sweet and smooth salsa romantica, with lyrics dwelling on love and romance, and its more explicit cousin, salsa erotica. Salsa romantica can be traced back to *Noches Calientes*, a 1984 album by singer José Alberto with producer Louie Ramirez. A wave of romantica singers, mostly Puerto Rican, found wide audiences with a new style characterized by romantic lyrics, an emphasis on the melody over rhythm, and use of percussion breaks and chord changes.[41] However, salsa lost popularity among many Latino youth, who were drawn to American rock in large numbers, while the popularization of Dominican merengue further sapped the audience among Latinos in both New York and Puerto Rico.[42] The 1980s also saw salsa expand to Mexico, Argentina, Peru, Europe and Japan, and diversify into many new styles.

In the 1980s some performers experimented with combining elements of salsa with [hip hop music](#), while the producer and pianist Sergio George helped to revive salsa's commercial success. He created a sound based on prominent trombones and rootsy, mambo-inspired style. He worked with the Japanese salsa band Orquesta de la Luz, and developed a studio orchestra that included Victor Manuelle, Celia Cruz, José Alberto, La India, Tito Puente and Marc Anthony. The Colombian singer Joe Arroyo first rose to fame in the 1970s, but became a renowned exponent of Colombian salsa in the 1980s. Arroyo worked for many years with the Colombian arranger Fruko and his band Los Tesos.

## 1990s to the present

In the 1990s Cuban salsa became more prominent, especially a distinct subgenre called timba. Using the complex songo rhythm, bands like NG La Banda and Los Van Van developed timba, along with related styles like songo-salsa, which featured swift Spanish [rapping](#). The use of rapping in popular songo-salsa was innovated by Sergio George, beginning with his work with the trio Dark Latin Groove, who "breathed the fire of *songo* rhythms and the energy of rap and [soul](#) into salsa".

Salsa remained a major part of Colombian music through the 1990s, producing popular bands like Sonora Carruseles, while the singer Carlos Vives created his own style that fuses salsa with vallenato and rock. Vives' popularization of vallenato-salsa led to the accordion-led vallenato style being used by mainstream pop stars like Gloria Estefan. The city of Cali, in Colombia, has come to call itself the "salsa capital of the world", having produced such groups as Orquesta Guayacan and Grupo Niche.

Salsa has registered a steady growth and now dominates the airwaves in many countries in Latin America. In addition, several Latino artists, including Rey Ruiz, Marc Anthony, and most famously, the Cuban-American singer Gloria Estefan, have had success as *crossovers*, penetrating the Anglo-American pop market with Latin-tinged hits, usually sung in English.

The most recent innovations in the genre include hybrids like merenhouse and salsa-merengue, alongside salsa gorda. Since the mid-1990s African artists have also been very active through the super-group Africando, where African and New York musicians mix with leading African singers such as Bambino Diabate, Ricardo Lemvo, Ismael Lo and Salif Keita. Salsa is only one of many Latin genres to have traveled back and influenced West African music.

# Sampler

A **sampler** is an [electronic musical instrument](#) that can record and store audio signal samples, generally recordings of existing sounds, and play them back at a range of pitches. However, *sampler* is sometimes used to describe instruments which store and play back samples but lack the capability to record them.

An early form of sampler was an instrument called the 'Mellotron' (later Novatron due to licensing issues) which used individual pre-recorded tape loops, one under each key on the keyboard. Mellotrons required a lot of maintenance, but had a characteristic sound that was used on many 1970s records by groups such as Yes, The Moody Blues and King Crimson.

## Overview

The emergence of the digital sampler made sampling far more practical, and as samplers added progressively more digital processing to their recorded sounds, they began to merge into the mainstream of modern digital synthesizers. The first digital sampling synthesiser was the Computer Music Melodian which was first available in 1976. The first polyphonic digital sampling synthesiser was the Australian-produced Fairlight CMI which was first available in 1979.

Prior to computer memory-based samplers, musicians used tape replay keyboards, which stored recordings of musical instrument notes and sound effects on analog tape.

Modern digital samplers use mostly digital technology to process the samples into interesting sounds. Akai pioneered many processing techniques, such as Crossfade Looping to eliminate glitches and Time Stretch which allows for shortening or lengthening of samples without affecting pitch and vice versa.

During the early 1990s hybrid [synthesizers](#) began to emerge that utilized very short samples of natural sounds and instruments (usually the attack phase of the instrument) along with digital synthesis to create more realistic instrument sounds. Examples of this are Korg's M1, 01W and the later Triton and Trinity series, Yamaha's SY series and the Kawai K series of instruments.

The modern-day [music workstation](#) usually features an element of sampling, from simple playback to complex editing that matches all but the most advanced dedicated samplers.

Samplers, together with traditional Foley artists, are the mainstay of modern sound effects production.

# Examples of digital samplers

## Computer Music Melodian

Computer Music Inc. was started in New Jersey USA in 1972 by Harry Mendell and Dan Coren. The company was established to develop and market musical instruments based on computer software.

The Melodian was based on the Digital Equipment Corporation PDP-8 computer and hand wired D/A and A/D conversion and tracking anti-aliasing filters. The Melodian was first used by Stevie Wonder in the "Secret Life of Plants" (1976). The Melodian was a monophonic synth with 12 bit A/D and sampling rates up to 22 kHz. It was designed to be compatible with analog synthesizers and had a feature where it would sync to the pitch of an analog synth, such as an Arp 2600. This means the Melodian captured all of the frequency modulation effects, including the touch ribbon control. It also could trigger off the ARPs keyboard so it could almost be thought of as a hybrid sampler/analog synth, making best use of the technology that was available at the time.

## Fairlight Instruments

Fairlight Instruments was started in Sydney Australia in 1975 by Peter Vogel and Kim Rylie. The company was originally established as a manufacturer and retailer of video special effects equipment.

The Fairlight CMI or Computer Music Instrument, released in (1979), started life as the QASAR M8. The M8 was hand-wired and legend has it that it took 2 hours to boot up! The CMI was the first commercially available digital sampling instrument. The original Fairlight CMI sampled using a resolution of 8-bits at a rate of 10 kHz and was comprised of two 8-bit Motorola 6800 processors, which were later upgraded to the more powerful 16-bit Motorola 68000 chips. It was equipped with two six octave keyboards, an alphanumeric keyboard, and an interactive video display unit (VDU) where soundwaves could be edited or even drawn from scratch using a light pen. Software allowed for editing, looping, and mixing of sounds which could then be played back via the keyboard or the software-based sequencer. It retailed for around \$25,000 US.

In 1982, Fairlight released the CMI-II which doubled the sampling rate to 16 kHz.

The CMI-IIx was released in 1984 and was the first to feature basic MIDI functionality.

1985 saw the release of the CMI-III which upped the sampling resolution to 16-bits. SMPTE was also added in this final version.

Notable users of the Fairlight CMI include: Trevor Horn, Art of Noise, Yello, Pet Shop Boys, and Jean-Michel Jarre.

## E-mu Systems

**E-mu Emulator** (1981) was E-mu Systems initial foray into sampling, and saved the company from financial disaster after the complete failure of the Audity due to a price tag of \$70,000! The name 'Emulator' came as the result of leafing through a thesaurus and matched the name of the company perfectly. The Emulator came in 2-, 4-, and 8-note polyphonic

versions, the 2-note being dropped due to limited interest, and featured a maximum sampling rate of 27.7 kHz, a four-octave keyboard and 128 kB of memory.

**E-mu Emulator II** (1985) was designed to bridge the gap between the Fairlight CMI and Synclavier and the Ensoniq Mirage. It featured 8-bit sampling, up to 1 MB of sample memory, an 8-track sequencer, and analog filtering. With the addition of the hard disk option, the Emulator II was comparable to samplers released 5 years later.

**E-mu Emulator III** (1987) was a 16-bit stereo digital sampler with 16-note polyphony, 44.1 kHz maximum sample rate and had up to 8 MB of memory. It featured a 16 channel sequencer, SMPTE and a 40 MB hard disk.

**E-mu SP-1200** was, and still is, one of the most highly regarded samplers for use in [hip-hop](#) related production. Its 12-bit sampling engine gave a desirable warmth to instruments and a gritty punch to drums. It featured 10 seconds of sample time spread across four 2.5-second sections.

## Akai

Akai entered the electronic musical instrument world in 1984 with the first in a series of affordable samplers the S612, an 8bit digital sampler module. The S612 was superseded in 1986 by the 16 bit S900.

The Akai **S900** (1986) was the first truly affordable digital sampler. It was 8-note polyphonic and featured 12-bit sampling with a frequency range up to 40 kHz and up to 750 kB of memory that allowed for just under 12 seconds at the best sampling rate. It could store a maximum of 32 samples in memory. The operating system was software based and allowed for upgrades that had to be booted each time the sampler was switched on.

The Akai MPC60 Digital Sampler/Drum Machine and MIDI Sequencer (1987) was the first non rack mounted model released. It is also the first time a sampler with touch sensitive trigger pads was produced by AKAI.

The Akai **S950** (1988) was an improved version of the S900, with a maximum sample frequency of 48 kHz and some of the editing features of the contemporary S1000.

The Akai **S1000** (1988) was possibly the most popular 16-bit 44.1 kHz stereo sampler of its time. It featured 16-voices, up to 32 MB of memory, and 24-bit internal processing, including a digital filter (18dB/octave), an LFO, and two ADSR envelope generators (for amplitude and filtering). The S1000 also offered up to 8 different loop points. Additional functions included Autolooping, Crossfade Looping, Loop in Release (which cycles through the loop as the sound decays), Loop Until Release (which cycles through the loop until the note begins its decay), Reverse and Time Stretch (version 1.3 and higher).

Other samplers released by AKAI include the MPC1000, MPC2000, MPC2000XL, MPC3000, MPC3000XL, MPC3000LE and the MPC4000.

## Roland

Roland Corporation manufactured the S series.  
- SP-202 - SP-303 - SP-404

## Other Manufacturers

Casio (no longer in production)  
Ensoniq  
Fairlight  
Korg  
Kurzweil

# Saxophone

The **saxophone** or **sax** is a conical-bored instrument of the [woodwind](#) family, usually made of brass and played with a single-reed mouthpiece like the [clarinet](#). It was invented by Adolphe Sax around 1840. The saxophone is most commonly associated with [popular music](#), [big band](#) music, and [jazz](#), but it was originally intended as both an [orchestral](#) and [military band](#) instrument. Saxophone players are appropriately called **saxophonists**. Former U.S. President Bill Clinton famously played his tenor saxophone at his own inaugural ball in 1993.

## History

The saxophone was developed circa 1840 by Adolphe Sax, a Belgian-born instrument-maker, flautist, and clarinetist working in Paris. Although he had constructed saxophones in several sizes by the early 1840s, he did not receive a 15-year patent for the instrument until June 17, 1846. It was first officially revealed to the public in the presentation of the bass saxophone in C at an exhibition in Brussels in 1841. Sax also gave private showings to Parisian musicians in the early 1840s. He drew up plans for 14 different types of saxophones, but they were not all realized.

The inspiration for the instrument is unknown, but there is good evidence that fitting a [clarinet](#) mouthpiece to an ophicleide is the most likely origin. (Sax built ophicleides among other instruments in the late 1830s.) Doing so results in an instrument with a definitely saxophone-like sound. The Hungarian/Romanian tarogato, which is quite similar to a soprano saxophone, has also been speculated to have been an inspiration. However, this cannot be so, as the modern tarogato with a single reed mouthpiece was not developed until the 1890s, long after the saxophone had been invented.

Sax's intent, which was plainly stated in his writings, was to invent an entirely new instrument which could provide bands and orchestras with a bass to the woodwind and brass sections, capable of more refined performance than the ophicleide, but with enough power to be used out-of-doors. This would explain why he chose to name the instrument the "Sound of Sax." In short, Sax intended to harness the finesse of a woodwind with the power of a brass instrument. However, Sax's amazing ability to offend rival instrument manufacturers and the resulting prejudice towards the man and his instruments led to the saxophone not being used in orchestral groups. For a long time it was relegated to military bands, despite Sax's great friendship with the influential Parisian composer Hector Berlioz.

For the duration of the patent (1846-1866) no one except the Sax factory could legally manufacture or modify the instruments, although this and Sax's numerous other patents were routinely breached by his rivals. After 1866 many modifications were introduced by a number of manufacturers.

Saxophones came to be associated, by many, with immorality. The Vatican officially condemned the instrument in the early 20th century, and various governments tried to limit their use, notably Nazi Germany and Japan in the 1930s.

## Construction

The saxophone uses a single reed mouthpiece similar to that of a [clarinet](#), but with a round or square evacuated inner chamber. The saxophone's body is effectively conical, giving it acoustic properties more similar to the [oboe](#) than to the [clarinet](#). However, unlike the [oboe](#), whose tube is a single cone, most saxophones have a distinctive curve at the bell. Straight soprano and sopranino saxophones are more common than curved ones, and a very few straight alto and tenor saxophones have been made, as novelties. Straight baritone and C melody saxophones have occasionally been made as custom instruments, but were never production items (reference , Jay Easton's custom Vito straight baritone and Bennie Meroff's custom Buescher Straight Baritone ). There is some debate amongst players as to whether the curve affects the tone or not.

## Materials

Nearly all saxophones are made from brass. After completing the instrument, manufacturers usually apply either a coating of clear or colored lacquer, or plating of silver or gold, over the bare brass. The lacquer or plating serves to protect the brass from corrosion, to enhance sound quality, and/or (in the case of colored lacquers) to give the saxophone an interesting visual appearance. That different lacquers provide different tone qualities is a hotly debated topic in the saxophone world - some say that it has no effect, while there is also research to show that there are differences. Generally, darker lacquer is usually associated with deeper timbres, while lighter lacquers such as silver are associated with brighter, more vibrant ones.

Other materials have been tried with varying degrees of success, as with the 1950s plastic saxophones made by the Grafton company, and the rare wooden saxophones. Prior to 1960, some instruments were plated with nickel as a cheaper alternative to silver; prior to 1930, it was common for instruments to be sold with a bare brass finish (without lacquer or plating). Certain companies, such as Yanagisawa, manufacture saxophones made from bronze, which is claimed to produce a warmer sound.

## The mouthpiece

Mouthpieces come in a wide variety of materials, including rubber, plastic, and metal. Less common materials that have been used include wood, glass, crystal, and even bone. Metal mouthpieces are believed by some to have a distinctive sound, often described as 'brighter' than the more common rubber. Some players believe that plastic mouthpieces do not produce a good tone. Other saxophonists maintain that the material has little, if any, effect on the sound, and that the physical dimensions give a mouthpiece its tone color. (Teal 17) Mouthpieces with a concave ("excavated") chamber are more true to Adolphe Sax's original design; these provide a softer or less piercing tone, and are favored by some saxophonists for classical playing.

Jazz and [popular music](#) saxophonists often play on high-baffled mouthpieces. These are configured so the baffle, or "ceiling," of the mouthpiece is closer to the reed. This produces a brighter sound which more easily "cuts through" a big band or amplified instruments. While high baffles (and the resulting tone) are commonly associated with metal mouthpieces, any mouthpiece may have a high baffle. Mouthpieces with larger tip openings provide pitch flexibility, allowing the player to "bend" notes, an effect commonly used in jazz and rock music. Classical players usually opt for a mouthpiece with a smaller tip opening and a lower baffle; this combination provides a darker sound and more stable pitch. Most classical players play on rubber mouthpieces with a round or square inner chamber.

## Reeds

Like [clarinets](#), saxophones use a single reed. Saxophone reeds are wider than clarinet reeds. Each size of saxophone (alto, tenor, etc.) uses a different size of reed. Reeds are commercially available in a vast array of brands, styles, and strength. Each player experiments with reeds of different strength (hardnesses) to find which strength suits his mouthpiece and playing style. Strength is usually measured using a numeric scale that ranges from 1 to 6 (though one rarely sees a reed at either end of this spectrum). Unfortunately, this scale is far from standardized between brands; thus a Rico #3 reed is decidedly softer than a Vandoren #3, for example.

Some players make their own reeds from "blanks", but as this is time-consuming and usually requires expensive equipment, most do not. Most players, however, adjust reeds by shaving or sanding. Methods for 'breaking in' reeds, caring for reeds, and adjusting reeds are controversial topics among players, and opinions about how long reeds remain playable differ greatly among players. Most players agree that reeds are somewhat inconsistent and require maintenance. Because saliva comes in contact with reeds, they should be rinsed right after playing in order to stifle germs and to prevent the saliva from deteriorating the reed's fibers. Dedicated saxophonists spend years perfecting their methods of reed selection, storage, and adjustment.

Most reeds are made from cane; however, synthetic reeds, made from various substances, are available, and are used by a small number of saxophonists. Many players consider them to have poor sound, or say they would consider them for use only in a context, such as a marching band, where tone quality is relatively unimportant. On the other hand, synthetic reeds are generally more durable than their natural counterparts, do not need to be moistened prior to playing, and can be more consistent in quality. Recent developments in synthetic reed technology has produced reeds made from synthetic polymer compounds, which are gaining increased acceptance among some players, especially for use when the instrument is played intermittently (during which time a natural reed might become dry).

## Members of the saxophone family

The saxophone was originally patented as two families, each consisting of seven instruments. The "orchestral" family consisted of instruments in the keys of C and F, and the "military band" family in E-flat and B-flat. Each family consisted of soprano, alto, tenor, baritone, bass and contrabass, although some of these were never made; Sax also planned--but never made--a subcontrabass (**Bourdon**) saxophone.

### Common saxophones

In music written since 1930, only the soprano in B $\flat$ , alto in E $\flat$ , tenor in B $\flat$  and baritone in E $\flat$  are in common use - these form the typical saxophone sections of [concert bands](#), military bands, and big-band jazz ensembles. The bass saxophone (in B $\flat$ ) is occasionally used in band music (especially music by Percy Grainger).

The vast majority of band and big-band music calls only for E $\flat$  alto, B $\flat$  tenor, and E $\flat$  baritone instruments. A typical saxophone section in a concert band might consist of four to six altos, one to three tenors, and one baritone. Occasionally a band or jazz ensemble will perform a piece that calls for soprano saxophone - in this case it is common practice for one of the players from the alto section to switch to soprano for that piece.

Most saxophone players begin learning on the alto, branching out to tenor, soprano or baritone after gaining competency. The alto saxophone is the most popular among classical composers and performers; most classical saxophonists focus primarily on the alto. In jazz, alto and tenor are predominantly used by soloists. Many jazz saxophonists also play soprano on occasion, but nearly all of them use it only as an auxiliary instrument.

The soprano has regained a degree of popularity over recent decades in jazz/pop/rock contexts, beginning with the work of [jazz](#) saxophonist John Coltrane in the 1960s. The soprano is often thought of as more difficult to play, or to keep in tune, than the more common alto, tenor and baritone saxophones. A few bass, soprano, and contrabass saxophones are still manufactured; these are mainly for collectors or novelty use, and are rarely heard - they are mostly relegated to large saxophone ensembles.

### Rare saxophones and novelty sizes

Of the orchestral family, only the tenor in C, soprano in C, and mezzo-soprano in F (similar to the modern alto) ever gained popularity. The tenor in C, generally known as the C melody saxophone, became very popular among amateurs in the 1920s and early 1930s, because its players could read music in concert pitch (such as that written for piano, voice, or violin) without the need to transpose. Although the instrument was popularized by players such as Rudy Wiedoeft and Frankie Trumbauer, it did not secure a permanent place in either jazz or classical music. The C-Melody was manufactured well into the 1930s long after its initial popularity had waned, although it became a special order item in the catalogs of some makers. The instrument is now a commonly encountered attic or garage sale relic, though since the 1980s a few contemporary saxophonists have begun to utilize the instrument once again. A similarly sized instrument, the contralto saxophone, was developed in the late 20th century by California instrument maker Jim Schmidt; this instrument has a larger bore and a new fingering system so it does not resemble the C melody instrument except for its key and register.

Also in the early 20th century, the C soprano (pitched a whole step above the B-flat soprano) was marketed to those who wished to perform oboe parts in [military band](#), vaudeville arrangements, or church hymnals. C sopranos are easy to confuse with regular (B-flat) sopranos, since they are only approximately 2 centimeters shorter in size. None has been produced since the late 1920s. The [mezzo-soprano](#) in F (produced by the American firm Conn during the period 1928-1929) is extremely rare; most remaining examples are in the possession of serious instrument collectors. Adolphe Sax made a few F baritone prototypes, but no serious F baritones were manufactured. E-flat baritone saxes made to high pitch (A = 456) do exist and it may be easy to mistake such an instrument for an F baritone upon sight inspection alone as the high pitch model will be noticeably smaller than a low pitch one. There are no known specimens of the bass saxophone in C, the first saxophone constructed and exhibited by Sax in the early 1840s. The only known F alto made by Sax known to exist is owned by retired Canadian classical saxophonist Paul Brodie, and was found in France. Lastly, despite Ravel's scoring for a sopranino saxophone in F in *Bolero*, no specimen is known to exist or to have been built by Sax or any other maker.

Construction difficulties mean that only recently has a true sopranissimo saxophone been produced. Nicknamed the Soprillo, this piccolo-sized saxophone is an octave above the soprano, and its diminutive size necessitates an octave key on the mouthpiece.

## Related instruments

A number of saxophone-related instruments have appeared since Sax's original work, most enjoying no significant success. These include the *saxello*, similar to a straight soprano but with a slightly curved neck and tipped bell; the straight alto; and the straight tenor (currently not in production; until recently, made only by a Taiwanese firm and imported to the United States by the L.A. Sax Company). Since a straight-bore tenor is approximately five feet long, the cumbersome size of such a design hinders both playing the horn (particularly when seated) and carrying it. King Saxellos, made by the H. N. White Company in the 1920s, now command prices up to US\$4,000. A number of companies, including Rampone & Cazzani and L.A. Sax, are marketing straight-bore, tipped-bell soprano saxophones as saxellos (or "saxello sopranos").

Two of these variants were championed by jazz musician Rahsaan Roland Kirk, who called his straight Buescher alto a *stritch* and his modified saxello a *manzello*; this unique instrument featured a larger-than-usual bell and modified keywork. Among some saxophonists, Kirk's terms have taken a life of their own in that it is believed that these were "special" or "new" saxophones that might still be available. Though rare, the Buescher straight alto was a production item instrument while the manzello was indeed a saxello with a custom made bell.

The Tubax, developed in 1999 by the German instrument maker Benedikt Eppelsheim, plays the same range, and with the same fingering, as the E-flat contrabass saxophone; its bore, however, is narrower than that of a contrabass saxophone, making for a more compact instrument with a "reedier" tone (akin to the double-reed contrabass sarrusophone). It can be played with the smaller (and more commonly available) baritone saxophone mouthpiece and reeds. Eppelsheim has also produced a B-flat subcontrabass Tubax, the lowest saxophone ever made.

Another unusual variant of the saxophone was the *Conn-O-Sax*, a straight-bore instrument in F (one step above the E-flat alto) with a slightly curved neck and spherical bell. The instrument, which combined a saxophone bore and keys with a bell shaped similar to that of a heckelphone, was intended to imitate the timbre of the English horn and was produced only in 1929 and 1930. The instrument had a key range from low A to high G. Fewer than 100 Conn-O-Saxes are extant, and they are eagerly sought by collectors.

## Bamboo "saxophones"

Although not true saxophones, inexpensive keyless folk versions of the saxophone made of bamboo were developed in the 20th century by instrument makers in Hawaii, Jamaica, Argentina, Thailand, and Indonesia. The Hawaiian instrument, called a xaphoon, is also marketed as a "bamboo sax," although its cylindrical bore more closely resembles that of a clarinet. Jamaica's best known exponent of a similar type of homemade bamboo "saxophone" was the mento musician and instrument maker Sugar Belly (William Walker). In the Minahasa region of the Indonesian island of Sulawesi, there exist entire bands made up of bamboo "saxophones" and "brass" instruments of various sizes. These instruments are clever imitations of European instruments, made using local materials.

## Writing for the saxophone

Music for all sizes of saxophone is written on the treble clef. The standard written range extends from a B-flat below the staff to an F or F# three ledger lines above the staff (although there are soprano models now both straight and curved that have a key for high G). Higher notes -- those in the altissimo range (ranging from high F# or above) -- can also be played using advanced techniques. Sax himself had mastered these techniques; he demonstrated the instrument as having a range of over three octaves up to a high B natural. Written articles of all sorts have referred to the altissimo as "faking" or employing "false fingerings". Both of these terms are incorrect. There is no "faking" involved, as with any other woodwind instrument, the player is simply employing the third and subsequent harmonics to extend the range of the instrument. The difference with the saxophone is that the utilization of these harmonics takes more effort on the part of the player than do other woodwinds, combined with a historical mistaken (and deeply ingrained) belief that the saxophone's range ends at high F or E-flat on older sopraninos, sopranos, baritones, and basses. Sax himself discontinued promotion of the extended range due to its perceived difficulty for the average player.

Virtually all saxophones are [transposing instruments](#): Sopranino, alto and baritone saxophones are in the key of E-flat, and soprano, tenor and bass saxophones are in the key of B-flat. Because all instruments use the same fingerings for a given written note, it is easy for a player to switch between different saxophones. When a saxophonist plays a C on the staff on an E-flat alto, the note sounds as E-flat a sixth below the written note. A C played on a B-flat tenor, however, sounds as B-flat a ninth below. The E-flat baritone is an octave below the alto, and the B-flat soprano is an octave above the tenor. The following discussion refers entirely to the notes as written, and therefore applies equally to all members of the saxophone family.

Since the baritone and alto are pitched in E-flat, they can play concert pitch music written in bass clef by imagining it to be treble clef and adding three sharps to the key signature. On the baritone, this allows the playing of bassoon and bass parts at sounding pitch. This is a useful skill, especially if baritone sax parts are not available.

Most late-model baritone saxophones have an extra key that allows the player to play a low A (concert C), but other members of the family do not (except for some basses and a few rare altos made by The Selmer Company), and composers who write this note for baritone should be aware that it may not actually be played if the saxophonist uses an older instrument.

Early on, most composers stayed away from composing for the saxophone due to their misunderstanding of the instrument. However, around the turn of the twentieth century, some people (many from the United States) began to commission compositions for the instrument. One prominent commissioner was Elise Hall, a wealthy New England socialite who took up playing the saxophone to aid in her battles with asthma (at the behest of her husband, a doctor). Though she did commission many pieces, the works didn't originally feature the saxophone very well (probably because she decided to demonstrate herself the saxophone's ability-- her skills were less than admirable by most accounts). Subsequent versions, however, have been arranged to better feature the saxophone, such as the "Rhapsodie" by Claude Debussy.

## The saxophone in ensembles

Besides functioning as a solo instrument, the saxophone is also an effective ensemble instrument, particularly when several members of the saxophone family are played in combination. Although only occasionally called for in [orchestral](#) music, saxophone sections (usually encompassing the alto, tenor, and baritone instruments, but sometimes also the soprano and/or bass) are an important part of the jazz [big band](#), as well as military, concert, and marching bands.

Ensembles made up exclusively of saxophones are also popular, with the most common being the saxophone quartet (comprising the soprano, alto, tenor, and baritone instruments, or, more rarely, two altos, tenor, and baritone). There is a repertoire of classical compositions and arrangements for this instrumentation dating back to the nineteenth century, particularly by French composers who knew Adolphe Sax. The Raschèr , Amherst , Aurelia and Rova Saxophone Quartets are among the most well known groups, and the World Saxophone Quartet is the preeminent jazz saxophone quartet. Historically, the Marcel Mule and Daniel Deffayet Quartets were highly regarded, beginning in 1928 and 1953, respectively. The Mule quartet is often considered to be the prototype for all future quartets due the level of virtuosity demonstrated by its members and its central role in the development of the quartet repertoire. Organized quartets did indeed exist prior to Mule's ensemble, the prime example being the quartet headed by Eduard Lefebvre (1834-1911), former soloist with the Sousa band, in the United States circa 1904-1911. Other ensembles most likely existed at this time as part of the saxophone sections of the many touring "business" bands that existed in the late 19th and early 20th centuries.

Larger all-saxophone ensembles exist as well. The most prominent professional saxophone ensembles include the Raschèr Saxophone Orchestra , London Saxophonic , Nuclear Whales Saxophone Orchestra [14], and Urban Sax. Very large groups, featuring over 100 saxophones, are sometimes organized as a novelty at saxophone conventions .

## Technique

Many believe it is relatively easy to become a competent saxophonist, especially when transferring from other woodwind instruments, but a considerable amount of practice is usually required to develop a pleasing tone color and fluent technique.

Playing technique for the saxophone is subjective based upon the intended style (classical, jazz, rock, funk, etc.) and the player's idealized sound. The design of the saxophone allows for a big variety of different sounds, and the "ideal" saxophone sound and keys to its production are subjects of debate. However, there is a basic underlying structure to most techniques.

## The embouchure

In the typical embouchure, the mouthpiece is generally not taken more than half-way into the player's mouth. The lower lip is supported by the lower teeth, and makes contact with the reed. The playing-position is stabilised with firm, light pressure from the upper teeth resting on the mouthpiece (sometimes padded with a thin strip of rubber known as a "bite-pad" or "mouthpiece-patch"). The upper lip closes to create an air-tight seal. The "double embouchure" in which the upper lip is curled over the upper teeth is not commonly used in modern times, however each player may eventually develop his/her own variation of the basic embouchure style in order to accommodate their own physical structure.

Two things are imperative to a full and quick-speaking sound: appropriate air pressure which is aided by diaphragm support and correct lip/reed contact allowing the reed to vibrate optimally. The player's diaphragm acts as a bellows, supplying a constant stream of air through the instrument. The throat should feel open, as when yawning. This openness should remain throughout the register of the saxophone, especially the low register (D down to B-flat).

## Vibrato

Saxophone vibrato is much like a vocal or string vibrato, except the vibrations are made using the jaw instead of the diaphragm or fingers. The jaw motions required for vibrato can be simulated by saying the syllables "wah-wah-wah". While most will say vibrato is not vital to saxophone performance (as its importance is inferior to proper tone quality), many argue it as being integral to the distinct saxophone color. Classical vibrato can vary between players (soft and subtle, or wide and abrasive). Jazz vibrato is typically standard amongst its users; fast and wide in fast tempos, delayed and soft in slower tempos. Players just starting out with vibrato will usually start out slow with exaggerated jaw movements. As they progress, the vibrato becomes quicker until the desired speed is reached.

## Tone effects

A number of effects can be used to create different or interesting sounds.

- *Growling* is a technique used whereby the saxophonist sings, hums, or even "growls", using the back of the throat while playing. This causes a modulation of the sound, and results in a gruffness or coarseness of the sound. It is rarely found in classical or marching

band music but often found in jazz, blues, rock 'n' roll and other popular genres. Some notable musicians utilizing this technique are Boots Randolph, Gato Barbieri, Ben Webster, Clarence Clemons and King Curtis.

- A glissando or sliding technique can also be used. Here the saxophonist bends the note using the embouchure and at the same time slides up or down to another fingered note. This technique is sometimes heard in big band music (for example, Benny Goodman's "Sing Sing Sing") and even in an orchestral score (George Gershwin's "Rhapsody in Blue").
- *Multiphonics* is the technique of playing more than one note at once. A special fingering combination causes the instrument to vibrate at two different pitches alternately, creating a warbling sound.
- The use of *overtones* involves fingering one note but altering the air stream to produce another note which is an overtone of the fingered note. For example, if low B-flat is fingered, a B-flat one octave above may be sounded by manipulating the air stream. Other overtones that can be obtained with this fingering include F, B-flat, and D. The same air stream techniques used to produce overtones are also used to produce notes above high F (the "altissimo register").
- This technique of manipulating the air stream is now commonly known as "voicing." Voicing technique, which is often compared to whistling, basically involves varying the position of the tongue, causing the same amount of air to pass through either a more or less confined oral cavity. This, in turn, causes the air stream to either speed up or slow down, respectively. As well as allowing the saxophonist to play overtones/altissimo with ease, proper voicing also helps the saxophonist develop a clear, even and focused sound throughout the range of the instrument. For a thorough discussion of proper voicing technique see "Voicing" by Donald Sinta and Denise Dabney.

## Electronic effects

The use of electronic [effects](#) with the saxophone began with innovations such as the Varitone system, which Selmer introduced in 1965. The Varitone included a small microphone mounted on the saxophone neck, a set of controls attached to the saxophone's body, and an amplifier and loudspeaker mounted inside a cabinet. The Varitone's effects included echo, tremolo, tone control, and an octave divider. Two notable Varitone players were Eddie Harris and Sonny Stitt. Similar products included the Hammond Condor.

In addition to playing the Varitone, Eddie Harris experimented with looping techniques on his 1968 [album](#) *Silver Cycles*.

David Sanborn and Traffic member Chris Wood employed effects such as wah-wah and delay on various recordings during the 1970s.

In more recent years, the term "saxophonics" has been used to describe the use of these techniques by saxophonists such as Skerik, who has used a wide variety of effects that are often associated with the [electric guitar](#).

## **Popular Brands**

Popular manufacturers of Saxophnes include King, Selmer, Yamaha, Conn, and Jupiter.

# Scale

In [music](#), a **scale** is a set of [musical notes](#) that provides material for part or all of a musical work. Scales are typically ordered in [pitch](#), with their ordering providing a measure of musical distance. Scales differ from [modes](#) in that scales do not have a primary or "tonic" pitch. Thus a single scale can have many different modes, depending on which of its notes is chosen as primary.

Every note in a scale is referred to as a *scale degree*. The distance between two successive scale degrees is called a "scale step." Composers often transform musical patterns by moving every note in the pattern by a constant number of scale degrees: thus, in the C major scale, the pattern C-D-E ("doe, a deer") might be shifted up a single scale degree to become D-E-F ("ray, a drop"). Since the steps of a scale can have various sizes, this process introduces subtle melodic and harmonic variation into the music. This variation is what gives scalar music much of its complexity.

Scales may be described according to the [intervals](#) they contain:

- for example: diatonic, [chromatic](#), whole tone

or by the number of different pitch classes they contain:

- most common: pentatonic, hexatonic, heptatonic or five, six, and seven tone scales, respectively.
- used in prehistoric music: *ditonic* or two, *tritonic* or three, *tetratonic* or four
- most commonly in [jazz](#) and [modern classical music](#): octatonic or eight.

Scales are often abstracted from performance or [composition](#), though they are often used [precompositionally](#) to guide or limit a composition. One or more scales may be used in a composition, such as in Claude Debussy's L'Isle Joyeuse. Below, the first scale is a whole tone scale, while the second and third scales are diatonic scales. All three are used in the opening pages of Debussy's piece.

## Terminological note

Musicians use the term "scale" in several incompatible senses.

Scale vs. Mode. Sometimes the term refers to an ordered collection in which no element has been chosen as primary. Thus musicians will talk about the "diatonic scale," the "octatonic scale," or the "whole tone scale." However, the term is sometimes used to mean "mode," indicating that an element of the scale has been chosen as most important. Thus the "C major scale" and the "A natural minor scale" contain the same notes; the difference between them consists only in which note is assigned primacy. Similarly, jazz musicians use the term altered scale to refer to the seventh mode of the ascending melodic minor scale. For consistency, this article will use the term "scale" to refer to an ordered collection with no "primary" or "tonic" note.

Scale vs. Scale Type. Sometimes the term "scale" refers to a specific ordered collection of pitches. For instance, the "C diatonic scale" contains the pitch classes C-D-E-F-G-A-B and no others, while the "G diatonic scale" contains the pitch classes G-A-B-C-D-E-F# and no others. However, the term "scale" is also used to refer to *types* of scale related by transposition. In this sense, musicians will talk about *the* diatonic scale, considering the C diatonic scale and G diatonic scale to be instances of a single, larger category. Consistency suggests distinguishing a "scale" (such as C or G diatonic) from "scale type" (*the* diatonic scale-type). To avoid neologisms, however, we will follow traditional musical practice, using the term "scale" in both senses. Context should allow readers to distinguish between particular scales and the larger types to which they belong.

In addition, the term "scale" is used in psychoacoustics to refer to various ways of measuring distances between pitches.

## Scales in Western music

Scales in [traditional Western music](#) generally consist of seven notes and repeat at the octave. Notes in the commonly used scales (see just below) are separated by whole and half step [intervals](#) of *tones* and *semitones* (the harmonic minor scale including a three-semitone interval; the pentatonic including two of these). Notes with one note between them are separated by three or four semitones.

Traditional Western classical music uses just three types of scale:

- The diatonic scale (seven notes)
- The melodic and harmonic minor scales (seven notes)

In the nineteenth and twentieth century, additional types of scale become common:

- The [chromatic scale](#) (twelve notes)
- The whole tone scale (six notes)
- The pentatonic scale (five notes)
- The octatonic or diminished scales

A large — indeed, virtually endless — variety of other scales exist:

- The Phrygian dominant scales (this is in fact a mode of the harmonic minor scale)
- The Arabic scales

## Scale degrees

A scale degree is a numeric position of a note within a scale ordered by increasing pitch. The simplest system is to name each degree after its numerical position in the scale, for example: the first, the fourth. Note that such an ordering requires the choice of a "first" note; hence numberings are not intrinsic to the scale itself, but rather to its modes (for example, the C major and A natural minor scales contain the same notes, but assign them different scale-degree numbers). However, the *difference* between two scale degrees is independent of the choice of scale degree 1. Thus whether two notes are adjacent in a scale, or separated by one note, does not depend on the mode under discussion. Because [intervals](#) are inclusive, a *fifth* describes a note which is four notes after the tonic.

Major scales have seven notes which are named, in order: tonic, supertonic, mediant, subdominant, dominant, submediant, leading-tone (or leading-note). Also commonly used is the "movable doh" solfege naming convention in which each scale degree is given a syllable. In the major scale, the solfege syllables are: Do, Re, Mi, Fa, So, La, Ti (or Si), Do (or Ut).

## Non-Western scales

In traditional Western music, scale degrees are most often separated by equally-tempered tones or semitones, creating at most, twelve pitches. Many other musical traditions employ scales that include other intervals or a different number of pitches. In the middle eastern Hejaz scale, there are some intervals of three semitones. Gamelan music uses a small variety of scales including Pélog and Sléndro, none including equally tempered intervals. Ragas in Indian classical music often employ intervals smaller than a semitone (Callow & Sheperd, 1972; Jhairazbhoy & Stone, 1963). Arab music maqams may use quarter tone intervals (Zonis, 1973). In both ragas and maqams, the distance between a note and an inflection (e.g., [ruti] of that same note may be less than a semitone.

## Microtonal scales

The term microtonal music usually refers to music with roots in traditional Western music that employs non-standard scales or scale intervals. The composer Harry Partch made custom musical instruments to play compositions that employed a 43-note scale system, and the American jazz vibraphonist Emil Richards experimented with such scales in his 'Microtonal Blues Band' in the 1970s. John Cage, the American experimental composer, also created works for prepared piano which use varied, sometimes random, scales. Microtonal scales are also used in traditional Indian Raga music, which has a variety of modes which are used not only as modes or scales but also as defining elements of the [song](#), or [raga](#).

## Jazz and blues

Through the introduction of blue notes, [jazz](#) and [blues](#) employ scale intervals smaller than a semitone. See *also*: [jazz scales](#). The blue note is an [interval](#) that is technically neither major or minor but 'in-between', giving it a characteristic flavour. For instance, in the [key](#) of E, the blue note would be either, a note between G and G# or a note moving between both. In blues a pentatonic scale is often used. In jazz many different [modes](#) and scales are used, often within the same piece of music. Chromatic scales are common, especially in modern jazz.

## Chords, patterns, and scalar transposition

As discussed above, musicians often utilize scales by shifting (transposing) a musical pattern by some constant number of scale degrees. This process is known as *scalar transposition*.

The harmonies of traditional tonal music are constructed in this way. Western tonal chords are stacks of thirds built above a particular scale degree, which is called the root of the harmony. Thus in a C diatonic scale: CDEFGAB, a three-note chord built on C will consist of the notes C-E-G. The same pattern, built on the note G, produces the harmony G-B-D.

# School band

A **school band** is a group of student musicians who rehearse and perform together, under the direction of a conductor (band director). The term "band" refers in this case to a [concert band](#) which generally consists of [wind](#) and percussion [instruments](#) only. A string bass (the band name for a double bass / contrabass) is often added as well.

# Types of ensembles within the school band program

## Junior or beginning band

Students will join the beginning band at different grade levels depending upon the school district (Usually 4th or 5th grade). At this point, students are just beginning to play for the first time. The beginning band will often perform concerts for the public as early as the holiday season. Instruments for beginning band students are found through a variety of means. Schools typically provide the larger instruments in the band for students because of the heavy financial burden.

## Concert or symphonic band

Student musicians in a concert band are students that have progressed past the beginning year. Depending upon the size and status of the school and band program, students will be placed in a [concert band](#) where they will focus more emphasis on ensemble sounds in addition to individual progress as a musician. Concert bands will typically perform more throughout the school year and will likely play more difficult music.

## Chamber ensembles

Many schools involve a [chamber music](#) program as a contrast to the larger [concert band](#). Chamber ensembles such as a brass quartet, woodwind choir or [percussion ensemble](#) provides students with more opportunities to be heard as individuals. More is required out of them as well given the nature of the smaller group.

## Jazz band

Usually consists of trombones, trumpets, saxophones, drums, guitar, bass and a piano. This ensemble is based after the concept of the [big band](#) from the mid 20th century. This is an ensemble that performs a style of music completely unlike that of the [concert band](#). Many students enjoy this style of music because it provides more opportunity for them to play alone (solo). Jazz bands are often times not conducted, but rather "led" by the band director who provides instruction and guidance, but may or may not actually conduct.

## Marching band

Many schools, especially United States high schools, have a [marching band](#), often as a complement to the school's football team.

# Instruments in school bands

## Woodwind

- [Piccolo](#)
- [Flute](#)
- [Oboe](#) (English horn is also occasionally used)
- [Bassoon](#)
- Alto saxophone
- Tenor saxophone
- Baritone saxophone (the soprano saxophone and bass saxophone are occasionally used)
- Soprano clarinet
- Alto clarinet
- Bass clarinet
- Contralto clarinet
- Contrabass clarinet

## Brass

- [Trumpet](#) or [cornet](#) (trumpet and cornet parts are often different in older works)
- French horn
- Tenor trombone
- Bass trombone
- Euphonium (also called a baritone) (often written bass clef and a baritone part in treble clef in B-flat)
- [Tuba](#)

## Percussion

- Snare drum
- Tom toms
- Bass drum
- Keyboard percussion, including orchestra bells, [xylophone](#), marimba, and [vibraphone](#)
- [Timpani](#)
- [Piano](#)
- Chimes
- [Cymbals](#) including crash, ride, and suspended
- [Tambourine](#)
- Cabasa

There are a variety of other auxiliary percussion instruments used on specific pieces.

# Schranz

**Schranz** is the name given to European (especially German) hard [techno](#), a style of techno typically around 140-150 BPM and based around massively bass-heavy kick drums, driving percussion and distorted, looping synth noises. The term originated in 1994 when Frankfurt-based DJ Chris Liebing used it to describe a certain type of techno in a record store he ran; it has no particular meaning in any language. There are speculations, however, that it was meant as a contraction of the to german verbs *schreien* (scream) and *tanzen* (dance), i.e. "scrance".

Other important producers in the genre beside Chris Liebing are DJ Amok, DJ Rush, Frank Kvitta, Sven Wittekind, Arkus P, Gayle San, Cari Lekebusch, Andreas Kremer, Adam Beyer, Tom Hades, Pet Duo, Felix Kroecker, Tomash Gee, Mario Ranieri, Patrik Skoog, Dr. Robotron and Mr. Mechanical Noyze and Robert Natus

## [Techno](#)

[Acid](#) - [Detroit](#) - [4-beat](#) - [Gabber](#) - [Ghettotech](#) - [Hardcore](#) - [Happy hardcore](#) - [Minimal](#) - [Nortec](#) - [Rave](#) - **Schranz** - [Tech house](#)

## Other [electronic music genres](#)

[Ambient](#) | [Breakbeat](#) | [Drum and bass](#) | [Electronica](#) | [Electronic art music](#) | [Hard dance](#) | [Hardcore](#) | [House](#) | [Techno](#) | [Trance](#) | [Industrial](#) | [Synthpop](#)

Category: [Techno music genres](#)

## Scramble band

A **scramble band** - also known as a **scatter band** - is a particular type of field-performing [marching band](#) with distinct characteristics that set it apart from other common forms of marching bands; most notably, scramble bands do not normally march. In fact, the name comes from the way in which the band moves between formations – members run to each form without using a prescribed path; this is known as *scrambling* or, in the western half of the United States, *scattering*.

## Characteristics

Scramble bands often take pride in their diversion from the normal marching band. In fact, most scramble bands *do not march* at all, regardless of whether their official group name contains a form of the word "March".

Like their marching counterparts, scramble bands almost always perform music using traditional band instruments. They will also stand in formations on a field, but that is usually where the similarity between scramble bands and "normal" marching bands ends. The formations themselves are often simple shapes or crude "pictures" that lend themselves to a particular section of the performance instead of intricate geometric or abstract shapes. Additionally, scramble band performances often rely on a humorous or satirical script, read during the performance by an announcer using a loudspeaker or public address system.

Scramble bands are generally student-run and tend to be smaller in membership than what one would expect from a marching band.

According to the self-appointed "Cleverest Band in the World" at Columbia University, the origin of scramble bands is as follows:

"See, in the 50s, our great country was going through a lot of changes. Disco was at its peak, little Shirley Temple was charming the hearts of Americans everywhere, Jesus was walking the earth, and Ronald Reagan was pushing hard for the new Women's suffrage movement. The Columbia University Marching Band, which had always been slightly wacky, took a good look at itself. "How," we asked ourselves, "could we make being in a marching band even more fun?" Well, we decided that the whole marching around and forming rhombi thing had gone out of style with World War II. So we introduced the world to the "scramble band" concept - so named for the way bandies would scramble from one interesting formation to the next."

While there is no widespread agreement as to which school actually invented the scramble band concept (The Harvard University Band, among other school bands, lays a claim), it is probably safe to assume that the process was pretty much as described.

Other characteristics of scramble bands vary by the particular group and may include:

- Non-standard instrumentation - Some bands include string or electronic sections to offer membership to musicians who would otherwise be excluded from participation in a marching band. Instruments in this category might include violins, cellos, string bass, electronic keyboards, and electric guitar. More unusual instrumentation such as bagpipes and accordions is not unheard of.
- Non-musicians - Just as membership often includes non-standard instrumentalists, it may also include people who have little or no musical talent at all. These members may "play" homemade instruments (washboards, trash can lids, mailboxes, etc.) or may participate in other various capacities.
- Skits or other dramatic performance - Members may dress in costume and/or employ the use of props (usually handmade) to mime to the audience a scene described or suggested by the announcer's script. Such scenes are often overdramatic (to aid

audience members seated far away) and make use of slap-stick comedy, where appropriate (or not).

## **Particular ensembles**

This style is practiced mainly by a number of college marching bands, primarily in more academically elite or liberal schools such as the Ivy League schools (excepting Cornell University), Stanford, the University of Virginia, and Rice.

## **Well-known scramble bands**

Brown University Band  
Columbia University Marching Band  
Dartmouth College Marching Band  
Harvard University Band  
Michigan Technological University Huskies Pep Band  
The University of Pennsylvania Band  
Princeton University Band  
Rice University's Marching Owl Band  
Stanford University Marching Band  
Virginia Pep Band  
Yale Precision Marching Band

Besides school scatter bands, there are other traditional arenas for similar comic treatments of outdoor marching music &mdash, like mummers parades, the pre-Rose-Parade parody known as The Doo Dah Parade, Chinatown parades, Mardi Gras parades, etc.

## Stunts and antics

Scramble bands are notorious for their irreverent stunts, and some of these prove to be controversial. The most upsetting events usually have consequences (see also: censorship) regardless of whether the band intended such controversy. Listed below are some of the more notable events in scramble band lore:

Columbia's altar-boy joke (tuition going down faster than...) while playing a Catholic school.

UVa's Inbred Family Feud gag against West Virginia.

Stanford's band accidentally rushed the field before a game against rival Cal ended. This memorable accident, seen to the right, became known as The Play, and is often seen on highlight reels.

More recently, Stanford's band was disciplined for a show with jokes about polygamy during a game against Brigham Young University in September 2004.

Rice launched a weather balloon-based "UFO", eventually tracked by bewildered air traffic controllers.

Yale was banned from West Point after a Yale-Army halftime show in which band members formed "USA" on the field, then dropped their pants and marched off, leaving the letters spelled out in clothing.

Another Yale halftime featured the marriage of two former band members. ("At Yale, Wedding Band Takes On a New Meaning", New York Times, October 10, 1992.)

Dartmouth was banned from Holy Cross for a show that involved a Ted Kennedy Triathlon which included the "Ted Kennedy drive and swim," a parody of the Chappaquiddick affair. Members of the Kennedy family were in attendance, and needless to say, were not pleased. The Dartmouth Band was allowed back for the first time in 2004.

Occasionally, the tables are turned. The Texas A&M Aggies misinterpreted (or simply didn't like) a 1973 performance of Rice's MOB and formed an angry mob (no pun intended) outside Rice's own stadium, trapping the Owl band inside for hours until police dispersed some of the crowd and allowed the band to exit, transported by food service trucks. (The entire show can be found here)

## Censorship

In recent years, administrators at many schools have taken steps to rein in their scramble bands' more embarrassing attempts at humor. These have included:

- Requiring approval of show content
- Replacing student leaders with university faculty or staff
- Refusing to allow the band to perform (a step occasionally also taken by a host school during away games)
- Disbanding the band

Categories: [Marching bands](#)

# Scratching

**Scratching** is a DJ or turntablist technique originated by Grand Wizard Theodore, an early hip hop DJ from New York (AMG). Theodore developed scratching from DJ Grandmaster Flash, who describes scratching as, "nothing but the back-cueing that you hear in your ear before you push it [the recorded sound] out to the crowd." (Toop, 1991) Kool Herc was also an important early figure. The technique is designed to accentuate the work of the DJ by creating an assortment of sounds through the rhythmical manipulation of a vinyl record, and has spread from hip hop culture to a number of other musical forms. Within hip hop culture, scratching is still of great importance in determining the skill of a DJ, and a number of competitions are held across the globe in which DJs battle one another in displays of great virtuosity.

Almost all scratches are produced by moving a vinyl record back and forth with your hand while it is playing on a turntable. This creates a distinctive sound that has come to be one of the most recognizable features of hip hop music. Ideally, scratching does not damage a record because the needle stays within the groove and does not move horizontally across the record's surface. The basic equipment setup for scratching includes two turntables, and a mixer with a crossfader. When scratching, this crossfader is utilized in conjunction with the "scratching hand" to cut in and out of the scratched record.

## Sounds and Techniques

Sounds that are frequently scratched include but are not limited to drum beats, horn stabs, spoken wordsamples, and lines from other songs. The three most commonly scratched sounds are the beep sound, "Ahhh" and "Frrresh", from the phrase "Ahhh - This stuff is really frrresh" taken from the record "Change the Beat" by Fab Five Freddy. This is most likely related to D.ST's use of the "frrresh" sound during the performance of "Rockit" at the 1984 Grammy Awards.

Any sound recorded to vinyl can be used, though a new generation of CD players providing a turntable-like interface has recently reached the market, allowing DJs to scratch not only material that was never released on vinyl, but also field recordings and samples from television and movies that have been burned to CD-R. Some DJs and anonymous collectors release 12-inch singles called ScratchTools or battle records that include trademark, novel or hard-to-find scratch fodder. Some DJs prefer to rotate the turntable 90 degrees counter-clockwise in an orientation known as "Battle-style" to put the tonearm of the turntable at the top, furthest away from the DJ. This frees up more of the platter to manipulation without interfering with the needle.

### Baby Scratch

The simplest scratch form, and the basis for all other scratch forms, the baby scratch is performed with the scratching hand only (the crossfader is not used). The scratching hand slowly moves the record back and forth. Moving the record slowly is important for this scratch form, otherwise it becomes a scribble scratch.

### Tear Scratch

Like the baby scratch, the tear is performed without the crossfader. The tear consists of a simple forward-back-back or forward-forward-back motion, effectively breaking the sound into triplets, where the baby scratch breaks it into duplets. The term "tear scratch" can also refer to a simpler, slower version of the chirp. For example: the fader is cut in, the record is dragged forwards, the fader is cut out then back in again as the record is dragged backwards. The fader is then cut out and the pattern continues.

### Scribble Scratch

The scribble scratch is performed without the crossfader, and is performed by tensing the forearm muscles of the scratching hand and rapidly jiggling the record back and forth in minute movements.

### Chirp Scratch

The chirp scratch involves fading the sound in and out with the crossfader hand while the scratching hand performs a baby scratch. When performed quickly, this creates a distinctive

"chirping" noise.

## **Transform Scratch**

The transform scratch was first popularized by its appearance in the title sequence for the cartoon *The Transformers*. It starts with the crossfader closed, and involves moving the record very slowly with the scratching hand while periodically "tapping" the crossfader open and immediately closing it again. The Flare scratch is the same as the transform, except that the crossfader begins open, and is bounced against the closed wall to periodically cut the sound out.

## **Crab Scratch**

The crab scratch consists of slowly moving the record while quickly tapping the crossfader open with each finger of the crossfader hand. In this method, the thumb acts as a spring, immediately pushing the crossfader closed after each tap. In this way, DJ's are able to perform transforms or flares much faster than they could by manipulating the crossfader with the whole hand. A precursor to the crab scratch was the twiddle scratch, where the first and middle finger tap the crossfader in rapid succession.

## **Orbit Scratch**

An orbit scratch describes any scratch, most commonly the flare, which is done forward and immediately backwards along the record's surface. Thus, an orbit scratch can be carried on indefinitely.

## **Tweak Scratch**

The tweak scratch, invented by DJ Mix Master Mike, is performed with the turntable's motor off. The record platter is set in motion manually, then "tweaked" faster and slower to create a songlike scratch. This scratch form is best performed with long, sustained sounds.

## World of Scratching

During the 90's up to the present day its usage in popular music has seen a substantial increase. Some examples of this would be within Nu-Metal acts (especially Limp Bizkit and Linkin Park) and in some pop music (Nelly Furtado). DJs are also often included as 'stage-props' (especially in the urban genre) where they stand behind turntables pretending to emulate scratching and mixing. The majority of these DJs are there simply to add effect to the stage and create more of an atmosphere.

Because of this, many people perceive scratching as an easy and simple skill to acquire where all one needs to do is move your hand back and forth to create the associated "wikki-wikki" sound. The reality is, scratching is a skill that requires considerable practice.

While scratching is becoming more and more popular within pop music, the art-form itself is still predominantly underground. One of the most influential groups to the world of scratching would be the Invisibl Skratch Piklz hailing from the San Francisco area. Forming in 1994 as DJs Qbert, Disk & Shortcut and later Mix Master Mike the group took scratching to a whole new level. With their focus primarily on scratching, the group displayed exactly what the turntable is capable of.

"The turntable is the most versatile instrument. You can be a drummer, you can be a guitarist, you can be a lead vocalist — anything." DJ Shortcut

With the departure of DJ Disk, enter two new members, Yogafrog followed by D-Styles. DJ A-Trak from Canada was also a guest member of the group after winning the Technics' DMC World Finals in 1997. After releasing their Shiggar Fraggar CD series and touring various countries around the world the group disbanded in 2001.

Each of its members however have continued to prove they are at the forefront of the scene by pursuing their own projects. In 1998, DJ Qbert made scratch history by composing the first ever album made entirely by scratching - from the beats to the sound effects. The album was entitled 'Wave Twisters' and was later released in 2001 as a feature length movie. DJ D-Styles (now a member of the Beat Junkies crew from Los Angeles), who contributed the 'Razorblade Alcohol Slide' chapter to Wave Twisters was at the same time working in his own 'scratch music' album entitled 'Phantazmagorea' - released in 2001. Both these albums displayed an array of new scratches & techniques, further proof that these guys were still out there pushing the boundaries. In 1996, while both still a part of the ISP group, DJs Qbert & Yogafrog set up their own company — Thud Rumble — dedicated to the art of scratching. Their main goal was to spread the art of scratching on a global scale. They released their own videos called Turntable TV where DJs from around the world would hang out and scratch.

In July of 2000, San Francisco's Yerba Buena Center for the Arts held Skratchcon2000, the first DJ Skratch forum that provided "the education and development of skratch music literacy". By bringing the globe's important DJs together in one arena, professional and amateur DJs were given the chance to learn and utilize various skills, techniques, and styles. In the past, Thud Rumble was involved in the facilitation of important historical DJ events like ITF (International Turntablist Federation) and the Vestax World DJ Championships. After being praised by Source Magazine as the "Greatest DJ event of all time", Thud Rumble had successfully added Skratchcon2000 to the list.

In 2001, Thud Rumble opened their office doors to become an independent company that managed and maintained the production and distribution of their own products. By working with various DJ artists to produce and distributed scratch records, Thud Rumble was able to provide a wider range of practice and/or performances tools for DJs. Thud Rumble have close ties with many of the leading electrical DJ equipment companies and have often been approached to help design new products for the DJ community. Most notable of all these is the Vestax QFO released in 2004. The QFO is a turntable/mixer in one, allowing DJs a portable

device able to set up literally anywhere. Designed mainly for this reason it has met mixed reviews however since its release all of Qberts shows have seen him using only the QFO.

## **DJ Q-bert**

Richard Quitevis aka. DJ Q-bert (or Q) is regarded as one of the most important figures in the scratch community today. The extent of his arsenal of turntable tricks and techniques can be seen in his self-produced DIY scratching DVD's released through Thud Rumble. Here he explains equipment set-up, gives advice on hand and arm strengthening techniques and offers a one-to-one tutorial on various different scratches from the most basic through to the most advanced. The DVD also offers a five-part battle section where DJs take turns at performing scratches over a looped beat.

## Scratching outside hip hop

Scratching has been incorporated into a number of other musical genres, including Pop, Rock, Jazz, and Classical music performances. Two of the earliest such examples were released in 1983: scratches by Grand Mixer DXT on Herbie Hancock's hit song "Rockit", and, more obscurely, on a few songs the first Golden Palominos record, where Bill Laswell or M.E. Miller scratched.

For recording use, samplers are often used instead of physically scratching a vinyl record.

The Beatmania music video game series simulates scratching with a "turntable" on the side.

Scratch is a documentary film about the origin of scratching and its modern practitioners.

Christian Marclay was one of the earliest and one of the most notable musicians to scratch outside hip hop.

# Screamo

**Stylistic origins:** [hardcore punk](#), [indie rock](#)

**Cultural origins:** mid 1980s Washington, DC

**Typical instruments:** [Guitar](#) - [Bass](#) - [Drums](#) - [Synthesizer](#)

**Mainstream popularity:** Sporadically through the 1980s and '90s, growing in the early 2000s

[Emocore](#) - [Hardcore emo](#) - [Emo violence](#) - **Screamo** - Emotional metalcore

[Post-hardcore](#)

Midwestern emo

[Timeline of alternative rock](#)

**Screamo** is a [musical genre](#) which evolved from [emo](#), more specifically [hardcore emo](#) in the early 1990s. Characteristic of the genre are hardcore screaming vocals and fast, harmonized guitars. Breakdowns in screamo songs are often slower and more melodic than in other genres, less of a "beatdown" and more an opportunity for introspection (and rest for the musicians). Other than that, it is fairly hard to classify (particularly since the rule about screaming vocals is bent fairly often). It is sometimes also mistakenly referred to as [emo violence](#), which is closely related (although bands in both genres borrow ideas from each other). Lyrically, screamo topics are often times introspective, although it is not uncommon to see a screamo band with political lyrics. Most screamo songs use imagery and metaphors to communicate lost love or failed friendships.

## History

In California in the early 1990s, Gravity Records from San Diego released many defining records of this style. Significant Emo bands from this time include Heroin, Angel Hair, Antioch Arrow, Universal Order of Armageddon Swing Kids, and Mohinder. In the New York/New Jersey era, bands such as Native Nod, Merel, 1.6 Band, Rye Coalition and Rorschach were feeling the same impulse. The labels Gern Blandsten Records and Troubleman Records released many of the influential records from that region and era. Many of these bands were involved with the ABC No Rio club scene in New York, itself a response to the violence and stagnation in the scene and with the bands that played at CBGBs, the only other small venue for hardcore in New York at the time.

There was an explosion of bands, some who influenced this were: Indian Summer, Evergreen, Current, Shotmaker, Portraits of Past, and Julia. These bands eventually became what is known as Emo, a style which intensified the dramatic aspects of vocal performances in order to achieve a cathartic breakthrough with the audience. Their music backgrounds differ, Julia and Evergreen both produced some of the richest Emo sounds, while Shotmaker railed off [hardcore punk](#) and found their niches in the brutal honesty of the human voice. Done well, the result was powerful emotional release that often left Emo bands and their audiences crying or screaming or very quiet at the end of performances. While effective, such open displays of emotion made many traditional hardcore fans uncomfortable, and caused much friction between the two camps.

In recent years, the internet has helped spread word of screamo through websites and through online distributions. Many fans of the genre have turned to eBay to expand their collections of rare and out-of-print records. This leads to very high prices on records that often cost a meager \$10 or less when they were first released. Some members of bands who have broken up have expressed displeasure in these high prices and urge fans not to buy them, or buy a posthumously released discography instead. There are alternatives to eBay including [vivalavinyll.org](#), a website dedicated to fairly trading and selling hardcore records, and providing accurate pressing information on releases.

In recent years, the term *screamo* has been very commonly used to describe emo, [post-punk](#), [alternative rock](#), [metalcore](#), or [hardcore](#) bands with emo influences.

Many "Screamo" bands have broken up but in the late 90s and early 2000s, another wave of Screamo bands began. But even then, many of these new bands have already broken up. These include bands such as the highly influential Saetia, Envy, Pg. 99, Orchid, and City of Caterpillar.

Despite how short-lived most recent screamo bands are, the underground screamo scene is still very large and is thriving throughout Europe and the United States.

## Second Viennese School

The **Second Viennese School** was a group of [composers](#) made up of Arnold Schoenberg and those who studied under him in early 20th century Vienna. Their music was initially characterized by post-romantic [expressionism](#) and, later, [atonality](#) and Schoenberg's serial technique, though Schoenberg's teaching (as his various published textbooks demonstrate) was highly traditional and conservative, and did not include discussion of his serial method.

The principal members of the school, besides Schoenberg, were Alban Berg and Anton Webern, although there are lesser known composers who perhaps ought to be covered by the term, such as the Greek Nikolaos Skalkottas.

The 'First Viennese School', which is rarely referred to as such except in comparison to the Second, is generally taken to consist of Vienna-based composers working in the late 18th and early 19th century, particularly Wolfgang Amadeus Mozart, Joseph Haydn, Ludwig van Beethoven and Franz Schubert.

## Formal sections

In [music](#) a **section** is "a complete, but not independent musical idea" (Bye 1993, p.51). Types of sections include including [introduction](#) or intro, exposition, [recapitulation](#), [verse](#), chorus or [refrain](#), [conclusion](#), coda or outro, fadeout, [bridge](#) or interlude; or a sectional form such as [binary form](#).

## Seikilos epitaph

The **Seikilos epitaph** is famed as the oldest surviving example of a complete musical composition, including musical notation, from anywhere in the world. The song, the melody of which is recorded, alongside its lyrics, in the ancient Greek musical notation, was found engraved on a tombstone, near Aidin, Turkey (not far from Ephesus). Also on the tombstone is an indication that it is by one Seikilos, for his wife, who presumably is buried there. Above the lyrics (transcribed here in modern Greek font) is a line with letters and signs for the tune:

Translated into modern musical notation, the tune is something like this:

The following is a transliteration of the words which are sung to the melody, and an English translation:

*Hoson zes, phainou*  
*Meden holos su lupou*  
*Pros oligon esti to zen*  
*To telos ho chronos apaitei*

While you live, shine  
Don't suffer anything at all  
Life is short  
And time demands its toll

The find has been dated variously from around 200 BC to around AD 100. While older music with notation exists (for example the Delphic Hymns), all of it is in fragments; the Seikilos epitaph is unique in that it is a complete, though short, composition.

Some scholars believe that an extant corpus of Chinese music, first recorded in the Tang dynasty (618-907 AD), predates this work as well as the earlier fragments of Greek music. This is based on the conjecture that because the recorded examples of Chinese music are ceremonial, and the ceremonies in which they were employed are thought to have existed "perhaps more than one thousand years before Christ" (Aalst), the musical compositions themselves are likely to have been performed, even in 1000 BC, in precisely the manner prescribed by the sources that were written down in the seventh century AD. It is based on this conjecture that Aalst dates the "Entrance Hymn for the Emperor" to c. 1000 BC. Even allowing for the hypothesis that the Emperor's court musicians transmitted these melodies with complete fidelity over sixteen centuries and that the Chinese court ceremonies never changed, there is no material evidence to date the composition, or any other piece of Chinese music, to earlier than the Tang dynasty (Pan). This leaves the Epitaph of Seikilos the oldest complete musical composition that can be reliably dated. It is the inscription of the Epitaph that is actually dated to the first century AD; it would be possible likewise to form a conjecture that the song itself was sung before this.

# Selling out

***Selling out*** is a common slang phrase. Broadly speaking, it refers to the compromising of one's integrity, morality and principles in exchange for money, success or other personal gain. It is commonly associated with attempts to increase mass appeal or acceptability to mainstream society. A person who does this is labelled a **sellout**.

Many people see nothing wrong with tailoring a product to the tastes of its audience, or with taking practical and financial considerations into account when making art. And, in regard to theater shows, musicals, etc, a "sell out" show is simply a show so popular that all tickets are sold out, and is generally considered as a milestone in terms of success. Selling out may be then gaining success at the cost of credibility. Though generally associated with the entertainment industry, regular individuals who similarly compromise their ideals (e.g. a Bohemian individual who suddenly switches to a socially conservative lifestyle) could also be considered sellouts.

## History of terms associated with selling out

Urban legends and myths were often created around American jazz musicians in the early 20th century to add to the artist's mystique. One popular myth was that the blues musician Robert Johnson sold his soul to the Devil in order to become successful. It's thought that the modern idea of selling out is a natural progression of this idea.

In the 1990s, comedian Bill Hicks coined the term "sucking Satan's cock", which he used to describe musical acts who make bland music to maximise sales, or allow their music to be used in advertising. This phrase has since become a widely used neologism, and is commonly used to describe the act of selling out.

In addition, "selling out" has very literal roots. For example, selling out of a company means selling all the stock one holds in a corporation. Selling out of an investment brings direct financial gain with a relinquish of responsibility for the content or service provided by the company.

## Criticism of the term

Selling out has frequently become used to describe anyone who changes artistic direction, as many fans assume that this must be done in an attempt to attain wider commercial appeal. This may fail to account for natural artistic [development](#), which may lead an artist in directions that their original fans disliked. Also, it can result in the artist(s) being afraid to *show* artistic evolution out of fear of alienating existing fans, which many argue is a prime example of going against one's beliefs or values in the pursuit of monetary gain (ie: selling out).

## Comedy

Although rare, stand-up comics face criticism of selling out. Most comedians who start out in comedy clubs often use foul language and blue humor in their routines. A comic who alters his routine by "sugar-coating" his language and using less-offensive material to obtain mainstream success may be accused of selling out. Some would also argue that comedians who decide to enter the film industry with comedy movies are selling out, depending on the quality and content of their movies. For example, some may accuse Adam Sandler of selling out by making movies in his now-trademark "goofball" style (though his starring role in *Punch-Drunk Love* is a striking exception).

One comic who has been labeled a sell-out is the ground-breaking George Carlin, who had changed the original title of his album and special, "Complaints and Grievances". The original title was "I like it when People Die". In light of the September 11th attacks in NYC, he changed the name, out of respect for those who died.

# Music

The phrase is mainly heard in the [musical](#) community, where it is used to imply that an artist has compromised their artistic integrity in order to gain radio airplay or obtain a recording contract, especially with a major label, the classic example of this being when Chumbawumba signed to EMI after years of viciously attacking the organisation. Often, the label will force the style of a particular record producer on the performer, or insist on inclusion of songs by commercial songwriters; or the label may refuse to release an album, deeming it uncommercial, though this indicates that the artist or group maintained their standards or values.

## Heavy metal

### Thrash Metal

One band often accused of selling out is Metallica. During the 1980s, the band was known for playing fast, aggressive thrash metal and band members repeatedly stated that they would never record a music video. Eventually they yielded, recording a video for the song One from the album ...And Justice For All in 1988. Some fans felt that this marked a change in their style, resulting in more radio-friendly, commercially-acceptable music than what the band had performed in previous years. A few others have accused the group of adopting a less aggressive sound in the 1990s, similar to alternative rock bands popular at the time. The band also received criticism and accusations of selling out after filing a lawsuit against the peer-to-peer computer network Napster in 2000. In contrast, the 2004 documentary Some Kind of Monster, which covers the lengthy process of creating the St. Anger album, shows the band recording an endorsement for a radio contest against their wishes, in order to secure airplay for their new material.

### Black metal

The [black metal](#) scene is notorious for the elitism of its fans and main members. One term that is regularly used is the word 'true'; that is, which bands should be considered 'true black metal' and which ones are simply posers. Bands considered 'true' are those who remain attached to the underground scene and its ideals; for example, since black metal was founded by anti-Christian bands, Christian black metal bands such as Antestor and Horde are inherently considered 'untrue' by many in the scene.

The debate has become more relevant in the recent past due to the increasing commercial success of bands like Dimmu Borgir and Cradle of Filth, who have their roots in the black metal scene (and maintain that image) but who are often considered sellouts by 'true' black-metallers.

### Nu-metal

With the increased popularity of [nu metal](#) bands in the late 1990s and early 2000s, the placement of a band into the nu metal genre has largely become a litmus test of selling out among metal fans. Bands that change their musical style are often accused of "jumping onto the nu metal bandwagon" for the sole purpose of gaining more airplay on radio and MTV. Metallica themselves have been accused of this upon the release of St. Anger, with which they jettisoned guitar solos for the first time in their history. Another example of this is the death metal band In Flames. Some of their fans claim that the band's most recent albums are no

longer "metal", but are more in the vein of bands such as Ko/n. It should be noted that the term nu-metal itself is used mainly as an insult, and many bands who are placed under the nu-metal category by fans would not consider themselves nu-metal, such as System of a Down. The term nu-metal, while having formerly been merely a descriptive term, now has pejorative connotations.

## **Metalcore**

The Welsh band Funeral for a Friend have been accused of selling out after they re-recorded the song "Juno" for their first studio album. The new version, named "Juneau" is much more melodic and easier to listen to for a more mainstream audience. Funeral for a Friend have denied this, and say it is showing that the band have matured. Ironically, the version they play live more closely resembles the original. This is most likely due to their large fanbase.

In more recent years, however, there has been a significant decline in the influence of nu metal on mainstream rock. This has been coupled with a tremendous rise in popularity of [metalcore](#) groups such as Atreyu, Killswitch Engage, Lamb of God, and Avenged Sevenfold. This, in effect, has caused many fans to shift their accusations of "selling out" away from nu metal (no longer considering it to be important) and directing it instead towards [metalcore](#) bands (see [fashioncore](#)).

## **Punk**

The accusation of selling out is often made against [punk](#) bands who sign to major labels (e.g., Green Day, The Offspring), since punk has a cultural tradition of independence and doing it yourself. Similarly, it is often heard in the [indie rock](#) and [metal](#) communities, which like punk have a tradition of mainstream rejection and/or anticconsumerism. The most famous indie rock sellout band would probably be Soul Asylum, who discarded their punk roots to adopt a mainstream rock sound in the early 1990s. Some of the early influential punk bands released records on major labels (Sex Pistols (Virgin / Warner) and The Clash (CBS)); some Sex Pistols fans argue that Virgin was still an independent company when the group signed to it and that Warner was the "sister" company of Virgin (like Capitol and EMI with The Beatles). In the early 90's Green Day was signed with an independent punk record company called Lookout! Records, but in 1994 they signed with Reprise Records and released Dookie. The album drew scorn from the band's earliest fans. More recently and more commonly, Green Day was accused of selling out with their album American Idiot, since songs like Holiday, Boulevard of Broken Dreams, and Wake Me Up When September Ends are believed to be too pop-oriented, and receive airplay on top 40 radio stations, in spite of the fact that Green Day are not considered "punk" at all by some Punk rock fans. Some of these artists have defended these actions as a necessary evil in order to achieve widespread distribution of their records and messages, and argue that selling out only occurs when the artist compromises the music in order to appeal to the broadest mainstream audience. As in the case of Green Day, some of their songs are more pop oriented because it helps tell the story. (American Idiot is a Punk Opera, that is, it tells a story throughout the album)

## **Hip hop**

Selling out is a controversial topic within both [hip hop music](#) and hip hop culture, with two wholly opposite views on the matter. Traditional "underground" hip hop artists and fans decry "selling out", and heavily criticize artists who change their style just to reach the top. They also heavily protest an emphasis on material things, gloss, and other such ornamentation. The hip-hop community also considers a performer to be a "sell-out" when they shun hip-hop's traditional African-American and Latino communities and appear to be pandering to a

mainstream (usually white) audience. For example, Kurtis Blow was considered a sell-out in the 1980s, MC Hammer was accused as being a sell-out during the 1990s, and 50 Cent during the 2000s.

Mainstream hip-hop music, on the other hand, embraces materialism and a "bling-bling" mentality. Such visual representations of wealth are seen as status symbols and things to be aspired to, as opposed to the attitude of traditional "hip hop heads" and punk or metal artists that states that these are things that artists should in some way feel ashamed of. Mainstream artists such as Master P and P Diddy have achieved vast personal fortunes and business empires, and often revel in their affluence in their music.

Hip-hop's lyrical content has changed very much as well, as mentioned in the above paragraph, new hip-hop is now much more popular and the artists are wealthier. Today the lyrics in hip-hop seem to reference more the wealth and "high life" of the rappers, where as in older hip-hop the lyrical content was more about "the ghetto" and were anti-establishment. Long time hip-hop fans express dissatisfaction with this change.

Mainstream [hip hop music](#)'s fixation on bling bling and other material and luxury goods has led to much criticism from media pundits, musical critics, and the non-mainstream hip-hop community. They charge that the phenomenon promotes consumerism and materialism, and strengthens racist arguments that young African American men are incapable of higher or more virtuous or spiritual goals than material gain.

Some of the most vocal critics of "bling bling"-oriented music are [alternative hip hop](#) artists. An example of this is the group Dead Prez, from "Hip Hop"

All y'all records sound the same  
I'm sick of that fake thug, R&B-rap scenario, all day on the radio  
Same scenes in the video, monotonous material  
Y'all don't hear me though  
These record labels slang our tapes like dope  
You can be next in line and signed; and still be writing rhymes and broke  
You would rather have a Lexus? or justice? a dream? or some substance?  
A Beamer? a necklace? or freedom?

## Other

Bob Dylan outraged [folk music](#) purists by, in their view, selling out their favorite music for [rock and roll](#) when he first played an [electric guitar](#) at the Newport Folk Festival (1965). However, Dylan has changed direction repeatedly throughout his career.

The band Queen have been considered as 'sellouts', as they have appeared on the popular show American Idol, presumably for a large amount of money. The show has had appearances by artists such as Shakira, and is thought to be pure [pop](#) music.

## References to selling out

### Songs

Many songs have been written about selling out, including:

- "Hooker with a Penis" by Tool
- "As I am" by Dream Theater
- "Tinsel Town Rebellion" by Frank Zappa
- "Selling Out" by Tom Lehrer
- "All Men Play On 10" by Manowar
- "Cashing in" by Minor Threat
- "Cherub Rock" by The Smashing Pumpkins
- "Corridor Of Chameleons" by Meshuggah

"Chainsaw Charlie (Murders In The New Morgue)" by W.A.S.P.  
 "Have a Cigar" by Pink Floyd  
 "Pull My Strings" by Dead Kennedys  
 "I'm Not Allowed to Like A.C. Anymore Since They Signed to Earache" by A.C.  
 "Johnny Quest Thinks We're Sellouts" by Less Than Jake  
 "Never Sell Out" by The Exploited  
 "Radio Stars" by Insane Clown Posse  
 "Sell Out" by Bigwig  
 "Sell Out" by Reel Big Fish  
 "Selling Out" by Tristania  
 "Our Broken Hearts (Scene from Top Gun 2)" by lostprophets  
 "Two Tabs of Mescaline" by Glassjaw  
 "Radio Friendly Unit Shifter" by Nirvana  
 "I Sucked A Lot Of Cock To Get Where I Am" by Regurgitator  
 "Bliss" by Delirious?  
 "Rock for Sustainable Capitalism" by Propagandhi  
 "Gone" by U2  
 "Mediocrity Gets You Pears (The Shaker)" by Against Me! (who subsequently signed to a major label.)  
 "Unprotected Sex With Multiple Partners" by Against Me!  
 ""you sold your rock 'n'roll" by gwem and the gwemetts  
 "Handbook for the Sellout" by Five Iron Frenzy  
 "Cut your Hair" by Pavement  
 "Sons of Plunder" by Disturbed  
 "Death or Glory" by The Clash  
 "I Told You So (Corporate Rock Really Does Suck)" by Carcass  
 "Know it All" by Lagwagon  
 "Champagne for My Real Friends, Real Pain for My Sham Friends" by Fallout Boy  
 "Sellout" by Biohazard

These songs range in approach to the term "selling out"; from declarations that the band will never sell out, to aggressive messages towards fans accusing bands of "selling out".

### **Nirvana**

Nirvana made repeated references to the act of selling out (including, clearly ironically, thanking their audiences for "pretending we're still punks"). One popular T-shirt produced by the band features the slogan "Flower Sniffin', Kitty Pettin', Baby Kissin' Corporate Rock Whores". Frontman Kurt Cobain also proposed the titles Verse Chorus Verse (in reference to the formulaic structure fans had come to expect of their songs) and Radio Friendly Unit Shifters as possible titles for the album that eventually became *In Utero*. Cobain further lampooned ideas of Nirvana's new commercial appeal by appearing on the cover of *Rolling Stone* magazine wearing a T-shirt reading "Corporate Magazines Still Suck". The first Nirvana item to be released following Cobain's death was the perhaps sarcastically titled VHS tape *Live! Tonight! Sold Out!!*.

### **The Who**

The *Who Sell Out* is an album by The Who with mock endorsement advertisements on the cover. The album pretends to represent a radio station that plays nothing but Who music, including mock commercials and radio-station promotions. The Who became very prolific at selling their work by the end of the 1990s, including "Love Reign O'er Me" for 7-Up, "Bargain" for Nissan, "Overture" for Claritin, "Happy Jack" for Hummer, "Baba O'Riley" for Hewlett Packard, and "I Can See for Miles" for Sylvania Silverstar headlights. More recently, their songs have been used as themes for all three CSI series.

## Movies

The term selling out is used in a similar sense when discussing the movie industry, in particular its directors.

### George Lucas

George Lucas has often received heavy criticism from Star Wars fans about selling out. An early example of this was on the issue of the Ewoks in Return of the Jedi. Many fans saw them as too "cutesy" and felt that their inclusion in the film was merely for marketing purposes towards younger audiences. These accusations would resurface and become more intense after the introduction of the controversial character Jar Jar Binks in the Star Wars prequel trilogies. Some fans saw the production and quality of the prequels themselves as evidence of selling out from Lucas (for example, the perceived excessive usage and reliance of CGI special effects in the movies). Furthermore, fans have criticized Lucas for making changes in the re-releases of the Star Wars films, in particular, the now infamous Han/Greedo shootout scene from A New Hope.

On a more general level, Lucas has also been criticized for the mass-marketing of Star Wars merchandise such as toys, cartoons, lunchboxes, etc. This has been pejoratively referred to as "milking the Star Wars franchise for money."

### Peter Jackson

Lord of the Rings director Peter Jackson began his career directing b-grade cult horror films such as Dead Alive, Bad Taste, and Meet the Feebles. Jackson's skill as a director, his over-the-top use of violence, and non-commercial yet highly ambitious plots filmed on tiny budgets made him a hero in the horror community. His two films following Meet the Feebles strayed from his extreme style, but it wasn't until he signed onto the Lord of the Rings trilogy that accusations of selling out arose. It's also worth noting that fans of the trilogy were excited to see that the series was entrusted to someone who many felt they could "trust." Since then he directed King Kong for a reported \$207 million and has agreed to executive produce the Halo movie for Microsoft.

### Kevin Smith

Kevin Smith achieved a cult following with his ultra-low budget indie flick Clerks., but has subsequently been labelled a sellout on numerous occasions, particularly by people who saw the cheaply-made style of Clerks. as a mark of artistic integrity, rather than a financial decision. The accusations began with his second film, Mallrats, in which he made many changes to the screenplay to appease studio executives. Renowned film critic Roger Ebert recalled, in his review of the movie [2], acting as chairman for a discussion panel of independent filmmakers at the Cannes film festival. One of the filmmakers was Smith, and whilst the other filmmakers discussed measures they could take to avoid excessive studio interference with their work, Smith said that he would do anything to get the movie greenlit. At the time Ebert thought he was joking, but in his opinion with *Mallrats*, Smith did just that.

For his part, Smith has taken to applying the phrase to himself with self-deprecating enthusiasm, for example, saying in an interview, "I've been saying I sold out for years. When Miramax bought the first movie (*Clerks.*), that was a sellout. And you know, we followed up with *Mallrats*. We sell so much damn merchandise on our Web site that it's kind of become a joke that I like to make money." . Smith has also mocked this by wearing shirts that jokingly say "SELL-OUT" and "INDIE" on them, as seen in making of footage for *Clerks 2*.

# Sentence

In music a **sentence** is "the smallest period in a [musical composition](#) that can give in any sense the impression of a complete statement." It "may be defined as a period containing two or more phrases, and most frequently ending with some form of perfect cadence."  
(Macpherson n.d.: 25)

# Septet

A **septet** is a formation containing exactly seven members. It is commonly associated with musical groups, but can be applied to any situation where seven similar or related objects are considered a single unit.

In [jazz music](#) a septet is any group of seven players, usually containing a drum set (pedal bass, snaredrum sometimes brushed, top hat cymbal, brushed cymbal), string bass or [electric bass](#), and groups of one or two of the following instruments, [guitar](#), [trumpet](#), [saxophone](#), [clarinet](#), or [trombone](#).

In [classical music](#), a septet is either a composition for performance by seven musicians, or a group of seven musicians who perform such a work. One of the most famous classical septets is the Septet in E-flat major, Op. 20, by Ludwig van Beethoven, composed around 1799-1800, for [clarinet](#), [bassoon](#), [horn](#), [violin](#), [viola](#), [cello](#), and double bass. The Septet in E-flat major, Op. 65, for [trumpet](#), [piano](#), [string quartet](#), and double bass by Camille Saint-Saëns from 1881 is regarded by some critics as one of that composer's greatest works. The modern composer Bohuslav Martinu wrote three septets: a group of six dances called *Les Rondes* for [oboe](#), clarinet, bassoon, trumpet, two violins, and piano (1930); a piece called Serenade No.3 for oboe, clarinet, four violins, and cello (1932); and a Fantasie for theremin, oboe, piano, and string quartet (1944). Darius Milhaud composed a String Septet in 1964 for [string sextet](#) and double bass.

# Serialism

In the [European classical music theory](#), **serialism** is a set of methods for [composing](#) and [analyzing works](#) of [music](#) based on structuring those works around the parameterization of parts of music: that is, ordering [pitch](#), dynamics, [instrumentation](#), [rhythm](#) and on occasion other elements into a *row* or *series* in which each gradation is assigned a numerical value within that series. In its strict definition each pitch, dynamic, colour or rhythmic element should only be used in its order in the series and used only once until the series repeats. The terms ***total serialism***, ***integral serialism*** and ***multiple serialism*** describe music which is serial in several parameters.

Important serial composers include Arnold Schoenberg, Anton Webern, Alban Berg, Karlheinz Stockhausen, Pierre Boulez, Luigi Nono and Jean Barraqué. Many composers wrote (and continue to write) serial pieces, and elements of 12 tone practice have been used to a greater or lesser degree by composers for whom it was not a basic trait of style, such as Igor Stravinsky, Benjamin Britten, Aaron Copland, Arvo Pärt, Alfred Schnittke and Dmitri Shostakovich, and a wide range of composers from 1920 forward felt it important to incorporate or respond to the use of twelve tone techniques, not just in classical music but in jazz as well. The use of mathematical concepts to control musical parameters has influenced composers who have not adopted strict serial methods, including Elliott Carter and Iannis Xenakis. Integral serialism was influential in the development of [electronic music](#) and synthesized music. The first total serial piece may have been *Nummer 2* (1951) for 13 instruments by Karel Goeyvaerts, although Milton Babbitt's *Three Compositions for Piano* (1947) is also credited with being the earliest total serial piece.

## Basic definition

Serialism is most specifically defined as the structural principle according to which a recurring series of ordered elements (normally a set - or 'row' - of pitches or 'pitch classes') which are used in order, or manipulated in particular ways, to give a piece unity. Serialism is often broadly applied to all music written in what Arnold Schoenberg called "The Method of Composing with Twelve Tones related only to one another", or [dodecaphony](#), and methods which evolved from his methods. It is sometimes used more specifically to apply only to music where at least one other element other than pitch is subjected to being treated as a row or series. The term *Schoenbergian serialism* is sometimes used to make the same distinction between use of pitch series only, particularly if there is an adherence to post-Romantic textures, harmonic procedures, voice-leading and other audible elements of 19th century music. In such usages *post-Weberian serialism* will be used to denote works which extend serial techniques to other elements of music. Another term used to make the distinction is *12 tone serialism*.

Serialism has been described by its practitioners as an extension and formalisation of earlier methods of 'cellular' thematic and motivic unification in [classical](#) and [romantic](#) music. This extension and formalisation is seen as having been motivated by the intensifying drive towards chromatic saturation and the resulting need to unify without using tonality.

Most serial music is deliberately structured as such. A row may be assembled 'pre-compositionally' (perhaps to embody particular intervallic or symmetrical properties), or it may be derived from a spontaneously invented thematic or motivic idea. Composing a serial work involves continually re-rhythmicising the various reappearances of the row in its Original, Retrograde, Inverted and Retrograde-Inverted forms as these are distributed through the various elements of the texture and employed to create accompaniments and subordinate parts as well as the main themes; each of these forms may also be transposed to begin on any note of the chromatic scale.

This row or series is used in one form as the "basic set", which constitutes the "center" of gravity for the piece. Each row or series is supposed to have three other forms: retrograde, or the basic set backwards, inverted, or the basic set "upside down" and retrograde-inverted, which is the basic set upside down and backwards. The basic set is usually required to have certain properties, and may have additional restrictions, such as the requirement that it use each [interval](#) only once. The most common requirement is that first half and second half of the row not be inversions of each other. The series in itself may be regarded as pre-compositional material: in the process of composition it is manipulated by various means to produce musical material.

# History of serial music

The serialization of [rhythm](#), dynamics, and other elements of music developed after the Second World War by arguing that the [twelve-tone](#) music of Arnold Schoenberg and his followers of the [Second Viennese School](#) had serialized pitch, and was partly fostered by the work of Olivier Messiaen and his analysis students, including Karel Goeyvaerts and Boulez, in post-war Paris. [Twelve-tone](#) music is regarded by some as a sub-category of serialism, whereas others regard serialism to be an outgrowth of twelve-tone music.

## Twelve tone music

In the early 20th century composers in the European classical tradition began searching for other ways to organize works of music other than reliance on the ordered system of chords and intervals known as tonality. Many composers used [modal](#) organization, and others began to use alternate scales within a tonal context provided by [jazz](#). There was an increasing movement to avoid any particular chord as being central, which was described as [atonal](#) or pantonal. Composers seeking to extend this direction in music began to search for ways to compose systematically.

Just after the First World War, Schoenberg began writing pieces with 12-note motifs and using a procedure to "work with the notes of the motif". He analogized this process to the contrapuntal rules of Bach, arguing that as Bach's rules produced tonality without referencing it, so his rules produced a new basic means of structuring music which was not yet understood. It is for this reason that Schoenberg is often referred to as the "founder" or creator of serialism.

While Schoenberg was concerned with the serial ordering of [pitch](#), his student Anton Webern began to relate other aspects of music to the basic row.

The politics of Nazi Germany intruded into the development of the musical idea. With the rise to power of Adolf Hitler and the implementation of "race laws" with regard to ownership, culture and employment, many of the main composers of 12-note music were placed on a list of Entartete musik ('Degenerate Music'), the Nazi term for all music that they disapproved of. There were two reasons, one was simply the nature of the composers as "Jewish", the other was the Nazi ideas of art as part of the propaganda arm of the state. Avant-garde forms of art were thus banned, even if the artist was a political adherent of Nazism. With this regime's rise, Arnold Schoenberg was obliged to emigrate, eventually to America in 1933, and his works and those of his students Alban Berg and Anton Webern were banned.

## Serialism invented and described

The period after World War II represents the codification of serialism as a body of theory. Most of the major concepts were named, refined, and a series of notational conventions were developed in order to deal with the particular problems of serial composition.

After the Second World War, students of Olivier Messiaen saw Webern's structure, and Messiaen's techniques of parameterization as the next way forward in composition. They began creating individual sets or series for each element of music. The elements thus serially determined included the duration of notes, their dynamics, their orchestration, and many others. They created the term serialism to describe what they were doing, and argued that the Twelve Tone works of Webern, Schoenberg and others were also "serial" works. To

differentiate 12 tone works from those with other forms of parameterization, the term "multiple serialism" was used, and if all parameters were serially controlled total serialism. Because of the Nazi repression, some young composers took serialism to be the advancing the cause of Anti-fascism. These included Stockhausen and Boulez. René Leibowitz, as composer, conductor, teacher and author was also influential in claiming the Second Viennese School as being the foundation for modern music. From these figures emerged two influential schools, the School of Paris around Pierre Boulez and a German school around Stockhausen.

Schoenberg's arrival in the US in 1933 helped accelerate the acceptance of both twelve tone music, and serialism more generally in American academia, at that time dominated by neo-classicism, though he himself felt his ideas were being discounted. Even before his death in 1951 two major theorists and composers, Milton Babbitt and George Perle, emerged as prominent figures actively involved with the analysis of serial music as well the creation of new works using sometimes radical extensions and revisions of the method. In many cases older composers were influenced to adopt tone rows or other serial procedures by their students, for example, Roger Sessions began to incorporate them in 1952, influenced by Milton Babbitt who was his student.

In the late 1950's Allen Forte began working on ways to describe atonal harmony, and to combine the methods of Heinrich Schenker, who was an ardent opponent of such music, with the developments in what was then contemporary music. He made extensive use of set notation, pitch classes and families and other terms which would later become standard in the description of serial composition. For example in 1964 he published an article entitled "A Theory of Set-Complexes for Music". In 1973 he published the very influential work *The Structure of Atonal Music*.

## Serialism and high modernism

Serialism, along with John Cage's aleatoric music, was enormously influential in post-War music. Theorists such as George Perle codified serial systems, and his 1962 text *Serial Composition and Atonality* became a standard work on the origins of serial composition in the work of Schoenberg, Berg and Webern. Declaring itself "revolutionary" and "a new tonality", serialism created an environment where experimentation with sound, in a manner similar to the exploration of pure painting in Abstract Expressionism was at the forefront of composition, which led to increased use of electronics and other applications of mathematical notation to composition, developed by theorists such as the composer and mathematician Milton Babbitt.

Other composers to use serialism include Luigi Nono, who developed similar ideas separately, Roger Reynolds, and Charles Wuorinen, the later works of Igor Stravinsky and the early works of George Rochberg. Major centers for serialism were the Darmstadt School and the "School of Paris" centered around Pierre Boulez.

Igor Stravinsky's adoption of serial techniques offers an example of the level of influence that serialism had after the Second World War. Previously Stravinsky had used series of notes without rhythmic or harmonic implications (Shatzkin: "A Pre-Canticle Serialism in Stravinsky" 1977). Because many of the basic techniques of serial composition have analogs in traditional counterpoint, uses of inversion, retrograde and retrograde inversion from before the war are not necessarily indicative of Stravinsky adopting Schoenbergian techniques. However with his meeting Robert Craft and acquaintance with younger composers, Stravinsky began to consciously study Schoenberg's music, as well as the music of Webern and later composers, and began to use the techniques in his own work, using, for example, serial techniques applied to fewer than 12 notes. Over the course of the 1950's he used procedures related to Messiaen, Webern and Berg. While it is difficult to label each and every work as "serial" in the strict definition, every major work of the period has clear uses and references to its ideas.

During this period Serialism's influence cut in two directions. As with the definition of [Sonata form](#) and tonality, one of the major intellectual projects was in analyzing previous works in the light of serial techniques, for example finding use of rows in previous composers going back to Mozart. The other was the use of serial forms of analysis and structuring of compositions even

by composers who were not using a row or a series as the means of structuring a work. The use of set theory, classes and parameterization is found in the post-war works of Elliott Carter, Witold Lutoslawski and even farther afield to essentially tonal composers such as Alwyn, Shostakovich and Britten.

## Serialism in the present

### Reactions to and against serialism

Serialism never found wide favour with classical-music audiences, even though many composers adopted it in various forms. It is no exaggeration to say that it became, in theory at least, the favored means of expression for High modernism beginning around 1950, and for the next two or three decades it continued to be regarded, predominantly in the musical academia of the USA and Germany, as the most important principle of musical construction. Some theorized that it would provide the basis for integration of [electronic music](#) and [aleatoric music](#); though in fact the latter, making recourse to chance procedures, evolved partly as a reaction against the over-controlled nature of Total Serialism. The various reactions against Serialism became matters of controversy in musical circles, helping to produce such movements as [Minimalism \(music\)](#) and [Neo-Romanticism](#).

Part of the reason for the centrality of serialism in the debate over the meaning and direction of concert music is that it was far from alone in an attempt to systematize music, and root music theory in the modern age. At the same time that Schoenberg was working on his pantonal ideas, other experimental composers were attempting to define harmony in terms of fundamental and measurable qualities, such as rhythm. This attempt to found music on a more axiomatic and rigorous basis formed the background for the introduction of the theories of the late 1940's and early 1950's. It was argued that serial music raised each note to specificity, an effect called pointalistic in analogy with the painting of Seurat.

The debate was often decidedly uncollegial: serial and other forms of avant garde music were condemned as being "not music", while proponents such as Pierre Boulez argued that "music exists in the avant garde or not at all". In the words of Roger Scruton (1997), "the order that exists in [serial compositions] is not an order that can be heard, when we hear the sounds as music." Academic departments often became battlegrounds, with professors trying to tilt the balance one direction or another. Ideologies formed around what constituted progress in music, and the history of music was retold, from different viewpoints, either to support the inevitability of serialism, or conversely to ground tonality in immutable realities.

Serialism also spawned a host of other attempts to incorporate process into music, including aleatory, or chance, music, and graphical notations which provided for wide ranging improvisation on the part of musicians. This might seem counter-intuitive given the assertion by many serial composers that serialism was about control over more and more of the score, but, in fact, it arose out of the desires for greater variety and texture to music, as expressed in the arguments in the 1950's over Total Serialism.

Within the community of modern music, exactly what constituted serialism was also a matter of debate. The wide conventional usage, is that the world "serial" music applies to all 12 tone music, which is a "subset" of serial music, and it is this usage that is generally intended in reference works. However, many practitioners, including Roger Sessions and Allen Forte argued that serialism was an historic outgrowth of a search for a new tonality, and that both were subsets of this wider search. Other practitioners of serial music argued that individual elements should not be under serial control, but instead under some form of stochastic patterning, or that the large scale of the composition should be under serial control, but individual events at the selection of the composer, or the performer.

Serialism, because of its focus on process would give birth to process musics, for example of John Cage and the early Steve Reich works such as *Drumming*. Some process music would retain the concern for the "liberation of dissonance" that Schoenberg declared to be

essential, while other composers would select largely consonant, or non-functionally dissonant materials.

Jazz artists in the middle of the 20th century began to work with serial and 12 tone techniques to expand the palette of jazz music. Most of these attempts were of the compositional nature such as composer-pianist Bill Evans who wrote tunes like "12 Tone Tune". More recently you have to works of American guitarist Bruce Arnold who composes and improvises with 12 tone and serial techniques.

Even 75 years after its creation (or 55, depending on which version of history one subscribes to), serial music maintains its aura of being "difficult" and archtypically "modern". Critics routinely fall into stances which praise or condemn it as a category, and works composed using serial techniques are considered "daring" programming choices. However, for every assertion of uniqueness, there are also critics that argue that fundamentally the much of the music is "very late Romanticism" raised to a very high level, and that it should be played with the same eye to harmonic richness and musical aesthetic.

# Theory of serial music

The vocabulary of serialism is rooted in set theory, and uses a quasi-mathematical language to describe how the basic sets are manipulated to produce the final result. Musical [set theory](#) is often used to analyze and compose serial music, but may also be used to study tonal music. According to Boulez, "Classical tonal thought is based on a world defined by gravitation and attraction, serial thought on a world which is perpetually expanding." The latter types of metaphors-- which seek to closely associate contemporary art with contemporary science-- are typical of mid-twentieth century Modern composers.

The basis for serial composition is Schoenberg's [Twelve-tone technique](#), where the 12 notes of the basic chromatic scale are organized into a row. This "basic" row is then used to create permutations, that is rows derived from the basic set. The row may be used to produce a set of intervals, or a composer may have wanted to use a particular succession of intervals, from which the original row was created. A row which uses all of the intervals in their ascending form once is an All-interval row. In addition to permutations, the basic row may have some set of notes derived from it which is used to create a new row, these are *derived sets*.

Because there are tonal chord progressions which use all 12 notes, it is possible to create rows with very strong tonal implications, and even to write tonal music using 12 tone technique, but this is not the norm. Most tone rows contain tonal cells which imply a root pitch, a composer can therefore emphasize or avoid emphasizing the tonal cell.

To serialize other elements of music, a system of quantifying an identifiable element must be created or defined. For example, if duration is to be serialized, then durations are to be specified. If tone colour, then the separate tone colours must be identified, and so on.

The selected set or sets, their permutations and derived sets form the basic material from which the composer works. Some serial works specify as little as possible, to give the composer the maximum amount of freedom when working, other works attempt to *pre-compose* as much as possible, which, taken to its limit is referred to as *automatism*.

Composition using serial methods focuses on each appearance of the set, called an aggregate. The theoretical ideal is that in an aggregate, no element should be reused until all of the other members have been used, and each member must appear only in its place in the series. This rule is violated in numerous works still termed "serial". A work is said to be "aggregate complete" if only one aggregate is sounding at the same time.

An aggregate is divided into complements: a subset of the series, and all of those elements of the series not part of that subset are said to be *complements* of each other. A subset is *self-complementing* if it contains half of the set, and its complement is both a permutation of the original subset. This is most commonly seen with *hexachords* or 6 notes of a basic tone row. A hexachord which is self-complementing for a particular permutation is referred to as *prime combinatorial*. A hexachord which is self complementing for all basic permutations - Inversion, Retrograde and Retrograde Inversion - is referred to as *all-combinatorial*. The concepts of combinatoriality were explored by Schoenberg and Webern, but were rigorously defined and explored in the work of Milton Babbitt.

The composer then presents the aggregate. If only the basic row is serialized, while duration, tone colour and other parameters form free variables in the presentation. If there are multiple serial sets, or if several parameters are associated with the same set, then a presentation will have these values calculated. Large scale design is achieved through the use of combinatorial devices, for example, treating of a subset of the basic set to a series of combinatorial devices. The presentation of an aggregate corresponds to units of music in common practice harmony, in that when the listener has heard all of the materials of the aggregate, they know that new presentation of the aggregate should be expected to begin, with its own combinatorial presentation. The sequence of presentations of aggregates corresponds

to the cadential structure of tonal harmony, in that it forms units which are complete unto themselves.

## Important composers

Milton Babbitt  
Jean Barraqué  
Alban Berg  
Luciano Berio  
Pierre Boulez  
Luigi Dallapiccola  
Brian Ferneyhough  
Roberto Gerhard  
Karel Goeyvaerts  
Bill Hopkins  
Bruno Maderna  
Luigi Nono  
Krzysztof Penderecki  
Henri Pousseur  
George Rochberg  
Arnold Schoenberg  
Humphrey Searle  
Roger Sessions  
Leopold Spinner  
Karlheinz Stockhausen  
Igor Stravinsky - late period only  
Anton Webern  
Hugo Weisgall

# Set theory

In [music](#), **set theory** provides concepts for categorizing musical objects and describing their relationships. Though developed in connection with atonal music, the concepts of set theory are very general and can be applied to tonal styles as well. Set theory deals with collections of [pitches](#) and pitch classes, which may be ordered or unordered, and which can be related by musical operations such as transposition, inversion, and complementation. The methods of set theory are sometimes applied to the analysis of rhythm as well.

## Mathematical set theory and musical set theory

Although musical set theory is often thought to involve the application of mathematical [set theory](#) to music, there are numerous differences between the methods and terminology of the two. For example, musicians use the terms transposition and inversion where mathematicians would use translation and reflection. Furthermore, musicians talk about "ordered sets" where mathematicians would talk about sequences or tuples. Moreover, music theory is more closely related to group theory and combinatorics than to mathematical set theory. Musical set theory is therefore best regarded as an unrelated field from mathematical set theory, with its own vocabulary, whose main connection to mathematical set theory is the use of naive set theory to talk about finite sets.

## The set and set types

The fundamental concept of musical set theory is the (musical) set, which typically refers to an unordered collection of equal tempered pitch classes. The elements of a set may be manifested in music as [simultaneous](#) chords, successive tones (as in a melody), or both. Notational conventions vary from author to author, but sets are typically enclosed in curly braces: {}. Some theorists use angle brackets <> to denote ordered sequences, while others, following mathematical convention, use parentheses (). Thus one might notate the unordered set of pitch classes 0, 1, and 2 (C, C#, and D) as {0,1,2}. The ordered sequence C-C#-D would be notated <0,1,2> or (0,1,2).

Though set theorists usually consider sets of equal tempered pitch classes, it is possible to consider sets of pitches, non-equal tempered pitch classes, rhythmic onsets, or "beat classes."

Two-element sets are called dyads, three-element sets trichords. Sets of higher cardinalities are called tetrachords, pentachords, hexachords, septachords, octachords, nonachords, decachords, undecachords, and, finally, the dodecachord.

## Basic operations

The basic operations that may be performed on a set are transposition and inversion. Sets related by transposition or inversion are said to be transpositionally related or inversionally related, and to belong to the same set class. Since transposition and inversion are isometries of pitch class space, they preserve the intervallic structure of a set, and hence its musical character. This can be considered the central postulate of musical set theory. In practice, set-theoretic musical analysis often consists in the identification of non-obvious transpositional or inversional relationships between sets found in a piece.

Some authors consider the operations of complementation and multiplication as well. (The complement of set  $X$  is the set consisting of all the pitch classes not contained in  $X$ .) However, since complementation and multiplication are not isometries of pitch class space, they do not necessarily preserve the musical character of the objects they transform. Other writers, such as Forte, have emphasized the Z-relation which obtains between two sets sharing the same total interval content, or interval vector. However, Z-related sets can have very different musical characters, and not all music theorists feel that the relationship is musically significant.

Operations on ordered sequences of pitch classes also include transposition and inversion, as well as retrograde and rotation. Retrograding an ordered sequence reverses the order of its elements. Rotation of an ordered sequence is equivalent to cyclical permutation.

Transposition and inversion can be represented as elementary arithmetic operations. If  $x$  is a number representing a pitch class, its transposition by  $n$  semitones is written  $T_n = x + n \pmod{12}$ . Inversion corresponds to reflection around some fixed point in pitch class space. If " $x$ " is a pitch class, the inversion with index number  $n$  is written  $I_n = n - x \pmod{12}$ .

## Transpositional and inversive set classes

Two transpositionally related sets are said to belong to the same transpositional set class ( $T_n$  set class). Two sets related by transposition or inversion are said to belong to the same transpositional/inversive set class (written  $T_nI$  or  $I_n$ ). Sets belonging to the same transpositional set class are very similar-sounding; while sets belonging to the same transpositional/inversive set class are fairly similar sounding. Because of this, music theorists often consider set classes to be basic objects of musical interest.

There are two main conventions for naming equal-tempered set classes. One derives from Allen Forte, whose *The Structure of Atonal Music* (ISBN 0300021208), is one of the first works in musical set theory. Forte provided each set class with a number of the form  $c-d$ , where  $c$  indicates the cardinality of the set and  $d$  is a unique identifying label. Thus the chromatic trichord  $\{0, 1, 2\}$  belongs to set class 3-1, indicating that it is the first three-note set class in Forte's list. The augmented trichord  $\{0, 4, 8\}$ , receives the label 3-12, which happens to be the last trichord in Forte's list.

Forte's nomenclature is a divisive issue in the music-theory community, with many theorists critical of it, and others strongly devoted to it. The primary criticisms of the system are the following. 1) Forte's labels are arbitrary and difficult to memorize, and it is in practice often easier simply to list an element of the set class. 2) Forte's system assumes equal-temperament and cannot easily be extended to include diatonic sets, pitch sets (as opposed to pitch class sets), multisets or sets in other tuning systems. 3) Forte's original system considers inversionally related sets to belong to the same set-class, though there are some musical situations in which this is not desirable.

The second, and perhaps most popular notational system labels sets in terms of their normal form, which depends on the concept of normal order. (There are, in fact, competing definitions of normal order in the music-theoretical literature; we will adopt the simplest one here.) To put a set in normal order, order it as an ascending scale in pitch class space that spans less than an octave. Then permute it cyclically until its first and last notes are as close together as possible. In the case of ties, minimize the distance between the first and next-to-last note. (In case of ties here, minimize the distance between the first and next-to-next-to-last note, and so on.) Thus  $\{0, 7, 4\}$  in normal order is  $\{0, 4, 7\}$ , while  $\{0, 2, 10\}$  in normal order is  $\{10, 0, 2\}$ . To put a set in normal form, begin by putting it in normal order, and then transpose it so that its first pitch class is 0.

Since transpositionally-related sets share the same normal form, normal forms can be used to label the  $T_n$  set classes.

To identify a set's  $I_n$  set class:

- Identify the set's  $T_n$  set class.
- Invert the set and find the inversion's  $T_n$  set class.
- Compare these two normal forms to see which is most "left packed."

The resulting set labels the initial set's  $I_n$  set class.

# Symmetry

The number of transpositions and inversions mapping a set to itself is the set's degree of symmetry. Every set has at least one symmetry, as it maps onto itself under the identity operation  $T_0$ . Transpositionally symmetric sets map onto themselves for  $T_n$  where  $n$  does not equal 0. Inversionally symmetric sets map onto themselves under  $T_n^I$ . For any given  $T_n/T_n^I$  type all sets will have the same degree of symmetry. The number of distinct sets in a type is 24 (the total number of operations, transposition and inversion, for  $n = 0$  through 11) divided by the degree of symmetry of  $T_n/T_n^I$  type.

Transpositionally symmetrical sets either divide the octave evenly, or can be written as the union of equally-sized sets that themselves divide the octave evenly. Inversionally-symmetrical chords are invariant under reflections in pitch class space. This means that the chords can be ordered cyclically so that the series of intervals between successive notes is the same read forward or backward. For instance, in the cyclical ordering (0, 1, 2, 7), the interval between the first and second note is 1, the interval between the second and third note is 1, the interval between the third and fourth note is 5, and the interval between the fourth note and the first note is 5. One obtains the same sequence if one starts with the third element of the series and moves backward: the interval between the third element of the series and the second is 1; the interval between the second element of the series and the first is 1; the interval between the first element of the series and the fourth is 5; and the interval between the last element of the series and the third element is 5.

## Sums

Sums are also occasionally used in musical set theory, though theorists do not agree about their significance. George Perle provides the following example:

"C-E, D-Fo, Em-G, are different instances of the same interval... the other kind of identity... has to do with axes of symmetry. C-E belongs to a family of symmetrically related dyads as follows:"

*D* Do *E* F Fo *G* Go  
*D* Co C B Ao A Go

Axis pitches italicized, the axis is pitch class determined.

Thus in addition to being part of the interval-4 family, C-E is also a part of the sum-2 family (with Go equal to 0).

The tone row to Alban Berg's Lyric Suite, {0,11,7,4,2,9,3,8,10,1,5,6}, is a series of six dyads, all sum 11. If the row is rotated and retrograded, so it runs { 0, 6, 5, 1, ...}, the dyads are all sum 6.

**Successive dyads  
from Lyric Suite  
tone row, all sum 11**  
*C* G D Do Ao *Eo*  
*B* E A Go Co *Fo*

Axis pitches italicized, the axis is dyad (interval 1) determined

# Sevillanas

**Sevillanas** is a type of [folk music](#), sung and written in Seville (Andalusia). Historically, they are a derivative of Castilian [folk music](#), spiced with a bit of Arabic rhythm. Technically, they are an evolution from Castilian seguidillas, they have a relatively limited musical pattern, but rich lyrics, based on country side life, virgins, towns, neighbourhoods, pilgrimage and, of course, love themes. They are sung by a plethora of local groups, like Los Romeros de la Puebla, Los de Gines, Las corraleras de Utrera, Cantores de Hispalis, and Los del Rio. Every year, dozens of new *sevillana* discs are published.

*Sevillanas* can be heard in southern Spain, mainly, in fairs and festivals, including the famous Seville Fair, La Feria de Sevilla. There is an associated dance for the music: "Baile por sevillanas", consisting in four different parts. One can find schools teaching "baile por sevillanas" in nearly every town in Spain.

Generally speaking, *sevillanas* are very light and happy music.

*Sevillanas* are not a part of [flamenco](#), though it may be confused with it.

# Sevillana

**Sevillana** is a popular [flamenco](#) dance from Seville. Its rhythm is 3/4 or better 6/8.

Sevillana does not come from Seville. It is an old folk dance, appearing always during the feasts, danced by couples of all ages and sexes, and usually danced by whole families and 'pueblos'. The choreography of Sevillana is stable, and knowing it is very useful, since it is a fiesta dance. This is why learning flamenco usually starts with this particular dance. Each sevillana is composed by 4 parts, each part divided in 3 'coplas', and each copla is made of 6 movements.

It is a very vivid dance, often excluded from flamenco. Paradoxically, during spectacles and shows it is usually Sevillana that people take for 'the real, true flamenco', as it is full of turns, flaunting and colorful skirts and in general- of joy.

Category: [Flamenco styles](#)

# Sextet

A **Sextet** is a formation containing exactly six members. It is commonly associated with musical groups, but can be applied to any situation where six similar or related objects are considered a single unit.

In [jazz music](#) a sextet is any group of six players, usually containing a drum set (pedal bass, snaredrum sometimes brushed, top hat cymbal, brushed cymbal), string bass or [electric bass](#), and groups of one or two of the following instruments, [guitar](#), [trumpet](#), [saxophone](#), [clarinet](#), or [trombone](#).

Six humans sharing the same gestational period are called sextuplets and are usually all born within a short period of time.

**Sextet** is also the name of a free [improvisation quartet](#) from Northern California. The group is comprised of Robert Schaulis (Clarinet), Austin Moore (Trumpet), Courtland Miles (Trumpet), and Nick Spangler (drums). Sextet is known for their percussive form of free jazz [Sextet Band].

## Shape note

**Shape notes** are a system of music notation designed to facilitate congregational singing. Shape notes of various kinds have been used for over two centuries in a variety of sacred music traditions practiced primarily in the Southern region of the United States.

## Shape notes

The idea behind shape notes is that the parts of a vocal work can be learned more quickly and easily if the music is printed in shapes that match up with the solfege syllables with which the notes of the musical scale are sung. For instance, in the four-shape tradition used in the Sacred Harp and elsewhere, the notes of a C major scale are notated and sung as follows:

A skilled singer experienced in a shape note tradition has developed a fluent triple mental association, which links a note of the scale, a shape, and a syllable. This association can be used to help in reading the music. When a song is first sung by a shape note group, they normally sing the syllables (reading them off of the shapes) to solidify their command over the notes. Next, they sing the same notes to the words of the music.

The syllables and notes of a shape note system are not tied to particular pitches (e.g. fa to C); rather, they depend on the key of the piece, so that the tonic note of the key always has the same syllable (here, fa), and similarly for the other notes of the scale. Some refer to this as a *moveable "do"* system.

## Four-shape vs. seven-shape systems

The system illustrated above is a *four-shape* system; six of the notes of the scale are grouped in pairs assigned to one syllable/shape combination. The syllables of this system date back to Elizabethan times in England, although the shapes are younger (see below). The other important systems are *seven-shape* systems, which give a different shape and syllable to every note of the scale. Such systems use as their syllables the note names "do, re, mi, fa, so, la, ti, do" familiar to most people. A few books (e.g. "The Good Old Songs" by C. H. Cayce) present the older seven-note syllabization of "do, re, mi, fa, so, la, si, do". In the seven-shape system invented by Jesse B. Aiken, the notes of a C major scale would be notated and sung as follows:

Users eternally debate the relative merits of four- and seven- shape systems. To an outsider, the seven-shape system seems more logical: since every syllable and shape corresponds to just one note of the scale, there is less ambiguity. Yet the four-shape system may be said to have its own virtues. Because there are fewer shapes, they are easier for most people to read from the page. Moreover, the assignment of multiple notes to three of the shape/syllable combinations is less pernicious than one might at first think, since the two pitches assigned to each ambiguous syllable/shape are set apart by a fairly wide interval (a perfect fourth), and are moreover harmonically related. In any event, even the seven-shape system is slightly ambiguous, since it does not specify the octave in which a note is set.

## **The effectiveness of shape notes**

Do shape notes "work", in the sense of actually facilitating the learning of music? Most modern participants in shape note traditions would probably argue that they do. On the other hand, newcomers to shape note singing who can already read music probably feel that the shapes are of no help at all, though the task of learning to use them might perhaps be enjoyed as a novel musical challenge.

A fair comparison would take the form of a controlled study, using experimental subjects who are young enough not to be set in their ways. Just such a study was carried out in the 1950s by George H. Kyme (see reference below), with an experimental population consisting of fourth and fifth graders living in California. Kyme took care to match his experimental and control groups as closely as possible for ability, quality of teacher, and various other factors. He found that the students taught with shape notes learned to sight-read quite a bit better than those taught without them. The results were statistically highly significant. Remarkably, Kyme found that the students taught with shape notes were also far more likely to pursue musical activities later on in their education.

## Origin and early history

As noted above, the syllables of shape note systems greatly antedate the shapes. The practice of singing music to syllables designating pitch goes back to about 1000 A.D. with the work of Guido of Arezzo; other early work in this area includes the cipher notation of Jean Jacques Rousseau, and the tonic sol-fa of John Curwen.

American forerunners to shape notes include the 9th edition of the Bay Psalm Book (Boston), and *An Introduction to the Singing of Psalm Tunes in a Plaine & Easy Method* by Reverend John Tufts. The 9th edition of the Bay Psalm Book was printed with the initials of four-note syllables (fa, sol, la, me) underneath the staff. In his book, Tufts substituted the initials of the four-note syllables on the staff in place of note heads, and indicated rhythm by punctuation marks to the right of the letters.

Shape notes themselves probably date from late 18th century America. They appeared publicly at the beginning of the nineteenth century, when two publications came out using shaped note heads - *The Easy Instructor* by William Little and William Smith in 1801, and *The Musical Primer* by Andrew Law in 1803, intended for use in singing schools. Little and Smith used the four-shape system shown above. Law's system had slightly different shapes: a square indicated *fa* and a triangle *la*, while *sol* and *mi* were the same as in Little and Smith. Law's invention was more radical than Little and Smith's in that he dispensed with the use of the staff altogether, letting the shapes be the sole means of expressing pitch. Little and Smith followed traditional music notation in placing the note heads on the staff, in place of the ordinary oval note heads. In the end, it was the Little/Smith system that won out, and there is no hymnbook used today that employs the Law system.

It was asserted by Andrew Law he was the inventor of shape notes. Little and Smith did not themselves claim credit for the invention<sup>1</sup>, but said instead that the notes were invented around 1790 by John Connelly<sup>2</sup> of Philadelphia, Pennsylvania. They claimed that Connelly signed over the rights of his invention to them in 1798.

Shape notes proved popular in America, and quickly a wide variety of hymnbooks were prepared making use of them. The shapes were eventually extirpated in the northeastern U.S. by a so-called "better music" movement, headed by Lowell Mason<sup>3</sup>. But in the South, the shapes became well entrenched, and multiplied into a variety of traditions. Ananias Davisson's *Kentucky Harmony* is generally considered the first Southern shape-note tunebook.

## The rise of seven-shape systems

By the middle of the 19th century, the "fa so la" system of four syllables had acquired a major rival, namely the seven-syllable "do re mi" system. Thus, music compilers began to add three more shapes to their books to match the extra syllables. Numerous seven-shape notations were devised. Jesse B. Aiken was the first to produce a book with a seven-shape note system, and he vigorously defended his "invention" and his patent. The system used in Aiken's 1846 *Christian Minstrel* eventually became the standard. This owes much to the influential Ruebush & Kieffer Publishing Company adopting Aiken's system around 1876. Two books that have remained in continuous (though limited) use, William Walker's *Christian Harmony* and M. L. Swan's *New Harp of Columbia*, are still available. These books use seven-shape systems devised by Walker and Swan, respectively.

## Currently active shape note traditions

Although seven-shape books may not be as popular as in the past, there are still a great number of churches in the South, in particular Primitive Baptist, and Church of Christ, that regularly use seven-shape songbooks in Sunday worship. These songbooks may contain a variety of songs from 18th century classics to 20th-century [gospel music](#). Thus today denominational songbooks printed in seven shapes probably constitute the largest branch of the shape note tradition.

In addition, nondenominational community singings are also intermittently held which feature early- to mid-20th century seven-shape gospel music such as Stamps-Baxter hymnals or Heavenly Highway. In these traditions, the custom of "singing the notes" (syllables) is generally only preserved during the learning process at singing schools and singing may be to an instrumental accompaniment, typically a piano.

The seven-shape system is also still used at regular public singings of 19th century songbooks of a similar type to the Sacred Harp, such as the Christian Harmony and the New Harp of Columbia. Such singings are common in North Carolina, Tennessee, and Alabama, and generally preserve the singing school custom of "singing the notes."

The four-shape tradition that currently has the greatest number of participants is Sacred Harp singing. But there are many other traditions that are still active or even enjoying a resurgence of interest. Among the four-shape systems, the Southern Harmony has remained in continuous use at one singing in Benton, Kentucky, and is now experiencing a small amount of regrowth. The current reawakening of interest in shape note singing has also created new singings using other recently moribund 19th-century four-shape songbooks, such as the Missouri Harmony, as well as new books by modern composers, such as the Northern Harmony.

## Nomenclature

Shape notes have also been called *character notes* and *patent notes*, respectfully, and *buckwheat notes* and *dunce notes*, pejoratively.

## Footnotes

- *Note 1:* Dick Hulan writes:

"My copy of William Smith's *Easy Instructor, Part II* (1803) attributes the invention [of shape notes] to 'J. Conly of Philadelphia'."

And according to David Warren Steel, in *John Wyeth and the Development of Southern Folk Hymnody*:

"This notation was invented by Philadelphia merchant John Connelly, who on 10 March 1798 signed over his rights to the system to Little and Smith."

- *Note 2:* This spelling is also given in sources as Conly, Connolly, and Coloney.
- *Note 3:* In a history of Little and Smith's work, Irving Lowens and Allen P. Britton wrote (see references):

"Had this pedagogical tool been accepted by 'the father of singing among the children', Lowell Mason, and others who shaped the patterns of American music education, we might have been more successful in developing skilled music readers and enthusiastic amateur choral singers in the public schools."

## Sheet music

**Sheet music** is a hand-written or printed form of [musical notation](#); like its analogs -- books, pamphlets, etc. -- the medium of sheet music typically is paper (or, in earlier times, parchment).

A common synonym for sheet music is *score*, and there are several types of scores, as discussed below. (*Note: the term score can also refer to [incidental music](#) written for a play, television programme, or film; for the last of these, see [film score](#).*)

## Purpose and use

Sheet music can be used a record of, a guide to, or a means to perform, a piece of music. Although it does not take the place of the sound of a performed work, sheet music can be studied to create a performance and to elucidate aspects of the music that may not be obvious from mere listening. Authoritative musical information about a piece can be gained by studying the written sketches and early versions of compositions that the composer might have retained, as well as the final autograph score and personal markings on proofs and printed scores.

As with literature, one must be able to read [musical notation](#) in order to make use of sheet music. The skill of sight reading is the ability of a musician to perform an unfamiliar work of music upon viewing the sheet music for the first time. Sight reading ability is expected of professional musicians and serious amateurs who play classical music and related forms. An even more refined skill is the ability to look at a new piece of music and hear most or all of the sounds ([melodies](#), [harmonies](#), [timbres](#), etc.) in one's head without having to play the piece.

With the exception of solo performances, where memorization is expected, classical musicians ordinarily have the sheet music at hand when performing. Even in [jazz](#) music, which is mostly [improvised](#), sheet music is used to give basic indications of [melodies](#), [chord](#) changes, and arrangements.

Sheet music is less important in other kinds of music, however. Although much [popular music](#) is published in notation of some sort, it is quite common for people to [learn a piece by ear](#). This is also the case in most forms of western [folk music](#), where [songs](#) and [dances](#) are passed down by oral -- and aural -- tradition. Music of other cultures, both folk and classical, is often transmitted orally, though some non-western cultures developed their own forms of [musical notation](#) and sheet music as well.

Although sheet music is often thought of as being a platform for new music and an aid to composition (i.e., the composer *writes* the music down), it can also serve as a visual record of music that already exists. Scholars and others have made transcriptions of western and non-western musics so as to render them in readable form for study, analysis, and recreative performance. This has been done not only with folk or traditional music (e.g., Bartók's volumes of Magyar and Romanian folk music), but also with sound recordings of improvisations by musicians (e.g., jazz piano) and performances that may only partially be based on notation. An exhaustive example of the latter in recent times is the collection *The Beatles: Complete Scores* (London: Wise Publications, c1993), which seeks to transcribe into staves and tablature all the songs as recorded by the Beatles in instrumental and vocal detail.

## Types of sheet music

Modern sheet music may come in several different formats. If a piece is composed for just one instrument or voice (for example, a [piano](#) or an *a cappella* [song](#)), the whole work will be written or printed in its own sheet music. If an instrumental piece is intended to be performed by more than one person, each performer will usually have a separate piece of sheet music, called a *part*, to play from. The sung part(s) in a vocal work usually are not issued separately today, although this was historically the case, especially before the advent of music printing.

When the separate instrumental and vocal parts of a musical work are printed together, the resulting sheet music is called a *score*. This term has also been used to refer to sheet music written for only one instrument or voice. The distinction between *score* and *part* applies when there is more than one part needed for performance. Scores come in various formats, as follows:

- A *full score* is a large book showing the music of all instruments and voices in a composition, lined up in a fixed order. It is large enough for a conductor to be able to read while directing rehearsals and performances.
- A *miniature score* is like a full score, but much reduced in size. It is too small for practical use, but handy for studying a piece of music, whether it be for large ensemble or solo performer. A miniature score may have some introductory remarks.
- A *study score* is sometimes the same size as, and often indistinguishable from, a *miniature score*, except in name. Some study scores are octavo size, thus somewhere between full and miniature score sizes. A study score, especially if it is part of an anthology for academic study, may include extra comments about the music and markings for learning purposes.
- A *piano score* (or *piano reduction*) is a more or less literal transcription for piano of a piece intended for many performing parts, especially orchestral works; this can include purely instrumental sections within large vocal works (see *vocal score* immediately below). Such arrangements are made for piano solo (two hands) or piano [duet](#) (one or two pianos, four hands). Extra small staves are sometimes added at certain points in piano scores for two hands in order to make the presentation more complete, even though it is usually impractical or impossible to include them while playing. As with *vocal score* immediately below, it takes considerable skill to reduce an orchestral score to such smaller forces. Sometimes markings are included to show which instruments are playing at given points. While piano scores are usually not meant for performance outside of study and pleasure, ballets benefit most from piano scores, because of their practicality in allowing unlimited rehearsal before the orchestra is absolutely needed. Piano scores of operas do not include separate lines for the vocal parts, but may add the sung text above the music.
- A *vocal score* (or, more properly, *piano-vocal score*) is a reduction of the full score of a vocal work (e.g., [opera](#), [musical](#), [oratorio](#), [cantata](#), etc.) to show the vocal parts (solo and [choral](#)) on their staves and the orchestral parts in a piano reduction (usually for two hands) underneath the vocal parts; the purely orchestral sections of the score are also reduced for piano. If a portion of the work is *a cappella*, a piano reduction of the vocal parts is often added to aid in rehearsal. While not meant for performance, vocal scores serve as a convenient way for vocal soloists and choristers to learn the music and rehearse separately from the instrumental ensemble. The vocal score of a [musical](#) typically does not include the spoken dialogue, except for cues.
  - The related but less common *choral score* contains only the vocal parts.

- A *short score* is a reduction of a work for many instruments to just a few staves. Rather than composing directly in full score, many composers work out some type of short score while they are composing and later expand the complete orchestration. (An opera, for instance, may be written first in a short score, then in full score, then reduced to a vocal score for rehearsal.) Short scores are usually not published; they may be more common for some performance venues (e.g., [band](#)) than in others.
- A *lead sheet*, also known as "*fake*" music, gives the least information of the types of score listed above. Almost exclusively limited to vocal music, it indicates the melody and lyrics, but usually shows the harmony only by placing indications of the underlying chords above the melody. Thus, in effect it is an enhanced vocal part rather than a detailed representation of the piece. It is commonly used in [popular music](#) and [jazz](#). A collection of fake sheets is known as a fake book.

# History

## Manuscripts

Before the 15th century, western music was written by hand and preserved in large bound volumes known as manuscripts. The best known examples of these are manuscripts of monophonic [chant](#). In the case of medieval polyphony, such as the [motet](#), writing space was economized by copying the parts in separate portions of facing pages, thus making possible performance by the few soloists needed. (This process was aided by the advent of [mensural notation](#) to clarify [rhythm](#) and was paralleled by the medieval practice of composing parts of polyphony sequentially, rather than simultaneously as in later times.) Manuscripts showing parts together in score format were rare, and limited mostly to organum, especially that of the Notre Dame school.

Even after the advent of music printing, much music continued to exist solely in manuscripts well into the 18th century.

## Printing

There were several difficulties in translating the new technology of printing to music. The first printed book to include music, the Mainz psalter (1457), had to have the notation added in by hand. This is similar to the room left in other incunabulae for capitals. Later staff lines were printed, but scribes still added in the rest of the music by hand. The greatest difficulty in using movable type to print music is that all the elements must line up - the notehead must be properly aligned with the staff, or else it means something other than it should. In vocal music text must be aligned with the proper notes (although at this time even in manuscripts this was not a high priority).

The first machine-printed music appeared around 1473, approximately 20 years after Gutenberg introduced the printing press. In 1501, Ottaviano Petrucci published *Harmonice musices odhecaton A*, which contained 96 pieces of printed music. Petrucci's printing method produced clean, readable, elegant music, but it was a long, difficult process that required three separate passes through the printing press. Petrucci later developed a process which required only two passes through the press, but was still taxing since each pass required very precise alignment in order for the result to be legible. This was the first well distributed printed polyphonic music. Petrucci also printed the first tablature with movable type. Single impression printing first appeared in London around 1520. Pierre Attaingnant brought the technique into wide use in 1528, and remained little changed for 200 years.

A common format for issuing multi-part, polyphonic music during the Renaissance was *part-books*. In this format, each voice-part for a collection of 5-part [madrigals](#), for instance, would be printed separately in its own book, such that all five part-books would be needed to perform the music. Scores for multi-part music were rarely printed in the Renaissance, although the use of score format as a means to compose parts simultaneously (rather than successively, as in the late Middle Ages) is credited to Josquin Des Prez.

The effect of printed music was similar to the effect of the printed word, in that information spread faster, more efficiently, and to more people than it could through manuscripts. It had the additional effect of encouraging amateur musicians, who could now afford music to perform. This in many ways affected the entire [music industry](#). Composers could now write more music for amateur performers, knowing that it could be distributed. Professional players could have more music at their disposal. It increased the number of amateurs, who professional players

could then earn money by teaching. Nevertheless, in the early years the cost of printed music limited its distribution.

In many places the right to print music was granted by the monarch, and only those with a special dispensation were allowed to do so. This was often an honour (and economic boon) granted to favoured court musicians.

In the 19th century the [music industry](#) was dominated by sheet music publishers. In the United States, the sheet music industry rose in tandem with blackface minstrelsy, and the group of New York City-based publishers and composers dominating the industry was known as "Tin Pan Alley". The late 19th century saw a massive explosion of parlour music, with a [piano](#) becoming *de rigeur* for the middle class home, but in the early 20th century the phonograph and recorded music grew greatly in importance. This, joined by the growth in popularity of radio from the 1920s on, lessened the importance of the sheet music publishers. The [record industry](#) eventually replaced the sheet music publishers as the music industry's largest force.

## **Current developments**

In the late 20th and into the 21st century, significant interest has developed in representing sheet music in a computer-readable format (see Music Notation Software), as well as downloadable files (see Ovation Press). Music OCR, software to "read" scanned sheet music so that the results can be manipulated, has been available since 1991.

Of special practical interest for the general public is the Mutopia project, an effort to create a library of public domain sheet music, comparable to Project Gutenberg's library of public domain books.

# Shibuya-kei

**Shibuya-kei** (70 Shibuya-style; also 70μ|óÉ "Shibuya-kei sound") is a variety of Japanese pop music which combines elements of jazz, fusion, traditional music, and other styles. Shibuya-kei music first gained popularity in the Shibuya district of Tokyo, from which it took its name. Despite under-marketing, it enjoyed enormous success in this region.

Initially, the term was applied to Flipper's Guitar, Pizzicato Five, and Schar Dara Parr, bands strongly influenced by French Ye Ye Music and its most notable proponent, Serge Gainsbourg. Other influences include Lounge, Bossa Nova and Hip-Hop. As the style's popularity increased at end of the 90s, the term began to be applied to many bands, such as Puffy, whose musical stylings began to reflect a more mainstream sensibility.

Some artists rejected or resisted being categorized as "Shibuya-kei," but the name ultimately stuck. The style was favoured by local businesses, including Shibuya Center Street's HMV Shibuya, which sold Shibuya-kei records in its traditional Japanese music section.

Increasingly, musicians outside of Japan, such as Britain's Momus, France's Dimitri from Paris, and the US artists Natural Calamity and Phofu are labelled Shibuya-kei. Many consider this a sign of the genre's acceptance far beyond its original anime and [dance music](#) audience.

# Shoegazing

**Shoegazing** is a style of [alternative rock](#) that emerged in Ireland and the United Kingdom in the late 1980s. Isn't Anything by My Bloody Valentine, released in 1988 (see 1988 in music) is said to have defined the sound.

## Technical definitions

Shoegazing is characterised by a self-deprecating, introspective, non-confrontational feel. Generally employed are distortion and the fuzzbox, droning riffs and a Phil Spector-esque wall of sound from the noisy guitars. Another way to describe the guitar effects would be "lead-guitarlessness", typically with two distorted rhythm guitars interweaving together and giving an exceptionally muddied sound. Although lead guitar riffs were often present, they were not the central focus of most shoegazing songs.

Vocals typically are subdued in volume and tone, but underneath the layers of guitars is often a strong sense of [melody](#). While the genres which influenced shoegazing often used drum machines, shoegazing more often features live drumming. Chapterhouse utilised both samples and live drumming, while drummers such as Chris Cooper of Pale Saints and the late Chris Acland of Lush often displayed complex drum patterns

The name was coined by the New Musical Express, noting the tendency of the bands' guitarists to stare at their feet (or their effects pedals), seemingly deep in concentration, while playing. Some fans will argue another story, that shoegazing music was originally made with the intention of being listened to while taking heroin,[citation needed] and that the name refers to a passage from the book Naked Lunch. Melody Maker preferred the more staid term The Scene That Celebrates Itself, referring to the habit which the bands had of attending gigs of other shoegazing bands, often in Camden. The key record labels associated with the genre were Creation Records (My Bloody Valentine, Ride, Slowdive) and 4AD.

## Influences

The Velvet Underground was often cited as a major influence, as the band had been on the C86 movement before it. Many of the bands eschewed the punk era altogether, although punk-era bands such as The Cramps, Pere Ubu and The Birthday Party proved influential in some cases, especially with the forerunners of the genre. However, artists such as The Jesus & Mary Chain and especially the Cocteau Twins and Spacemen 3 (and later Spiritualized) gave birth to the genre directly rather than through oblique influences.

Michael Azerrad's *Our Band Could Be Your Life* traces shoegazing to a Dinosaur Jr tour of the United Kingdom. While not generally classified as a shoegazing band, Dinosaur Jr did share a tendency to blend poppy melody with loud guitars. Early Boo Radleys tracks were firmly modelled on the first two Dinosaur albums.

## **"The scene that celebrates itself"**

The first stirrings of recognition came when indie writer Steve Lamacq referred to Ride in a review for the NME as "The House of Love with chainsaws". In the United States of America the music is sometimes now referred to as "dream pop".

The genre label was quite often misapplied. Key bands such as Ride, Chapterhouse and Slowdive emerged from the Thames Valley and as such Swervedriver found themselves labelled 'shoegazers' on account of their own (coincidental) Thames Valley origins - despite their more pronounced Hüsker Dü stylings. Curve were once described as "the exact point where shoegazer meets goth" and the genre did overlap with others to some extent. It was certainly the case that bands such as Blur, on occasion, adopted elements of shoegazing ('She's So High' for instance) on a purely commercial basis. The careers of Thousand Yard Stare and Revolver were caught up in a general backlash which affected the scene. In spite of this, bands like Chapterhouse, Ride and Slowdive ("the My Bloody Valentine Creation can afford" went one wry review) did leave behind several albums that on reflection have stood the test of time as indicative of 90s British indie.

## Post movement directions

Slowdive eventually became the [alt.country](#)-leaning Mojave 3, while other shoegazing bands either split, or moved in other directions. Andy Bell of Ride, for example, later joined Oasis after his own [Britpop](#) project Hurricane #1 faltered. Several former members of shoegazing bands later moved towards [post-rock](#) and even [trip hop](#).

## Nu-gazing and current trends

After the initial first wave of bands whose careers petered out in the early 1990s, or moved in different directions, a number of bands such as Bethany Curve and Brian Jonestown Massacre were able to take inspiration from these groups and pursue new audiences. In recent years the NME has recently pointed out the shoegazing influence in a number of up and coming bands, which it has called "nu-gazing". Bands of this nature include Telewise, Air Formation, Scarling., Autolux, Amusement Parks on Fire, The Radio Dept, Mahogany, Readymade, Los Sonidos Distantes, Joy Zipper, M83, Ulrich Schnauss, Oppressed by the Line, Heroes of Switzerland, Experimental Aircraft and Engineers, and most recently Serena Maneesh. The genre is very strong within its own ranks, much alluding to the ideal "the scene that celebrates itself." Clubs such as Club AC30 and Club Violaine, along with the support of such labels as The Gaia Project and Bella Union are supporting more and more dream-pop and shoegaze bands. There are many holdouts of devoted players and listeners on both sides of the Atlantic, and a strong following in South America.

The first two albums by Black Rebel Motorcycle Club are influenced by shoegazing.

The genre, though derided to some extent by the music press at the time, has left something of a legacy, as the new crop of bands demonstrates. The last album by My Bloody Valentine, *Loveless*, released in 1991 is critically acclaimed to be the landmark album of shoegazing, with Ride's first album *Nowhere* seen as a close contender.

# Siguiriyas

**Siguiriyas** (also *seguiriyas*, *seguidilla gitana*) is a form of [flamenco](#) music belonging to the cante jondo category. Its deep, expressive style is among the most important in flamenco. The siguiriyas are normally played in the key of A-major with each falseta consisting of 12 counts (4 measures of 3/4 time) with emphasis on the 1st, 3rd, 5th, 8th and 11th beats as shown here:

[1] 2 [3] 4 [5] 6 7 [8] 9 10 [11] 12

Sometimes this pattern is described as only having 5 counts: 3 fast, and 2 slow. Compare this rhythmic pattern with that of the soleares. This rhythm, however, has been the subject of disagreement, possibly due to changes in style. At different times, scholars have detected a 3/4 time, a combination of 3/8 and 3/4 (closest to the example above), and later 2/4 and 3/8.

Category: [Flamenco styles](#)

# Simultaneity

**Simultaneity** is the property of two events happening at the same time in at least one reference frame.

- In [music](#) a simultaneity is more than one complete [musical texture](#) occurring at the same time, rather than in succession. This first appeared in the music of Charles Ives, and is common in the music of Conlon Nancarrow, and others. A pitch simultaneity is also more than one [pitch](#) or pitch class all of which occur at the same time, or simultaneously. *Simultaneity* is a more general term than [chord](#): most [chord progressions](#) or [harmonic](#) progressions are then simultaneity successions, though not all simultaneity successions are harmonic progressions and not all simultaneities are chords.

Categories: [Musical texture](#)

# Sinfonia

**Sinfonia** is the Italian (Spanish, and also Portuguese) word for [symphony](#) (see that article for etymology). In music *Sinfonia* has however some specific meanings and connotations, that are understood when the word *sinfonia* is used outside the realm of Latin-based languages:

## Late Renaissance - Early Baroque

In the very late [Renaissance](#) and early [Baroque](#), a **sinfonia** was an alternate name for a [canzona](#), fantasia or ricercar. These were almost always instrumental forms, all rooted however in a polyphonic tradition. Later in the Baroque period it was more likely to be a type of [sonata](#), especially a trio sonata or one for larger ensemble. Still later in the Baroque era, the word was used to designate an instrumental prelude, as described in the next section.

## Overture and/or early symphony

In larger vocal-instrumental forms of the 17th and 18th centuries, for example [operas](#) and [oratorios](#), a **sinfonia** was generally an instrumental prelude, sometimes also an interlude/[intermezzo](#) or postlude, providing contrast with adjacent vocal or otherwise different sections.

A specific form of such kind of preluding piece, in the early 18th century, was the three-movement *sinfonia* which became the standard type of [overture](#) to an Italian opera. Most of the time these pieces were in D major (for maximizing open-string resonance on string instruments), opening and ending with a fast movement, with a slow movement in the middle. Examples of this type of Italian *sinfonia* are the numerous three-movement opera overtures by Alessandro Scarlatti, all archetypal Italian overtures.

In France however *overtures* had always been one-movement preluding pieces, usually in a A-B-A form, where the "A" sections had a slow tempo with a stately (double)dotted rhythm, while the "B" middle section was comparatively fluent and fast. This [musical form](#) became known as the French overture. By the time this type of overture was adapted by German composers like Bach and Handel from the early 18th century on, it could be as well the preluding movement of a (dance) [suite](#), in which case *overture* was sometimes used as a synonym for the entire *suite* (e.g. Bach's *French Overture*, BWV 831).

Most of Handel's operas and oratorios start with the *French* type of overture movement, even if he occasionally calls such movement a *sinfonia* (as he did for the *Messiah*, actually calling it a *Sinfony*). But Handel would use the *Italian* type of orchestral prelude/interlude too, for instance the *Introduzione* to the cantate *Delirio amoroso*, HWV 99. Also the instrumental *Pifa* featuring in the *Messiah* did not so much derive from French examples. An interesting anecdote is that when Mozart made a German version of the *Messiah*, some 30 years after Handel's death, he changed the name of the opening *Sinfony* to *Ouverture*, but more or less did away with its *French* characteristics: he softened the dotted rhythm of the "A" section with some more flowing horn melodies, and by speeding it up a bit also made it less distinct from the "B" section: the result is that the "A" part appears as not much more than a moderate preamble to a "fast" symphonic movement (the "B" section).

In the mean while, also from the early 18th century on, the 3-movement *Italian* type of *sinfonia* had started to lead a life on its own: it could be composed as an independent [concerto](#)-like piece (without soloists however). For instance Vivaldi composed as well 3-movement independent *sinfonias*, not so different from some of his string concertos, as well as composing similar *sinfonia* preludes for his operas.

Bach sometimes used the term *sinfonia* in the then antiquated meaning of an instrumental single-movement piece, e.g. for the keyboard inventions BWV 787-801, using a three-voice polyphonic style. Note that in 20th century, publishers started to publish these *sinfonias* as "Three-Part Inventions", where "Part" is an independently flowing melody ("voice", but in the instrumental meaning) in a single-movement work.

If Bach opened a vocal work with one or more separate instrumental movements (which was all in all not so often), he would usually call such piece a *sinfonia* or alternatively a *sonata*. For the *sinfonias* the style would be rather *Italian* (also for the single-movement ones) than *French*:

- One-movement *sinfonia* opening the secular cantatas *Non sa che sia dolore*, BWV 209 and *Mer Hahn en neue Oberkeet*, BWV 212
- *Sinfonia* followed by an "adagio" opening the *Easter oratorio*, BWV 249. Although the chorus joins in the third movement of that oratorio, these three successing opening movements could be seen as a 3-movement "Italian" *sinfonia* to the oratorio.

- Some opening movements of his church cantatas were like up-time movements of organ concertos (BWV 29, 35, 49, 169) - later Bach would rework some of these sinfonias to harpsichord concerto movements.

Both Handel and Bach used the French type of overture to start their orchestral suites. For suites they composed for a solo instrument there often was no preluding movement. If there was, that opening movement would usually be either an *Overture/Ouverture* (in that case always referring to the *French* style), or otherwise a *Prelude/Praeludium*. The style of such preludes was less defined but would often emulate the style of a fast movement of an Italian sinfonia.

As the 18th century progressed, the usual name for an instrumental prelude to a vocal/theatrical work would settle on *overture*. Although such overtures would generally be one-movement pieces, they were no longer in the *French* style, but rather adapted the *Italian* preluding sinfonia, for instance a loud, triadic, motto-type leading motif, a reprise preceded with minimal thematic development, and an overall mood of expectation rather than resolution.

The idea of the Italian 3-movement sinfonia as an independent orchestral composition lived on too: the earliest symphonies of Haydn and Mozart were composed in this format. Mozart also composed divertimentos in the Italian sinfonia format, with some ambiguity whether such divertimentos were indeed intended as independent instrumental compositions, or rather as instrumental interludes (for theatre productions etc).

But then Haydn made the Italian sinfonia/non-solistic concerto and the French type of overture/suite meet again: he took the three movements of a sinfonia, and inserted a fourth between the two last movements of the Italian model. That additional movement was a menuet, which had until then only been an almost obligatory movement of a suite. He also took some characteristics of the French style overture movement, as well as of what was the [sonata](#) in those days, amongst others the possibility to start the first movement of such four-movement composition with a slow introductory passage. But the resulting composition was no longer called a "sinfonia" (at least not outside Italy and Spain): the [symphony](#) was born.

## Symphony with an alternate scope

Later **sinfonia** would occasionally be used as an alternate name for a [symphony](#), from the [Romantic era](#) on. Often, but not always, the title "sinfonia" is used when the work is seen as, or intended to be, lighter, shorter, or more Italianate or *Baroquish* in character than a full-blown (romantic) symphony (with its dominantly Germanic pedigree).

Examples of such "sinfonias" composed after the [classical era](#) include:

- Felix Mendelssohn's twelve early symphonies, most of them string symphonies in three movements and all of them composed before his five other more elaborate symphonies, are sometimes called "sinfonias", to distinguish them from the Symphonies 1 to 5 that were published during - or shortly after - the composer's lifetime. The Italian is a composition of the latter series, so always called a "symphony". On the other hand Mendelssohn used the term *sinfonia* in the "overture" meaning for the first movement of his *Lobgesang* symphony. This can be seen as one of the many Bach reminiscences Mendelssohn inserts in his music: these references to the old master were especially thick in this "symphony-[cantata](#)", as it was to be premiered in the Thomaskirche in Leipzig.
- Vincent d'Indy wrote a *Sinfonia brevis de bello Gallico* that is: "Brief sinfonia of the War in Gaul".
- Richard Strauss chose the name *Sinfonia Domestica* ("Domestic Symphony") for a full scale symphony he composed 1902-1903. Maybe this symphony shows a somewhat sunnier side than most of his other orchestral compositions - but then large parts of the work also portray domestic tiffs and other tensions, ending in an elaborate fugue restoring coherence in the household.
- Benjamin Britten wrote a *Sinfonia da Requiem* in 1941. Here *Sinfonia* is rather an allusion to seriousness and/or solemnity, than to any kind of lightness.

Categories: [Musical forms](#) | [Renaissance music](#) | [Baroque music](#) | [Classical music era](#)

# Sinfonia concertante

**Sinfonia concertante** is a [musical form](#) that originated in the [classical music era](#), and is a mixture of the [symphony](#) and the [concerto](#) genres:

- It is a *concerto*, in that it has one or more soloists (in the classical music era usually more than one).
- It is a *symphony* in that it does not particularly put the soloist in the spotlight: the impression is rather *symphonic* as a whole, with some solistic interventions not outspokenly *dominating* the orchestra (in a concerto, which is the Italian word for *battle*, the role of the soloist is rather something like *defying* the orchestra, trying to prove he can do at least as well as a whole orchestra).

## Classical era

Until the [baroque era](#), preceding the classical music era, the differences between [concerto](#) and [sinfonia](#) (or: symphony), had not been all that clear (*sinfonia* could also be used as the name for an [ouverture](#) to a stage work; for example, Antonio Vivaldi wrote concertos without discernible soloists, which stylistically have few differences compared to his sinfonias). The baroque genre that comes closest to the *sinfonia concertante* is the [concerto grosso](#).

By the classical era, both the symphony and the concerto had a more definite meaning (and the *concerto grosso* had disappeared altogether), which led in the last decades of the 18th century to composers, for example the Mannheim school, attempting to produce a cross-over between the two genres. Also Johann Christian Bach, the "London Bach", was publishing symphonies concertantes in Paris from the early 1770s on. Mozart, acquainted with the Mannheim school from 1777 and probably not unaware of J.C. Bach's publications, put considerable effort into attempts to produce convincing *sinfonia concertantes*.

His most successful *concertante symphonies* are the following:

- *Sinfonia Concertante for Violin, Viola and Orchestra K. 364* (the only one Mozart is actually considered to have finished that exists in an authentic copy).
- *Sinfonia Concertante for Oboe, Clarinet, Horn, Bassoon and Orchestra K. 297b* (known from an arrangement, possibly inauthentic).

Joseph Haydn, despite producing a considerable number of symphonies (over 100) and concertos (for all kinds of instruments), produced only one *sinfonia concertante*, now sometimes numbered as his Symphony No. 105. Haydn's *sinfonia concertante* however draws still much more from the "Concerto Grosso" style (i.e. opposing a *group* of soloists to an orchestra) than Mozart's more *symphonic* treatment of the genre.

Beethoven seems to have avoided the risky *sinfonia concertante* genre, although some say his *Triple concerto* is his answer to that genre.

## Romantic era

Few composers still called their compositions *sinfonia concertante* after the classical music era. However, some works such as Hector Berlioz' *Harold in Italy*, for viola and orchestra approach the genre.

Camille Saint-Saëns' Symphony No. 3 features an [organ](#) that is partially immersed in the orchestral sound, but also has several distinct solo passages. Also semi-solistically, in the second half of the work, this symphony features a part for piano four hands.

By the end of the 19th century, several French composers had started using the *sinfonia concertante* technique in [symphonic poems](#), for example, Saint-Saëns uses a violin in *Danse macabre*, and César Franck a piano in *Les Djinns*.

Édouard Lalo's most known work, the *Symphonie Espagnole* is in fact a *sinfonia concertante* for violin and orchestra.

A work in the same vein, but with the piano taking the "concertante" part is Vincent d'Indy's *Symphonie Cévenole* or *Symphonie sur un chant montagnard français* (*Symphony on a French Mountain Air*).

Max Bruch explored the boundaries of the solistic and symphonic genres in the *Scottish Fantasy* (violin soloist), *Kol Nidrei* (cello soloist), and *Serenade* (violin soloist).

Nicolai Rimsky-Korsakov's *Scheherazade* can be considered a *sinfonia concertante* for violin and orchestra.

## 20th century

In the 20th century, some composers such as Frank Martin and Malcolm Williamson again used the name *sinfonia concertante* for their compositions. The Prokofiev work features a cello soloist, whereas Martin's work, more reminiscent of the classical works with multiple soloists, features a piano, a harpsichord, and a cembalo. Another example is Joseph Jongen's 1926 *Symphonie Concertante* Op. 81, with an organ soloist, and Peter Maxwell Davies's *Sinfonia Concertante* for wind quintet, timpani and string orchestra 1982.

Also P. D. Q. Bach produced a (spoofical) "*Sinfonia Concertante*".

- The [concerto for orchestra](#) differs from the sinfonia concertante in that concertos for orchestra have no soloist or group of soloists that remains the same throughout the composition.

## Notes

1. For example, in the explanatory notes from the booklet to the CD "BEETHOVEN - *Triple Concerto/Choral Fantasia*" (Capriccio Classic Productions No. 180240, 1988).

# Singer

A **singer** is a type of [musician](#) who uses his or her [voice](#) to produce [music](#). Usually, singing refers to vocal [melody](#) only, though **vocalist** is a similar term which also encompasses non-melodic sounds and effectively includes anyone using their voice as part of a musical composition, including spoken word and [rapping](#).

A lead singer (in barbershop music simply called a **lead**) is one who sings the primary vocals of a [song](#), as opposed to a **backing singer** who sings backup vocal(s) to a song or harmonies to the lead singer. An exception is in five-part [gospel](#) a cappella music, where the lead is the highest of the five voices and sings a descant, never the [melody](#) which may be in any of the other four parts.

In [European classical music](#) and [opera](#), voices are treated just like [musical instruments](#). [Composers](#) write music for these instruments, understanding the skills and vocal properties of the singers. Singers build careers by specializing in certain musical styles.

To help both composers and singers, voice classification systems evolved, of which there are now many systems. How loud or how fast a singer can sing can be taken into account, while some systems include non-musical characteristics like what a singer looks like, how well a singer acts (crucial in opera), or how funny a singer can be. In Germany, opera houses use a complex sorting procedure, called the fach system, that considers all these elements.

Classifying singers by range and sex is the most common method. But even using these guidelines, there are still many categories. Some common classifications are:

- Female voices:
  - [soprano](#), the highest female voice
  - [mezzo-soprano](#), the middle female voice
  - [contralto](#), the lowest female voice, called alto in chorus music
- Male voices:
  - treble/boy soprano, the highest male voice (unbroken, boy)
  - countertenor, the highest broken male voice (falsetto)
  - [tenor](#), the highest broken male voice (not falsetto)
  - [baritone](#), the middle male voice
  - [bass](#), the lowest male voice

There are many other designations, including soubrette, heldentenor, [bass-baritone](#), coloratura, [baritenor](#) and basso buffo. There are even categories for men capable of singing in the female range. This type of voice is rare, but still used in opera. In [Baroque](#) music, many roles were written for castratos, male singers who were castrated as boys to prevent their voices from changing. Today, with training, a man can still sing these roles. This singer is called a sopranist, countertenor, or [male alto](#).

Singers may also be classified according to the style of music they sing, such as soul singers or carnatic vocalists.

# Singing

**Singing** is the act of producing musical sounds with the [voice](#), which is often contrasted with speech. Air is expelled with the diaphragm as with ordinary breathing, and the [pitch](#) is altered with the vocal cords. With the lips closed, this is called humming. A piece of [music](#) created to accompany a singing part, or a cappella piece of music is called a [song](#); someone who sings is called a [singer](#).

Most singing involves shaping the voice to form words, but types of [voice instrumental music](#) which use open sounds or nonsense syllables ("vocables") also exist, for instance, scat singing and yodeling. Solfege assigns certain syllables to [notes](#) in the [scale](#).

Nearly anyone who can speak can sing, since in many respects singing is merely sustained speech. It can be informal and just for pleasure, for example, singing in the shower; or it can be very formal, such as singing done professionally as a performance or in a recording studio. Singing at a high amateur or professional level usually requires a great deal of regular practice, and/or instruction. Many top-quality singers regularly take or have taken a great deal of professional instruction from one or more voice coaches.

Singing is often done in a group, such as a [choir](#), and may be accompanied by [musical instruments](#), a full [orchestra](#), or a band. Singing with no instrumental accompaniment is called *a cappella*.

Show choir is a combination of singing and dancing. Many schools and colleges offer show choir groups for students to participate in. Not only must participants be able to sing well and blend in with a group, but they must be able to dance at the same time. This requires endurance, flexibility, and strong vocals, which can all be acquired through practice.

It is also imperative that singers continuously practise with drills, [voice exercises] and strengthening activities. Without constant practice, the singers range can be significantly decreased, requiring extra rehearsal to regain the voices' previous capability.

In [hardcore punk](#), hoarse shouting takes the place of singing, while in [emo](#), some bands scream rather than sing. In metal, particularly the sub-genre of [death metal](#), low growls called [death grunts](#) are favoured over standard singing.

## Techniques

The human voice is usually considered to have at least three voice registers; ranging from lowest to highest, they are the chest register, head register, and falsetto. (The whistle register, comprising the highest notes that a human voice can reach, is also often considered a "full" register, though the ability to use it well is fairly rare.) Some singers remain in a single range (usually the chest register) throughout their songs, but many will switch between these different ranges in order to produce a wide range of pitches, or even simply for effect. Yodelling is a technique that requires rapidly switching between at least two different registers many times in the same phrase, producing a distinct high-low-high-low sound.

Vibrato is a technique used by singers (and many instrumentalists, for instance, [string instruments](#) that are played with a bow can produce vibrato tones) in which a sustained note actually wavers very quickly and consistently between a very slightly higher and a lower tone, giving the note a slight quaver.

Melisma occurs when a singer switches pitch while singing the same syllable. It is used heavily in operatic singing, as well as to a somewhat lesser extent in [popular music](#).

## Singing school

A **singing school** is a school for teaching vocal music. Singing schools form an interesting cultural tradition in the Southern United States. While some singing schools are offered for credit, most are informal programs. Many singing schools are religious in nature, associated with one or more Christian traditions. Singing schools are often associated with churches that have an a cappella tradition, such as the Church of Christ and Primitive Baptists. Singing schools are also common in connection with the Sacred Harp shaped note singing tradition. They are also common with churches in rural areas of the south, such as Missionary Baptist, that still use Hymnals printed in the seven shape note system.

# History

Singing schools began in the Northeastern United States in the early days of American history. The New England colonies were founded by settlers seeking religious freedom; they believed in the importance of congregational singing of hymns in Christian worship and thus saw it as important to train each churchgoer to sing.

According to Eskew and McElrath, "The singing school arose as a reform movement in early eighteenth-century New England." In some denominations controversies existed on whether congregations should sing audibly, and whether singing should be limited to the Psalms of David. This New England controversy centered around "regular singing" versus the "usual way". The "usual way" consisted of the entire congregation singing in unison tunes passed on by oral tradition. "Regular singing" consisted of singing by note or rule. Though intended for the entire congregation, "regular singing" sometimes divided the congregation into singers and non-singers. Massachusetts ministers John Tufts and Thomas Walter were among the leaders in this "reform movement". Tufts' *An Introduction to the Singing of Psalm Tunes* is generally considered the first singing school manual. By the middle of the 18th century the arguments for "regular singing" had generally won the day. By the end of the 18th century, the singing school manuals had become standardized in an oblong-shaped *tunebook*, usually containing tunes with only one stanza of text.

A shaped note system of music notation was developed to aid amateurs in singing songs from notation, and this tradition was incorporated into singing schools. In time divergent shaped note systems arose, including Sacred Harp, which had four different shapes, and a seven-shape note system. With these systems, it was possible to teach nearly any interested person to read music.

Eventually singing schools in the north faded to obscurity, while in the south and west they became a prominent social event for small town Americans looking for something to do.

Singing schools were often taught by traveling singing masters who would stay in a location for a few weeks and teach a singing school. A singing school would be a large social event for a town; sometimes nearly everyone in the town would attend and people would come for miles. Many young men and women saw singing schools as important to their courtship traditions. Sometimes the entire life of a town would be put on hold as everyone came out to singing school. In this way, singing schools resembled tent revivals.

One common tradition was the "singing school picture" taken of the teacher and students on the last day of school. Many old black and white photographs exist as records of these events from the nineteenth and early twentieth centuries; genealogical researchers often find these records useful. The pictures were often taken in front of a blackboard with the name of the teacher and date of the school. Some of these pictures show small classes, while others record very large schools.

Singing schools underwent many changes as cities grew and the population moved away from an agrarian lifestyle. One of the most notable changes was the length of schools; at one time it was common for schools to last four weeks. Then this was shortened to two weeks, and finally it became the norm for a singing school to last one week. Singing schools held less interest for the general public and could rarely get attendance from an entire town. Instead the schools would be attended by interested students from a much larger region. In the case of Sacred Harp singing schools, students usually attended because of their interest in the Sacred Harp singing tradition; in other schools, students attended because of an interest in vocal church music, especially for those churches that maintain an all *a capella* music tradition.

Travelling singing school masters faded away in favor of annual schools in the same location. *Primitive Baptists* have established three permanently located singing schools in the state of Texas (Harmony Hill at Azle, Harmony Plains at Cone, Melody Grove at Warren). The

Cumberland Valley School of Gospel Music (org. 1983), a popular non-denominational seven-shape note singing school, meets annually in Pulaski, Tennessee. *Camp Fasola* represents a new venture (org. 2003) by Sacred Harp enthusiasts into a permanent annual singing school.

Laura Ingalls Wilder related attending a singing school as a young lady in Little Town on the Prairie, one of the Little House Books. Her husband, Almanzo Wilder, proposed to her there. Singing schools are also common in Missionary Baptist churches, as well as rural churches across the South. This would include Methodist, Church of God, Southern Baptist, and other denominations. Many of these churches still prefer to use shape note hymnals, as opposed to round note versions that many denominational publishing houses only provide. The Do Re Mi Gospel Music Academy in Tennessee carries on the tradition of a church affiliated singing school. They have a one week program each June, and many members of this organization are members of various Missionary Baptist Churches. They also use song books published by Leoma Music Co., Barry Witcher Publishing and Sammy Cornwall Publishing. For instructional use they use the *Rudiments of Music* and *Understanding Harmony* written by Marty Phillips of jeffress/phillips music co.

# Curriculum

The basic subject taught at a singing school is [music theory](#), and sight reading, the ability to sing a piece of music by reading the music notation. The basic knowledge required to do this can usually be taught in one week, but a couple of years of practice are usually required to become proficient. Most religious schools also focus extensively on song leading, the ability to direct a group in vocal music. Song leading requires both music theory skills and public speaking skills. Most religious schools are associated with Christian religious traditions that allow only male leadership; thus, many schools offer song leading classes only for men and boys. Other schools allow women to attend song leading classes and practice the skills, but not lead, while still others teach men and women alike in the exact same program.

In addition, many schools teach [harmony](#), the art of writing multiple parts of music for a song, and [lyric](#) writing, the art of composing words for a song.

Many singing schools have published their own small textbooks on music theory, harmony, and song and lyric composition. These are often offered to students as part of the tuition charge of the school. Students are also generally obliged to purchase a pitchpipe, a small instrument that sounds a single note. Those students that learn song leading are taught to use the pitchpipe to establish the key and starting note of a song. Primitive Baptists and others do not believe in or use a pitch pipe to establish pitch, instead pitching by ear.

It is common for students to continue to return to their singing school year after year, even after completing all the curriculum the school offers, for additional practice as well as for the social opportunity the school represents. Many singing school students eventually become teachers. Though singing schools do not have the prominence they once did, for many people they are an important event to look forward to year-round.

Sacred Harp singing schools use one or more of the 20th century editions of *The Sacred Harp* as curriculum. Some of these are one-day workshops held in conjunction with a singing convention. The emphasis is on teaching newcomers and advanced musicians the note system and traditions of *Sacred Harp*.

## List of *Singing masters*

Aiken, Jesse B.  
Arnold, Robert Sterling (1905-2003)  
Billings, William (1746-1800)  
Cooper, Wilson Marion (1850-1916)  
Funk, Joseph (1778-1862)  
Hayes, Autrey  
Kieffer, Aldine Silliman (1840-1904)  
Morgan, Justin (ca. 1747- ca. 1798)  
Phillips, Marty  
Showalter, Anthony J. (1858-1924)  
Stamps, Virgil Oliver (1892-1940)  
Teddlie, Tillit Sidney (1885- 1987)  
Vaughan, James David (1864-1941)  
Walbert, W. B. (1886-1959)  
Walker, William (1809-1875)  
White, Benjamin Franklin (1800-1879)

Joe Roper, native of Hayden, Al. 1915-1990. Inducted into Southern Gospel Music Hall of Fame, October, 2005. Byron E. Reid, Hayden, AL. 1929 - to date. Taught over 300 singing schools across North Alabama, and has had over 100 songs published. Key Dillard, Murfreesboro, TN., founder of the Cumberland Valley School of Gospel Music, and the Do Re Mi Gospel Music Academy, as well as taught singing schools across the South and in Jamaica, Trinidad and Tobago on Mission trips.

Other singing school teachers include Jimmy Jeffress and Gene Jeffress. Both are music educators by trade, and affiliated with the jeffress/phillips music co. of Crossett, Arkansas. They are currently both State Senators in Arkansas, but keep involved in teaching, composing Southern Gospel Music, and in singing with the Jeffress Family music group. They both have had 30 years of public education in choral and school choir programs , in addition to singing schools. They teach in the annual Jeffress School of Gospel Music. Marty Phillips, the editor of the company is a first cousin.

James E. Reid, Minister of Music and singing school teacher, has taught in over 100 singing schools in North Alabama, including the ALABAMA SCHOOL OF GOSPEL MUSIC. He has served as a Minister of Music in several Southern Baptist Churches in North Alabama, and has composed over 150 songs, co-writing some with his father, Byron E. Reid, and his brother Dr. Byron L. Reid, Music Editor of Leoma Music Co. He has taught private students in the last 30 years, in addition to his church work. Like the great Beethoven, only his loss of hearing has compelled him to retire prematurely from the music field. He was a student of Autrey Hayes, another great teacher in the Southern Gospel Music tradition. His contributions to Southern Gospel Music and the Alabama Southern Baptist Convention will remain for many years.

EUGENE MCCAMMON, Current Director of the CUMBERLAND VALLEY SCHOOL OF GOSPEL MUSIC, and Music Editor of the Cumberland Valley Music Company, is a retired music educator, and a singing school teacher of over thirty years. In addition to teaching in CVSGM, he has taught in the North Georgia School of Gospel Music, Ben Speers' Stamps-Baxter School of Gospel Music, and various music seminars' over the years. He is a published composer of over 250 songs with Stamps-Baxter, James D. Vaughan, Jeffrees and Jeffrees/Phillips, Leoma, Gospel Heritage, National, Texas Legendary and other companies. He has served as President of the NATIONAL GOSPEL SINGING CONVENTION, and is the current EXECUTIVE SECRETARY of the Board of Directors. Prof. McCammons' influence in the field of Southern Gospel Music is having a major impact on all people of all ages today, and his music reaches untold thousands around the world.

Dr. Byron L Reid, Music Editor with Leoma Music Co., has over 200 published southern gospel convention songs by Convention Music Co., Stamps-Baxter Music, James D. Vaughan Music, Leoma Music Co., Jeffress Music Co., National Music Co., Cumberland Valley Music, Jeffress-Phillips Music, Ben Speer Music and Texas Legendary Music. He has taught singing schools over the last 30 years in various churches, as well as private music students. He is currently on staff with the DOREMI GOSPEL MUSIC ACADEMY. Dr. Reid served as President of the Tennessee State Gospel Singing Convention in 1990, and President of the National Gospel Singing Convention in 2006. He has served in various conventions in Alabama, Mississippi and Tennessee over his years in Southern Gospel Music. His song writing class at the DOREMI GMA has produced from one to three new songs each year, collectively by the class or individually by some of his students. He continues to have an impact on many young people today.

Joel McKissack, noted Southern Gospel music composer and lyricwriter, and currently Senior Music Editor of Leoma Music Co., has taught in singing schools over the last 30 years. He has taught in the DOREMI Gospel Music Academy and served on the Board of Directors for the CUMBERLAND VALLEY SCHOOL OF GOSPEL MUSIC. He has contributed to the industry by his design and use of computer graphics and in music notation. He is the director of BALT music, McKissack Music Makers and MONJERLEE Music and continues to work producing CD's of this style of music. He has written over 100 songs by seven different publishers and continues to be a leading influence in the area of Southern Gospel Convention Music.

# Single

In [music](#), a **single** is a short [record](#), usually featuring one or two tracks as [A-side](#), often accompanied by several [B-sides](#), usually [remixes](#) or other [songs](#). Most singles have only one A-side and are named after this song, but some may have a double A-side (a famous example being Strawberry Fields Forever/Penny Lane by the Beatles), where two tracks are given equal billing in the title of the single. Occasionally, a single will not be identical in name to the featured track—such as the Nine Inch Nails single, Closer to God.

In the older record format, there was no "track 1" as the disc itself was reversible, so the difference between an A-side and a B-side was one of promotion. [CD singles](#) do have a defined ordering of tracks, so that even on a double A-side single, one track has to come first. Some single releases have been released in two different versions, one with each track first (such as Muse's non-album single Dead Star/In Your World or In Your World/Dead Star), or with two CDs with one track each (such as Kent's single FF/VinterNoll2). Records with more than two A-sides are usually not considered singles, but [EPs](#).

The lead tracks (and sometimes B-sides) of singles usually come from an [album](#) (either one already released or one about to be) and the release of the single is partly to promote sales of the album. Non-album singles are also produced. A typical number of singles to release from an album is two to four — more is considered exceptional.

Singles often feature "radio edit" or "single edit" versions of the main song, which differ from the original recording in being edited to an attractive length for radio play, having expletives censored (often by re-recording with different lyrics), or both.

## Situations in UK and US

In the United Kingdom before the early 1990s, singles were released to radio and shops on the same day. As radio airplay increased, the single would climb in the chart, reach a peak position, often about a month later, and then slowly drop out of the chart. Since the early 1990s, record companies have released singles to radio months in advance of their commercial release. This saturates the audience in the song, ensuring that it enters the chart with maximum sales. Thus, today's singles typically debut at their peak position. This trend has led to the common sight of not one single in the UK Top 75 gaining in the chart. Singles also spend less time at #1 and fall down the chart more rapidly, spending less time overall since they never climb to their peak. In addition, while before the 90s, the first single from an album was released several weeks in advance of the album, today singles are typically released one week, or occasionally two weeks, before the album's release. The trend of single sales declining and no singles rising in the chart has been checked by the recent introduction of digital sales in the UK.

Recently Gnarls Barkley made history by releasing "Crazy (Gnarls Barkley song)", this became the first UK number-one single based solely on downloads

Some other strategies are employed in the release of lead singles from an album. On occasion, lead singles are released months in advance of the album they appear on. Two examples are Oasis' "Some Might Say" and Pulp's "Help the Aged". Less commonly, two separate singles are released at the same time to promote an album. An example is the simultaneous release of the Manic Street Preachers' "Found That Soul" and "So Why So Sad".

In the United States, since the early 1990s, singles have increasingly not been issued commercially at all. While this precluded them from charting on the Hot 100, Billboard magazine recognised the trend and in December 1998 modified the rules to allow airplay-only tracks, which they call album cuts, to chart. Since then, airplay-only singles have frequently topped the chart. However, the former rule disqualified such long-term airplay #1 hits as No Doubt's "Don't Speak" from charting on the Hot 100 at all. Recently, Billboard too has accounted for digital sales in its calculation of single chart positions.

# History

Singles have been issued on various formats, including 7-inch, 10-inch and 12-inch vinyl discs (usually playing at 45 rpm); 10-inch shellac discs (playing at 78 rpm); cassette, 3 and 5-inch CD singles and 7-inch plastic flexi discs. Other, less common, formats include singles on digital compact cassette, DVD, and LD, as well as many non-standard sizes of vinyl disc (5", 8", etc.)

The sales of singles are recorded in charts in most countries in a Top 40 format. These charts are often published in magazines and numerous television shows and radio programs count down the list. In order to be eligible for inclusion in the charts the single must meet the requirements set by the charting company, usually governing the number of songs and the total playing time of the single.

In popular music, the relative commercial and artistic importance of the single (as compared to the EP or album) has varied over time, technological development, and according to the audience of particular artists and genres. Singles have generally been more important to artists who sell to the youngest purchasers of music (younger teenagers and pre-teens), who tend to have more limited financial resources and shorter attention spans. Perhaps the golden age of the single was on "45's

" in the 1950s and early 1960s in the early years of [rock music](#); albums became a greater focus as artists like The Beatles and others created albums of uniformly high quality and coherent themes (one of many examples being the concluding medley on Abbey Road), a trend which reached its apex in the development of the [concept album](#). Over the 1980s and 1990s, the single has generally received less and less attention as albums, which on compact disc had virtually identical production and distribution costs but could be sold at a higher price, became most retailers' primary method of selling music. The single became almost exclusively a promotional tool for radio play and to appear on television via the video clip.

[Dance music](#), however, has followed a different commercial pattern, and the single, especially the 12-inch vinyl single, remains a major method by which dance music is distributed.

As of 2005, the single seems to be undergoing something of a revival. Commercial music download sites reportedly sell mostly single tracks rather than whole albums, and the increase in popularity seems to have rubbed off on physical formats. Portable MP3 players, which make it extremely easy to load many songs from different artists and play them, are claimed to be a major factor behind this trend.

A related development has been the popularity of mobile phone ringtones based on pop singles (on some modern phones, the actual single can be used as a ringtone). These are reportedly a very lucrative new business for the music industry.

In a reversal of this trend, recently a single has been released based on a ringtone itself. The Crazy Frog ringtone, which had become a cult hit in Europe in 2004, was released as a mashup with Axel F in June 2005 amid a massive publicity campaign and subsequently hit #1 on the UK charts.

## Video singles

In relation to music singles, the industry has released music videos as singles as well. Originally released on very short VHS cassettes (T-15), these eventually were released on LaserDisc as LD-singles (18 cm or 8" format, instead of the full 1'12"/30 cm LD), and on cDVD as DVD-singles (8 cm or 3" format, instead of the full 12 cm/5.25" DVD).

# Singspiel

**Singspiel** ("song-play") is a form of German-language [music](#) drama, similar to modern [musical theater](#), though it is also referred to as a type of [operetta](#) or [opera](#). It is characterized by spoken dialogue, sometimes performed over music, interspersed with ensembles, popular songs, [ballads](#) or [arias](#) (which were often folk-like and strophic in nature).

The first *Singspiel* were probably translations of English ballad operas from the late 18th century. French comic operas (Opéra comique) were also frequently transcribed into the German, as well. Singspiel was considered popular entertainment, and was usually performed by traveling troupes, rather than by established companies within metropolitan centers.

*Singspiel* plots are generally comic or romantic in nature, and frequently include elements of magic, fantastical creatures, and comically exaggerated characterizations of good and evil. While tragedy was a less frequent motif, it should be noted that most of the Singspiel that are still part of the modern operatic canon were those written on more serious themes, such as Ludwig van Beethoven's *Fidelio*, or Carl Maria von Weber's *Der Freischütz*

Wolfgang Amadeus Mozart touched the genre under an imperial commission for the New National Theatre in Vienna with *Die Entführung aus dem Serail* in 1782. He continued to write in the genre, with works such as *Zaide*, *Der Schauspieldirektor* and *Die Zauberflöte*, although some argue that because it incorporates a significant number of elements from various other musical and dramatic genres, it is a work that defies such a clear-cut classification.

*Singspiel* is considered the predecessor of German romantic opera, and many of the genre's composers, such as Beethoven and Weber, paved the way to the more complex operatic style associated with Wagner, Richard Strauss and others. As a result of this evolution, however, Singspiel itself had become basically obsolete by the end of the 19th century. Other than for a handful of works, most of the genre is generally not considered to be part of the modern classical canon.

To a certain extent, a more recent spingspiel could be the preschool series "Wonder Pets" on Nick Jr..

[Music of the United States](#) - [Music of Canada](#)

The Sioux are a diverse group of Native Americans generally divided into three subgroups: Lakota, Dakota and Nakota.

Among the Dakota, traditional songs generally begin in a high pitch, led by a single vocalist (solo) who sings a phrase that is then repeated by a group. This phrase then cascades to a lower pitch until there is a brief pause. Then, the song's second half, which echoes the first, is sung (incomplete repetition). The second part of the song often includes "honor beats", usually in the form of four beats representing cannon fire in battle. The entire song may be repeated several times, at the discretion of the lead singer.

Many songs use only vocables, syllabic utterances with no lexical meaning. Sometimes, only the second half of the song has any lyrics.

In some traditional songs, women sing one octave above the men, though they do not sing the first time the song is sung or the lead line at any time.

Percussion among the Dakota use drums, sometimes with syncopation. In competition songs, beats start off irregular and are then followed by a swift regular beat.

The Dakota Flag Song begins special events, such as powwows, and is not accompanied by a dance. Other kinds of songs honor veterans, warriors or others, or are sacred in origin, such as inipi songs.

# Siren

A **siren** is a loud noise maker. The original version would yield sounds under water, suggesting a link with the sirens of Greek mythology. Most modern ones are civil defense or "air raid" sirens, tornado sirens, or the sirens on emergency service vehicles such as ambulances, police cars and fire engines.

There are two general types, pneumatic and electronic.

## Pneumatic

The pneumatic siren, which is a free [aerophone](#), consists of a rotating disk with holes in it (called a siren disk or rotor), such that the material between the holes interrupt a flow air from fixed holes on the outside of the unit (called a stator). As the holes in the rotating disk alternately prevent and allow air to flow it results in alternating compressed and rarefied air pressure, i.e. sound. Such sirens can consume large amounts of energy.

# Electronic

Electronic sirens incorporate circuits such as oscillators, modulators, and amplifiers to synthesize a selected siren tone (wail, sawtooth, bellring, or beebaw) which is played through external speakers.

Electronic sirens seem to be better for clearing traffic in front of vehicles, while pneumatic sirens seem better at protecting vehicles passing or turning through an intersection. It is not unusual, especially in the case of modern fire engines, to see an emergency vehicle equipped with both types of sirens.

Sirens are also used as [musical instruments](#), such as in Edgard Varese's *Hyperprism* (1924), *The Klaxon: March of the Automobiles* (1929 by Henry Fillmore, *Ionisation* (1931), and, recorded, in his *Poeme Electronique* (1958).

The device was invented by the Scottish natural-philosopher (physicist) John Robison. It was improved and given its name by Charles Cagniard de la Tour.

# Sitar

The **sitar** is a [Hindustani classical](#) instrument. Acoustic sitars typically have a gourd acting as the resonating chamber. A distinctive feature are the curved frets, which are movable (allowing fine variation in tuning) and raised (so that resonant, or sympathetic, strings can run underneath the frets, giving a very lush sound). A typical sitar has 18, 19 or 20 strings (depending on the style) — there are 6 (in the Vilayat Khan style) or 7 (in the Ravi Shankar style) playable strings on top and 11, 12 or 13 sympathetic strings or tarbs under the frets. It is rather difficult to tune the instrument. The strings can be tuned using both the pegs on the sides or the 'beads' at the bottom, which are mainly for fine tuning.

## Etymology and History

The origin of the name, *sitar* is from Persian, like some other words used in Indian musical terminology. The corresponding Persian name is *sehtar*, (*seh* means three and *tar* means string) meaning three strings. In Afghanistan, the *sitar* is also used and is pronounced "sehtar." However, there are significant differences between the *sehtar* and *sitar*, suggesting that the *sitar* developed later and is possibly a direct descendant of the *sehtar*, which is in turn derived from the Kurdish *tembûr*. Both the *tembûr* and *sehtar* were used in pre-Islamic Persia and are used in Iran today. It is also quite likely that the *sitar* is an adaptation of the much older Indian instrument the *rudra veena*.

## Playing the Sitar

The dominant hand is used to pluck the string using a metallic plectrum called the mezbab. Traditional approaches to learning the sitar involve a long period of apprenticeship under the tutelage of a master during which the apprentice would accompany the master with a tambura, providing a droning chord [harmony](#) for the sitar's [melody](#). Nowadays it is possible to purchase books and videos to assist home learning. The sitar became popular in the West when The Beatles used it in "Norwegian Wood (This Bird Has Flown)", "Love You To", "The Inner Light", "Tomorrow Never Knows", and "Within You Without You". Beatles guitarist, George Harrison, was inspired by — and later taught by — Ravi Shankar.

Learning to play the sitar is a difficult process. The entire 3 octave range of the instrument is achieved by sliding the index finger of the left hand up and down the neck of the sitar over a single melody string, while the mezbab on the index finger of the right hand strikes the string. Thus it demands a very high degree of technical mastery to play even simple melodies with clarity and accuracy. It is also a rather painful process for the beginner until the hard calluses and black grooves on the tips of the index and middle finger, which typify the sitar player, begin to develop. A specialised technique called "Meend" involves pulling the main melody string down over the bottom portion of the sitar's curved frets, with which the sitarist can achieve a 7 semitone range of microtonal notes. Meend gives the sitar its characteristic fluid sound, but typically takes the sitarist a decade or more of hard practice to achieve with fluency and precision.

In one of the more common tunings (used by Ravi Shankar among others) the strings are tuned C C G C G C F. The sympathetic strings are tuned depending on the [raga](#), although for beginners it is acceptable to tune them according to a C major scale: C, D, E, F, G, A, B, C, D, E. This corresponds with the Indian scale Sa Re Ga Ma Pa Dha Ni Sa Re Ga.

When playing sitar, the thumb of the plucking hand should stay on the side of the fretboard just above the main bowl, the plucking arm should carry all of the weight of the sitar by applying pressure to the main bowl with the elbow and other arm muscles, the fingering hand should move freely without having to carry any of the weight. Generally only the index and middle fingers are used for fingering.

# Ska

**Ska** is a form of Jamaican music which began in the early 1960s. Combining elements of traditional mento and calypso with an American [jazz](#) and [rhythm and blues](#) sound, it was a precursor in Jamaica to rocksteady and later [reggae](#). It is the predominant form of music listened to by Rudeboys, Mods, and Skinheads, amongst others, with artists such as Symarip, Laurel Aitken, The Charmers and The Pioneers aiming songs at these groups as far back as the 1960s.

Musical historians typically divide the history of ska into three waves. Ska's popularity has waxed and waned since its original inception, and has had revivals of note in England in the 1980s and another wave of popularity in the 1990s.

## First Wave

After World War II, Jamaicans purchased radios in increasing numbers and were able to hear American [R&B](#) from southern cities like New Orleans, Louisiana, whose artists (such as Fats Domino) had the most influence on early ska. To meet the demand for such music, entrepreneurs like Prince Buster, Clement "Coxsone" Dodd, and Duke Reid formed sound systems, portable [discotheques](#) which appeared at dances and other gatherings. Sound system operators were able to obtain records from Miami and New Orleans, and these records were hot commodities in Jamaica. Often, these sound system operators removed labels from the most popular records in order to enjoy a monopoly on the best-liked tunes and draw the most customers.

When New Orleans-style [R&B](#) fell out of favor by 1960, Jamaican artists began recording their own version of it. The music of ska is known for the placement of the accented [guitar](#) and [piano](#) rhythms on the upbeats. The word "ska" may have onomatopoeic origins in a tradition of poetic or possibly even musical rhythms. Guitarist Ernest Ranglin said that "the offbeat guitar scratching that he and other musicians played was referred to as 'skat! skat! skat!'" Some believe that Cluet Johnson coined the term. Bassist Johnson and the Blues Blasters were Coxsone Dodd's house band in the 50s and earliest 60s before the rise of the mighty Skatalites. In explaining the 'ya-ya' sound of the music & rhythm being made, the word 'ska' popped out. This may be because he greeted all his friends as 'skavoozee', perhaps imitating American hipsters of the era. One other theory is that it was merely an abbreviation of the term "speed calypso", which is arguably a fairly accurate description of the music.

Some believe that the early [jazz](#) and [rock 'n' roll](#) broadcasts from American radio stations were misinterpreted by an eager Jamaican music audience, hence the off-beat rhythms that almost mimicked the break up of weak radio signals that hit the West Indian shores. Others consider ska not a misinterpretation but its own response to American music. The sound of ska was created at facilities like Studio One and WIRL Records in Kingston, Jamaica, by producers like Dodd, Reid, Prince Buster, and Edward Seaga (later Jamaica's prime minister). The upbeat sound of ska coincided with the celebratory feelings surrounding Jamaica's independence from the U.K. in 1962, an event commemorated by ska songs such as Derrick Morgan's "Forward March" and the Skatalites' "Freedom Sound".

As music changed in America, so did ska. For example, ska was influenced by [jazz](#) and [rock](#). Ska groups like Clement Dodd's house band, The Skatalites often did instrumental ska versions of popular American and British music, such as Beatles tunes, movie themes, or surf instrumentals. In 1966 and 1967, when American [soul](#) became slower and smoother, ska changed its sound accordingly and resulted in rocksteady, a style of music with the bass playing more varied rhythms, more emphasis on the downbeat, and soulful vocals. Some

historians suggest that the popularity of rocksteady's slowed tempo was a result of an exceptionally warm summer of 1966, during which dancers were physically too hot to dance to the uptempo numbers. Some notable rocksteady musicians are the Melodians, who scored a hit with 'Rivers of Babylon', The Ethiopians, and Desmond Dekker, who did a number of rocksteady songs during the late sixties. The Maytals, another popular rocksteady group, coined the term 'reggae' with their hit "Do the Reggay". Rocksteady lasted until the emergence of [reggae](#) in 1968.

Ska was showcased at the 1964 New York World's Fair. Byron Lee & the Dragonaires were selected over the Skatalites as the band for the occasion, and Prince Buster, Eric "Monty" Morris, and Peter Tosh performed with them, presenting ska music to the world. Prince Buster and U-Roy of Jamaica brought Ska to the U.K. in the early 1960s where it has been a major inspiration to many bands, such as The Specials, Madness, The Beat, Bad Manners, The Selecter, and to some extent UB40 and many other underground music acts from dance to reggae.

## Second Wave

The [Two Tone](#) (or 2 Tone) era was named after the similarly titled record label, formed by Jerry Dammers, keyboardist of The Specials. The band was formulated from the greatly diverse West Midlands region of England in the late 1970s, with bands such as The Beat and The Selecter in support of the scene.

Supplementing the lilting Jamaican rhythms of ska with punk rock's uncompromising lyrics and brutal [guitar chords](#) resulted in a hybrid that satisfied a thirst for a [moshing](#) groove, plenty of [melody](#) via the [horns](#), and thoughtful, irreverent, or politically charged lyrics. The Two Tone movement pushed towards racial unity, and was symbolized by a black and white checkerboard pattern. The Specials keyboard player, Jerry Dammers, established a record label that he named "Two Tone Records". The label's name had a double meaning, the first was in honor of the two tone tonic suits that the original Jamaican ska musicians typically wore and the second was to signify the multi-racial membership of most of the British ska bands as racial tensions were reaching a high point in late 70's UK and US. The British ska bands were very respectful to the original Jamaica artists and in many cases did them a service by remaking their songs and turning them into hits again. In one case, the Jamaican artist Prince Buster actually made more money from royalties from cover artists than he ever made from his own records. Although Two Tone ska did not hide its musical roots and was not afraid to cover some of the great older songs, it definitely had a sound of its own. Two Tone recordings are characterized by faster tempos, fuller instrumentation and a harder edge than original 50's and 60's ska. The branches that stem from the influence of some of these ska bands are long reaching, a number of bands like The Police, The Clash, and Elvis Costello mention ska music as being incredibly important in their musical background and the number of bands that were influenced by bands such as those goes on and on..

## Third Wave

(see also: [Third wave of ska](#))

Beginning in the late 1980s, the [third wave of ska](#) moved across the Atlantic Ocean and became popular in the United States. Combining elements of ska with [rock](#), [punk](#), [hardcore](#), and [jazz](#), musicians of the third wave created a new style of ska. [Ska punk](#) and Skacore, sub-genres of the third wave, make up a majority of this genre. This third wave of ska music was concentrated primarily in the United States, with large centers in New York and California and smaller groupings throughout the rest of the country and the world. An enormous growth of the third-wave Ska movement occurred after the release of No Doubt's Tragic Kingdom

(1995). More mainstream success followed with The Mighty Mighty Bosstones's single "The Impression That I Get"

Some of the most popular and longlasting third wave ska bands are The Suicide Machines, Fishbone, The Mighty Mighty Bosstones, Bim Skala Bim, Reel Big Fish, The Aquabats, Streetlight Manifesto, Catch 22, Less Than Jake, Buck-O-Nine, Mustard Plug, Operation Ivy, Mad Caddies, Skankin' Pickle, The Toasters, The Planet Smashers, The Pietasters and Goldfinger.

While chronologically, bands like The Allstonians, The Slackers, Let's Go Bowling, and Hepcat can be classified as third wave groups, their sound is much more similar to that of the first wave. Their music is influenced by or strongly resembles the ska of 1960s Jamaica. Some bands in New York combined punk, hardcore and ska sounds with limited pop influences. Choking Victim, Leftover Crack, INDK, Crack Rock Steady 7, and Morning Glory are some of the bands in this genre.

**Ska** - [Reggae](#) - [Oi!](#) - [Punk Rock](#) - [Streetpunk](#) - [Hardcore](#)

[Dub](#) - [Roots reggae](#) - [Two Tone](#)

Categories: [Music genres](#)

## Ska jazz

Ska jazz is a musical form derived by combining the melodic content of [jazz](#) with the rhythmical and harmonic content of [ska](#). It is considered to be a subgenre of [third wave ska](#), but lacks much of the punk rock feel associated with third wave ska.

## Orchestration

While lacking the size of a standard [jazz band](#), ska jazz bands contain a rhythm section consisting of [electric guitar](#), [bass guitar](#), [keyboard](#), and drum set, as well as a brass section comprised of any combination of the following: [trumpet](#), [trombone](#), alto saxophone, tenor saxophone, and baritone saxophone. Occasionally, there may be included one or more vocalists, but the genre is primarily focussed on [instrumental](#) tunes.

## Style

Most ska jazz tunes are instrumental, thus the brass carry the [melody](#), with occasional improvised solos. The rhythm section places accents on the off beats, thus giving the music a more upbeat and [Reggae](#)-ish feel than traditional jazz.

# Skate punk

**Skate punk** (also known as **Skatepunk**, **Skate-punk**, **Sk8 Punk**, **Skate-thrash**, or **Skate-core**) was originally a derivative of [hardcore punk](#), so named because of its popularity among skateboarders.

## Overview

Skate punk bands used a similar aggression as hardcore, but with different musical topics. At the time, of the emergence of this genre, skateboarding was still seen as an outcast activity (similar to that of surfing, from which skateboarding has its origins). Many bands used that 'outcast' feeling, of being a skater, and thus the stereotypes that came with that, as fuel for their music. Often, bands like JFA would talk about their problems with police, or 'preps', and the harsh treatment they received from them, in their songs and albums.

Many bands of the "Nardcore" music scene from Oxnard, California—such as Dr. Know, Agression, Scared Straight, Ill Repute, and NOFX—are extensions of this genre. Despite coverage in Thrasher Magazine, this style of punk differs from thrash. The legendary 1970s skateboarder Duane Peters grew into skate punk via skateboarding, forming two skate punk bands: U.S. Bombs and later The Hunns (also known as Duane Peters and the Hunns, die Hunns). Other bands associated with skateboarding are Suicidal Tendencies, Minor Threat, Against All Authority, Lagwagon, Glue Gun, Millencolin, No Use For A Name, Plow United and popular Japanese band HI-Standard.

## History

In the 1980s, music by hardcore punk bands such as Black Flag and the Circle Jerks were very popular among skateboarders. Some bands, like JFA and Big Boys, are considered by many as two of the first 'skate punk' bands. They were skateboarders that also played in punk bands and used their passion for skateboarding in the context of many of their songs. Other examples of this are Free Beer and Los Olvidados. Many of these bands were regularly covered in *Thrasher*, a skateboarding magazine that also helped develop the skate punk scene. *Thrasher* released many skate videos, featuring the music of these bands on the soundtrack.

The movement of Skate punk reached an all time high in the 1990's with the formation of the VANS Warped Tour, whose first tour featured Ska/punk legends Sublime and all girl rock band L7. The 1997 Warped Tour featured performances by bands classifiable as skate punk, such as the reunited Descendents, Lagwagon, The Suicide Machines, Pennywise, Face to Face, Millencolin, and The Bouncing Souls.

## Disambiguation

Skate punk can also describe the fashion created by earlier skateboarders. The clothes worn by "skate punks" includes thrift store clothing or anything that openly rejects mainstream sweatshop labor clothing. A skate punk's attire will be strewn with holes and rips due to the hazards of skating itself.

# Skiffle

**Skiffle** is a type of [folk music](#) with a [jazz](#) and [blues](#) influence, usually using homemade or improvised instruments such as the washboard, tea chest bass, kazoo, cigar-box fiddle, comb and paper, and so forth, as well as more conventional instruments such as [acoustic guitar](#) and [banjo](#). Skiffle and jug band music are closely related. It was particularly popular in Britain during the 1950s and 1960s.

Skiffle first became popular in the early 1900s in the United States, starting in New Orleans. The Oxford English Dictionary states that "skiffle" was a slang term for "rent party."

Originally, skiffle groups were referred to as "spasm bands." By the 1920s and 1930s, a form of skiffle was being played in Louisville and Memphis. Skiffle's roots are also found in the jazz bands of the 1940s and 1950s.

The first use of the name on records was in 1925 by the otherwise unknown Jimmy O'Bryant and his Chicago Skiffers. In 1948 Dan Burley & His Skiffle Boys, led by barrelhouse piano player and journalist Burley, brought together New Orleans bassist Pops Foster, and guitar-playing brothers Brownie and Sticks McGhee.

Skiffle became extremely popular in the United Kingdom in the late 1950s. Skiffler Lonnie Donegan had major international success with the Leadbelly song, "Rock Island Line" and the novelty song "Does Your Chewing Gum Lose It's [sic] Flavour on the Bedpost Over Night?" Other well known British skiffle groups include The Gin Mill Skiffle Group, and The Quarry Men, who later became the The Beatles. In the 1984 mockumentary This is Spinal Tap, the fictitious rock group Spinal Tap had its beginnings in skiffle, as The Lovely Lads.

Mick Jagger was a member of the Barber-Colyer Skiffle Band but claims he did not really enjoy skiffle music. Nonetheless, it was the popularity of simple skiffle music that opened young Britons' eyes to the idea that they could play music and have hit records. The result, several years later, was the musical explosion called the [British Invasion](#) (1964-66).

Several decades following the British Invasion, American [indie rock](#) bands like Guided By Voices would imitate the "Brit pop" of the 1960s with affected faux-English accents. Only some would go as far as the Strapping Fieldhands and actually mimic their skiffle roots (even going so far as to have a song named "Lonnie Donegan's Mum's Tea Chest").

## Skiffle bands

At present, a number of skiffle bands are active, with most groups being based in various European nations. These groups include:

### Australia

- Rock Island Linesmen, The (Victoria)

### Austria

- Worried Men Skiffle Group (Vienna)

### Denmark

- Modvind (central Jutland)

### Germany

- Anyway (Leverkusen)
- Black Bear Skiffle Company (Harz)
- Black Bottom Skiffle Group (Munich)
- Bourbon Skiffle Company (Hannover)
- Caddy Skiffle Group (Hannover)
- Die Popel (Essen)
- Ha He Ho & Co. Skiffle Band (Bremen)
- Heavy Gummi (Düsseldorf)
- Janker's Skiffle Group, The (Mülheim an der Ruhr)
- J. J. Tabb Skiffle Group (Hamburg)
- Midnighttrain Skiffle-Band (Remscheid)
- Old Boys Skiffle Corporation, The (Hamburg)
- Skiffle Track (Hamburg)
- Skiffle Train (Bergedorf [eastern Hamburg])
- Steam Skiffle Gang (north Hamburg)
- Vati's Muntere Skiffle Buben (Pforzheim)
- Wedding Skiffle Orchestra (Berlin)
- Yellow Moon (Hamburg)

### Netherlands

- Bottle Up and Go (Enkhuizen, North Holland)  
Mosam Skiffle Train, The (Maastricht)

## Switzerland

- Sunday Skiffers

## United Kingdom

- Doghouse Skiffle Group (Hull, East Yorkshire, England)  
KC Moaners Skiffle Band (Leeds, Yorkshire, England)  
Kick 'n' Rush Comedy Skiffle Band (Mansfield, Nottinghamshire, England)  
London Philharmonic Skiffle Orchestra  
Ode & the BeBops (Swindon, Wiltshire)  
The Quarrymen (later the Beatles) (Liverpool area)  
Railroad Bill (Cardiff, Wales)  
Tommy Steele and the Steelmen (London)  
Titanic Wash Hoose Band (Falkirk, Scotland)  
Ugly Dog Skiffle Combo (north Norfolk)  
The Yorkshire Teabags Skiffle Group (Sheffield, South Yorkshire, England)

## United States

- Boondockers Skiffle Band, The (Sacramento, California)  
Lunch Hour Skiffle Band (Ann Arbor, Michigan)  
Old Line Skiffle Combo (Maryland)  
Strapping Fieldhands (Philadelphia, Pennsylvania)  
Wahoo Skiffle Crazyies (Staten Island, New York)

# Skinheads

**Skinheads**, named after their shaven heads, are members of a subculture that originated in Britain in the 1960s, where they were closely tied to the Rude Boys of the West Indies and the Mods of the UK.

# Categories

There are several different types of skinheads, and three main political categories:

- **Traditional** skinheads (Trads, **Trojan Skinheads**) - They identify with the original skinhead movement (The Spirit of 69) in terms of music, style, culture and working class pride. Unlike the other categories, traditionalist skinheads often do not regard attitudes toward racism as central to the subculture.
- **SHARP** (**S**kinheads **A**gainst **R**acial **P**rejudice) - Aggressively anti-racist and usually political, often left wing. The moniker "SHARP skinheads" is commonly used for all outspoken anti-racist skinheads, even if they aren't members of a SHARP organization. Anti-racist skins also include RASH (**R**ed and **A**narchist **S**kinheads), Redskins, and Anarcho-Skinheads.
- **White Power** skins and Nazi-Skinheads - Racist. Despite the common moniker, many Nazi skins have no connection to the original skinhead culture in terms of style or interests. SHARPs and traditional skinheads sometimes refer to them as Boneheads.

These categories are descriptive, not definitive. There are many skinheads who don't fit in any of these categories. The usefulness of these terms is to explain the dominant forces of skinhead social structure.

# History

In the early 1960s, Britain saw a continuation of the entrenched class system, which offered most working class people substandard educational, housing and economic opportunities. However, Britain was also experiencing a post-war economic boom, which led to an increase in disposable income among many young people. Some of those youths invested in new fashions popularized by American soul groups, British RnB bands, certain movie actors, and Carnaby Street clothing merchants. These were the Mods, a youth subculture noted for its consumerism and devotion to style, music and scooters. Mods of lesser means made do with practical styles that suited their lifestyle and/or employment circumstances - steel-toe boots, straight-legged denim jeans, button-down shirts and braces (suspenders in the USA). When possible, their limited funds were spent on smart outfits worn in the evenings to dancehalls, where they enjoyed [ska](#), [reggae](#), and rocksteady beats.

Around 1965, a schism developed between the "peacock" mods, who always wore the latest expensive clothes, and the "hard" mods (also known as "gang" mods), who were identified by their shorter hair and working-class image. Also known as "lemonheads" and "peanuts", these hard mods were commonly known as skinheads by about 1968. The shorter hair may have come about for practical reasons, since long hair can be a liability in industrial jobs and a disadvantage in streetfights. An alternate explanation is that skinheads cut their hair short in defiance of the more bourgeois hippie culture popular at the time. In addition to retaining many mod influences, early skinheads were greatly interested in Jamaican Rude Boy style and culture, especially [Reggae](#) and [Ska](#) music.

Skinhead culture exploded in 1969 to the extent that even the rock band Slade temporarily adopted the look. By the 1970s, the skinhead subculture started to fade, and some of the original skins dropped into new categories, such as the "Suedeheads" (defined by the ability to manipulate one's hair with a comb), "Smoothies" (often with hairstyles down to shoulder length), and "Bootboys" (associated with gangs and hooliganism). Some fashions returned to the mod roots, reintroducing the wearing of brogues or loafers, suits, and the slacks-and-sweater look.

In the mid-1970s, the skinhead movement was reborn after the introduction of [Punk Rock](#). Skinheads with even shorter hair and less emphasis on style grew in numbers and grabbed the attention of the media, as a result of hooliganism during football matches, sometimes to the point of rioting. These Skinheads wore bigger boots(14-20 eyelet), tighter pants, and bleachers. Later on though, the style was mainly reverted back to the original mod inspired dress rather than the punk style.

Skinheads also gained a great deal of media attention after some of them were recruited by far right political parties like the National Front. The party's position against blacks and Asians appealed to some working class skinheads who blamed immigrants for economic and social problems. Racist violence in England dates back a couple of hundred years, and certainly was not introduced by the skinhead subculture. In the late 1960s and 1970s, much racist violence was directed towards Pakistani immigrants, derisively called "Pakis". In the 1970s however, racist violence was more identified with organized racist groups such as the National Front, and some racist hooligans adopted the skinhead image. This led to the public's common misconception that all skinheads are neo-Nazis. In the meantime, the skinhead subculture had spread beyond The UK and Europe.

In an attempt to counter this negative stereotype, some anti-racist skinhead organizations were formed. In the USA, Skinheads Against Racial Prejudice (SHARP) started in 1987, and Anti-Racist Action (ARA) began in 1988. SHARP then spread to the UK and beyond, and other less political skinheads also spoke out against neo-Nazis and in support of traditional skinhead culture. Two examples are the Glasgow Spy Kids in Scotland, and the publishers of

the Hard As Nails zine in England. The Skinhead sub culture has since spread around the world, and there are many different kinds of skinheads.

# Style

Coordinating fashion, such as the clothing, accessories, and grooming techniques listed below, is an essential part of the skinhead culture.

## **Tops:**

- Men: fitted Ben Sherman, Fred Perry, Brutus, Jaytex, Arnold Palmer or other brands of button-up or polo shirts; Lonsdale shirts or sweatshirts; V-neck sweaters; cardigan sweaters; sweater vests; T-shirts; fitted blazers.
- Women: Same as men, with addition of dress suits, comprised of a  $\frac{3}{4}$  length jacket and matching short skirt.

## **Suits:**

- Traditional skinheads are known to wear tailored suits to events such as soul dances or ska concerts. Skinheads are particularly known to favour tonic suits (also known as shark-skin suits), so named for the shiny material.

## **Coats:**

- MA-1 type Flight Jackets (popular brands include Warrior and Alpha) in black or sage green; blue denim jackets (Levi or Wrangler); Harrington jackets; Monkey jackets; Crombie-style overcoats; sheepskin  $\frac{3}{4}$  length coats; Donkey jackets.

## **Bottoms:**

- Men: Blue Levi's or Wrangler jeans, straight leg with rolled cuffs (turn-ups) to show off the boots, often with the seam cut off and sewn to give a neater, flatter turn-up, and "properly" fitted; Sta-Prest flat-fronted slacks and other trousers; bleachers (jeans splattered with household bleach to resemble camouflage trousers) popular among punk-influenced Oi! skins; combat trousers, popular among Oi! skins and scooter boys.
- Women: Same jeans and trousers as men, but also skirts and stockings. Some skingirls wear fishnet stockings and mini-skirts, but that was introduced with the skinhead revival, not in the 1960s.

## **Footwear:**

- Men: Boots, originally regular army or workboots, then Dr. Martens (Docs or DMs) and later brogues and loafers. Grinders and other brand boots have now become popular, partly because Dr. Martens boots are no longer made in England. During the '60s, steel-toe boots were often referred to as "bovver boots" - thought to derive from the Cockney pronunciation of "bother".
- Women: Docs, Monkey boots or loafers.

**Hats:** Trilby hats; pork pie hats; scally caps (Benny in the UK); "flat caps" (driver's caps).

**Braces:** No more than  $\frac{3}{4}$  inch in width (In some areas, wider braces are considered to identify one as either white power or a wanna-be).

## **Hair:**

- Men: Originally, between a 2 and 4 grade clipguard (short, but not bald); beginning in the late '70s, typically shaved close with no greater than a number 2 guard. Now some skinheads clip their hair with no guard, and some even shave it with a razor. This started with the introduction of the Oi! scene. Many skinheads sport sideburns of various styles, usually neatly trimmed.
- Women: Skinhead girls commonly wear a "Chelsea" shaved on top with fringes grown out in the back, sides and front; also known as a feathercut. Some females in the skinhead subculture just have normal hairstyles, and others have chosen to shave their hair just like male skinheads.

## **Laces and braces**

Some skinheads, particularly highly political ones, attach significance to the color of their laces, braces, and (less commonly) flight jackets, using them to advertise their beliefs and affiliations. The particular colors used vary regionally and locally, however, so only skinheads in the same area are likely to interpret them accurately.

The "braces and laces game" has largely fallen into disuse, particularly among Traditionalist skinheads, who are more likely to choose their colors for fashion purposes. Additionally, in many areas laces must be 'laddered'—arranged with the outside laces horizontal and parallel, resembling a ladder—to be considered of any significance.

## Music

Originally, the subculture was associated with the ska and reggae music of musicians like Desmond Dekker, Laurel Aitken, Symarip and Joe the Boss. The link between skinheads and reggae led to the sub-genre known as skinhead reggae.

Other types of music popular amongst early skinheads were Motown, Northern Soul, Rocksteady, and mod RnB. Suedeheads of the '70s were also known to listen to British glam rock bands like The Sweet and Mott the Hoople.

The most popular music for the late '70s Skinhead was Two-Tone, named after a Coventry-based record label that featured such bands as The Specials, Madness, and The Selecter. Two-Tone was the musical integration of Ska, Rocksteady and punk rock. The label scored many top 20 hits, and eventually a number one. During this time (1979 - 1981), skinheads were a common sight on the UK highstreets.

In the '70s and early '80s Oi! became accepted by skinheads and punks. Oi! continues to be one of the most popular genres among skinheads. Musically, Oi! combines elements of punk rock, football chants, pub rock and '70s British glam rock. Some forefathers of Oi! were Sham 69, Cock Sparrer and Menace. The term Oi! as a musical term is said to come from the band Cockney Rejects and journalist Garry Bushell, who championed the genre in Sounds magazine. Well-known Oi! bands of the late '70s and early '80s include Angelic Upstarts, Blitz, Last Resort, Combat 84 and 4-Skins. Not exclusively a skinhead genre, many Oi! bands included both skins, punks and people who fit in neither category, who were sometimes called herberts.

U.S. Oi! began in the '80s with bands such as the Bruisers (the singer is now in Dropkick Murphys), Anti-Heros (who sued the makers of American History X for wrongful use of their logo), and Iron Cross (whose singer Sab Grey is said to be of Jewish descent). American skinheads have also accepted [hardcore punk](#), with bands such as Warzone, Agnostic Front, and Cro-mags. Current American Oi! bands are generally closer musically to hardcore than to early British street-punk.

White power skins have a separate musical culture known as Rock Against Communism, which features bands such as Skrewdriver, Brutal Attack and Bound for Glory.

## Glossary of terms

3i's or 3-eyes, 8i's (8-eyes) etc.

Leather shoes or boots, having the given number of eyelets for laces on either side.

Other common numbers are 10, 12, 14, 18, and 20.

Bleachers

Blue jeans treated with household bleach to create a camouflage-like pattern. They were popular among punk rock-influenced Oi! skins in the '70s and '80s.

Bonehead

A derisive term used by Traditional and anti-racist skinheads for a neo-Nazi skinhead.

Also used in the UK as a derogatory term for scruffy punk-influenced skinheads.

Boot party

[US] Euphemism for a skinhead-style fight (involving kicking), especially where one side outnumbered the other.

Bovver boy

[Europe] A skinhead who regularly or frequently seeks out enemies to beat down. The enemies are generally members of rival football (soccer) team supporters or members of other youth subcultures. *Bovver* is a Cockney slang word literally meaning "bother".

Braces

A fashion accessory for holding up one's trousers, consisting of a pair of elasticized bands which go over the shoulders and fasten to the trousers (usually in the form of a clip in the case of jeans) in the front and back. Although in the US these are commonly called *suspenders*, skinheads usually use the British term. (*Suspenders* in British English means a *garter belt*.)

Chelsea

1. Traditionally, a female skinhead. Also called a "skinhead girl" or "skingirl".
2. The traditional haircut of a female skinhead, consisting of short hair on the crown, sides and back with a longer fringe in the front and on the neck. Also known as a feathercut.

Crucified Skinhead

An icon depicting a skinhead suspended from a cross and often seen on a T-shirt or patch, or as a tattoo. It symbolizes the hardships of the skinhead lifestyle (such as being vilified as a racist whether one is or is not) and makes a statement about one's commitment to the lifestyle.

Fence-walker

A derisive term used by political skinheads for those who refuse to take sides, or who will associate with opposing groups.

Skank

A dance style associated with ska music.

[Skinhead](#) - [Ska](#) - [Reggae](#) - [Oi!](#) - [Northern Soul](#) - [Punk Rock](#) - [Streetpunk](#) - [Hardcore](#)

## Slip-cueing

**Slip-cueing** is a DJ technique that consists of holding a record still while the platter rotates underneath the slipmat and releasing it at the right moment. This way the record accelerates to the right speed almost immediately, without waiting for the heavy platter to start up. Slip-cueing was introduced to the disco scene by Francis Grasso.

"Francis was the first DJ to perfect the current technique for stitching records together in seamless sequences. He invented the trick of "slip-cueing"; Holding the disc with his thumb while the turntable whirled beneath insulated by a felt pad, he would locate with an earphone the best spot to make the splice, then release the next side precisely on the beat. When he got Thorens turntables with speed controls, he supplemented his cuing technique with speed changes that enabled him to match up the records perfectly in tempo." (Goldman, 1978)

However there is evidence that the technique of slip cueing had originated in the broadcast industry several years before its adoption by Francis Grasso.

# Slovenian-style polka

**Slovenian-style polka** is an American style of [polka](#) in the Slovenian tradition. It is fast and features [piano](#) and [accordion](#). It is usually associated with Cleveland and other Midwestern cities. It is also known as "Cleveland Style" or, more rarely, "Croatian Style".

The Slovenian style polka band always includes a piano accordion and a diatonic button accordion, also called a "button box". There is often a [banjo](#) or [saxophone](#) as well as a [bass guitar](#) and [drum](#) set for rhythm. The Slovenian style polka in the United States of America came about when immigrants from Slovenia taught the old songs to their children. Those children, as adults, translated the old songs from the Slovene language into English, and arranged them in a polka beat. At first Slovenian style polka was just music for ethnic clubs and union halls, but the commercial success of Frankie Yankovic and other musicians soon introduced the genre to a wider audience.

In addition to Frankie Yankovic, notable musicians in this style include Walter Ostanek, Joe Grkman, Dick Tady, and Johnny Pecon.

# Sludge metal

**Sludge metal** is a form of [heavy metal music](#) that is generally regarded as a fusion between [doom metal](#) and [hardcore](#). It is generally regarded to have been invented by The Melvins, but was popularized chiefly by a number of New Orleans based bands, a scene and sound popularly referred to as NOLA. The slow, extremely heavy rhythms of doom metal are combined with the shouting vocal delivery and occasional bursts of speed reminiscent of hardcore. There is often crossover between this genre and stoner metal, but sludge metal generally avoids the positive outlook on life that is common in stoner metal.

Guitars and bass are heavily distorted and often use large amounts of feedback to give a 'dirty' atmosphere. Drums are rooted in hardcore, with many hardcore beats and rhythms being present in the majority of sludge bands. Vocals are shouted as in hardcore, and lyrics are generally blue-collar in nature, reflecting on society, generally in a cynical or downtrodden manner.

Sludge metal has several loosely defined subgenres. Traditional sludge metal is the purest form of the genre, occupied by bands such as Crowbar and Acid Bath. Another common genre is sometimes known as Southern Sludgcore, typified by extreme, almost [noise](#)-like distortion, even slower tempos, and generally hateful and controversial lyrics that revolve around subjects such as misogyny or drug addiction. Eyehategod is generally regarded as the founder of this genre. Another genre growing as of late is atmospheric sludge metal. This genre uses a very atmospheric, at times nearly ambient atmosphere, with less aggression and more philosophical and spiritual lyrics. Pelican and Isis are the forerunners of this genre. Sludge also is often fused with other genres, such as [doom metal](#), stoner metal, or [grindcore](#).

Sludge metal bands include:

- Acid Bath
- Black Label Society
- Bongzilla
- Boris
- Buzzov\*en
- Cavity
- Corrupted
- Corrosion of Conformity (later)
- Crowbar
- Cult of Luna
- Dot(.)
- Down
- Electric Wizard
- Eyehategod
- Geezer
- Goatsblood
- Grief
- High on Fire
- Iron Monkey
- Isis
- Mare
- Mastodon
- Neurosis
- Noothgrush
- Old Man Gloom (band)
- Pelican
- Putrid Sloth
- Six Feet Under

Skid Row (Some of their later stuff was Sludge styled)  
Sleep  
Soilent Green  
Sourvein  
Superjoint Ritual

## Smooth jazz

**Smooth jazz** is generally described as a genre of music that utilizes instruments (and, at times, [improvisation](#)) traditionally associated with [jazz](#) and stylistic influences drawn from, among other sources, [funk](#), [popular](#) and [R&B](#). Since the late 1980s, it has become highly successful as a radio format; one can tune in to a "smooth jazz"-themed station nearly everywhere in the United States. Despite its apparently large following, there has been something of a backlash against the genre, mostly from [jazz](#) purists who consider its recordings bland and overly commercial.

## Origins

Smooth jazz as it is known today first emerged in the mid- to late-1970s, pioneered by such artists as Grover Washington, Jr., Spyro Gyra and Pieces of a Dream, stemming from a number of extant styles including [jazz fusion](#). Unlike that form, however, smooth jazz tends to emphasize melody and deemphasize improvisation.

However, The genre's roots can be traced to some time earlier: in the late 1960s famed record producer Creed Taylor worked with guitarist Wes Montgomery to three widely popular records (1967's *A Day in the Life* and *Down Here on the Ground* and 1968's *Road Song*) consisting of instrumental versions of familiar [pop](#) songs such as "Eleanor Rigby", "I Say a Little Prayer" and "Scarborough Fair".

From this success, Taylor founded CTI Records. Many established jazz performers recorded for CTI (including Freddie Hubbard, Chet Baker, George Benson and Stanley Turrentine) though the records they recorded under Taylor's guidance were typically aimed as much at pop audiences as at jazz fans; critic Scott Yanow writes that "Taylor had great success in balancing the artistic with the commercial."

## Description

The average smooth jazz track is on the "downtempo" (most widely-played tracks are in the 90-105 BPM range) side, layering a lead, melody-playing instrument ([saxophones](#) are the most popular, with [guitars](#) a close second) over a backdrop that tends to consist of programmed rhythms and various pads and/or samples. (Though much of what is played under the banner of the "smooth jazz" radio format contains vocals, this is not usually the case for music recorded with the intent of categorization as smooth jazz. Rather, the stations in question pull their vocal tracks from the work of artists like Simply Red or Luther Vandross, who are normally considered "soul" or "R&B".)

# Radio

Smooth jazz as a radio format has its roots in the construction of what were once called "beautiful music" stations, which generally played fifteen-minute sets consisting of instrumentals bookending a vocal song or two.

The first jazz radio station to attempt to reach an audience beyond hardcore jazz fans was New York's WRVR-FM, which was acquired by Sonderling Broadcasting in 1976. Under its new management, WRVR more than tripled its audience by emphasizing artists like George Benson and Pat Metheny that were crossing over to more popular formats. After WRVR was switched to country format WKHK in 1980 (it is now Adult Contemporary station WLTW) it was just a short time before WPIX-FM was switched to WQCD, under the auspices of consultant George Burns, to take over the "mass-appeal" jazz mantle. In Detroit, traditional jazz station WJZZ (now WDMK) went through a similar transition to a more mainstream sound in the late 1980s and also saw its ratings improve.

"Smooth jazz" has gone on to be recognized as a successful radio format, first emerging in name in the mid- to late-1980s (often, they would be transitioned from existing "new age" stations) and subsequently spreading into most radio markets within the United States and many without. Currently prominent smooth jazz stations include Seattle's KWJZ, Denver's KJCD, Los Angeles' KTWV, Philadelphia's WJJZ, Chicago's WNUA, Detroit's WVMV (which has often been ranked as the top-rated music station in the market and routinely outperforms its mainstream Adult Contemporary competitors), [www.baysmoothjazz.com](http://www.baysmoothjazz.com) (Online Internet Radio) and New York's WQCD (which experimented with a Chill Music-based format for a time but soon returned to its focus on Smooth Jazz).

The majority of major-market smooth-jazz radio stations are heavy on soft R&B vocals from artists like Luther Vandross, Sade, Anita Baker and Stevie Wonder, and crossover Adult Contemporary hits from pop artists like Celine Dion and Mariah Carey. Many also feature classic soul music heavily, particularly softer Motown gold such as "My Girl" and "Just My Imagination" by the Temptations and "I Heard It Through The Grapevine," "Let's Get It On" and "Sexual Healing" by Marvin Gaye. For the most part, today's smooth-jazz stations give little airplay to the vocalists originally featured as part of the "new age" format, such as Enya and Basia, although there are exceptions, such as PositiveVibesRadio.net, XM Satellite Radio's smooth-jazz channel, called "Watercolors," and the smooth-jazz format delivered to radio stations via satellite by the Jones Radio Network. Among the stations carrying programming from the Jones Radio Network include the simulcast duo WJSJ-FM/WSJF-FM in Jacksonville, Florida; KSKX-FM in Colorado Springs, Colorado; KMGK-FM in Glenwood, Minnesota; and WJZQ-FM in Traverse City, Michigan. Jones has also begun to integrate Chill material into its music mix, although not nearly as heavily as New York's WQCD did during its short-lived experimentation with Chill.

The popularity of smooth jazz in major American radio markets has led to a proliferation of station-sponsored [music festivals](#) around the country where a number of the genre's performers play shows on the same stage throughout a day. They are usually held at high-profile locations such as resort hotels or wineries.

## Popular artists

The groups or recording artists that rise to the top of the smooth jazz charts tend to play their instruments in a distinctively melodic fashion such that they are recognizable within just a few measures; this category includes names like saxophonist David Sanborn and guitarists Craig Chaquico and Peter White. Some performers, such as Dave Koz, attain fame via their numerous collaborations with many other of the genre's big names.

While the world of smooth jazz has thus far been relatively male-dominated, the successful female performers -- Keiko Matsui, Joyce Cooling, Mindi Abair, Candy Dulfer, Sade, Brenda Russell, and Anita Baker, for example, tend to be very much so.

## Development

A popular recent development is **urban jazz**, which incorporates aspects of [hip-hop](#). This style is aimed at audiences who would normally listen to urban contemporary radio stations that play a mix of hip-hop and R&B. Among the musicians who frequently perform urban jazz are Dave Koz, Boney James, Paul Jackson Jr., Urban Jazz Coalition and former NBA player-turned-bassist Wayman Tisdale.

Another nascent trend involves the fusion of smooth jazz and [electronica](#), the results of which are similar to what has, among electronica enthusiasts, come to be called "chill." Radio stations such as New York's WQCD and DJs such as Rafe Gomez have pioneered the usage of playlists that blend tracks from both genres. Norman Brown is also popular.

## Criticism

"Smooth jazz" is a controversial term. Traditional [jazz](#) purists contend that smooth jazz is, in actuality, not jazz of any kind, regarding it as a misleading marketing buzzword that represents an attempt to hijack the ostensible prestige of jazz in order to sell what is really a form of "elevator music". They consider the smooth jazz genre uninspired, lacking the depth of expression, harmonic and rhythmic sophistication, and complex improvisation that are hallmarks of traditional jazz. Recurring accusations charge smooth jazz with offering a watered-down sound whose aim is to appeal to a larger, mainstream, middle class white audience, though, notably, radio demographics have indicated that middle- and upper-middle class African Americans constitute what may be a significant percentage of smooth jazz listenership.

Others contend that smooth jazz is indeed a viable jazz subgenre, positing that attempts to maintain jazz music as a kind of museum exhibit are narrowminded, presenting over a century's continued cross-pollination between jazz and R&B as evidence. Furthermore, they point out that the music of such widely respected musicians as Pat Metheny, David Sanborn, Marcus Miller and others are often classified as smooth jazz, and that many of these artists are capable of performing well in multiple [styles](#).

Especially intense vitriol has been directed toward saxophonist Kenny G, whose hit singles dominated smooth jazz radio in the late 1980s and early 1990s. He is one of the most successful artists in the field; however, his detractors claim that his music is uninspired and boring and often extrapolate these opinions to others in the smooth jazz sphere. Enthusiasts of the smooth jazz style however, argue that G's music is no longer representative. Pat Metheny has been long known as a hateful critic of Kenny G's music.

## **Smooth jazz albums generally considered to be genre-defining**

Tourist in Paradise by The Rippingtons  
Double Vision by Bob James and David Sanborn  
Rise by Herb Alpert  
Morning Dance by Spyro Gyra  
Breezin' by George Benson  
Collaboration' by George Benson and Earl Klugh  
Feels So Good by Chuck Mangione  
Festival by Lee Ritenour  
Fourplay by Fourplay  
Rapture by Anita Baker  
Winelight by Grover Washington, Jr.

## Snap music

**Snap** is a new subgenre of [hip-hop](#) music that is emerging from Atlanta, Georgia. A close cousin to similar Dirty South style [crunk](#), snap is characterized by its namesake finger-snapping, and its very primitive, stripped-down approach to hip-hop. Tracks commonly consist plainly of a hi-hat, bass, snapping, a main groove, and a vocal track. Invented for use at clubs, it is unusually languid for normal dance music, with a slow tempo. There is some debate over the true origin of snap, with both rap outfits Dem Franchize Boyz and D4L and leading producer Mr. Collipark claiming themselves the creators.

## Examples Of Snap Music

Some examples of Snap Music songs are:

"I Think They Like Me" by Dem Franchize Boyz  
"Laffy Taffy (song)" by D4L  
"What's Hanneenin" by Trap Squad  
"Betcha Can't Do It Like Me" by D4L  
"Lean Wit It, Rock Wit It" by Dem Franchize Boyz  
"Do It Like Me Baby" by D4L  
"Do It To It" by Cherish  
"Play" by David Banner  
"Wait (The Whisper Song)" By the Ying Yang Twins  
"Snap Ya Fingaz" by Lil Jon  
"Wuz Up!" by Bo Hagon  
"Ya Dig" by Young Jeezy  
"It's Going Down" by Yung Joc  
"Poole Palace (Do It, Do It)" by BHI  
"Hustle Money" by Yung Money

# Soca music

**Soca** is a [dance music](#) which is a mix of Trinidad's calypso and Indian music and rhythms, especially chutney music—it is not, as is often said, a fusion of [soul](#) and calypso. It combines the melodic lilting sound of calypso with an insistent percussion.

The acknowledged father of soca was Lord Shorty (né Garfield Blackman), whose 1963 recording of "Cloak and Dagger" started the trend. Shorty experimented with calypso by adding Indian rhythm instruments like the dhantal, tabla and dholak. His "Īndrani" was the first mainstream hit from the genre, and was followed by a watershed album called Endless Vibrations, which spawned numerous imitators. Lord Shorty initially referred to his musical discovery as "solka", meaning the true "soul of calypso". "Solka" was changed to "Soca" by a musical journalist.

Like calypso, soca was used for both social commentary and risqué humor, though the initial wave of soca acts eschewed the former. Lord Shorty was disillusioned with the genre by the 1980s because soca was being used to "celebrate the female bottom, rather than uplift the spirits of the people". Soon after, Shorty moved to the Piparo forest, converted to the Rastafari movement and changed his name to Ras Shorty I. There, he created a fusion of reggae and gospel music called jamoo in the late 1980s.

Some of the greatest soca artists of all time are Shadow, The Mighty Sparrow, the late Lord Kitchener, and Superblue (previously Blue Boy), and more recently artists such as Machel Montano, Destra Garcia, Shurwayne Winchester, Denise Belton and Maximus Dan.

Some soca songs which have become hits:

- "Hot Hot Hot" - Buster Pointdexter (originally recorded by Arrow)
- "Follow the leader" - Soca Boys (originally recorded by Nigel and Marvin Lewis)
- "Who Let the Dogs Out" - Baha Men (originally recorded by Anselm Douglas)
- "Sweet Soca Music" - Sugar Daddy
- "Turn Me On" - Kevin Lyttle
- "Tempted to Touch" - Rupee (Soca artist)
- "We Not Givin' Up" - Machel Montano and Xtatik

Soca music has evolved like all other music over the years, with Calypsonians experimenting with other rhythms, some examples are:

1. Rapso : trinidad dialect rap with smooth calypso melody and bold lyric
2. Chutney music: A fusion of traditional Indian percussion and style of singing and Calypso; Tempo usually around 154 BPM
3. Ragga soca: A fusion of Jamaican Dancehall style Reggae and Soca

Soca influences can be found in many other styles, e.g. [hip hop](#) and Reggaeton.

# Social dance

**Social dance** is a major category or classification of [danceforms](#) or dance styles, where sociability and socializing are the primary focuses of the dancing.

This compares to other major categories based on purpose:

Ceremonial dance - Competitive dance - Erotic dance - Participation dance -  
Performance dance

Many social dances are [partner dances](#). In fact, quite often when spoken about social dances, ballroom or other partner dances are kept in mind. However it is natural to include in this category such groups of dances as [circle dances](#), [line dances](#), novelty dances, or simply club dancing in solo.

- [Ballroom dance](#)
- [Swing dance](#)
- Club dance
- Country and Western dance
- Ethnic dance
- [Folk dance](#)
- Scottish country dance
- [Square dance](#)
- Street dance
- [Tango](#)

There may be aspects of any of the above dance forms that are either competitive or performance-oriented in nature.

## Social history of the piano

The **social history of the piano** is the consideration of its use in relation to developing social trends; a look at the [piano's](#) social history. The piano was invented in the early 18th century and is widely found to the present day.

Throughout the 18th and early 19th centuries, pianos were financially beyond the reach of most families, and the pianos of those times were generally the property of the gentry and the aristocracy. Visiting music masters taught their children, more often the girls than the boys, to play the piano. It was widely felt at the time that ability to play the piano made young women more marriageable.

Women who had learned to play as children often continued to play as adults, thus providing music in their households. For instance, Emma Wedgwood (1808-1896), the granddaughter of the wealthy industrialist Josiah Wedgwood took piano lessons from none other than Frédéric Chopin, and apparently achieved a fair level of proficiency. Following her marriage to Charles Darwin, Emma still played the piano daily, while her husband listened appreciatively.

A number of female piano students became outright *virtuose*, and the skills of woman pianists inspired the work of Haydn, Mozart, and Beethoven, who dedicated difficult-to-play works to their woman friends. However, careers as concert musicians were typically open only to men (an important exception was Clara Schumann).

Over the course of the 19th and 20th centuries, the middle class of Europe and North America increased in both numbers and prosperity. This increase produced a corresponding rise in the domestic importance of the piano, as ever more families became able to afford pianos and piano instruction. The piano also became common in public institutions, such as schools, hotels, and public houses. As elements of the Western middle class lifestyle gradually spread to other nations, the piano became common in these nations as well, for example in Japan.

To understand the rise of the piano among the middle class, it is helpful to remember that before mechanical and electronic reproduction, music was in fact performed on a daily basis by ordinary people. For instance, the working people of every nation generated a body of [folk music](#), which was transmitted orally down through the generations and sung by all. The parents of Joseph Haydn (1732-1809) could not read music, yet Haydn's father (who worked as a wheelwright) taught himself to play the [harp](#), and the Haydn family frequently played and sang together. With rising prosperity, the many families that could now afford pianos and music adapted their home-grown musical abilities to the new instrument, and the piano became a major source of music in the home.

Amateur pianists in the home often kept track of the doings of the leading pianists and composers of their day. Professional virtuosi wrote books and methods for the study of piano playing, which sold widely. The virtuosi also prepared their own editions of classical works, which included detailed marks of tempo and expression to guide the amateur who wanted to use their playing as a model. (Today, students are usually encouraged to work from an urtext edition.) The piano compositions of the great composers often sold well among amateurs, despite the fact that, starting with Beethoven, they were often far too hard for anyone but a trained virtuoso to play perfectly. Evidently, the amateur pianists obtained satisfaction from coming to grips with the finest music, even if they could not perform it from start to finish.

A favorite form of musical recreation in the home was playing works for four-hand piano, in which the two players sit side by side at a single piano. Sometimes members of the household would sing or play other instruments along with the piano.

Parents whose children showed unusual talent often pushed them toward professional careers, sometimes making great sacrifices to make this possible. Artur Schnabel's book *My Life and Music* (reprinted 1988; Mineola, NY: Dover) vividly depicts his own experience along this lines, which took place in the Austro-Hungarian Empire in the late 19th century.

The piano's status in the home remained secure until technology made possible the enjoyment of music in passive form. First the [player piano](#) (ca. 1900), then the home phonograph (which became common in the decade before World War I), then the radio (in the 1920s) dealt severe blows to amateur piano-playing as a form of domestic recreation. During the Great Depression of the 1930s, piano sales dropped sharply, and many manufacturers went out of business.

Another blow to the piano was the widespread acceptance in the late 20th century of the electronic keyboard. This instrument, in its cheaper forms, is widely considered to provide only a poor substitute for the tonal quality of a good piano (see [piano](#) for why), but it is much more flexible and in many ways better suited to the performance of [popular music](#).

Nevertheless, the piano survives to this day in many 21st century homes. The pianos being bought today tend to be of higher quality and more expensive than those of several decades ago, suggesting perhaps that domestic piano playing may have concentrated itself in homes of wealthier or better-educated members of the middle class. It is unlikely that ability to play the piano contributes much these days to the marriageability of daughters, but many parents still feel today that piano lessons teach their children concentration and self-discipline, and open a door into the world of [classical music](#).

# Soft rock

**Soft rock**, also referred to as **lite rock**, **easy rock**, and **mellow rock**, is a style of [music](#) which uses the techniques of [rock and roll](#) to compose a softer, supposedly more ear-pleasing sound for listening, often at work. Soft rock is usually sung with higher-pitched vocals, and the lyrics tend to be non-confrontational, focusing in very general language on themes like love and relationships. The genre tends to make heavy use of [pianos](#), [synthesizers](#) and sometimes [saxophones](#). 'Soft rock' is an ambiguous term used for popular music as well.

Soft rock began in the early 1970s with bands like Bread and Fleetwood Mac. It became hugely popular later in the decade. By 1977, some radio stations, like New York's WTFM, had switched to an all-soft-rock format. Around that same time, Chicago, which had previously been a jazz-rock band, switched to soft rock and reached their biggest commercial successes. Even Led Zeppelin, considered by some to be standard bearers of [hard rock](#), flirted with the genre at the time in songs like 1979's "Fool in the Rain".

Other bands/singers who have recorded a considerable number of songs considered soft rock include: Air Supply, America, Phil Collins, Céline Dion, Gloria Estefan, Every Little Thing, Whitney Houston, Elton John, Carole King, Gordon Lightfoot, Bette Midler, Steve Perry, Savage Garden, Seals and Crofts, Eric Serra, Carly Simon, Rod Stewart, James Taylor, and Wilson Phillips.

In the early 1990s, soft rock began to be known as "adult contemporary".

# Software synthesizer

A **software synthesizer**, also known as a **softsynth** or **virtual instrument** is a computer program for digital audio generation. It works like a common [synthesizer](#), but is realized entirely in software. A software synthesizer will typically respond to MIDI calls like a normal synthesizer module.

## Types of software synthesizer

*Software synthesizers* can run as stand-alone applications or as plugins within other applications.

There are various audio plugin formats that allow implementation of *software synthesizers* including:

- VST cross platform
- DirectSound, part of DirectX, Windows only
- DSSI based on LADSPA Linux only
- MESS based on the MusE sequencer but not limited to it, Linux only
- Audio Units Mac only
- RTAS, based on Pro Tools, Mac and Windows
- TDM
- MAS, based on Digital Performer, Mac and Windows
- ReWire created by Propellerhead Software, Mac and Windows

## Popular software synthesizers

- Absynth
- Adventus VSTi
- Albino
- Blue
- Cameleon5000 Additive Morphing VSTi
- Chuck (a strongly-timed, concurrent, and on-the-fly audio programming language)
- Click MusicalKEYS freeware software synthesizer
- Crystal
- Csound (A programming language that allows synthesis of scores)
- Cubase
- FL Studio
- FluidSynth - previously known as IIWU Synth
- FM7 (Yamaha DX7 emulator)
- GURU
- Hydra
- impOSCar (OSC OSCar emulator)
- Lounge Lizard - Electric Piano (Based on physical modelling)

# Sonatas

**Sonata** (From Latin and Italian *sonare*, 'to sound'), in [music](#), literally means a piece "played" as opposed to [cantata](#) (Latin *cantare*, to sing), a piece sung. The term, being vague, naturally evolved through the history of music, designating a variety of forms prior to the [Classical](#) era. The term would take on increasing importance in the classical period, and by the early 19th century the word came to be used for a principle of composing large scale works, and be applied to most instrumental genres, regarded alongside the fugue as the fundamental method of organizing, interpreting and analyzing concert music. In the 20th century the term continued to be applied to instrumental works, but the formal principles enunciated and taught through the 19th century were weakened or loosened.

## Usage of "sonata"

The baroque applied the term sonata to a variety of works, including works for solo keyboard, and for groups of instruments. In the transition from the Baroque to the Classical periods, the sonata undergoes a change in usage, from being a term applied to many different kinds of small instrumental work, to being more specifically applied to chamber music genres with either a solo instrument, or a solo instrument with the piano. Increasingly after 1800, the term applies to a form of large scale musical argument, and in this sense is the general meaning in musicology and works on musical analysis. Generally if some more specific usage is meant, then the particular body of work will be noted, for example the "sonatas of Beethoven", will mean the works specifically labelled sonata, whereas "Beethoven and sonata form" will apply to all of his large scale instrumental works, whether concert or chamber. In the 20th century, sonatas in this sense would continue to be composed by influential and famous composers, but many works which do not meet the strict criterion would also be created and performed.

## Forces

In the baroque period, a sonata was for one or more instruments with continuo. After the baroque most works designated as sonatas specifically are performed by a solo instrument, most often a keyboard instrument, or by a solo instrument together with a keyboard instrument. Beginning in the early 19th century, works were termed "sonata" if they fell into a particular form, even if not labelled as "sonata".

In the classical period and afterwards, sonatas for piano solo were the most common genre of sonata, with sonatas for violin and piano and cello and piano being next. However sonatas for a solo instrument other than keyboard have been composed, as have sonatas for other combinations of instruments, and for other instruments with piano.

# Brief history of the usage of sonata

## The Baroque sonata

By the time of Arcangelo Corelli two polyphonic types of sonata were established, the sonata da chiesa (church sonata) and the sonata da camera ("ordinary" sonata).

The sonata da chiesa, generally for one or more [violins](#) and [bass](#), consisted normally of a slow introduction, a loosely fugued allegro, a cantabile slow movement and a lively finale in some such [binary form](#) as suggests affinity with the dance-tunes of the [suite](#). This scheme, however, is not very clearly defined, until the works of Johann Sebastian Bach and George Friderich Handel, when it becomes the sonata par excellence and persists as a tradition of Italian violin music even into the early 19th century in the works of Boccherini.

The sonata da camera consisted almost entirely of idealized dance-tunes. By the time of Bach and Handel it had, on the one hand, become entirely separate from the sonata, and was known as the suite, partita, ordre or (when it had a prelude in the form of a French opera-overture) the [overture](#). On the other hand, the features of *sonata da chiesa* and *sonata da camera* became freely intermixed. But Bach, who does not use those titles, yet keeps the two types so distinct that they can be recognized by style and form. Thus, in his six solo violin sonatas, Nos. 1, 3 and 5 are sonate de chiesa, and Nos. 2, 4 and 6 are called partitas, but are admissible among the sonatas as being sonate da camera.

The term *sonata* is also applied to the series of over 500 works for harpsichord solo written by Domenico Scarlatti. Most of these pieces are in one movement only, usually comprising two parts that are in the same tempo and use the same thematic material. (Occasionally, there will be changes in tempo within the sections.) They frequently involve virtuosity and are admired for their great variety and invention.

The sonatas of Domenico Paradies are mild and elongated works of this type with a graceful and melodious little second movement added. The manuscript on which Longo bases his edition of Scarlatti frequently shows a similar juxtaposition of movements, though without definite indication of their connection. The style is still traceable in the sonatas of the later classics, whenever a first movement is in a uniform rush of rapid motion, as in Mozart's violin sonata in F (Kochel's Catalogue, No. 377), and in several of Clementi's best works.

## The sonata in the Classical era

The practice of the classical era would become decisive for the sonata, which would move from being a term, to being considered the fundamental form of organization for large scale works. This evolution would take, however, 50 years. It would apply both to the structure of movements, (see [Sonata form](#) and [History of sonata form](#)) and to the layout of movements in a multi-movement work. In the transition to the classical period there were several names given to multimovement works, including "divertimento", "serenade", and "partita", many of which are now regarded as "sonatas". The usage of "sonata" as the standard term for such works is somewhere in the 1770s. Haydn labels his first piano sonata as such in 1771, after which the term "divertimento" is used very sparingly in his output. The term "sonata" was increasingly applied to either a work for keyboard alone (See [Piano sonata](#)), or for keyboard and another instrument, often the violin or cello. It was less and less frequently applied to works with more than two instrumentalists, for example piano trios were not often labelled "sonata for piano, violin and cello".

Initially the most common layout of movements was:

1. Allegro - which at the time was understood to mean not only a tempo, but the importance of some degree of working out of the theme. (See Charles Rosen's *The Classical Style*)
2. A middle movement which was, most frequently, a slow movement, that is an Andante or Largo, or, less frequently, a Menuet. This could be in theme and variation form.
3. A closing movement, early on sometimes a minuet, as in Haydn's first three piano sonatas, but afterwards, generally an Allegro, Presto, and often labelled Finale. This could be a rondo.

However, the use of two movement layouts also occurs, a practice Haydn uses as late as the 1790's. There is also in the early classical period the possibility of using four movements, with a dance movement inserted before the slow movement as in Haydn's Piano sonatas No. 6 and No. 8. Mozart's sonatas would also be primarily in three movements. Of the works that Haydn labelled piano sonatas, divertimenti or partita in Hob XIV 7 are in 2 movements, 35 are in three movements and 3 are in four movements, there are several in three and four movements whose authenticity is listed as "doubtful". Composers such as Boccherini would publish sonatas for piano and obligato instrument with an optional third movement - in Boccherini's case 28 Cello sonatas.

But increasingly instrumental works were laid out in four, not three movements, a practice seen first in String Quartets and Symphonies, and reaching the Sonata proper by the early numbers Sonatas of Beethoven. However, two and three movement sonatas continue to be written through out the classical era: Beethoven's opus 102 pair has a two movement C Major sonata and a three movement D major sonata.

The four movement layout was by this point standard for the [string quartet](#) and overwhelmingly the most common for the [symphony](#). This layout is:

1. An allegro, which by this point was in what is called [Sonata form](#), complete with exposition, development and recapitulation.
2. A slow movement, an Andante, Adagio or Largo.
3. A dance movement, frequently minuet and trio or especially later in the classical era, a scherzo and trio
4. A finale in faster tempo, often in a sonata rondo style.

This four movement layout became considered the standard for a "sonata", and works without four movements, or with more than four, were increasingly felt to be exceptions, and were labelled as having movements "omitted", or had "extra" movements. This usage would be noted by critics by the early 1800's and codified into teaching soon thereafter.

It is difficult to overstate the importance of Beethoven's output of sonatas, 32 piano sonatas, plus sonatas for cello and piano and violin and piano, forming a large body of music which would over time increasingly be felt to be essential for any instrumentalist of ability to master.

## Sonata in the Romantic Era

The early 19th century began to establish conservatories of music, and codify the practice of the classical era. In this context, the current usage of the term "sonata" was established, both in terms of form, and in the sense that a full sonata is the normative example of concert music, which other forms are seen in relation to. Carl Czerny declared he invented the idea of sonata form, and music theorists began to write of the sonata as an ideal in music. From this point forward, the word "sonata" in music theory as often labels the musical form as well as much as particular works. Hence references to a symphony as a "sonata for orchestra". This is referred to by Newman as the "sonata idea", and by others the importance of the "sonata principle".

Among works expressly labelled sonata, some of the most famous sonatas composed in this era, there is the "Funeral March" sonata of Chopin, the sonatas of Mendelssohn and the three sonatas of Robert Schumann, Franz Liszt and later the sonatas of Johannes Brahms and Sergei Rachmaninoff.

In the early 19th century the [sonata form](#) was defined, from a combination of previous practice and the works of important classical composers, particularly Haydn, Mozart, Beethoven, but as well composers such as Clementi. Works which were not labelled "sonata" were felt to be an expression of one governing structural practice. The term "sonata" acquired the meaning of the structure of larger works. Because the word became definitively attached to an entire concept of musical layout, the differences in classical practice began to be seen as important to classify and explain. It is during this period where the differences between the three and the four movement layouts became a subject of commentary, with the prevailing theory being that the "concerto" was laid out in three movements, and the "symphony" in four, and that the four movement form was the superior layout. The "concerto" form was thought to be "Italianate" while the four movement form's predominance was ascribed to Haydn, and was considered "German".

For example critic JW Davison wrote in his *The Works of Fredrick Chopin*, on page 7 (1843):

Such are the impressions to which we are subject under the influence of this wonderful work – a very triumph of musical picturing – a conquest over what would seem it be unconquerable – viz. – the mingling of the physical and metaphysical in music – the sonata representing a dual picture - ...the battle of the actual elements and the conflict of human passions – the first for the multitude, the last for the initiated.

The importance of the sonata in the clash between Brahmsians and Wagnerians is also of note, Brahms represented, to his adherents, the adherence to the form as it was understood, while Wagner and Liszt claimed to have transcended the procrustean nature of its outline, for example Ernest Newman, not to be confused with William Newman, wrote, "Brahms and the Serpent" :

That, perhaps, will be the ideal of the instrumental music of the future; the way to it, indeed, seems at last to be opening out before modern composers in proportion as they discard the last tiresome vestiges of sonata form. This, from being what it was originally, the natural mode of expression of a certain eighteenth century way of thinking in music, became in the nineteenth century a drag upon both individual thinking...

This view, that the sonata is truly only at home in the classical style, and became a road block to later musical development is one that has been held at various times by composers and musicologists, including recently by Charles Rosen. In this view the sonata needed no description to Haydn, Mozart and Beethoven's era, in the same sense that Bach "knew" what a fugue was and how to compose one, where as later composers were bound by an "academic" sense of form that was not well suited to the Romantic era's more frequent and more rapid modulations.

## **Sonata after the Romantic Era**

The sonata was closely tied in the romantic era to tonal harmony and practice. Even before the ending of this practice, large scale works increasingly deviated from the four movement layout which had been considered standard for almost a century, and the structure of movements internally began to alter as well. The "sonata idea", as well as the term "sonata" continued to be central to musical analysis, and a strong influence on composers, both in large scale works and in chamber music. The role of the sonata as an extremely important form of extended musical argument would inspire composers such as Hindemith, Prokofiev,

Shostakovich to compose in sonata form, and works in traditional sonata structure continue to be composed and performed.

The piano sonatas of Scriabin would begin from standard forms of the late [romantic](#) period in music, but would progressively abandon the formal markers which were taught, and would be composed as single movement works, he is sometimes thought of as a composer on the boundary between romantic and modern practice of the sonata.

Farther afield, Pierre Boulez would compose three sonatas in the early 1950's, which while they were neither tonal, nor laid out in the standard four movement form, were intended to have the same importance as sonatas. Elliot Carter would begin his transition from neo-classical composer to avant-garde with his Cello Sonata.

# The Sonata in scholarship and musicology

## The sonata idea or principle

Research into the practice and meaning of sonata form, style and structure would be the impulse for important theoretical works by Heinrich Schenker, Arnold Schoenberg and Charles Rosen among others, and the pedagogy of music would continue to rest on an understanding and application of the rules of sonata form as almost two centuries of development of practice and theory and codified it.

The development of the classical style and its norms of composition would form the basis for much of the music theory of the 19th century and 20th century. As a form, it was compared to the baroque fugue as being at the pinnacle of formal organization, and generations of composers, instrumentalists and audiences were guided by the understanding of sonata as an idea. The sonata idea begins before the term had taken its present importance, as the classical era changed its norms of performance practice. The reasons for these changes, and how they relate to the evolving sense of a new formal order in music is a matter of a great deal of research. Some common factors which were pointed to include: the change of music from primarily vocal to being instrumental; the changes in performance practice, including the end of the use of the continuo and the playing of all movements of a work straight through; the shift from the idea that each movement should express one emotion, to one which integrated contrasting themes and sections; the move from polyphonically based composing to homophonically based composing; changes in the availability of instruments; the change in the formal organization of movements away from binary organization; the rise of more dance rhythms; and changes in patronage and presentation.

Crucial to most interpretations of the sonata form is the idea of a tonal center and, as the Grove Concise dictionary of music puts it: "The main form of the group embodying the 'sonata principle', the most important principle of musical structure from the Classical period to the 20th century: that material first stated in a complementary key be restated in the home key".

The sonata idea was described by Newman in his monumental three volume work, begun in the 1950's and published in what has become the standard edition of all three volumes in 1972. He notes that according to his research, theorists had generally shown "a hazy recognition of 'sonata form' during the Classical Era and up to the late 1830's" and places particular emphasis on Reicha's 1826 work describing the "fully developed binary form", for its fixing of key relationships, Czerny's 1837 note in preface to his Opus 600, and Adolph Bernhard Marx who in 1845 wrote a long treatise on the "sonata form". Up until this point, Newman argues, the definitions available were quite imprecise, requiring only instrumental character and contrasting character of movements.

Newman also notes however that these codifications were in response to a growing understanding that the 18th century had a formal organization of music, and that it was important to understand it. Before the publication of Reicha, Czerny or Marx, there are references to the "customary sonata form", and in particular to the organization of its first movement. He documents in his works the evolution of analysis as well, showing that early critical works on sonatas, with some very notable exceptions, dealt with structural and technical details only loosely. Instead, many important works of the sonata genre or sonata form were not analyzed comprehensively in terms of their thematic and harmonic resources until after the beginning of the 20th century.

## 20th century theory

Two of the most important theorists in European musicology of the 20th century, Heinrich Schenker and Arnold Schoenberg, both had ideas with tremendous importance to the analysis and general understanding of the sonata. Their ideas were extremely rigorous, and placed tremendous emphasis on the long range influence of tonal materials. Both advanced theories of analysis of works which would be adopted by later theorists. Importantly, while the two men disagreed with each other, eventually their ideas were often used in combination.

Heinrich Schenker argued that there was an *urlinie* or basic tonal melody, and a basic bass figuration. That when these two were present, there was basic structure, and that the sonata represented this basic structure in a whole work with a process known as interruption. Arnold Schoenberg advanced the theory of *monotonicity*, which argued that a single work should be played as if in one key, even if movements were in different keys, that the capable composer would reference everything in a work to a single tonic triad.

For Schenker tonal function was the essential defining characteristic of comprehensible structure in music, and his definition of the sonata form rested, not on themes groups or sections, but on the basic interplay between the different "layers" of a composition. For Schoenberg, tonality was not necessary to comprehensibility, but the same importance of structural function of notes to "explain" the relationship of chords and counterpoint to an overarching set of relationships. Both men argued that tonality, and hence sonata structure in tonal form, was essentially hierarchical - that what was immediately audible was subordinate to large scale movements of harmony, that vagrant chords and events were less significant than the movement between chords which asserted their central importance over others.

As a practical matter, Schenker applied his ideas to the editing of the piano sonatas of Beethoven, using original manuscripts and his own theories to "correct" the available sources, while many of these changes were and are controversial, the basic procedure, of using tonal theory to infer meaning into available sources as part of the critical process, even to completing works left unfinished by their composers, is used today and is an essential part of the theory of sonata structure as taught in most music schools.

# Sonata da Chiesa

**Sonata da Chiesa** is Italian for "church [sonata](#)".

Sonatas are [instrumental compositions](#) of three or more [movements](#). There are various forms of sonata, such as the sonata da camera, as well as the sonata da chiesa. The sonata da camera (chamber sonata) is often more lively and incorporates a [dance](#) theme, while the sonata da chiesa is more sombre (suited to a church).

The sonata da chiesa is an instrumental composition dating from the [Baroque](#) period, generally consisting of four movements. More than one melody was often used, and the movements were ordered slow–fast–slow–fast with respect to tempo. The second movement was usually a fugal allegro, and the third and fourth were binary forms that sometimes resembled the sarabande and gigue.

It is often mistakenly believed these sonatas were composed to be performed in religious ceremonies. While this may well have happened when voluntary music was required, they are not in the same category as, say, a requiem. These sonatas were often performed in [concert](#) for entertainment.

One of the greatest exponents of the sonata da chiesa was the Milanese Arcangelo Corelli (1653–1713). Among his finest compositions are Six Sonata da Chiesa, Op. 1. Another composer of this form of music was G. B. Bassani who circa 1710 composed twelve sonata da chiesa.

After 1700 this type of sonata tended to merge with the sonata da camera. This sonata da chiesa had become outdated by the time of Joseph Haydn (1732–1809), although he did compose a few pieces in this style, as did Mozart a few years later, although this term was now seldom used.

# Sonata form

**Sonata form** refers to both the standard layout of an entire [musical composition](#) and more specifically to the standardized form of the first [movement](#). The latter is also referred to as **sonata-allegro form**. Sonata form is both a way of organizing the composition of a work and a way of analyzing an existing work. While described and named in the early 19th century, the models for the form were works of the [classical period](#), most specifically Haydn, Mozart, and Beethoven, and the form is rooted in the schematics described in the late 18th century. The standard description of the sonata form is rooted in the [common practice period](#) of [harmony](#), though more modern descriptions of theorists such as Heinrich Schenker and Charles Rosen argue that there is a single tonal background which defines all sonata movements.

This is not to be confused with the term [sonata](#), which applies both to a genre of works, and to works which exemplify sonata form. This article deals with the formal outline as it would be taught in a composition class.

## Use of the term

A sonata-allegro movement is divided into sections. It may begin with an *introduction*, which is generally slower than the main movement, and then proceeds to the **exposition**. The exposition presents the primary thematic material for the movement: one or two theme groups, often in contrasting styles and in opposing [keys](#), bridged by a **transition**. The exposition typically concludes with a **closing theme** and/or a **codetta**. The transition leads to the **development** where the harmonic and textural possibilities of the thematic material are explored, and which then transitions to the **recapitulation** where the thematic material returns in the tonic key. The work may conclude with a *coda*, or "tail" beyond the final cadence of the recapitulation.

*Sonata form* is also used to describe the layout of a multi-movement work. The *three movement* or *concerto* form has a sonata-allegro first movement, a slow movement as the second movement, and a fast movement, though not necessarily an allegro, as the final movement. The *four movement* or *symphony* form adds a dance movement either before or after the slow movement.

Pieces for orchestra that bear the form of a sonata are referred to as [concertos](#) or [symphonies](#), with or without soloists, respectively. [Chamber works](#) in sonata form are typically named after the ensemble: for example, [string quartet](#), [piano trio](#), [wind quintet](#), or for the instrument playing with piano accompaniment. For example, a "cello sonata" generally refers to a sonata for cello and piano, whereas a "sonata for cello solo" would be for the cello alone.

The terms Sonata-Allegro, Sonata Form, First Movement Form, all describe the same process. The sonata form became almost standard for the first movement of a symphony, especially in the period 1780 to 1900. These movements are also often marked *allegro*, hence the names 'Sonata-Allegro Form' and 'First Movement Form'.

## Outline of sonata form

The standard description of the sonata form is as follows:

**Introduction:** This section is optional, or may be reduced to a minimum. If it is extended, it is generally slower than the main section, and focuses on the dominant key. It may or may not contain material which is later stated in the exposition. The introduction increases the weight of the movement, and also permits the composer to begin the exposition with a theme that would be too light to start on its own, as in Symphony No. 103 (Haydn: Drumroll Symphony). Usually, but not always, the introduction is excluded from the exposition repeat.

Occasionally the material of introduction reappears in its original tempo later in the movement. Often, this occurs in the coda, as in Mozart's string quintet K. 593, the Drumroll Symphony, or Beethoven's Piano Sonata No. 8 (Pathétique).

**Exposition:** the primary thematic material for the movement is presented. This section can be further divided into:

- *First subject group* – this consists of one or more themes, all of them in the home key. So if the piece is in C major, all of the music in the first group will be in C major.
- *Transition* – in this section the composer modulates from the key of the first subject to the key of the second.
- *Second subject group* – one or more themes in a different key to the first group. If the first group is in a major key, the second group will usually be in the dominant, or whichever key is to fill the dominant role in the movement. In pieces in a major key this will be the perfect fifth higher, for example if the original key is C major, the key of the music of the second group will be G major. If the first group is in a minor key, the second group will generally be in the relative major, so that if the original key is C minor, the second group will be in E flat major. The material of the second subject is often different in rhythm or mood from that of the first subject (frequently, it is more lyrical).
- *Codetta* – the purpose of this section is to bring the exposition section to a close with a perfect cadence in the same key as the second group. Often the codetta contains a sequence of themes, each of which arrives at a perfect cadence. The whole of the exposition may then be repeated. Often the last measure or measures of the exposition are slightly different between the repeats, one to point back to the tonic, where the exposition began, and the second to point towards the development.

**Development:** generally starts in the same key as the exposition ended, and may move through many different keys during its course. It will usually consist of one or more themes from the exposition altered and occasionally juxtaposed and may include new material or themes - though exactly what is acceptable practice is a famous point of contention. Alterations include taking material through distant keys, breaking down of themes and sequencing of motifs, and so forth.

The development varies greatly in length from piece to piece, sometimes being relatively short compared to the exposition and in other cases quite long and detailed. However, it almost always shows a greater degree of tonal, harmonic and [rhythmic](#) instability than the other sections. At the end, the music will turn towards the home key and enter the recapitulation. The transition from the development to the recapitulation is a key moment in the work.

**Recapitulation:** this is an altered repeat of the exposition, and consists of:

- *First subject group* – usually in exactly the same form as it appeared in the exposition.

- *Transition* – now altered so that it does not change key, but remains in the piece's home key.
- *Second subject group and codetta* – usually in the same form as in the exposition, but now in the same key as the first group. If the first group was in a minor key, the second group and codetta may be shifted into the minor for the recapitulation. On rare occasions may be in the parallel major key (for example, C minor/C major).

**Coda:** After the final cadence of the recapitulation, the movement may continue into a "tail", which will contain material from the movement proper. Codas, when present, vary considerably in length, but, like introductions, are not part of the "argument" of the work, however it ends with a perfect cadence in the home key. Codas may be quite brief tailpieces, or they may very long and elaborate; a famous example is the finale of Beethoven's Symphony No. 8. Further examples of extended codas from Beethoven include the first movement from the Piano Sonata No. 23 (Appassionata) and also the third movements from the Piano Sonata No. 14 (Moonlight) and the Piano Sonata No. 17 (Tempest).

Some, in lieu of the above terminology, refer to the "principal theme" and "second theme" (abbreviated P. and S., respectively) instead of the first and second subject groups as well as the "closing" (abbreviated Cl.) instead of the codetta. Parts of the sonata form are also sometimes called the "main" and "subordinate theme" or the first and second "subjects".

## Monothematic expositions

It is not necessarily the case that the move to the dominant key in the exposition is marked by a new theme. Haydn in particular was fond of using the opening theme, often in a truncated or otherwise altered form, to announce the move to the dominant. Mozart, despite his prodigious melodic gift, also occasionally wrote such expositions, for instance in the piano sonata K. 570 or the string quintet K. 593. Such expositions are often called **monothematic**, meaning that one theme serves to establish the opposition between tonic and dominant keys. This term is misleading: most "monothematic" works have multiple themes: most works so labelled have additional themes in the second subject group. Only on occasion (for example, in Haydn's string quartet Op. 50 no. 1) did composers perform the *tour de force* of writing a complete sonata exposition with just one theme: another more recent example is Edmund Rubbra's 2nd Symphony.

That monothematic expositions usually have additional theme is used by Charles Rosen to illustrate his theory that the Classical sonata form's crucial element is that the arrival of the dominant be *dramatized* in some way. Using a new theme was a very common way to achieve this effect, but other resources such as changes in texture, salient cadences and so on were also accepted practice.

## Modulation to keys other than the dominant

The key of the second subject may be something other than the dominant or the relative major. About halfway through his career, Beethoven began to experiment with other tonal relationships between the tonic and the second subject group. Most commonly, both in Beethoven and other composers, the mediant or submediant, rather than the dominant, is used for the second group. For instance, the Waldstein sonata, in C major, modulates to the mediant E major, while the Hammerklavier sonata, in B-flat major, modulates to the submediant G major.

## Modulations within the first subject group

The first subject group need not be entirely in the tonic key. In the more complex sonata expositions there can be brief modulations to fairly remote keys, followed by reassertion of the tonic. Thus, Mozart's String quintet in C, K. 515 visits C minor, D-flat major, and D major before finally moving to the dominant of G major.

## Sonata form in concertos

An important variant on traditional sonata-allegro form is found in the first movement of the Classical [concerto](#). Here, the orchestra usually prepares for the entrance of the soloist by playing some of the themes that will be heard during the main part of the movement, a sort of introduction but in the main tempo. The soloist then enters, sometimes with material of its own (as in Mozart's twentieth piano concerto memorably, and others), and continues with a sonata-form exposition usually, but not always, closely related to that opening orchestral introduction. (With Mozart, for instance, some of the most memorable themes of that opening orchestral tutti are held off until the development. In his twenty-fifth piano concerto one of them, which hadn't been heard since then, becomes the main *subject* of the development. One of the earliest books ever devoted to his concertos, by Cuthbert Girdlestone, pointed this out often.)

Towards the end of the recapitulation, there is usually a [cadenza](#) for the soloist alone. This has an improvisatory character (it may or may not actually be improvised) and serves, generally, to prolong the harmonic tension on a dominant chord before the orchestra ends the piece in the tonic.

# The history of sonata form

*Main article: [History of sonata form](#)*

The term sonata is first found in the seventeenth century, when instrumental music had just begun to separate itself from vocal music. Originally "sonata" (derived from the Italian word, suonare, to play) meant a piece for playing, in distinction to "cantata," a piece for singing. For some time the term sonata did not imply a definite type of form.

Sonata form came to dominate many forms of musical composition during the [Classical era](#), and was defined and made central to concert music in the [Romantic era](#). It has continued to be influential through the subsequent history of classical music through the modern period. The 20th century saw a wealth of scholarship that sought to place the structure of the sonata form on basic tonal laws.

## Sonata form and other musical forms

Sonata form shares characteristics with both [binary form](#) and ternary form. In terms of key relationships, it is very like binary form, with a first half moving from the home key to the dominant and the second half moving back again (this is why sonata form is sometimes known as *compound binary form*); in other ways it is very like ternary form, being divided into three sections, the first (exposition) of a particular character, the second (development) in contrast to it, the third section (recapitulation) the same as the first.

The early binary sonatas (more than 500) by Domenico Scarlatti provide excellent examples of the transition from binary to sonata-allegro form. Among the many sonatas are numerous examples of the true sonata form being crafted into place. During the 18th century many other composers like Scarlatti were discovering this same musical form by experimenting at their keyboards harmonically and melodically.

## Theory of the sonata form

The sonata form is a guide to composers as to the schematic for their works, for interpreters to understand the grammar and meaning of a work, and listeners to understand the significance of musical events. A host of musical details are determined by the harmonic meaning of a particular note, chord or phrase. The sonata form, because it describes the shape and hierarchy of a movement, tells performers what to emphasize and how to shape phrases of music. The theory of the "sonata form" begins with the description, in the 1700's, of schematics for works, and was codified in the early 19th century. This codified form is still used as the basic pedagogy of the sonata form.

In the 20th century, emphasis moved from the study of themes and keys to how harmony changed through the course of a work and the importance of cadences and transitions in establishing a sense of "closeness" and "distance in a sonata". The work of Heinrich Schenker and his ideas about "foreground", "middleground" and "background" became enormously influential in the teaching of composition and interpretation. Schenker believed that inevitability was the key hallmark of a successful composer, and that therefore works in the sonata form would demonstrate an inevitable logic.

In the simplest example, playing of a cadence should be in relationship to the importance of that cadence in the overall form of the work. More important cadences are emphasized by pauses, dynamics, sustaining and so on. False or deceptive cadences are given some of the characteristics of a real cadence, and then this impression is undercut by going forward more quickly. For this reason changes in performance practice bring changes to the understanding of the relative importance of various aspects of the sonata form. In the classical era, the importance of sections and cadences and underlying harmonic progressions gives way to an emphasis on themes. The clarity of strongly differentiated major and minor sections gives way to a more equivocal sense of key and mode. These changes produce changes in performance practice: when sections are clear, then there is less need to emphasize the points of articulation. When they are less clear, greater importance is placed on varying the tempo during the course of the music to give "shape" to the music.

Over the last half century a critical tradition of examining scores, autographs, annotations and the historical record has changed, sometimes subtly, occasionally dramatically, the way in which the sonata form is viewed. It has led to changes in the way works are edited, for example, the phrasing of Beethoven's Piano works has undergone a shift to longer and longer phrases which are not always in lock step with the cadences and other formal markers of the sections of the underlying sonata form. Compare the recordings of Schnabel from the beginning of the recording era, with those of Barenboim, and then Pratt shows a distinct shift in how the structure of the sonata form is presented to the listener over time.

For composers, the sonata form is like the plot of a play or movie script, describing when the crucial plot points are, and the kinds of material that should be used to connect them into a coherent and orderly whole. At different times the sonata form has been taken to be quite rigid, and at other times a freer interpretation has been generally considered permissible. Questions such as whether themes may be presented in the "wrong" keys or the "reverse order" show eras with a stricter understanding of sonata form.

## **Musical criticism and sonata form**

Due to its centrality to classical music, the sonata form has been a topic of interest to musical critics ever since its origin. For full discussion, see [Criticism and sonata form](#).

# Sonata forms

The [sonata](#) forms cover the whole ground of instrumental music from CPE Bach to the advent of the instrumental lyric as matured by Schumann and of the [symphonic poem](#) originated by Liszt.

They also have a profound influence on classical [opera](#) and vocal music, and hence, by repulsion, upon Wagner, whose life-work consisted in emancipating the music-drama from them. The conditions which developed them were the conditions which made Gluck's reform of opera possible; for they are at once the means and the expression of that 18th-century change in the language of music which made it a truly dramatic medium. Hence our present task is the discussion of the largest and most central problems pure music has ever dealt with; and, while the external technicalities are numerous and prominent, they are significant only so long as we maintain their connexion with those problems with which the true masters (and only the true masters) of the sonata forms are concerned. Much, then, that is essential to the true sonata forms must come under the headings of instrumentation, harmony, and other musical categories. But here we must confine ourselves to the purely formal aspect, allowing only such allusion to other aspects as will help us to see behind superficial appearances.

## The Sonata Style

The sonata forms are representative of the type of music that attracts us primarily by its design and its larger contrasts, and only in the second place by the vitality of its texture. In Bach's art the reverse is the case; we listen chiefly to the texture, and our delight in the larger designs, though essential, is seldom more than subconscious. Art-forms existed already in Bach's time, in which the shape, and not the texture, was the object of attention, but these were lighter forms. Bach himself was the greatest master of them, but he never transcended what was then their legitimate limit as an art which is related to his larger work much as decorative designs are related to architecture. Bach's suites and partitas contain (apart from their great preludes, in which other principles are involved) one form embodied in several different dance rhythms, which is the germ from which the sonata was developed. It is sometimes known as the "binary" form; but as some eminent writers classify its later development as "ternary," we shall here avoid both terms, and refer to it in its earlier manifestations as the "suite" form, and in its later as the "sonata" form. This form is often typified in the compass of a single melody without change of key or marked division, as in that beautiful English tune "Barbara Allen," where the half-close on the dominant in the fourth bar is symmetrically reproduced as the full close on the tonic at the end. On a larger scale it admits of great variety and elaboration, but the style of the classical suite never allows it to become much more than the musical analogue of a pattern on a plate. The passage from the material in the main key to that in the foreign key (from A to B in the above diagram) is continuous and unnoticeable, nor is the second part of the design which leads to the return of B in the tonic noticeably different in style or movement from the earlier part. It has a slightly greater range of key, for the sake of variety, but no striking contrast. Lastly, the rhythms, and such texture as is necessary to keep the details alive, are uniform throughout.

Now, the essential advance shown by the true sonata forms involves a direct denial of all these features of the suite style. No doubt one natural consequence of working on a larger scale is that the sonata composer tends to use several contrasting themes where the suite composer used only one; and an equally natural consequence is that the shape itself is almost invariably amplified by the introduction of a recapitulation of A as well as of B in the tonic.

But these facts do not constitute a vital difference between sonata and suite forms. They do not, for instance, enable composers like Boccherini and the later Italian violin writers to emancipate themselves from the influence of the suite forms, though the designs may be enlarged beyond the bursting point. The real difference lies, indeed, in every category of the art, but primarily in a variety of rhythm that carries with it an entirely new sense of motion, and enables music to become not only, as hitherto, architectural in grandeur and decorative in detail, but dramatic in range. The gigue of Bach's C major suite for violoncello, and the allemande of his D major clavier partita, will show that the suite forms were amply capable of digesting a non-polyphonic style and a group of several contrasted themes; but they still show the uniformity of rhythm and texture which confines them to the older world in which visible symmetry of form is admissible only on a small scale. Haydn can write a movement, perhaps shorter than some of Bach's larger dance movements, containing only one theme and mainly polyphonic in texture, as in the finale of his tiny string quartet in D minor, Op. 42; but the transformations of his one theme will be contrasted in structure, the changes of rhythm will be a continual surprise, the passage from the first key to the second will be important and emphatic, and at every point the difference in scope between his sonata music and Bach's suite music will be as radical as that between drama and lyric. The process of this change was gradual; indeed, no artistic revolution of such importance can ever have been accomplished more smoothly and rapidly. Yet Philipp Emmanuel Bach, the first to realize the essentials of the new style, obtained his object only at the cost of older elements that are essential to artistic completeness. And Haydn himself was hardly able to reinfuse such vitality of texture as would give the new form permanent value, before he was forty years of age. Haydn's earlier string quartets, from Op. 1 to Op. 33, present one of the most fascinating spectacles of historical development in all music. He was content to begin at a lower level of brilliance.

In all stages of development it has been usual to repeat at least the first portion. The repetition is indicated by a sign and may be ignored in analysis, though Haydn, Beethoven and Brahms have sometimes produced special effects by it. The repetition of the second part is now obsolete, and that of the first nearly so than some of his contemporaries; because from the outset his object was the true possibilities of the new style, and no luxuriance of colour could blind him to the lifelessness of an art that is merely suite-form spun out. Haydn's earliest quick movements in sonata forms are often as short as any suite movement, except when he writes for orchestra, where he is influenced by the style of the operatic overture as we find it in Gluck and in the symphonies of Philipp Emmanuel Bach. In his slow movements he at first more often than not worked in the style and form of the operatic aria; and in so mature a piece as the quartet in G major, Op. 17, No. 5, he not only endorses Philipp Emmanuel Bach's evident conviction that operatic recitative is within the scope of the sonata, but convinces us that he is right. It was easy for the early composers of sonatas to introduce theatrical features into their instrumental music; for the very fact that the sonata forms were in poly-phonic days the forms of lighter music is a consequence of their original identity with the forms of stage-music and dance. But it needed a very great composer to realize not only the radically dramatic character of a sonata form in which the rhythm and texture is emancipated from the metrical bondage of the suite, but also its true limitations as pure instrumental music. As Haydn's work proceeded, so did the freedom of his rhythm and its consequent inner dramatic life increase; while the external operatic influences soon disappeared, not so much because they were out of place, as because opera itself "paled its ineffectual fires" in the daylight of the pure instrumental drama with its incomparably swifter and terser action. Polyphony, on the other hand, steadily increased, and was so openly encouraged that in the first set of Haydn's quartets which is entirely free from archaism (Op. 20) three of the finales are regular fugues. And from that time onward there is hardly a work of Haydn's in which highly organised fugato passages are not a frequent means of contrast.

## **The Sonata Form**

In the last-mentioned quartets of Haydn and the works of Mozart's boyhood, the normal sonata form, as we now accept it, is firmly established. It is, no doubt, equally true of Philipp Emmanuel Bach's form; and thus we see how little the external shape of a movement tells us as to the ripeness or genuineness of the specimen. Apart from this, much confusion of thought is caused by the unfortunate terms "first and second subject," which have misled not only many teachers but nearly all pseudo-classical composers into regarding the exposition of the movement as consisting essentially of two themes expanded to the requisite size by appropriate discourse. When we use the terms "first and second subject," then, let us be understood to mean any number of different themes, in any variety of proportion, but separable into two groups of which the first is in the tonic while the second is in another related key, which is called the complementary key. The exposition of a movement in sonata form contains, then, these two "subjects" and represents these two keys; and unless the work is too large or too emotional for merely decorative emphasis, the exposition is generally repeated. Then the development follows. It is normally founded on the materials of the exposition, but neither confines itself steadily to any key nor leaves its material as it found it. On the contrary, its function is to provide a wide range of modulation, and to put the materials into fresh light by regrouping them.

It cannot be too strongly insisted that in the sonata forms there are no rules whatever for the number of themes and their relative prominence among themselves and in their development. After the development the first subject returns in the tonic, with an effect which, after so many changes of key, is always reassuring as regards subject design, and sometimes intensely dramatic. The second subject form in an advanced state of development; and further pro-follows, also in the tonic. This recapitulation is normally very exact, except for the alteration necessary to bring the second subject into the tonic instead of the complementary key, an alteration which, of course, will chiefly affect the first subject, if, indeed, the original transition was not so simple that it could be merely suppressed. In highly organized works, however, this point is often marked by some special stroke of genius, and even in the most exact recapitulations the great masters make minute changes which throw the second subject into higher relief.

Modern criticism tends to dismiss the recapitulation as a conventional and obsolescent feature; but this is a great mistake. The classics, from Scarlatti to Brahms, give overwhelming proof that it is a primary instinct of composers with a living sense of form to conceive of all kinds of exposition as predestined to gain force by recapitulation, especially in any part that resembles a second subject. Haydn we shall find to be an extreme case; but we have only to regard his true second subject as residing in the very end of his exposition, and his mature work will then illustrate the point with special force. Beethoven seems to give one notorious detail to the contrary effect, in the first movement of his C minor symphony, but the passage only proves the rule more forcibly when seen in its context. The powerful phrase that announced the second subject is in the recapitulation transferred from the resounding triumph of the horns to the impotent croaking fury of the [bassoons](#). This looks like a mere inconvenient result of the fact that in 1808 the horns could not transfer the phrase from E flat to C without a change of crook. But in earlier works Beethoven has made them change crooks on far less provocation; and besides, he could easily have contrived a dozen tone-colours more dignified than that of the bassoons.

The point must, then, be one of Beethoven's touches of Shakespearian grotesqueness; and certainly it draws attention to the recapitulation. But even if we dismiss it with impatience we are then immediately confronted with a new melodic and harmonic poignancy in the subsequent crescendo, produced by changes as unobtrusive and as essential to the life of the whole as are the deviations from mechanical symmetry in the forms of leaves and flowers. With the recapitulation the bare essentials of sonata form end; but the material will probably, in works on a large scale, furnish ample means of adding a more emphatic conclusion, which is then called the coda. In Beethoven's hands the coda ranges from a dramatic non-existence, as in the distant thunder in which the first movement of the D minor sonata expires, to the mighty series of new developments and climaxes which, in the 3rd and 9th symphonies and many other works, tower superbly above the normal structure.

Haydn's later treatment of sonata form is very free. He shows a sense of space and breadth which, if second to Beethoven's, can only be said to be so because the terms of Haydn's art did not give it fuller expression. The scale on which he worked was so small that he soon found that a regular recapitulation took up all the room he wanted for larger growths to a brilliant climax. Moreover, he found that if his second subject began with material in sharp contrast to the first, it tended to make his movements sound too undeveloped and sectional for his taste; and so in his later works he generally makes his second subject on the same material as his first, until the very end of the exposition, where an exquisitely neat new theme forms the close. This cadence-theme also rounds off the whole movement with an appearance of regularity which has led to the belief that Haydn, like Mozart, observes a custom of rigid recapitulation from which Beethoven was the first to emancipate the form. The truth is that the brilliant new developments which oust the recapitulation almost entirely in Haydn's form are more like Beethoven's codas than anything else in earlier music, and the final appearance of the neat cadence-theme at the end is, from its very formality, the most brilliant stroke of all. Lastly, these tendencies are characteristic, not of Haydn's early, but of his late work. They have been described as "showing form in the making"; but this is far from true. They show progress was only possible by the introduction of new qualities which at first had a decidedly restraining effect.

Mozart's greater regularity is due, not to a more formalizing tendency than Haydn's, but to the fact that he works on a larger scale and with a higher polyphony. In actual length, Mozart's movements are so much greater than Haydn's that sharply contrasted themes and regular recapitulations do not hamper him. On the contrary, they give his designs the necessary breadth. This was not more his aim than Haydn's; but he had the opportunities of a later generation and the example of Haydn's own earlier work, besides a vast experience of composition (both in [contrapuntal](#) and sonata forms) that began in his miraculous infancy and made all technical difficulties vanish before he was fifteen. At sixteen he was writing string-quartets in which his blending of polyphonic and sonata style is more surprising, though less subtle, than Haydn's. At twenty-two he was treating form with an expansiveness which sometimes left his music perilously thin, though he was never merely redundant. The emphatic reiterations in the Paris symphony are not mannerisms or formulas; they are the naturally simple expression of a naturally simple material. In a series of easy-going works of this kind he soon learnt the conditions of breadth on a large scale; and, by the time he came under the direct influence of Haydn, every new polyphonic, rhythmic and instrumental resource enlarged the scale of his designs as fast as it increased their terseness and depth. His career was cut short, and his treatment of form reached its limit only in the direction of emotional expression. The sonata style never lost with him its dramatic character, but, while it was capable of pathos, excitement, and even vehemence, it could not concern itself with catastrophes or tragic climaxes. The G minor symphony shows poignant feeling, but its pathos is not that of a tragedy; it is there from first to last as a result, not a foreboding nor an embodiment, of sad experiences. In the still more profound and pathetic G minor quintet we see Mozart for once transcending his limits. The slow movement rises to a height not surpassed by Beethoven himself until his second period; an adequate finale is unattainable with Mozart's resources, and he knows it. He writes an introduction, beautiful, mysterious, but magnificently reserved, and so reconciles us as he best can to the enjoyment of a lighthearted finale which has only here and there a note of warmth to suggest to us any pretension of compatibility with what went before.

Beethoven discovered all the new resources needed to make the sonata a means of tragic expression, and with this a means of expressing a higher rapture than had ever been conceived in music since Palestrina. He did not, as has sometimes been said, emancipate sonata forms from the stiffness of the recapitulation. On the contrary, where he alters that section it is almost invariably in order to have, not less recapitulation, but more, by stating some part of the second subject in a new key before bringing it into the tonic. Here, as has been suggested above, the effect of his devices is, both in minutiae and in surprises, to throw the second subject into higher relief. Every one of the changes which appear in the outward form of his work is a development from within; and, as far as any one principle is more fundamental than others, that development is primarily harmonic.

We have elsewhere mentioned his practice of organizing remote or apparently capricious modulations on a steady sequential progression of the bass, thereby causing such harmonies to appear not as mere surprises or special effects (a form in which they have a highly artistic function in Mozart and Haydn) but as inevitable developments. The result of this and a host of similar principles is an incalculable intensification of harmonic and emotional expression. Let us compare the opening of the second subject of Haydn's quartet in A major, Op. 20, No. 6, with the corresponding passage in the first movement of Beethoven's sonata, Op. 2, No. 2. Haydn executes the masterly innovation of a second subject that before establishing its true key passes through a series of rich modulations. He begins in E minor, rapidly passing through G and A minor, and so to the dominant of E, in various phases of tender humour and cheerful climax. The keys are remote but not unrelated, the modulations are smooth, and the style is that of a witty improvisation. Beethoven's second subject is intensely agitated; its modulation begins like Haydn's as regards key, but its harmonies are startling and its pace tremendous. Its regular rising bass carries it in two steps to a totally unrelated key, through which it is urged by the same relentless process with increasing speed, and when it is at last driven to the threshold of the key which it seeks as its home there is a moment of suspense before it plunges joyfully into its cadence.

Such resources as this enable Beethoven to give rational dramatic force to every point in his scheme, and so they soon oust those almost symbolical formulas of transition and cadence which are a natural feature in Mozart's music and a lifeless convention in imitations of it. The growth of Beethoven's forms is externally most evident in his new freedom of choice for the complementary key. Hitherto the only possible key for the second subject was in major movements the dominant, and in minor movements the relative major or dominant minor. A sonata which begins by treating all directly related keys as mere incidents in establishing the tonic, will very probably choose some remoter key as its main contrast; and it is worth while trying the opening of the Waldstein sonata (Op. 53) with the simple alteration of C sharp and A natural for C natural and A sharp in the bass of the twenty-first bar, so as to bring the whole transition to the second subject on to the orthodox dominant of G, in order to see, on the one hand, how utterly inadequate that key is as a contrast to the opening, and, on the other hand, how unnecessarily long the transition seems when that is the key which it is intended to establish.

## The Sonata as a whole

The history of the Waldstein sonata marks the irrevocable transition from Mozart to Beethoven (see iv. 88); and in his rejection of the well-known Andante in F (which was originally intended for its slow movement) Beethoven draws attention to the problem of the sonata as a whole, and the grouping of its movements. The normal sonata, in its complete (or symphonic) form, consists of four movements: firstly, a quick movement in that sonata form *par excellence* to which our discussion has been hitherto confined; then two middle movements, interchangeable in position, the one a slow movement in some lighter form, and the other a dance movement (the minuet, or scherzo) which in earlier examples is of hardly wider range than a suite movement. The finale is a quick movement, which may be in sonata form, but generally tends to become influenced by the lighter and more sectional [rondo form](#), if indeed it is not a set of variations, or even, in the opposite extreme, a fugue.

Aesthetically, if not historically, this general scheme is related to that of the suite, in so far as it places the most elaborate and highly organized movement first, corresponding to the allemande and courante; while the slow movement, with its more lyric character and melodious expression, corresponds to the sarabande; the minuet or scherzo to the lighter dance tunes or "Galanterien" (such as the gavotte and bourree), and the lively finale to the gigue. But just as the whole language of the sonata is more dramatic, so are the contrasts between its movements at once sharper and more essential to its unity. Hence, the diversity of outward forms within the limits of these four movements is incalculable.

The first movement is almost always in the sonata form par excellence, because that admits of higher organization and more concentrated dramatic interest than any other. Often after such a movement a slow piece in the form conveniently known as A B A, or simple "ternary" form (i.e. a broad melody in one key, followed by a contrasted melody in another, and concluded by a recapitulation of the first) is found to be a welcome relief, and of great breadth of effect. Of course in all true classics the very simplicity of such movements will be inspired by that sense of rhythmic freedom and possibility of development that permanently raises sonata forms from the level of a mere decorative design; nor, on the other hand, is there any limit to the complexity of form possible to a slow movement, except that imposed by the inevitable length of every step in its slow progress. Still, the tendency of slow movements, even more than of finales, is to prefer a loose and sectional organization. Sonata form is frequently used in them by Haydn and Mozart with the success attainable only by the greatest masters of rhythmic flow; but even in their works the development is apt to be episodic in character, and is very often omitted. The minuet, in Haydn's and Mozart's hands, shows a surprising amount of rhythmic variety and freedom within the limits of a dance tune; but Haydn, as is well known, sighed for its development into something larger; and, though Beethoven had long emerged from his "first period" before he could surpass the splendid minuet in Haydn's quartet in G major, Op. 77, No. 1, he achieved in the scherzo of his Eroica symphony the first of a long line of movements which establish the scherzo as an essentially new art-form.

The only condition that affects the forms of finales is that a sonata involves a considerable stretch of time, and therefore its end must be so designed as to relieve the strain on the attention. In a drama or a story the deeper artistic necessity for this is masked by the logic of cause and effect, which automatically produces the form of an intrigue ending in a denouement. In music the necessity appears in its purest form. There is no need for finales to be less serious than first movements; or even, in certain ways, less complex; but the attention which could be aroused at the outset by problems must be maintained at the end by something like a solution. Hence the use of the lighter rondo forms, which, by dividing the work into shorter and more distinct sections, make the development easier without unduly limiting its range. Hence, also, the influence of rondo style upon such finales as are cast in true sonata form; and hence, lastly, the paradox that the fugue has occasionally been found a possible means of expression for the finale of a dramatic sonata. For the complexity of the fugue, though incessant, is purely a complexity of texture, and the mind in following that texture instinctively abandons any effort to follow the form at all, finding repose in the change of its interests.

Now, just as within the typical scheme of first and second subject development and recapitulation in the first movement, there is room for genius in the contrasting of different rhythms and proportions, so, within the limits of the simple four-movement scheme of the whole sonata is there room for genius in the contrast of various types and degrees of organization. The complete four-movement scheme seldom appears in works for less than three instruments. Beethoven was the first to adopt it for solo sonatas, and he soon thought fit to make omissions. In Haydn's work for less than four instruments it was not even necessary that the "sonata" form itself should be represented at all. Its essential spirit could be realized in the melodic and rhythmic freedom of a group or couple of more sectional movements, nor did Beethoven (in Op. 26 and Op. 27, No. 1) consider such works unworthy of the name of sonata, or (in Op. 54) incapable of expressing some of his most original ideas. No design is known to pure instrumental music that is not possible as a movement of a sonata, if it has the characteristic freedom of rhythm and is not much over a quarter of an hour in length. There is no form that has not been so applied; and, indeed, the only instrumental form that has maintained a larger development outside than inside the scheme of the sonata is that of variations.

As the scope and complexity of the sonata style grew, so did the interdependence of its movements become more evident. With Mozart and Haydn it is already vital, as we have seen in the crucial case of Mozart's G minor quintet; but the differences between one scheme and another are not remarkable until we study them closely; and, except in key-relationship, it would be difficult to trace anything more concrete than principles of contrast as interacting

between one movement and another. But Beethoven's dramatic power finds as free expression in the contrasts between whole movements as it finds within the movements themselves. In his later works, the increase in harmonic range, with the consequent prominence of remoter key-relationships, necessitating the dwelling on these keys at greater length causes the key-system of each movement to react on the others to an extent that would be purposeless in the art of Haydn and Mozart. Thus in the B flat trio, Op. 97, we find such remote keys as G major, D flat and D major placed in positions of great functional importance, until we come to the finale, which keeps us in suspense by its very low and quiet key-colour, contrasting so oddly with its bacchanalian temper. But when the whole main body of this finale has passed before us in the drab colours of tonic, dominant and sub-dominant, the coda marvellously explains everything by opening with an enharmonic modulation to the most distant key yet attained except as a transitory modulation.

As Beethoven proceeded, his growing sense of the functional expression of musical forms enabled him to modify and strengthen them until their interaction was as free as its principles were exact. In the C sharp minor quartet (Op. 131) the opening fugue is functionally an enormously developed introduction. The following allegro, in the startling key of D major, the "artificial" flat supertonic, is a first movement, with its development suppressed, and with certain elements of rondo style as a necessary contrast to the preceding fugue. The startling effect produced by this key of D major necessitates, a simple and limited key-system within the movement itself, thus accounting for the absence of a development. The remaining movements fall into their place among the keys that lie between the keys of D major and C sharp minor. Thus the slow movement (to which the brief allegro moderato forms a dramatic introduction) is a great set of variations in A major, and the strictness of its variation form allows no change of key until the two brilliant bursts of remoter harmony, F and C, in the coda. Then follows a scherzo of extremely simple design, in E major, with a small part of its trio in A. A short introduction in G sharp minor, the dominant, completes the circle of related keys and leads to the finale which (though cast in a compound of rondo and sonata form that would allow it a free range of modulation) contents itself with very simple changes, until towards the end, where it systematically demonstrates the exact relationship of that first surprising key of D major to C sharp minor.

## **The Unity of the Sonata**

The gigantic emotional range of Beethoven's work is beyond the scope of technical discussion, except in so far as the technical devices themselves suggest their emotional possibilities. The struggle between decadence and reaction since the time of Beethoven indicates on the one side the desire to rival or surpass Beethoven in emotional expression without developing the necessary artistic resources; and, on the other side, a tendency to regard form as a scheme which the artist first sets up and then fills out with material. Early in the 19th century these tendencies gave rise to controversies which are not yet settled; and before we discuss what has taken place since Beethoven we must consider the connexion between sonata movements in a last new light.

Historical views of art are apt to be too exclusively progressive and to regard higher and lower degrees of organization in an art-form as differing like truth and falsehood. But in trying to prove that the megatherium could not survive under present conditions, we must beware of arguing that it never existed; nor must we cite the fact that man is a higher organism in order to argue that a jelly-fish is neither organic nor alive. Organization in art, as elsewhere, may be alive and healthy in its lowest forms. The uniformity of key in the suite forms is low organization; but it is not inorganic until a mild seeker after novelty, like AG Muffat, tries to introduce more keys than it will hold. The interdependence of movements in Haydn and Mozart is not such high organization as the ideal form of the future, in which there is no more breaking up of large instrumental works into separate movements at all; but neither is it a mere survival from the decorative contrasts of the suite. Evolutionists must not forget that in

art, as in nature, the survival of the fit means the adaptability to environment. And the immortal works of art bring their proper environment with them into later ages.

The large instrumental forms have, until recent times, remained grouped into sonata movements, because their expression is so concentrated and their motion so swift that they cannot, within the limits of a single design, give the mind time to dwell on the larger contrasts they themselves imply. Thus, in the "Sonata Appassionata," the contrast between the first subject and the main theme of the second is magnificent; but that calm second theme lasts just the third part of a minute before it breaks off. Now, though the third part of a minute bears about the same proportion to the whole design as five hundred lines does to the design of Paradise Lost; though, moreover, this theme recurs three times later on, once in an exact recapitulation, and twice transformed in terribly tragic climaxes; yet the mind refuses to be whirled in less than ten minutes through a musical tragedy of such Shakespearian power without opportunity for repose in a larger scheme of contrasts than any attainable by the perfection and breadth of the single design within these limits. Hence the need for the following slow set of variations on an intensely quiet tune, which, by its rigorous confinement to the tonic of a nearly related key, its perfect squareness of rhythm, and the absolute simplicity and strictness of its variations, reveals the true pathos of the first movement by contrast with its own awful repose; until its last chord, the first in a new key, falls like a stroke of fate, and carries us headlong into the torrent of a finale in which nothing dares oppose itself to those sublime forces that make the terror of tragedy more beautiful than any mere appeal for sympathy. Thus the dramatic interdependence of sonata movements is very strict. Yet the treatment by each movement of its own thematic material is so complete that there is little or no scope for one movement to make use of the themes of another. Such instances as may be suspected in Beethoven's later works (for example, the similarity of opening themes in various movements of the sonatas are too subtle to be felt more than subconsciously; while the device of clearly quoting an earlier movement occurs only in three intensely dramatic situations (the introductions to the finales in Op. 101, the violoncello sonata, Op. 102, No. 1, and the 9th symphony) where its whole point is that of a surprise.

## The Sonata since Beethoven

It is unlikely that really vital sonata work will ever be based on a kind of Wagnerian *Leitmotif* system, until the whole character of instrumental form shall have attained the state of things in which the movements are not separated at all. There has been no ambitious or "progressive" composer since Beethoven who has not, almost as a matter of etiquette, introduced the ghosts of his earlier movements into his finale, and defended the procedure as the legitimate consequence of Beethoven's Op. 101. But, while there is no a priori reason for condemning such devices, they illustrate no principle, new or old. The nearest approach to some such principle is furnished once by Schumann, who always ingeniously adapts the outward forms of the sonata to his own peculiar style of epigrammatic and antithetic expression, discarding as beyond his scope the finer aspects of freedom and continuity of rhythm, and constructing works which bear much the same relation to the classical sonata as an elaborate mosaic bears to an easel-picture. Dealing thus with a looser and more artificial type of organization, Schumann was able in his D minor symphony to construct a large work in which the movements are thematically connected to an extent which in more highly organized works would appear like poverty of invention, but which here furnishes a rich source of interest.

Many other experiments have been tried since Beethoven, by composers whose easy mastery is that of the artist who, from long practice in putting material into a ready-made form, becomes interested in the construction of new ready-made forms into which he can continue to put the same material. A sense of beauty is not a thing to be despised, even in pseudo-classical art; and neither the many beautiful, if mannered, works of Spohr, which disguise one stereotyped form in a bewildering variety of instrumental and literary externals, nor the far more important and essentially varied works of Mendelssohn deserve the

contempt which has been the modern correction for their high position in their day. But we must not forget that the subject of sonata forms is no mere province, but covers the whole of classical instrumental music; and we must here pay attention only to the broadest essentials of its central classics, mentioning what diverges from them only in order to illustrate them. Schubert's tendencies are highly interesting, but it would carry us too far to attempt to add to what is said of them in the articles on Music and Schubert.

The last great master of the sonata style is Brahms. A larger scale and more dramatic scope than Beethoven's seems unattainable within the limits of any music identifiable with the classical forms; and the new developments of Brahms lie too deep for more than a bare suggestion of their scope here. Much of the light that can as yet be shed upon them will come through the study of Counterpoint and Contrapuntal Forms. Outwardly we may see a further evolution of the coherence of the key-system of works as wholes; and we may especially notice how Brahms's modern use of key-relationships makes him carry on the development of a first movement rather in a single remote key (or group of keys) than in an incessant flow of modulations which, unless worked out on an enormous scale (as in the 2nd and 4th symphonies), will no longer present vivid enough colours to contrast with those of the exposition. Beethoven's last works already show this tendency to confine the development to one region of key. Another point, fairly easy of analysis, is Brahms's unlimited new resources in the transformation of themes.

But no mere formal analysis or argument will go further to explain the greatness of Brahms than to explain that of Beethoven, Haydn or Mozart. Yet by that outward sign of dramatic mastery in the true sonata style, that variety of rhythmic motion which we have taken as our criterion, Brahms has not only shown in every work his kinship with Haydn, Mozart and Beethoven, but in one particular work he has given us documentary evidence of his faith in it. In his last years he revised, or rather recomposed, his first piece of [chamber music](#), the trio in B major, Op. 8. The new material differs from the old, not only as a fresh creative impulse, but also in the simple fact that it moves literally four times as fast. Such rapidity is not shown by any external display of energy; indeed there is incomparably more repose in the new version than in the old. But the comparison of the two clearly demonstrates that the true sonata style is, now, as at the outset, primarily a matter of swift action and rhythmic variety; and nothing more certainly indicates the difference between the true style and the lifelessness of decadence or academicism than this sense of motion and proportion.

In so far as the tendencies of modern instrumental music represent an artistic ideal which is foreign to that of the sonata without being false, they represent a different type of motion, wider in its sweep, and consequently slower in its steps. The forms such a motion will produce may owe much to the sonata when they are realized, but they will certainly be beyond recognition different. In all probability they constitute the almost unconscious aims of the writers of symphonic poems from Liszt onwards, just as the classical sonata constituted the half-conscious aim of more than one quaint writer of 18th-century programme-music. But the growing importance and maturity of the symphonic poem does not exclude the continued development of the sonata forms, nor has it so far realized sufficient consistency and independence of style to take as high a place in a sound artistic consciousness.

The wider sweep of what we may conveniently call "ultra-symphonic" rhythm owes its origin to Wagner's life-work, which consisted in evolving it as the only musical medium by which opera could be emancipated from the necessity of keeping step with instrumental music. Small wonder, then, that the new art of our time is as yet, like that of Haydn's youth, stage-struck; and that all our popular criteria suffer from the same obsession. One thing is certain, that there is more artistic value and vitality in a symphonic poem which, whatever its defects of taste, moves at the new pace and embodies, however imperfectly, such forms as that pace is fit for, than in any number of works in which the sonata form appears as a clumsy mould for ideas that belong to a different mode of thought. If from the beginnings exemplified by the symphonic poems of the present day a new art-form arises in pure instrumental music that shall stand to the classical sonata as the classical sonata stands to the suite, then we may expect a new epoch no less glorious than that which seems to have closed with Brahms. Until this aim is realized the sonata forms will represent the highest and purest ideal of an art-form that music, if not all art, has ever realized.

# Sonata rondo form

**Sonata rondo form** was a form of musical organization often used during the [Classical music era](#). As the name implies, it is a blend of [sonata form](#) and rondo form.

## Structure

An explanation of sonata rondo form requires first some preliminary coverage of rondo form and sonata form.

Rondo form involves the repeated use of a theme, set in the tonic key, with episodes, each involving a new theme, intervening among the repetitions, like this:

A B A C A D A . . .

Usually the episodes (B, C, D, etc.) are in a different key from the tonic.

[Sonata form](#) involves an opening section in the tonic, followed by a movement to the dominant key. Together, these musical events form the *exposition*. The following section is the [development](#), which usually employs material from the exposition, rearranging it in various ways and migrating to musically remote keys. In the [recapitulation](#), the original opening material is repeated in some form, then the material that earlier moved to the dominant is repeated in some form--but this time in the tonic. In abstract terms, then, sonata form looks like this:

[A B']<sub>exp</sub> [C'']<sub>dev</sub> [A B]<sub>recap</sub>

where a single prime (') means "in the dominant" and a double prime (") means "in remote keys".

Occasionally, sonata form includes an "episodic development," which uses mostly new thematic material. An example is the first movement of Beethoven's piano sonata Op. 14, no. 1. The episodic development is often the kind of development that is used in sonata rondo form, to which we now turn.

The simplest kind of sonata rondo form is a sonata form that repeats the opening material in the tonic as the beginning of the development section.

[A B']<sub>exp</sub> [A C'']<sub>dev</sub> [A B]<sub>recap</sub>

By adding in this extra appearance of A, the form reads off as **AB'AC''AB**, hence the alternation of A with "other" that characterizes the rondo. Note that if the development is an episodic development, then C'' will be new thematic material--thus increasing the resemblance of sonata rondo form to an actual rondo.

## The "delayed return" variant in Mozart

Mozart, in his [piano concertos](#), often used a variant type of sonata rondo form, in which the themes of the recapitulation are rearranged: the opening bars reappear quite late, after most of the music of the exposition has been recapitulated, but before the final sequence of themes ("codetta") that rounds off the section. Thus:

[A B' Codetta]<sub>exp</sub> [A C"]<sub>dev</sub> [**B A** Codetta]<sub>recap</sub>

Mozart's purpose was perhaps to create a sense of variety by not having the main theme return at such regular intervals.

# Codas

Often, regular sonata form includes a coda:

[A B']<sub>exp</sub> [C'']<sub>dev</sub> [A B]<sub>recap</sub> [D]<sub>coda</sub>

This longer version of sonata form has a counterpart in sonata rondo form. If the coda is arranged to begin with the opening material, then we have yet another instance of A:

[A B']<sub>exp</sub> [A C'']<sub>dev</sub> [A B]<sub>recap</sub> [**A** D]<sub>coda</sub>

Thus: AB'AC''ABAD.

## **Sonata rondo form as a variant of rondo form**

It is also possible to describe sonata rondo form by starting out with rondo form and describing how it is transformed to be more like sonata form. For this explanation, see rondo.

## Uses of the sonata rondo form

Sonata rondo form is almost exclusively used in the finales of multi-movement works. It is considered a somewhat relaxed and discursive form. Thus, it is unsuited to an opening movement (typically the musically tightest and most intellectually rigorous movement in a Classical work), and too long for a slow movement (where the slow tempo would make the full sonata-rondo formula impossible to realize in a movement of reasonable length). Here are some movements written in sonata rondo form:

- Beethoven, Sixth Symphony, last movement
- Beethoven, Eighth Symphony, last movement
- Haydn, "Drumroll" Symphony, last movement
- Mozart, Piano Concerto No. 23 in A major, K. 488, last movement

- Charles Rosen, *Sonata Forms*. New York: Norton, 1988.

# Song

A **song** is a relatively short [musical composition](#) for the [human voice](#) (possibly accompanied by other [musical instruments](#)), which features words ([lyrics](#)). It is typically for a solo [singer](#), though may also be a [duet](#), trio, or for more voices (works with more than one voice to a part, however, are considered [choral](#)). The words of songs are typically of a poetic, rhyming nature, although they may be religious verses or free prose. Songs can be broadly divided into many different forms, depending on the criteria used. One division is between "art songs", "[popular](#) songs", and "[folk songs](#)". Other common methods of classification are by purpose (sacred vs secular), by style ([dance](#), [ballad](#), [Lieder](#), etc.) or by time of origin ([Renaissance](#), Contemporary, etc).

Colloquially, *song* is commonly used to refer to any music composition, even those without vocals (though in music styles that are predominately vocal-based, a composition without vocals is often called an [instrumental](#)).

# Cultural types

## Art songs

**Art songs** are songs created for performance in their own right, or for the purposes of a European upper class, usually with [piano](#) accompaniment, although they can also have other types of accompaniment such as an [orchestra](#) or [string quartet](#), and are always notated. Generally they have an identified author(s) and require voice training for acceptable performances. The German word for song, "[Lied](#)" (plural: "Lieder"), is used in French and English-speaking communities to refer to the serious art song, whereas in German-speaking communities the word "Kunstlied" (plural: "Kunstlieder") is used to distinguish art song from folk song ("Volkslied"). The lyrics are often written by a lyricist and the music separately by a composer. Art songs may be more formally complicated than popular or folk songs, though many early Lieder by the likes of Franz Schubert are in simple strophic form. They are often important to national identity.

Art songs feature in many European cultures, including but not limited to: Russian (romansy), Dutch (lied), Italian (canzoni), French (mélodies), Scandinavian (sånger), Spanish (canciones). Cultures outside of Europe may have what they consider to be a classical music tradition, such as India, and thus feature art songs.

Of the [romantic music](#) era, the art song is considered one of the most distinctive music forms developed. The accompaniment of pieces of this period is considered as an important part of the composition. The art song of this period is often a duet in which the vocalist and accompanist share in interpretive importance. The pieces were most often written to be performed in a home setting although today the works enjoy popularity as concert pieces. The emergence of poetry during this era was much of what inspired the creation of these pieces by Brahms, Schumann, Schubert and other period composers. These composers set poems in their native language. Many works were inspired by Johann Wolfgang von Goethe and Heinrich Heine. An art song with a German text is often referred to as a [Lied](#). The romantic art song was often reflective of the popular poetic notions of despair created by places, legends, nature or lost love. Some composers would interpret the poem literally and create music which imitated the music and imagery of the poem. The vocal melody was created to reflect the form and emphasis of the poem. The mood of the piece would often be summarized in the closing piano section called a postlude. To reflect the stanzas of a poem, the composer could use strophic form to reuse music for each stanza. Another method would be to write new music for each stanza to create a unique form, this was through-composed form known in German as durchkomponiert. A combination of both of these techniques in a single setting was called a modified strophic form. Often romantic art songs sharing similar elements were grouped as a song cycle. (Kamien, 217–18)

## Popular songs

**Popular songs** are songs which may be considered in between art songs and folk songs. They are usually accompanied in performance and recording by a [band](#). They are not anonymous in origin and have known authors. They are often but not always notated by their author(s) or transcribed after recording and tend to be composed in collaboration more often than art songs, for instance by an entire band, though the lyrics are usually written by one person, usually the lead singer. Popular songs are often a part of individual and cultural, but seldom national, identity. Performers usually often have not undergone formal voice training

but highly stylized vocal techniques are used. Many people consider songs in popular music to have in general simpler [structures](#) than art songs, however, musicologists who are "both contemptuous and condescending [of popular music] are looking for types of production, musical form, and listening which they associate with a different kind of music...'classical music'...and they generally find popular music lacking" (Middleton 1990, p.103).

### **Song structure or how a pop song is constructed**

Popular songs almost always have a well defined [structure](#). The song is constructed using three to five individually distinct musical sections, which are then strung together to form the complete song. A structural analysis of a typical pop song is as follows:

- Introduction
- [Verse](#)
- [Chorus](#)
- [Verse](#)
- [Chorus](#)
- [Instrumental Bridge](#)
- Repeat chorus to fade

The above pop song structure is an extremely common way of building a modern pop song, including [heavy metal](#), [hip hop](#), [rock](#) songs and all other genres of pop songs. Some extremely musically simple song structures have songs which have only a single section which is repeated with slight modifications in order to sustain a listener's interest in the song.

Pop songs also have rhyming schemes which are commonly used by lyricists. These are classified using capital letters of the English alphabet. For example, a song's verse section may have this rhyming scheme: **ABAC ABAD**. This means that the verse comprises of eight lines. Lines 1, 3, 5 and 7 rhyme with each other. Also, lines 2 and 6 rhyme. Whereas lines 4 and 8 do not rhyme with any lines.

### **Folk songs**

**Folk songs** are songs of often anonymous origin (or are public domain) that are transmitted orally. They are frequently a major aspect of national or cultural identity. Art songs often approach the status of folk songs when people forget who the author was. Folk songs are also frequently transmitted non-orally (that is, as [sheet music](#)), especially in the modern era. Folk songs exist in almost every, if not every, culture. For more on folk songs, see [Folk music](#).

For a list of influential songs, see:

## **Song forms**

## Song structure (popular\_music)

Songs in [popular music](#) are almost never through-composed. That is, they almost always use the [sectional](#) forms such as strophic form. Other common [forms](#) include thirty-two-bar form, verse-chorus form, and twelve bar blues.

The first two sections listed below are considered primary, while the intro or introduction and coda (music) or ending may or may not be used in different performances and are not considered essential to the identity of most songs. A bridge is slightly more important. These two sections are usually repeated throughout a song though the bridge, intro, and outro are usually only used once.

# Verse

*Main article:* [Verse](#).

In popular music a verse roughly corresponds with a poetic stanza. When two or more sections of the song have basically identical music and different lyrics these sections are probably the verses of the song.

# Chorus

*Main article: [Refrain](#).*

In popular music, chorus is used to mean the refrain of a song, which often sharply contrasts the verse melodically, rhythmically, and harmonically, and assumes a higher level of dynamics and activity, often with added instrumentation. Chorus form, or strophic form, is a sectional and/or additive way of structuring a piece of music based on the repetition of one formal section or block played repeatedly.

When two or more sections of the song have basically identical music and lyrics these sections are probably instances of the chorus.

# Bridge

*Main article: [Bridge \(music\)](#).*

In song writing, a bridge is an interlude that connects two parts of that song, building a harmonic connection between those parts.

Normally you should have heard the verse at least twice. The bridge may then replace the 3rd verse or precede it. In the latter case it delays an expected chorus. The chorus after the bridge is usually last and is often repeated in order to stress that it is final.

If when you expect a verse or a chorus you get something that is musically and lyrically different from both verse and chorus it is probably the bridge.

## **AABA form**

Thirty-two-bar form uses four sections, most often eight measures long each ( $4 \times 8 = 32$ ), two verse or A sections, a contrasting B section, the bridge or "middle-eight", and a return of the verse in one last A section (AABA).

## **Variation on the basic structure**

Verse-chorus form or ABA form may be combined with AABA form, in compound AABA forms.

## Twelve bar blues and other chord progressions

*Main article:* [chord progression](#).

Sections are often defined through the use of different chord progressions in different sections. However, the repetition of one chord progression may mark off the only section in a simple verse form such as the twelve bar blues.

## **Songs by genre**

## Songs popular at sporting events

A list of songs that are often heard at stadiums and arenas where sporting events are played. This includes [fight songs](#) of professional and collegiate sports teams, [popular music](#) hit songs, [dance music](#), [hip-hop music](#), [heavy metal](#) and classic rock, and even [classical music](#). It can also include patriotic fare, including [national anthems](#). Many songs often allow fans to sing along or shout various phrases in synch with the music. This music is often used to get a crowd into a frenzy, inspire athletic performance, and celebrate victory.

# Songwriter

A **songwriter** is someone who writes the [lyrics](#) to songs, the [musical composition](#) or [melody](#) to songs, or both. That is to say, a songwriter is a lyricist, a [composer](#), or both. The word 'songwriter' is however more commonly used to describe one who writes popular songs than to describe a writer of art songs.

## History and background of songwriters

Songwriters may perform the songs they write themselves, or may write for somebody else to perform. People who sing their own songs are nowadays typically called [singer-songwriters](#), although the tradition of doing this dates back hundreds of years. It is often speculated that pre-historic man must have made up and sung songs. More recently, the [troubadours](#) of the middle ages sang their own work, as did the German Minnesingers.

Most art songwriting is written for somebody other than the composer to perform, although it is known that Schubert often sang his own songs at private parties, and there have been a number of composers who were also singers and wrote for themselves, Carl Loewe being one example.

Many modern [rock and roll](#) bands have one or two songwriters, usually members of the band. In many cases, the lead singer is one of the songwriters.

There have been quite a few popular songwriting teams such as the Tamla Motown team of Brian Holland, Lamont Dozier and Eddie Holland and the teams of Lennon and McCartney, Elton John and Bernie Taupin, Alan Jay Lerner and Frederick Loewe, George and Ira Gershwin, Jagger and Richards, Roger Cook and Roger Greenaway, Rodgers and Hart, The Bee Gees, the Jackson brothers and Ashford & Simpson.

Many songwriters also serve as their own music publishers, while others have outside publishers. Legally, songs may only be copied or performed publicly by permission of the authors. The legal power to grant these permissions may be bought, sold or otherwise transferred. This is governed by copyright law. Songwriting and publishing royalties can be a substantial source of income, particularly if a song becomes a hit record.

# Sonorism

**Sonorism** is an approach to [musical composition](#) that focuses on the characteristics, quality, and texture of sound. This emphasis on sound is inherently connected with a search for new types of sounds, and sonorism relies on experimenting with [instruments](#) to create novel playing techniques. As a movement, sonorism was initiated in the 1960s in the new avantgarde of Polish music.

## Notable sonoristic composers

Grażyna Bacewicz  
Tadeusz Baird  
Henryk Mikołaj Górecki  
Wojciech Kilar  
Witold Lutosławski  
Krzysztof Penderecki  
Bogusław Schaeffer  
Avet Terterian

# Sopanam

**Sopanam** is a form of [Indian classical music](#) developed in the temples of Kerala in the wake of the increasing popularity of the Jayadeva's 'Gita Govinda' or 'Ashtapathi'. Sopanasangitham is sung by the side of the steps (Sopanam) of Temple, with the accompaniment of the drum called 'Idakka'. The sopanasangitam in its traditional form is seen at its best among the Marars and Poduvals, who were hereditary Ambalavasi Brahmins engaged to do the same.

Kerala has shared the general musical culture of peninsular India from the earliest times. South Indian music is generally known as [Carnatic music](#) because of its common features. Each region of the south has its own culture. Kerala's music is known as Sopanam. Sangeetam (Music) appears to have acquired its name from the 'Sopanam' which means 'Sanctum Sanctorum' of the temple. Its essential features were born out of a happy blending of the Vedic, the folk and tribal music of the region.

The characteristic features of this music are, simple structure and peculiar forms of expression.

The structure of the Sopanam music is believed to reflect the experience of the devotee in ascending the heights of devotion. Sopanam music developed and became popular through the practice of singing invocatory songs in front of the 'Kalam' of Kali (floor drawing of Kali) and later on at the sanctum of the temple. There are a few powerful schools connected with the temples like Pazhoor, Tiemandhamkunnu, Guruvayoor, Ramamangalam. In these temples, this music had been hereditarily practiced by temple singers. Neralattu Rama Poduval of Tirumandhamkunnu bani, Janardhanan Nedungadi of Guruvayoor, Damodara Marar belonging to the Mudi yettu bant of Pazhoor are some of the most effective experts.

Sopanam music as it is practiced in different schools, maintains its rustic nuances with the feeling of devotion as its basic quality. From the temple sanctum this music has taken many diversions and grown as dance music in Ashtapadiyattam; the mould of which was later adopted by Krishnanattam, devotional music in Kalam pattu and dramatic music in Mudi yettu and Kathakali. In spite of its ramified developments, it failed to become pure concert music.

# Sophomore album

**Sophomore album** is a term for a band or artist's second album. It is a commonly held belief among music aficionados that this second album, rather than the [debut album](#), is the release that actually sets the tone for an artist's career. The equivalent term in British music criticism is the "difficult second album". "Sophomore Slump" or "second album syndrome" are terms used to describe when the follow up to a well-received album or film is a critical and commercial disappointment. Conquering the sophomore slump, in the sight of music critics, is often a sign of future success.

## **Causes of the sophomore slump/ second album syndrome**

The sophomore release from a band or artist whose first album received widespread critical acclaim is often awaited with a certain amount of trepidation. The public's usually expects that a follow up film or album to a classic one will be just as good, if not better, than it's prequel. Due to the heightened anticipation of the public, the second album or movie may be regarded critically, as it will be hard for the artist to live up to the hype created by the original. What could be viewed as a good movie or album might therefore seem worse (even if it is not). Reasoning for this can be because the new material no longer breaks boundaries, which the original may have done.

Examples include;

- Little Britain season 3 — the third season has been regarded as "repetitive", yet although it retains the same style of humour as the originals, it no longer breaks new boundaries and loses its appeal.

# Sopranist

# Soprano

In [music](#), a **soprano** is a [singer](#) with a voice ranging approximately from the A below middle C to high C two octaves above middle C (i.e. A3-C6). Some sopranos can go much higher, up to F6. In four part chorale style harmony, the soprano takes the highest part, which usually encompasses the [melody](#).

The word "soprano" generally refers to a female [singer](#) of this highest vocal range and to her voice. Male singers whose voices have not yet changed are known either as "boy sopranos" or, in the Anglican and Roman Catholic traditions, as trebles. Some adult male singers use a special technique without using falsetto in order to sing in this high range, and they are known as [sopranists](#).

[Contralto](#)

### Male ranges

[Sopranist](#)

[Alto](#)

[Tenor](#)

[Baritenor](#)

[Baritone](#)

[Bass-baritone](#)

[Bass](#)

Historically women were not allowed to sing in the Church, so the soprano roles were given to young boys, and later to castrati, who were men whose larynxes had been fixed in a pre-adolescent state through the process of castration.

More generally, a **soprano** is a relatively high-pitched member of a group of similar instruments (for example, the soprano [saxophone](#)).

# Types of soprano and soprano roles in operas

In [opera](#), the character and [timbre](#) of soprano voices are often categorized according to the German Fach system. However, several roles are regularly sung by sopranos who are considered to belong to another "Fach". For example, Lyric Coloratura Sopranos and Full Lyrics often sing Lucia (Lucia di Lammermoor). Sopranos usually play the heroine in opera. The soprano *Fächer*, with examples of respective roles, are:

## **Soprano**

[Alto](#)

[Tenor](#)

[Basso](#)

- Soubrette: A sweet, lightweight voice whose range is mostly in middle voice. Plays comedic, saucy, but likable characters.
  - Adele (Die Fledermaus)
  - Amor (Orfeo ed Euridice)
  - Ännchen (Der Freischütz)
  - Belinda (Dido and Aeneas)
  - Despina (Cosi fan tutte)
  - Lisa (La Sonnambula)
  - Marzellina (Fidelio)
  - Musetta (La bohème)
  - Nannetta (Falstaff)
  - Olympia (Les contes d'Hoffmann)
  - Pamina (Die Zauberflöte)
  - Servilia (La clemenza di Tito)
  - Susanna (Le Nozze di Figaro)
  - Tamyris (Il re pastore)
  - Zerlina (Don Giovanni)
  
- Lyric Coloratura: A light, acrobatic voice, with a range into the 6th octave.
  - Adina (L'Elisir d'Amore)
  - Agrippina (Agrippina)
  - Alcina (Alcina)
  - Alminera (Rinaldo)
  - Amina (La Sonnambula)
  - Blondchen (Die Entführung aus dem Serail)
  - Celia (Lucio Silla)
  - Elisa (Il re pastore)
  - Elvira (I Puritani)
  - Gilda (Rigoletto)
  - Ilia (Idomeneo)
  - Juliette (Roméo et Juliette)
  - Lakmé (Lakmé)
  - Lucia (Lucia di Lammermoor)
  - Magda (La Rondine)
  - Norina (Don Pasquale)
  - Ophélie (Hamlet)

Oskar (Un Ballo in Maschera)  
Sofie (Der Rosenkavalier)  
Zerbinetta (Ariadne auf Naxos)

- Dramatic Coloratura: An acrobatic voice with powerful dramatic qualities, with a range up to F6.
  - Anne (The Rake's Progress)
  - Cleopatra (Giulio Cesare)
  - Donna Anna (Don Giovanni)
  - Fiordiligi (Così fan tutte)
  - Königin der Nacht (Queen of the Night) (Die Zauberflöte)
  - Konstanze (Die Entführung aus dem Serail)
  - Lady Macbeth (Macbeth)
  - Leonora (Il Trovatore)
  - Lucrezia (Lucrezia Borgia)
  - Mathilde (Guillaume Tell)
  - Norma (Norma)
  - Rosalinda (Die Fledermaus)
  - Violetta (La Traviata)
  
- Full Lyric Soprano: A sweet, graceful voice, with range similar to that of the soubrette but with a stronger quality, and stronger upper register. Reserved for ingenues and other sympathetic characters.
  - Agathe (Der Freischütz)
  - Antonia (Les contes d'Hoffmann)
  - Contessa (Figaro)
  - Euridice (Orfeo ed Euridice)
  - Liù (Turandot)
  - Manon (Manon)
  - Marguerite (Faust)
  - Martha (Martha)
  - Micaëla (Carmen)
  - Mimi (La bohème)
  - Nedda (Pagliacci)
  - Pamina (Die Zauberflöte)
  - Zaide (Zaide)
  
- Spinto Soprano: A full lyric voice that can be pushed to dramatic climaxes.
  - Agathe (Der Freischütz)
  - Aida (Aida)
  - Alice Ford (Falstaff)
  - Butterfly (Madama Butterfly)
  - Desdemona (Othello)
  - Donna Elvira (Don Giovanni)
  - Elisabetta (Don Carlos)
  - Manon (Manon Lescaut)
  - Margherita (Mefistofele)
  - Rusalka (Rusalka)
  - Tatajana (Eugene Onegin)
  - The Marschellin (Der Rosenkavalier)
  - Wally (La Wally)

- Dramatic soprano: A powerful, rich, emotive voice. Used for the heroic, tragic, and/or victimized women of opera. Range from Bb3 or A3 to C6.
  - Abgaille (Nabucco)
  - Amelia (Un Ballo in Maschera)
  - Ariadne (Ariadne auf Naxos)
  - Butterfly (Madama Butterfly)
  - Elsa (Lohengrin)
  - Gioconda (La Gioconda)
  - Kundry (Parsifal)
  - Leonora (La Forza del Destino)
  - Leonore (Fidelio)
  - Santuzza (Cavalleria Rusticana)
  - Sieglinde (Die Walküre)
  - Tosca (Tosca)
  
- Wagnerian soprano: A dramatic voice that can assert itself as an instrument over a large orchestra (over eighty pieces). Usually a mythic heroine.
  - Brünnhilde (Die Walküre, Siegfried, Götterdämmerung)
  - Elektra (Elektra)
  - Elizabeth (Tannhäuser)
  - Isolde (Tristan und Isolde)
  - Salome (Salome)
  - Senta (Der fliegende Holländer)
  - Turandot (Turandot)

Two types of soprano especially dear to the French are the Dugazon and the Falcon, which are intermediate voice types between the **soprano** and the [mezzo soprano](#): a Dugazon is a darker-colored soubrette, a Falcon a darker-colored soprano drammatico.

# Soul blues

**Soul blues** is a style of [blues](#) music developed in the late 1960s and early 1970s that combines elements of [soul music](#) and urban contemporary music. Singers and musicians who grew up listening traditional electric blues (Muddy Waters, Jimmy Reed, Elmore James etc.), soul singers (such as Sam Cooke, Ray Charles and Otis Redding) and Gospel music wanted to bridge their favorite music together. One of the pioneers of this style was Bobby Bland and the song "The Thrill Is Gone" by BB King was a hint for future trends in this subgenre. Additional musicians in this style include ZZ Hill, Otis Clay, Latimore, Little Milton, Johnny Adams, Solomon Burke, Wilson Pickett, Bobby Rush and Johnnie Taylor. Soul blues saw its popularity rise in 1980s Bobby Bland continues with this style. This is a sub-genre within the blues genre which is very popular with African American audiences but less known by white audiences.

# Soul jazz

**Soul jazz** was a development of [hard bop](#) which incorporated strong [blues](#) and [gospel](#) influences in music for small groups featuring keyboards, especially the Hammond organ. Important soul jazz organists include Bill Doggett, Charles Earland, Richard "Groove" Holmes, Les McCann, "Brother" Jack McDuff, Jimmy McGriff, Lonnie Smith, Don Patterson, Jimmy Smith and Johnny Hammond Smith. Tenor saxophone was also important in soul jazz; important soul jazz tenors include Gene Ammons, Eddie "Lockjaw" Davis, Eddie Harris, Houston Person, and Stanley Turrentine. Also player Lou Donaldson was also an important figure.

Unlike [hard bop](#), soul jazz generally emphasized repetitive grooves and melodic hooks, and [improvisations](#) were often less complex than in other jazz styles.

Probably the best known soul jazz recording is Ramsey Lewis's "The In Crowd," a major hit of 1965. Soul jazz was developed in the late 1950s, and was perhaps most popular in the early 1970s, though many soul jazz performers, and elements of the music, remain popular.

[Soul music](#) is only distantly related to soul jazz – it arose from [gospel](#) and [blues](#) rather than from jazz sources.

## Regional scenes

Detroit soul - Memphis soul - Philly soul

**Soul music** is a combination of [rhythm and blues](#) and [gospel](#) which began in the late 1950s in the United States. Rhythm and blues (a term coined by music writer and record producer Jerry Wexler) is itself a combination of [blues](#) and [jazz](#), and arose in the 1940s as small groups, often playing [saxophones](#), built upon the blues tradition. Soul music is differentiated by its use of gospel-music devices, its greater emphasis on vocalists, and its merging of religious and secular themes.

## The story of soul

Sam Cooke, Ray Charles and James Brown are commonly considered the beginnings of soul music. Solomon Burke's early recordings for Atlantic Records codified the style, and as Peter Guralnick writes, "it was only with the coming together of Burke and Atlantic Records that you could see anything resembling a movement." Burke's recordings, in the early 1960s, of "Cry to Me," "Just Out of Reach" and "Down in the Valley" are considered classics of the genre.

In Memphis, Stax Records produced recordings by Otis Redding, Wilson Pickett and Don Covay (Covay also recorded in New York City for Atlantic). Joe Tex's 1965 "The Love You Save" is another classic soul recording. An important center of soul-music recording was Florence, Alabama, where the Fame Studios operated. Jimmy Hughes, Percy Sledge and Arthur Alexander recorded at Fame; later in the 1960s, Aretha Franklin would also record in the area. Fame Studios, often referred to as "Muscle Shoals", after a town neighboring Florence, enjoyed a close relationship with Stax, and many of the musicians and producers who worked in Memphis also contributed to recordings done in Alabama.

Another important Memphis label that produced soul recordings was Goldwax Records, whose owner was Quinton Claunch. Goldwax signed O. V. Wright and James Carr, who would go on to make several records considered essential examples of the genre. Carr's "The Dark End of the Street," written by Chips Moman and Dan Penn (often incorrectly credited to Dan Penn/Spooner Oldham), was recorded at two other important Memphis studios, Royal Recording and American Sound Studios, in 1967. In addition, American Studios owner Chips Moman produced "Dark End of the Street," and the musicians on the record were his house band of Reggie Young, Bobby Woods, Tommy Cogbill and Gene Chrisman. And Carr also made recordings at Fame, utilizing musicians David Hood, Jimmy Johnson and Roger Hawkins.

Aretha Franklin's 1967 recordings, such as "I Never Loved a Man That Way I Love You," "Respect" (a song originally by Otis Redding), and "Do Right Woman-Do Right Man," are commonly considered to be the apogee of the soul-music genre, and among its most commercially successful productions. During this period, Stax artists such as Eddie Floyd and Johnnie Taylor also made significant contributions to soul music. By 1968, the soul-music movement had begun to splinter, as James Brown and Sly and the Family Stone began to expand upon and abstract both soul and rhythm and blues into other forms. As Guralnick writes, "More than anything else, though, what seems to me to have brought the era of soul to a grinding, unsettling halt was the death of Martin Luther King in April of 1968."

Howard Tate's recordings, in the late 1960s, for Verve Records, and later, for Atlantic, produced by Jerry Ragovoy, are another important body of work in the soul genre.

Later examples of soul music include the recordings of The Staple Singers, such as "I'll Take You There," as well as the 1970s recordings, done at Willie Mitchell's Royal Recording in Memphis, of Al Green. Mitchell's Hi Records continued the tradition of Stax in that decade, releasing not only many hits by Green but also important contributions from Ann Peebles, Otis Clay, O. V. Wright and Syl Johnson. Bobby Womack, who recorded with Chips Moman in the late 1960s, continued to produce soul-music recordings in the 1970s and 1980s.

Detroit was another city which produced some important late-soul recordings; producer Don Davis, from the city, worked with Stax artists such as Johnnie Taylor and The Dramatics. The Detroit Emeralds, on early-'70s recordings such as "Do Me Right," are an important link between soul and the later disco style. Motown Records artists such as Marvin Gaye and Smokey Robinson contributed to the evolution of soul music, although their recordings were conceived in a more overtly [pop music](#) vein than those of Redding, Franklin or Carr.

Although they are somewhat different from classic soul stylistically, recordings by Chicago-based artists such as Jerry Butler and The Chi-Lites are often considered part of the genre.

Music produced by white musicians which is stylistically similar to black soul music sometimes is called blue-eyed soul.

By the early 1970s, soul music had been influenced by [psychedelic rock](#) and other influences. The social and political ferment of the times inspired artists like Gaye (What's Going On) and Curtis Mayfield (Superfly) to release album-length statements with hard-hitting social commentary. Artists like James Brown led soul towards more dance-oriented music, resulting in funk music; funk was typified by 1970s bands like Parliament-Funkadelic, The Meters, and James Brown himself, while more versatile groups like War, the Commodores and Earth, Wind and Fire also became popular. During the 70s, some highly slick and commercial blue-eyed soul acts like Philadelphia's Hall & Oates achieved mainstream success, as well as a new generation of street-corner harmony or "city-soul" groups like The Delfonics and Howard University's Unifics.

By the end of the 70s, [disco](#) was dominating the charts and funk. Philly soul and most other genres were dominated by disco-inflected tracks. During this period, groups like The O'Jays and The Spinners continued to turn out hits.

After the death of disco in the early 1980s, soul music survived for a short time before going through yet another metamorphosis. With the introduction of influences from electro music and [funk](#), soul music became less raw and more slickly produced, resulting in a genre of music that was once again called [R&B](#) (although the term is no longer an acronym), usually distinguished from the earlier rhythm and blues by identifying it as "contemporary R&B".

**Today** the North of England is a bastion of "The Music" aka Soul Music, with many of the most prolific collectors in the world residing and/or socialising there. Both the Northern Soul and [Modern soul](#) genres flourish in the clubs of that small strip of land, spanning from Liverpool to Leeds and from Preston down to Stoke.

# Genres of soul

## Blue-eyed soul

Usually performed by white artists, blue-eyed soul is often characterized by catchy hooks and melodies. It arose from a mixture of Elvis Presley and Bill Haley-derived [rockabilly](#) and Dion and The Four Seasons-inspired doo wop; other performers include Righteous Brothers, Hall & Oates, The Rascals, Mitch Ryder & the Detroit Wheels, Dusty Springfield, Boy George, George Michael. David Bowie's Young Americans album is widely regarded as a late classic of the genre.

## Detroit (Motown) soul and Northern soul

Dominated by Berry Gordy's Motown empire and often referred to as the "Motown Sound", Detroit soul is strongly rhythmic and influenced by gospel. It often includes handclapping and a powerful bass line, and includes [violins](#), [bells](#) and other untraditional instruments. Motown's house band was The Funk Brothers. Other performers: Marvin Gaye, The Temptations, Smokey Robinson & the Miracles, Gladys Knight & the Pips, Martha Reeves & the Vandellas, The Marvelettes, Mary Wells, Diana Ross & the Supremes, The Jackson 5, The Four Tops, Stevie Wonder; songwriters: Holland-Dozier-Holland, Norman Whitfield, Barrett Strong, Smokey Robinson, Nickolas Ashford & Valerie Simpson, Ivy Jo Hunter, Roger Penzabene.

[Northern Soul](#) is a style of music with associated dance styles and fashions that developed in the 'North of England' in the late 1960s. In the beginning the dancing was athletic, featuring spins, flips, and drops. The music originally consisted of obscure American soul recordings with an uptempo beat, very similar to and including Tamla Motown, plus more obscure labels (e.g. Okeh) from Northern cities like Detroit and Chicago (in contrast to Southern styles like Memphis soul). By 1970 British performers were recording numbers for this market, and the scarcity of soul records with the required beat led to the playing of stompers, or records by any artist which featured the right beat. The phrase 'Northern Soul' was coined by English journalist Dave Godin sometime around 1971 when writing his column in Blues and Soul magazine. Northern Soul is amongst the most expensive of all musical genres to collect and the movement has set new heights in the resale market of obscure vinyl. Many hundreds of 7" discs have now broken the £1,000 [c.\$2,000] valuation barrier, with some even dwarfing that sum. For example, Frank Wilson's "Do I love you" was sold, several years ago, for £15,000 [c.\$30,000]. The value of many discs has appreciated due to a combination of factors such as the quality of beat, melody and lyric [virtually always deeply touching the listener, by expressing heartache / pain / joy due to the vagaries of romantic love] in combination with rarity. Most Northern soul artists were having a go at stardom without all of the necessary ingredients being in place. Low-budget, independent labels simply couldn't deliver the necessary promotion, nor radio play. Thence, the often very talented artists with superb compositions, had to go back to their day jobs, thinking themselves failures, with the records being poorly promoted and sinking into obscurity, never to be heard outside of Northern England again!

## Modern soul

*For more details on this topic, see [Modern soul](#)*

Modern soul is a term coined in Northern England and was born out of Northern Soul. Its birth can arguably be traced back to a single event. One night in the mid 70s, Ian Levine, a DJ at the Blackpool Mecca soul club played a new release by a group called The Carstairs. This caused a falling-out within the followers of Northern Soul music. Some wanted to stick with the traditional "stomper" sound, whilst some were ready to move on and explore the new releases, seeking and accepting a richer, more intricately-produced and complex-sounding, Hi-Fi friendlier product. New releases were thereafter referred to as "Modern Soul" by the soul fans. A new genre that has flourished - it is alive and well in 21st Century England - had been born.

## **Southern soul**

Generally refers to a driving, energetic soul style combining [R&B](#)'s energy with pulsating Southern [gospel music](#) sounds, as produced at Stax in Memphis. Stax self-consciously nurtured a distinctive sound, which included putting vocals further back in the mix than most contemporary R&B records, the use of vibrant horn parts in the place of background vocals, and a focus on the low end of the frequency spectrum. The vast majority of Stax releases were backed by house bands Booker T and the MGs (which included soul legends Booker T. Jones, Steve Cropper, Duck Dunn, and Al Jackson) and the Memphis Horns (the splinter horn section of the Mar-Keys), and the label counted Otis Redding, Carla Thomas, Sam & Dave, Rufus Thomas, William Bell, and Eddie Floyd among its stars.

## **Memphis soul**

A shimmering, sultry style of soul music produced in the 1960s and 1970s at Stax Records and Hi Records in Memphis, featuring tasteful, melancholic, melodic horns, organ, bass, and drums, as heard in recordings by Hi's Al Green and Stax's Booker T. & the M.G.'s. The latter group also sometimes played in the harder-edged Southern soul style. The Hi label's Hi Rhythm Section house band and Willie Mitchell's production style developed the signature, surging soul style heard in the label's many hit recordings of the 1970s. Some Stax recordings also fit into this style and had their own unique sound.

## **Neo soul**

*For more details on this topic, see [Neo soul](#).*

A mixture of 1970s soul-styled vocals and instrumentation with a contemporary R&B sound and hip hop beats and rap interludes, neo-soul first appeared, after previous permutations in [new jack swing](#) and [hip-hop soul](#), in the mid-1990s with the work of Tony! Toni! Toné! and D'Angelo. Lauryn Hill, Musiq Soulchild, The Roots and Alicia Keys began massively popularizing the sound. Other performers include Jill Scott, Jaguar Wright, Erykah Badu, Adriana Evans, Maxwell, and India.Arie or even English-born Joss Stone and Tom Fox

## **Philadelphia soul**

Based primarily in the output of the Philadelphia International label, Philadelphia soul had as distinguishing characteristics a lush orchestral sound and doo-wop-inspired vocals. Thom

Bell, and Kenneth Gamble & Leon Huff are credited as the founders of Philadelphia soul, which was dominated by artists such as The Delfonics, The Stylistics, Patti LaBelle, The Three Degrees, MFSB, Harold Melvin & the Blue Notes, and McFadden & Whitehead.

## **Psychedelic soul**

A blending of [psychedelic rock](#) and soul music in the late-1960s that paved the way for the mainstream emergence of [funk music](#) a few years later. Principle figures included muticultural band Sly & the Family Stone, The Fifth Dimension, and, with producer Norman Whitfield, The Temptations and The Undisputed Truth.

# Sound module

A **Sound module** (sometimes referred to as **tone generator**) is an [electronic musical instrument](#) without a human-playable interface such as a keyboard, for example. Sound modules have to be "played" using an externally connected device. The external device may be a controller, which is a device that provides the human-playable interface and may or may not produce sounds of its own, or a [sequencer](#), which is computer hardware or software designed to play electronic musical instruments. Connections between sound modules, controllers, and sequencers are generally made with MIDI, which is a standardized protocol designed for this purpose.

Sound modules may use any number of technologies to produce their sounds. A sound module may be a [synthesizer](#), a [sampler](#), a digital piano, or a rompler.

Drum modules are sound modules which specialize in [percussion](#) sounds. Drum modules may be triggered by external trigger pads or pickups as well as through MIDI. Drum modules are distinguished from [drum machines](#) through their lack of dedicated on-board triggers and lack of an integrated sequencer.

Sound modules are often rack-mountable, but might also have a table-top form factor.

A sound module has the same advantages over a fully-integrated instrument as does any system with a modularized design:

- **Cost** — a sound module is cheaper than a comparable instrument equipped with a controller
- **Space** — a sound module takes up less room than an instrument equipped with a controller
- **Obsolescence cycles** — when it becomes obsolete, a sound module can be replaced without changing a favorite controller, or vice versa.

Because most electronic instruments are designed in a modularized way, manufacturers often release a sound module version of their fully-integrated instruments. A sound module may have all the other features of the controller-equipped version, but it often has a smaller display or limited programming controls. In this case, sounds can be loaded through MIDI or external media. In some cases, sound modules have expanded capacity for sounds in comparison to the controller-equipped version.

Hardware sound modules have in recent years been replaced to a large extent with [software equivalents](#).

## Notable sound modules

Yamaha TX16W (1988), sound module with an ability to boot OS from diskette; known particularly well for having a third-party OS codenamed Typhoon 2000 by NuEdge Development, a group of hackers who were dissatisfied with original OS.  
Roland Sound Canvas series (1991), first sound module to implement General MIDI standard with GS extensions.

Categories: [Synthesizers](#)

# Recorded music

**Sound recording and reproduction** is the electrical or mechanical re-creation and/or amplification of sound, often as [music](#). This involves the use of audio equipment such as microphones, recording devices and loudspeakers. From early beginnings with the invention of the phonograph using purely mechanical techniques, the field has advanced with the invention of electrical recording, the mass production of the 78 record, the magnetic wire recorder followed by the tape recorder, the vinyl LP record. The invention of the compact cassette in the 1960's, followed by the walkman, gave a major boost to the mass distribution of music recordings, and the invention of digital recording and the compact disc in 1983 brought massive improvements in ruggedness and quality. The most recent developments have been in digital audio players like the Apple iPod.

The field covers many areas, from Hi-Fi to Professional audio, Internet radio and Podcasting.

Developments in recording and editing have transformed the record, movie and television industries in recent decades. Editing became practicable with the invention of magnetic tape recording but computers and digital processing made it much easier, quicker and more powerful. We now divide the process of making a recording into tracking, mixing and mastering. Multitrack recording makes it possible to capture sound from several microphones, or from different 'takes' to tape or disc with maximum headroom and quality, allowing maximum flexibility in the mixing and mastering stages for editing, level balancing, compressing and limiting, and the addition of effects such as reverberation, equalisation, flanging and many more.

The Beatles, under producer George Martin, were among the first to experiment with multitrack techniques and effects on the album Sgt. Pepper's Lonely Hearts Club Band.

# Soundtrack

**Soundtrack** refers to the recorded sound accompanying a visual medium such as a motion picture, television show, or video game.

## **Physical portion of film**

In terms of film formats, the soundtrack is the physical area of the film which records the synchronized sound.

# Movie and television soundtracks

*Main article: [film soundtrack](#)*

The term **soundtrack** most commonly refers to the [music](#) used in a movie (or television show), and/or to an [album](#) sold containing that music. Sometimes, the music has been recorded just for the film or album (e.g. Saturday Night Fever). Often, but not always, and depending on the type of movie, the soundtrack album will contain portions of the score, non-diegetic music composed for thematic effect as the movie's plot occurs. In 1916, Victor Schertzinger recorded the first music specifically for use in a motion picture, and releasing soundtracks of songs used in films became standard in the 1930s. Henry Mancini, who won an Emmy Award and two [Grammys](#) for his soundtrack to *Peter Gunn*, was the first composer to have a widespread hit with a song from a soundtrack.

The *soundtrack* on a record can contain all kinds of music (including "inspired by"; see the *Harry Potter* soundtracks), contained in a movie; the *score* contains only music by the original film's composer(s).

The best-selling soundtrack to date is The Bodyguard, the lead single of which, "I Will Always Love You" by Whitney Houston, is one of the best-selling singles of all time.

## Video game soundtracks

Soundtrack may also refer to the [music used in video games](#). While sound effects were nearly universally used for action happening in the game, music to accompany the gameplay was a later development. Rob Hubbard and Martin Galway were early composers of music specifically for video games for the 1980s Commodore 64 computer. Koji Kondo was an early and important composer for Nintendo games. As the technology improved CD-quality soundtracks replaced simple midi files starting in the early 1990s and the soundtrack to popular games such as the Final Fantasy series began to be released separately. In addition to compositions written just for video games, advent of CD technology allowed developers to incorporate licensed songs into their soundtrack. (The Tony Hawk series is a well known example of this) Furthermore when Microsoft released the Xbox in 2001 it featured an option to allow users to customize the soundtrack for certain games by ripping a CD to the Hardrive.

## Book soundtracks

To this date, only twice has a soundtrack been written specifically for a book.

The foremost was written for Tolkien's *The Hobbit* and his trilogy *The Lord of the Rings*. It was composed by Craig Russell for the San Luis Obispo Youth Symphony. Commissioned in 1995, it was finally put on disk in 2000 by the San Luis Obispo Symphony.

A far more advanced soundtrack was introduced for the 1996 *Star Wars* novel *Shadows of the Empire* (written by author Steve Perry). Lucasfilm chose Joel McNeely to write a score. This was an eccentric, experimental project, in contrast to all other soundtracks, as the composer was allowed to convey general moods and themes, rather than having to write music to flow for specific scenes. A project called "Sine Fiction" has made some soundtracks to novels by science-fiction writers like Isaac Asimov and Arthur C Clarke, and have this far released 14 soundtracks to science-fiction novels or short stories. All of which is available for free download.

- [Film soundtrack](#)
- [Soundtrack album](#)

## Soundtrack album

A **soundtrack album** is any [album](#) that incorporates music from a particular feature film. In some cases, not all the songs from the movie are included in the album, however there are rare cases of songs in the trailers that do not appear in the movie but occur on the soundtrack album. Also, music that is not in the movie can sometimes be incorporated onto a soundtrack album; one notable example is the South Park: Bigger, Longer and Uncut soundtrack.

In some cases, recorded dialogue may be incorporated into the album. This comes in two kinds: audio clips from the movie itself (used on the album for Pulp Fiction, for example) or radio dramas that involve the characters from the movie involved in other events (example: King of Pirates, from FLCL)

# Origins

**Southern Gospel music** is a popular American form of Christian music. The birth of the genre is generally considered to be 1910, which is the year the first professional quartet was formed for the purpose of selling songbooks for the James D. Vaughan Music Publishing Company.

Southern Gospel is sometimes called "quartet music" by fans due to the original all male, tenor-lead-baritone-bass quartet make-up. Early quartets were typically accompanied only by piano or guitar. Over time, full bands were added and even later, pre-record accompaniments were introduced. A typical modern Southern Gospel group performs with pre-recorded tracks augmented by a piano player and possibly a few other musicians.

Some of the genre's roots can be found in the publishing work and "normal schools" of Aldine S. Kieffer and Ephraim Ruebush. Southern Gospel was promoted by traveling singing school teachers, quartets, and shape note music publishing companies such as the A. J. Showalter Company (1879) and the Stamps-Baxter Music and Printing Company. Over time, Southern Gospel came to be an eclectic musical form with groups singing black gospel-influenced songs, traditional hymns, a capella songs, country gospel, bluegrass, and the difficult 'convention songs'.

Convention songs typically have contrasting homophonic and contrapuntal sections. In the homophonic sections, the four parts sing the same words and rhythms. In the contrapuntal sections, each group member has a unique lyric and rhythm. These songs are called 'convention songs' because various conventions were organized across the United States for the purpose of getting together regularly and singing songs in this style. Convention songs were employed by training centers like the Stamps-Baxter School Of Music as a way to teach quartet members how to concentrate on singing their own part. Examples of convention songs include "Heavenly Parade," "I'm Living In Canaan Now," "Give The World A Smile," and "Heaven's Jubilee."

In the first decades of the twentieth century, Southern Gospel drew much of its creative energy from the Holiness movement churches that arose throughout the south. Early gospel artists such as The Carter Family and The Cook Family Singers achieved wide popularity through their recordings and radio performances in the 1920s and 1930s. Others such as Homer Rodeheaver, the Cathedral Quartet, George Beverly Shea and Cliff Barrows, became well-known through their association with popular evangelists such as Billy Sunday, Rex Humbard and Billy Graham.

## Representative Artists

Some of the best known southern gospel male quartets from various decades include the Blackwood Brothers, the Cathedral Quartet, J. D. Sumner & The Stamps Quartet, the Statesmen Quartet, the Jordanaires, the Imperials, Gold City, the Kingsmen, the Gaither Vocal Band, the Florida Boys, the Hoppers, the Masters V, the Inspirations and the Oak Ridge Boys.

Although the genre is known for its all male quartets, trios and duos have been a vital element of Southern Gospel for most of the genre's history, from the Sons Of Song, Wendy Bagwell & Sunliters, and the Happy Two in decades past to more modern groups like Greater Vision, the McRaes, the Crabb Family, the Hoppers and the Ruppes. Pioneer groups like the Speer Family, the Klautt Indian Family, the Chuck Wagon Gang, The Happy Goodman Family, the LeFevres, and the Rambos paved the way for modern mixed quartets and family-based lineups. Other famous family groups from various decades include the Hinsons, the Talleys, the Martins and the Bill Gaither Trio.

Unlike most forms of popular music where soloists (and/or soloists with background vocalists) generally outnumber vocally balanced groups, vocal groups thrive in Southern Gospel. However, the genre has a growing number of popular soloists. Many of these gained their initial popularity with a group before launching out on their own as soloists. The most popular of these being Squire Parsons, Kirk Talley, David L Cook, Ivan Parker, and Walt Mills.

## **Gaither Homecoming Series**

Traditional Southern Gospel music underwent a tremendous revival in popularity during the 1990s thanks to the efforts of Bill and Gloria Gaither and their Gaither Homecoming tours and videos, which began as a reunion of many of the best known and loved SGM individuals in 1991. Thanks in part to the Homecoming series, Southern Gospel music now has fans across the United States and in a number of foreign countries like Ireland and Australia.

## Today's Southern Gospel

In 2005, *The Radio Book*, a broadcast yearbook published by M Street Publications, reported 285 radio stations in the USA with a primary format designation as "Southern Gospel," including 175 AM stations and 110 FM stations. In fact, "Southern Gospel" was the 9th most popular format for AM stations and the 21st most popular for FM. Southern Gospel radio promoters routinely service more than a thousand radio stations which play at least some Southern Gospel music each week. Recent years have also seen the advent of a number of internet-only Southern Gospel "radio" stations.

Over the last decade, a newer version of Southern Gospel has grown in popularity. This style is called Progressive Southern Gospel and is characterized by a blend of traditional, modern country, and pop music elements.

Lyrically, most Progressive Southern Gospel songs are patterned after traditional Southern Gospel in that they maintain a clear evangelistic and/or testimonial slant. Next to musical styles and artist personalities, Southern Gospel purists view lyrical content as the key determining factor for applying the Southern Gospel label to a song.

Although there are some exceptions, most Southern Gospel songs would not be classified as Praise and Worship. Few Southern Gospel songs are sung "to" God as opposed to "about" God. On the other hand, Southern Gospel lyrics are rarely vague about the Christian message, which is a complaint many Southern Gospel fans have about non-P&W, but otherwise "Contemporary Christian music" (CCM), especially when those CCM songs "cross over" and receive recognition through airplay on mainstream radio.

## Southern Gospel Media

Southern Gospel became popular initially through songbooks. Southern Gospel is one of the few surviving genres that was there to exploit recording, radio, and television technologies from the very beginning and use these advancements to further promote the genre.

The dominant print magazine for Southern Gospel since the 1970s has been the *Singing News*. Their radio airplay charts and annual Fan Awards presentations are always popular topics for Southern Gospel fans to discuss.

The biggest e-zine for today's Southern Gospel is SoGospelNews.com, which has been reporting on Southern Gospel for over 10 years. The site contains the most recognized weekly Southern Gospel chart as well as the internet's largest Southern Gospel community with forums and a chat room. Their Annual SGN Music Awards are unique in that they recognize accomplishments made within the industry over the past year.

A number of other internet media outlets have been formed in recent years as well. The modern Southern Gospel fan may still subscribe to a magazine, but most keep up with their favorite artists via a Southern Gospel news site on the internet.

# Southern rap

**Stylistic origins:** A form of [hip hop music](#) that combines the elements of Jamaican Dancehall toasting with the rhythms of [R&B](#), [disco](#) and [funk](#) among other influences.

**Cultural origins:** Early-1980s Southern United States

**Typical instruments:** Prominent [drum machine](#) - [Turntable](#) - [rapping](#) - [Sampler](#) - [synthesizer](#) - human beatboxing

**Mainstream popularity:** Remains a staple of popular music since the late 1980s; dominant in the 2000s.

[Snap music](#) - [Dirty South](#) - [Crunk](#) - [Memphis rap](#) - New Orleans Rap - [Chopped and screwed](#) - [Miami bass](#) - Bounce music

**Southern rap** (or **Dirty South hip-hop**) is a type of [hip hop music](#) that emerged in the late-1980s as a popular force from cities such as Houston, Miami, Atlanta, Memphis and New Orleans.

## History and rise to popularity

In the late 1980s, a distinctive bass-heavy scene [Miami bass](#) evolved out of [electro hop](#) and similar hip hop-influenced dance scenes in Miami, including Luther Campbell and his group, 2 Live Crew. 2 Live Crew became infamous after their album, *Nasty As They Wanna Be* (1989) was banned in a Florida town and the group was subsequently arrested on obscenity charges after performing; the charges were eventually dismissed. The Miami Bass scene that 2 Live Crew typified is simply one form of southern rap and barely made any headway nationally.

The first rap group to put southern rap music on the map were the Geto Boys. The Geto Boys hailed from Houston, TX and consisted of Willie D, Bushwick Bill, and Scarface. Houston was the first city outside of New York City and Los Angeles to attract attention from the rap world. The musical strength of the Geto Boy's 1989 local debut, *Grip It! On That Other Level*, garnered the attention of Def Jam founder Rick Rubin to executive produce and release their 1990 nationwide debut *The Geto Boys*. However it was the Geto Boy's seminal 1991 hit, "Mind Playin' Tricks on Me", that broke down the barrier for southern rap. The raw and unforgiving lyrics about paranoia and losing one's mind proved to the nation that southern rap was more than the booty rap and Vanilla Ice antics produced out of Miami. The song is considered a hip-hop classic and proves to be influential even today. While hosting BET's Top 25 countdown in 2004, Outkast's Andre 3000 remarked that "Mind Playin' Tricks on Me" "put Southern rap on the map." The Geto Boy's Scarface later launched a successful solo career and is referred to the original "King of the South", solidifying Houston's status as one of the first cities in southern rap.

Five months after "Mind Playin' Tricks on Me" was released came Tennessee's Arrested Development, and their brand of uplifting, spiritual party singles from their debut LP, *3 Years, 5 Months & 2 Days in the Life Of...*. Their sound was a world apart from the sexually explicit, bass heavy party music of Miami, but sales were swift and reviews were raving. While Arrested Development was not able to keep their momentum going, their success did set the stage for the mainstream breakthrough of southern hip hop with OutKast and Goodie Mob in the middle of the decade.

OutKast, more than any other group, put Atlanta on the hip hop map, and became one of the most popular groups in hip hop by the end of the decade. *Aquemini*, their third LP, was a groundbreaking album that redefined southern hip hop, and was able to successfully appeal to both the core audience and the mainstream audience. While OutKast, Goodie Mob, and a number of other Atlanta-based acts (many, like OutKast and Goodie Mob, of them part of Organized Noize's Dungeon Family collective) balanced critical and commercial success, New Orleans rapper/label mogul Master P popularized a bounce-based sound that focused more on commercial appeal than artistry.

Master P's No Limit label popularized rappers such as Mystikal and Silkk the Shocker, and the competing Cash Money label presented acts such as The Hot Boys (The B.G., Juvenile, Lil Wayne, and Turk). The No Limit/Cash Money formula was also successful co-opted by Miami's Slip-N-Slide label, which included Trick Daddy and Trina. Labels such as Cash Money and No Limit also caused Dirty South music to be associated with "mass produced" albums released in rapid succession. The CD packaging for these releases typically featured brightly-colored, heavily Photoshopped "bling bling"-style album covers; and a whole page of the liner notes for each LP was usually devoted to advertising its follow-ups.

A number of other southern cities were the home base for popular hip hop acts. The controversial Three Six Mafia hailed from Memphis, Tennessee, Scarface and The Geto Boys from Houston, Texas, Nappy Roots from Bowling Green, Kentucky, Petey Pablo from Greenville, North Carolina, and Missy Elliott, Timbaland, and The Neptunes from Virginia Beach.

Southern rap is, arguably, the most popular form of hip-hop today. East Coast (most notably New York) critics, DJ's, and even a few rappers have frequently expressed their distaste for Southern dominance, the latest being 50 Cent in a recent MTV.com interview, while East Coast rap is currently struggling for mainstream recognition. Some hip-hop experts speculate that this will eventually lead to a regional war, a la the infamous East Coast/West Coast feud.

## Typical features

Stylistically, Dirty South is notably different from its northern and western counterparts. Whereas [East Coast hip hop](#) has historically been associated with complex lyrics and sparse urban beats, contemporary southern rap is largely characterized by its upbeat, exuberant, club-friendly tunes, and simplistic rhythmic lyrical delivery. Within certain esoteric hip-hop circles, Southern rappers have been criticized for a perceived over-reliance on production and lacking [lyrical substance](#) or creativity. In particular, [crunk](#) music (a popular offshoot of New Orleans Rap's bounce music) has been criticized for its repetitive chants and its materialistic and sexually-profane content. Despite these criticisms, the Southern rap genre is now one of the dominant forces driving hip-hop record sales.

The production style of southern rap can veer towards either a [soul](#)-based sound (Dungeon Family, Arrested Development) or a more "street" sound (No Limit, Cash Money, Mystikal). Where most East Coast rap operates at tempos around 90-120 beats per minute, Southern rap runs rhythms at 140-160, upwards of 180 beats per minute, and then places the snare twice as far apart from one another. This leaves more time to be filled between the kick (on the down beat of the first measure) and the snare (on the downbeat of the second). Sometimes this space is filled with quick trills of hi-hats, a style pioneered by Three 6 Mafia and Hit Man Sammy Sam's Big Oomp Records; other times, it is filled with additional snare patterns, for instance, Pastor Troy's "Ain't No Mo Play in G.A.", or Miracle's "Bounce". The fastest and slowest rhymer in hip-hop both belong to southern rap, as different talents adapt to the music's distinct tempo. Sampling, while still used, is less common in Southern hip-hop production.

A mainstay feature of hip-hop has always been giving 'shout-outs' to entire coasts, states, or cities, but a more recent trend that is particularly common in southern rap has been to include much more specific shout-outs to specific neighborhoods or local jurisdictions, such as the wards of New Orleans, for example, and particular housing projects.

## Southern rock

**Southern rock** is a style of [rock music](#) that was very popular in the 1970s, and retains a fan base to the present.

## 1950s and 1960s – Origins

Rock music's origins lie mostly in the music of Southerners, and many stars from the first wave of 1950s [rock and roll](#) such as Elvis Presley, Little Richard, and Jerry Lee Lewis hailed from the Deep South. But the British Invasion, and the rise of [folk rock](#) and [psychedelic rock](#) in the middle 1960s, shifted the focus of new rock music away from the rural south and to large cities like Liverpool, London, New York, San Francisco, and Los Angeles.

In the late 1960s, traditionalists such as Creedence Clearwater Revival (from Northern California), and The Band (Canadian, though drummer Levon Helm is a native Arkansan) revived interest in the roots of rock music.

## 1970s – Peak of popularity

Eventually the spotlight once again turned to bands from the American South. The Allman Brothers Band out of Macon, Georgia made their national debut in 1969 and soon gained a loyal following. Their [blues](#)-rock sound on one hand incorporated long jams informed by [jazz](#) and [classical music](#), and on the other hand incorporated softer elements of [country](#) and [folk](#) with a Southern feel. The death of guitarist and leader Duane Allman in 1971 did not prevent them from gaining widespread popular appeal for the next several years, until internal tensions broke them apart after 1976.

The Allmans were signed to Capricorn Records, a small Macon outfit headed by Phil Walden (former manager of Otis Redding). A number of somewhat similar acts also recorded on Capricorn, including the Marshall Tucker Band from South Carolina, Wet Willie from Alabama, Grinderswitch from Georgia (and comprised of Allmans roadies), and the Elvin Bishop Band from Oklahoma.

Not on Capricorn, but loosely associated with this first wave of Southern rock, were Barefoot Jerry from Tennessee and the Charlie Daniels Band from Tennessee. Indeed it was Charlie Daniels, a big-bearded fiddler with a knack for novelty songs, who gave Southern rock its self-identifying anthem with his 1975 hit, "The South's Gonna Do It", whose lyrics mentioned all of the above bands and then asserted: "Be proud you're a rebel / Cause the South's gonna do it again." A year earlier, Daniels had started the Volunteer Jam, an annual concert held in Tennessee that would bring together many Southern rock artists in a loose setting.

In the early 1970s, a different wave of [hard rock](#) Southern groups emerged that emphasized stripped down boogie rhythms, fast guitar leads derived from [heavy metal](#), and lyrical themes borrowed from the concurrent [outlaw country](#) movement. Also mentioned in "The South's Gonna Do It", Lynyrd Skynyrd out of Jacksonville, Florida dominated this genre until the deaths of lead singer Ronnie Van Zant and other members of the group in a 1977 airplane crash. Groups such as 38 Special, The Outlaws, Molly Hatchet, Blackfoot, and Black Oak Arkansas also thrived in this genre for a time.

This branch of Southern rock's use of Southern imagery, in particular the Confederate Rebel Flag, and lyrics seemingly extolling redneck values drew considerable criticism and derision. Some groups such as Black Oak Arkansas played up these images to the point of obvious parody. More attention was focused on Lynyrd Skynyrd's "Sweet Home Alabama" (1974), widely perceived as a redneck anthem and containing lines pointed at Neil Young's song "Southern Man" (which indicted Alabama as a state full of George Wallace-style segregationists). How Van Zant really meant "Sweet Home Alabama" is much debated, with many taking it as ironic or satiric and pointing out that Young and Van Zant respected each other as musicians.

In any case, this redneck strain was not universal in Southern rock; the Allman Brothers had multiple African American members (percussionist Jai Johanny Johanson and bassist Lamar Williams) at a time when mainstream rock was actively resegregating. Moreover, the Allmans' Southern feel came more from the temperament of its music ("Hot 'Lanta", "Little Martha", interpolations of "Will the Circle Be Unbroken") than any explicit cultural identification. Phil Walden, the Allmans, and other Capricorn artists had also played a part in Jimmy Carter's successful, unity-based run for the presidency; Carter himself was an avowed Allmans fan. Even within the Skynyrd branch of Southern rock, the appearance of Molly Hatchet on the dance-oriented show Solid Gold showed that the redneck rock/metal combination had some universal appeal.

Not all Southern rock artists fit into the above molds. The Atlanta Rhythm Section and the Amazing Rhythm Aces were more focussed on tight vocal harmonies, while the Dixie Dregs and Allmans offshoot Sea Level explored [jazz fusion](#).

## 1980s and on – Continuing influence

Southern rock gained popularity far beyond the American south, and influenced groups as far flung as Australia's AC/DC and Britain's Def Leppard. Hard rock fans appreciated the blazing guitar solos, and working class listeners responded to the lack of glamour and rock star pretension in this music.

However, by the beginning of the 1980s, with the Allmans and Skynyrd both broken, with Capricorn Records in bankruptcy, and with Jimmy Carter out of office, much of Southern rock had become thoroughly enmeshed into corporate [arena rock](#). With the rise of MTV, New Wave, and hair metal, most surviving Southern rock groups were relegated to secondary or regional venues.

One notable exception was Texas' ZZ Top, who had started in 1970 and were the final band mentioned in "The South's Gonna Do It". In the 1980s they added slick [synthesizer](#) production to their boogie blues sound, and skillfully used [music videos](#) to achieve great popularity. There were occasional hits by groups such as the Georgia Satellites as well.

During the 1990s the Allman Brothers reunited and became a strong touring and recording presence again, and the jam band scene revived interest in extended improvisatory music (although the scene also owed much to the Grateful Dead, a group that relied heavily on southern music traditions). Incarnations of Lynyrd Skynyrd also made themselves heard. Hard rock groups with southern rock touches such as Jackyl renewed some interest in Southern rock, while groups such as Kings of Leon combined Southern rock with rawer genres, such as [garage rock](#). Classic rock radio stations played some of the more familiar 1970s works, and Daniels' Volunteer Jam concerts were still going.

But most rock groups from the South, such as Georgia's R.E.M., B-52's, Widespread Panic, and Black Crowes, and Mississippi's Blind Melon, incorporated Southern musical and lyrical themes without explicitly allying with any Southern rock movement.

In 2005 Southern rock received new exposure from an unlikely source: singer Bo Bice took an explicitly Southern rock sensibility and appearance to a runner-up finish on the massively watched but normally pop-oriented American Idol television program. Fueled by a key early performance of the Allmans' "Whipping Post" and later performing Skynyrd's "Free Bird" and, with Skynyrd on stage with him, "Sweet Home Alabama", Bice demonstrated – and Idol judge Randy Jackson celebrated – that Southern rock still had a place in the American music pantheon. More recently, metal acts like Black Label Society, Every Time I Die, The Showdown and Maylene and the Sons of Disaster have blended strong Southern Rock influences with heavy metal music. A number of crossover acts from country music also are reviving the genre. Among these are Drive-By Truckers, Ryan Adams, Cross Canadian Ragweed, The Great Divide, and Reckless Kelly. These bands often come from Oklahoma's Red Dirt music scene or the Texas music scene as opposed to mainstream country meccas like Nashville. Probably one of the more unlikely blends is that of punk and Southern Rock, most notably Slobberbone and Jason and the Scorchers (both now disbanded).

# Space rock

**Space rock** is a style of [music](#); the term originally referred to a group of early mostly British 1970s [progressive rock](#) and [psychedelic](#) bands like Hawkwind, characterized by heavy bass and drums, [synthesizers](#), and science fiction and drug references (such as Spacemen 3's legendary quotation: "taking drugs to make music to take drugs to"), though it was later repurposed to refer to a series of late 1980s British [alternative rock](#) bands with a more shimmering, melodic sound.

More than most genres of music, space rock has a single seminal album, Hawkwind's *Space Ritual* (1973), a two-disk live album advertised as "88 minutes of brain-damage" documenting Hawkwind's successful 1972 tour of their blow-out show complete with liquid lights and lasers, nude dancers (notably the earth-mother figure Stacia), wild costumes, and psychedelic imagery. This hard-edged concert experience provided an alternative to the increasingly relaxed work of Pink Floyd (and across the Atlantic the Grateful Dead) and attracted a motley but dedicated collection of psychedelic drugs users, science-fiction fans, and motorcycle riders.

The science fiction author Michael Moorcock collaborated with Hawkwind on many occasions: for example, he wrote the lyrics for many of the spoken-word sections on *Space Ritual* including the paranoid classic "Sonic Attack", and "The Black Corridor" included verbatim quotes from Moorcock's novel of the same name. More amusingly, Moorcock (with Michael Butterworth) wrote the band into fiction as superheroes in a post-apocalyptic England in 1976's *Time of the Hawklords* (with a later sequel written only by Butterworth titled *Queens of Deliria*).

An album *The New Worlds Fair* by "Michael Moorcock and the Deep Fix" was released in 1975, which included a number of Hawkwind regulars in the credits. ("The Deep Fix" was the title story of an obscure collection of short stories by "James Colvin" published in the 1960s). Moorcock wrote the lyrics to an album track entitled "Black Blade", referring to the sword Stormbringer in the Elric books, by the American band Blue Öyster Cult: Moorcock has even performed this song live with BÖC. The cyberpunk author John Shirley has also contributed to the lyrics of BÖC.

By the early 1990s, mainly British alternative rock genres like space rock, [twee pop](#), [shoegazing](#) and [noise pop](#) emerged into the mainstream with the explosion of [Britpop](#) bands like Blur, Suede and Oasis. By 1991, though, the original space rock bands had mostly fallen apart, and the musicians had moved on to new bands or new styles.

## **Oddity: Odd ditty**

The probable earliest example of something like space rock is a song written in the 1940s by Ewan MacColl and Peggy Seeger for a BBC radio show called *You're Only Young Once*. The song is called *Space Girl* and parodies most of the major themes of 1940s science fiction. (A version was recorded on "The World of Ewan MacColl and Peggy Seeger" volume 2: Songs from the radio ballads in 1971 on *Argo Records* label).

A much shorter version of the same song was recorded in the 1960s by Shirley Collins.

## Early space rock

Sheb Wooley - Purple People Eater (1958)

Joe Meek and The Blue Men - "I Hear A New World - An Outer Space Music Fantasy" (1960)

The Tornados - Telstar (1962) (which was also the first number one hit for a British group in the American chart)

# Spacesynth

**Spacesynth**, also known as **synthdance**, **spacedance** and **spacedisco**, is a genre of electronic [dance](#) derived from [italo disco](#). Most tracks are completely instrumental and are focused on upbeat futuristic, science fiction and epic battle scene style themes with driving basslines and catchy [synthesizer](#) riffs. The genre began in the mid-1980s and lasted until the early 1990s. Most of the artists were centered around Italian label Memory Records. Since the genre's decline it has gone underground, with new albums being published by a number of European independent [record labels](#).

# History

At that time synthesizers and [electronic](#) sounds had become an essential part of [popular music](#) and were widely used by such artists as Vangelis, Jean-Michel Jarre, Kraftwerk and Art of Noise. [Synthpop](#) hits like Magnetic Fields 2, Pulstar and Magic Fly are well known tracks even today.

In the meantime in Italy a music style called italo disco was dominating [discos](#). At first spacesynth was just an instrumental version of italo disco focusing on the synth side of the style, but eventually it evolved into a genre in its own right. Cyber People released successful singles "Polaris" and "Void Vision" for the Memory Records. Koto developed his own Italo-inspired synth music style and the single "Visitors" was a big hit in 1985.

Soon after there were other similar groups - also outside of Italy. Erik van Vliet from The Netherlands established Laserdance, and together with Michiel van der Kuy, Laserdance became the most successful spacesynth group ever. Their debut album "Future Generation" (1987) sold approximately 150 000 copies and the singles "Powerrun" and "Humanoid Invasion" were big hits in Europe. Koto and Laserdance could be considered the most popular spacesynth groups. They set the standards of the genre and since the golden era of spacesynth many producers have tried to replicate that sound.

In the early 1990s spacesynth started to lose its popularity and almost completely vanished during the 1990s when [eurodance](#), [house](#), [techno](#) and their subgenres were dominating electronic music charts. Spacesynth was nearly forgotten until it showed some signs of recovering towards the end of the decade. There has recently been a growing interest in spacesynth again as the 1980s melodic sound is becoming popular again. During the last few years Hypersound and Alpha Centauri have released a numerous of spacesynth albums from many new artists.

# Spank jazz

**Spank jazz** is an underground musical genre which combines [jazz](#) idioms with elements of [funk](#), [hip hop](#), [rock](#), [popular](#) and [electronic music](#). The name of the style was coined in 2005 upon the release of the Coventry band Hojo's debut, and only album Glassbox. The album itself features the track Spank Jazz from which the style's name and slovenly characteristic is derived. The style of spank jazz was notably pioneered by Sunim Korja; a composer, producer and multi-instrumentalist, and a founding member of Hojo, together with musician/composer Rudy Gaw and singer-songwriter Verity Pabla. A vast number of stylistic influences of spank jazz are drawn from a diverse range of artists such as Beck, Tricky, James Brown and Brian Wilson, together with the arrangements of Gil Evans (Miles Davis' collaborator) and the work of the American composer George Gershwin.

As of 2006 spank jazz remains deeply rooted in the underground music scene of Coventry, possibly to be long-lost due to the disbanding of Hojo in mid-2005. However, spank jazz remains an eclectic style of music playing a significant, albeit minor role in the evolution of contemporary jazz.

# Spectral music

**Spectral music** is [music](#) that is concerned with [timbral](#) structures, especially when decisions about timbre are informed by a mathematical analysis known as a Fast Fourier Transform. FFTs can be used to provide graphs that illustrate details about the timbral structure of a sound, which might not be initially apparent to the ear. FFTs can also be used in creating sounds with computers, in order to transform the timbre of a sound in various ways, such as creating hybrid timbres through a collection of processes known as cross-synthesis, or applying a room reverberation to a sound through a process known as convolution.

Spectral music was first associated with France and especially with the music of Gérard Grisey, Tristan Murail, Phillippe Leroux, and Phillippe Hurel. As was the case with [impressionism](#) and many other labels for musical style, those composers whose music has been called "spectral" do not generally accept the label.

# Speed metal

**Stylistic origins:** [Power Metal](#) - [Thrash Metal](#)

**Cultural origins:** Early-Mid 1970s, United Kingdom

**Typical instruments:** [Guitar](#) – [Bass guitar](#) – [Drums](#)

**Mainstream popularity:** Moderate in the late 1970's, Slightly more popular until early 1990's, Underground ever since

[Thrash Metal](#) – [Groove metal](#)

United Kingdom - United States

**Speed metal** is a cross-genre reference to bands, mainly from the [thrash metal](#) and [power metal](#) genres. The term is mainly used to differentiate between bands of either genre who use tempos or beats that are faster than is normal for either genre, but also tends to refer to bands that combine aspects of the two genres. *Thundersteel* by Riot (CBS/Sony 1988) is widely considered to be a seminal speed metal album. Bands such as Judas Priest and Accept, although not typically cited as speed metal bands, are usually considered to be the main developers of the faster tempos common amongst speed metal bands.

Speed metal does not belong only to a genre of bands that possess a typical style ;for instance, some [glam metal](#) bands' and [heavy metal](#) bands' songs can also be classified as speed metal. For example, titles like "Queen of the Reich" (Queensrÿche), "Slave to the Grind" (Skid Row), "Robotman" (Scorpions), "Paris is Burning" (Dokken), "Live Wire" (Mötley Crüe), "Tear it Loose" by (Twisted Sister), "Be Quick or Be Dead" (Iron Maiden), "Hell to Eternity" (W.A.S.P.), "Badboys" (Whitesnake), "Kill the King" (Rainbow) and "Scream of Anger" (Europe) are speed metal songs.

Two of the earliest speed metal songs are Deep Purple's "Highway Star" from their 1972 album *Machine Head* and Black Sabbath's "Into the Void", from their 1972 album *Master of Reality*. Earlier efforts with a similar style include Black Sabbath's "Paranoid" (from the album of that name, 1970) and also Deep Purple's "Speed King" (from the 1970 *In Rock* LP) and "Fireball" (From the 1970 *Fireball* LP). However, it was "Highway Star" that introduced into heavy metal both the extreme speed of the single-note riffing and also the complex guitar and keyboard solos (performed by Ritchie Blackmore and Jon Lord, respectively), borrowed from progressive rock of the '70s, but heavily influenced by [classical music](#). These features commonly went on to be associated with more modern [metal genres](#), but at the time, was typical of speed metal characteristics.

Later speed metal includes X Japan's *Ill Kill You* (1985), Helloween's *Walls of Jericho* (1985), Motörhead's live album *No Sleep 'til Hammersmith* (1981), and the band Megadeth, who consider themselves as the "World's State-of-the-Art Speed Metal Band". Prior to joining Megadeth, Marty Friedman collaborated with Jason Becker in the band Cacophony, who are often cited as speed metal.

The term "speed metal" is still used to glorify and differentiate bands with high-speed playing, though the term is branching out to include bands from both [gothic metal](#) and [progressive metal](#) as well. Some believe that Painkiller (1990), the last album Judas Priest released before the departure of singer Rob Halford (who would later return in 2004), has set a new standard for speed metal.

# Speedcore

**Speedcore** is a form of [hardcore techno](#) that is typically identified by its high rate of beats per minute and aggressive themes. Tracks can range from 235 BPM all the way up to 1000 BPM and above (there is some debate around a genre called extratone, in which the music must be 1000 BPM or above and is soaked in noise. Some say it doesn't exist while others feel it surpasses speedcore in intensity). Unlike other styles of aggressive [dance music](#) like [gabber](#), the high rate of BPM makes Speedcore less accessible as a danceable genre, although most fans of the genre headbang and [mosh](#) to the music.

The typical speedcore track is characterized by a general anti-music and anti-establishment sentiment. The music is angry, aggressive and often attempts to foster an atmosphere of hostility for the listener. Speedcore [DJs](#) push the boundaries of [electronic dance music](#) and often use offensive themes in their music to create such extremes.

While most speedcore artists are content to attack the normal standards of music, or even the gabber music that spawned them, the extremism of speedcore has caused some to turn inwards and parody the standards of the genre. Much like how [happy hardcore](#) relates to gabber and hardcore techno, these songs utilize samples of lighter and more manic themes, like Bing Crosby and Futurama, to create their extreme sound.

## Characteristics

Aside from the very fast tempo of speedcore, which never drops below 235 BPM, speedcore can often be distinguished from other forms of [hardcore techno](#) by an aggressive and overridden electronic percussion track that is often punctuated with hyperactive snare or tom-tom fills. The Roland TR-909 is often the [drum machine](#) of choice for speedcore performers due to its ability to generate heavily distorted bass-drum kicks that anchor the percussion tracks.

As with many other forms of techno, [synthesizers](#) are also heavily used, often producing heavily distorted and/or disharmonic melodies to complement the underlying drums. Although any analog or hybrid synth can be used, the analog/digital hybrid Roland Juno-106 is a common favorite with speedcore artists. Pure digital synthesizers are comparatively rare in speedcore.

Samples are often used to further heighten the aggressive nature of speedcore, with many artists using audio samples of violent scenes from movies by directors such as Martin Scorsese and Stanley Kubrick. Samples of actors such as Joe Pesci and R. Lee Ermey are especially popular, especially in older speedcore works. Some artists are content to sample shouted obscenities and incorporate these samples into their music.

Phonograph turntables, usually specialized belt-drive and direct-drive models, are frequently used during the recording process to produce various "scratching" and speed distortion effects that are often difficult to produce with synthesizers. During live performances, most speedcore artists and DJs consider turntables indispensable.

## Raves and the "Scene"

Taken by itself, listening to speedcore on vinyl or a CD can be an exhilarating experience. Within the context of a speedcore [rave](#), however, external stimuli such as strobe lights, fog machines, and even costumes worn by some performers can heighten the adrenaline rush. Some choose to amplify the experience during raves by abusing alcohol and/or illicit drugs.

Speedcore raves often take place in "underground" dance clubs or industrial warehouses. While the average raver (including many gabbers) wear any kind of clothing that strikes their fancy, from campy "club kid" outfits to street clothes, speedcore aficionados often wear black or camouflage clothing, often imprinted with apolitical or anarchistic messages. Any outward expressions of political sentiment or actual calls for the use of violence to achieve social or political change are heavily discouraged, if not banned outright. Satirization of political themes is often common, with Nazism being a frequent target for abuse. The main reason for attending a speedcore rave, however, is similar to the reasons for slam-dancing at a [punk rock](#) concert or thrashing around in a mosh pit - it's an energy release where speedcore ravers gather to release their collective frustrations with the many facets of society with their friends, and lots of loud, fast, aggressive music.

# Spiritual

A **spiritual** is an African American song, usually with a Christian religious text. Originally monophonic and a cappella, these songs are antecedents of the [blues](#). The terms *Negro spiritual*, *Black spiritual*, and *African-American spiritual* are all synonyms; in the 19th century the term *jubilee* was more common (at least among African-Americans; whites often called them *slave songs*). Some musicologists call them *African-American folk songs*.

## Historical background

Spirituals were often expressions of religious faith, although they may also have served as socio-political protests veiled as assimilation to white, American culture. They were originated by African slaves in the United States. Slavery was introduced into the European colonies in 1619, and slaves largely replaced indentured servants as an economic labor force during the 17th century. This labor force would remain in bondage for the entire 18th century and much of the 19th century. They were set free with the ratification of the Thirteenth Amendment to the United States Constitution by United States Secretary of State William Henry Seward on December 18, 1865. The Amendment was passed by Congress January 31, 1865, and was ratified by 27 of the then 36 states.

During slavery in the U.S., there were systematic efforts to de-Africanize the captive black workforce. Slaves were forbidden to speak their native languages, to play drums, or practice their mostly Animist and Muslim faiths. They were urged and often forced to become Christians by slavemasters who often used Christianity as a tool of control.

Scholars debate the degree to which Christianity among African slaves in the U.S. was a syncretic faith, but there is no doubt blacks suffused their practice of religion with African religious beliefs and customs. The imprint of Africa was evident in the oral and musical traditions in the style and cadence of liturgical delivery, and in call and response in song and sermon; in the use of blue notes and syncopation in musical expression and dance styles; in the sometimes exuberant, but always very personal and democratic, self-expression through testifying, possession and speaking in tongues; and in full-immersion baptism. In comparison with the worship style of whites, Africanized Christianity was often lively, loud and spontaneous.

It was not long before further restrictions were placed on the religious expression of slaves. Rows of benches in places of worship discouraged congregants from spontaneously jumping to their feet and dancing. The use of musical instruments of any kind often was forbidden, and slaves were ordered to desist from the "paganism" of the practice of spiritual possession. Nonetheless, the Christian principles that teach those who suffer on earth hold a special place with God in heaven undoubtedly spoke to the slaves who saw this as hope and could certainly relate to the suffering of Jesus.

Because they were unable to express themselves freely in ways that were spiritually meaningful to them, slaves often held secret religious services. During these "camp meetings" and "bush meetings," worshippers were free to engage in African religious rituals such as spiritual possession, speaking in tongues and shuffling in counterclockwise ring shouts to communal shouts and chants. It was there also that slaves further crafted the impromptu musical expression of field songs into the so-called "line signing" and intricate, multi-part harmonies of struggle and overcoming, faith, forbearance and hope that have come to be known as "Negro Spirituals."

While slaveowners used Christianity to teach slaves to be long-suffering, forgiving and obedient to their masters, as practiced by slaves, it became a kind of liberation theology. The story of Moses and The Exodus of the "children of Israel" and the idea of an Old Testament warrior God who struck down the enemies of His "chosen people" resonated deeply with slaves ("He's a battleaxe in time of war and a shelter in a time of storm"). In black hands and hearts, Christian theology became an instrument of liberation.

So, too, in many instances did the spirituals themselves. Spirituals sometimes provided comfort and eased the boredom of daily tasks, but above all, they were an expression of spiritual devotion and a yearning for freedom from bondage. In song, lyrics about the Exodus were a metaphor for freedom from slavery. Songs like "Steal Away (to Jesus)", or "Swing Low, Sweet Chariot" raised unexpectedly in a dusty field, or sung softly in the dark of night, signalled that the coast was clear and the time to escape had come. The River Jordan

became the Ohio River, or the Mississippi, or another body of water that had to be crossed on the journey to freedom. "Wade in the Water" contained explicit instructions to fugitive slaves on how to avoid capture and the route to take to successfully make their way to freedom. Leaving dry land and taking to the water was a common strategy to throw pursuing bloodhounds off one's trail. "The Gospel Train", and "Swing Low, Sweet Chariot" all contained veiled references to the Underground Railroad, and "Follow the Drinking Gourd" contained a coded map to the Underground Railroad. The title itself was a reference to the Big Dipper, which pointed the way to the North Star and freedom.

"Swing Low, Sweet Chariot" is one of the best known spirituals:

(Refrain)

Swing low, sweet chariot,  
Coming for to carry me home,  
Swing low, sweet chariot,  
Coming for to carry me home.

I looked over Jordan, and what did I see?  
Coming for to carry me home,  
A band of angels coming after me,  
Coming for to carry me home.

(Refrain)

If you get there before I do,  
Coming for to carry me home,  
Tell all my friends I'm coming, too.  
Coming for to carry me home.

(Refrain)

I'm sometimes up and sometimes down,  
Coming for to carry me home,  
But still my soul feels heavenly bound,  
Coming for to carry me home.

(Refrain)

The brightest day that I can say,  
Coming for to carry me home,  
When Jesus washed my sins away,  
Coming for to carry me home.

(Refrain)

- Traditional

## Choral arrangements of the spiritual

With the advent of Harry Burleigh (1866–1949), the spiritual began to develop into a sophisticated art form. Burleigh attended the conservatory in New York City that was founded by Jeannette Thurber. Seeking to attract a prestigious faculty, Thurber had asked Czech composer Antonín Dvořák to head her conservatory; Dvořák agreed to do so, on the condition that talented Native American or African American composers be allowed to attend without paying tuition. Burleigh was accepted as a student, and became Dvořák's protégé, during which time he sang the traditional spirituals for Dvořák. With Dvořák's encouragement, Burleigh began to compose classical song and choral arrangements of spirituals, which were later made famous by artists such as the Fisk Jubilee Singers, Marian Anderson, Robert McFerrin Sr., and William Warfield. Another notable artist who had a successful career singing classical music and spirituals was Roland Hayes. In fact he made history by coming to Boston from Georgia to study voice, but was faced with obstacles all along the way. He never gave up and became the first African-American singer to sing in Boston's Symphony Hall. He went on to sing to great acclaim in Europe and throughout the United States. Today, the Roland Hayes School of Music, Boston's only and oldest high school of music, stands as a testament to his contribution to music and his people. Another great composer of classical settings of spirituals was Hall Johnson (1887–1970).

Some examples of spirituals which were set in this way are "Ride On King Jesus," "Ain't Got Time to Die," and "Hold On."

## Split album

A **split album** (or **split**) is a music [album](#) which includes tracks by two or more separate artists. This is similar in nature to the way some [singles](#) that are released. A split was initially done on vinyl records, with music from one artist on one side of the record and music from a second artist on the opposite side. As vinyl records have declined in popularity, this format has been done on CDs. Although there is not multiple sides to a CD, the idea is still the same. From the early 1980s through the present, the format has been used widely by independent record labels, and artists in [punk rock](#), [hardcore](#), and [indie rock](#) circles have often released music in this way.

# Square dance

**Square dance** is a [folk dance](#) where four couples (eight dancers) begin and end each sequence in a square formation, with one couple on each side of a square. This is called being in your "sets-in-order". The dance was first described in 17th century England but was also quite common in France and throughout Europe. It has become associated with the United States of America due to its historic development in that country.

The various **square dance steps** are based on the steps used in traditional folk dances and social dances of the various people who migrated to the USA. Some of these traditional dances include Morris dance, English Country Dance, and the quadrille. Square dancing is enjoyed by people around the world, and people around the world are involved in the continuing development of this dance.

**Square dancers** are prompted or cued through a sequence of steps (**square dance choreography**) by a **square dance caller** to the beat of music. The caller leads, but usually does not participate in the dance.

## Two types of square dancing

There are two different types of square dance:

- Traditional square dance, which nowadays is frequently presented in alternation with contra dances, and is most prevalent in New England, with Appalachia and the South being close seconds. Another name for a traditional square dance is quadrille, a dance which originated in mid-18th century France, and spread in popularity throughout upper-class England and the rest of Europe.
- Modern Western square dance, which is also called "Western square dance", "contemporary Western square dance", or "modern American square dance". The basis of modern Western square dance was established during the 1930s and 1940s by Lloyd Shaw, who solicited definitions from callers across the country in order to preserve traditional American folk dance. Since the 1970s modern Western square dance has been promoted and standardized by Callerlab, the international association of modern Western square dance callers. Modern Western square dance is sometimes presented in alternation with [round dances](#).

## Comparing square dance calls

In this context a "call" refers to the name of a specific dance step. It may alternatively refer to the phrase used by a caller to cue the dancers so they dance the specified step, or to the dance step itself. It mirrors the ambiguity of the word "dance", which may mean a dance event, the dancing of an individual to the playing of one piece of music, or dancing in general.

A square dance call may take a very short time or a very long time to execute. In traditional square dancing the timing of a call is fitted to the music, but in modern Western square dancing many calls have been given formally-specified durations, usually 4-32 "counts" (where a count is roughly one step).

Traditional and modern Western square dancing have a number of calls in common, but there are usually small differences in the way they are performed. For example, the "Allemande Left" is traditionally performed by grasping left hands with the other dancer, leaning backwards slightly, and walking halfway around a central axis then stepping through. In modern Western dance the grip is modified so that each dancer grips the forearm of the other, and there is less leaning. These modifications make it easier to enter and exit the step, and thus easier to incorporate into a long sequence of calls.

Traditional square dance uses about forty or fifty calls, and every dance is explained before you dance it. There is a list of some examples of traditional square dance steps at [Conradance](#). Participants are made to feel welcome to make mistakes (within limits), and the mistakes can sometimes make the dance a lot more fun.

In modern Western square dance the participants are expected to have learned and become proficient in a particular *program*, a defined set of calls. Dancing modern Western square dance is constantly challenging and surprising due to the unknown or unexpected choreography of the caller (i.e. the way the caller ties together the "calls" and the formations which result)—unlike traditional square dance, very rarely are two modern Western dances ever alike! Like traditional square dancing, recovering from occasional mistakes is often part of the fun, but dancers are usually encouraged to dance only those programs at which they are fairly proficient.

## Comparing square dance music

The two types of square dance are accompanied by different types of music.

Traditional square dance is danced to traditional "country dance" music: Irish jigs and reels for the most part, as well as folk music from Quebec (Canada), England, Scotland, and other countries. The music is almost always performed live by a traditional dance music band, and played on acoustic instruments, such as the fiddle. [banjo](#), [guitar](#) and double bass. "Old time music" is one form of dance music played at traditional square dances.

Modern Western square dancing is danced to a variety of music types, everything from pop to traditional country to Broadway musical to contemporary [country music](#)—even rock and techno. The music is usually played from recordings; the beat is also somewhat faster, as the "perfect" modern Western square dance tempo is 120-128 bpm. At this speed dancers take one step per beat of the music.

## Other comparisons

Modern Western square dance is organized by [square dance clubs](#). Clubs offer classes, social and dance evenings, as well as arrange for larger dances which are usually open to the general square dancing public (i.e. non-club members). Larger dances sometimes request a strict western-style dress code, which originated in the late '50s and early '60s and is known as "traditional square dance attire", although it was not traditional before that time. Clubs may choose to advertise their dances as requiring less strict dress codes known as "proper" or "casual" (no dress code). Traditional square dance groups are less structured and often have no particular dress code.

## Designations

Square dance is the State Dance or the State [Folk Dance](#) of numerous states in the USA.

## The Promenade Act

The *Promenade Act* (H. R. 645) is a bill before the United States Congress that proposes that Square Dance be designated as the national folk dance, and that defines certain other dances (i.e. [round dance](#), the contra dance, the [line dance](#), the heritage dance, and clogging) as square dance.

# Squeezebox

The term **Squeezebox** is a colloquial expression referring to any [musical instrument](#) of the general class of hand-held bellows-driven [free reed aerophones](#). The term is so applied because such instruments are generally in the shape of a rectangular prism or box, and the bellows is operated by squeezing. Some consider squeezebox to be a derogatory term, although no concise English term exists to replace it.

# Examples

- [Accordion](#)
- [Concertina](#)

## St. Louis blues

The **St. Louis blues** is a type of [blues](#) music. It is usually more [piano](#)-based than other forms of the blues, and is closely related to the [jump blues](#), [ragtime](#) and piano blues. Typically, a small number of singers, a pianist and a few other instruments (used primarily for rhythm) make up a band.

# Stadium anthem

**Stadium anthems** or **sports anthems** are a musical genre identifying songs that are played over the public address systems at stadiums and arenas during breaks in the action to rally the fans. Unlike college [fight songs](#), stadium anthems were not written for use at sports events.

Stadium anthems are characterised by a catchy up tempo rhythm and a repeated vocal catchphrase, often a statement of pride or arrogance. Most stadium anthems are drawn from popular [rock and roll](#) or [rap](#) hits. Others are drawn from familiar movie scores, particularly elements of the Star Wars and Jaws soundtracks.

Some stadium anthems are popular in a particular region, or with a specific team because of a reference in the song's lyrics. The Stormers run onto the pitch with Will Smith's Men In Black playing, because of their all black kit. The Dallas Cowboys made heavy use of "Should've Been a Cowboy" by Toby Keith in the 1990s, while sports teams in Alabama often use "Sweet Home Alabama" by Lynyrd Skynyrd. (The University of Alabama marching band often plays Deacon Blues by Steely Dan due to the school's mention in its lyrics.)

At college football games, the schools' [marching bands](#) often add stadium anthems to their repertoires.

Some of the more popular stadium anthems include:

- AC/DC - "For Those About to Rock (We Salute You)", "Thunderstruck", "Hell's Bells", and "You Shook Me All Night Long"
- Baha Men - "Who Let The Dogs Out"
- Beastie Boys - "Intergalactic "
- Benny Benassi - "Satisfaction"
- Black Eyed Peas - "Let's Get It Started"
- Black Sabbath - "Iron Man"
- Blur - "Song 2"
- Chumbawamba - "Tubthumping"
- Crystal Method - "Name Of The Game"
- Darude - "Sandstorm"
- Dream Theater - "Metropolis (Part 1)"
- Europe - "The Final Countdown"
- James Brown - "I Got You (I Feel Good)"
- Gary Glitter - "Rock and Roll Part 2" (sometimes referred to as the "Hey" song)
- Guns N' Roses - "Welcome to the Jungle"
- House of Pain - "Jump Around"
- Kool and the Gang - "Celebration"
- LL Cool J - "Mama Said Knock You Out"
- MC Hammer - "U Can't Touch This"
- Ted Nugent - "Cat Scratch Fever" (especially among teams with feline nicknames)
- Opus - "Live Is Life"
- Ozzy Osbourne - "Crazy Train"
- P.O.D. - "Boom"
- The Prodigy - "Firestarter"
- Queen - "We Will Rock You" and "We Are The Champions"
- Rolling Stones - "Start Me Up"
- Scorpions - "Rock You Like A Hurricane"
- Steam - "Na Na Hey Hey Kiss Him Goodbye"
- Survivor - "Eye Of The Tiger"
- Tag Team - "Whoomp, There It Is"
- Tina Turner - "Simply The Best"
- Twisted Sister - "We're Not Gonna Take It"

2 Unlimited - "Get Ready For This"  
Village People - "YMCA"  
Zombie Nation - "Kernkraft 400"

# Stage piano

A **stage piano** is a digital piano that reproduces sound electronically by the use of sampled or digitally modelled sounds. It differs from other digital [pianos](#) in their design — the stage pianos are just the keys and controls, not the stand and pedals that other digital pianos have. Additionally, stage pianos are typically more portable and flexible than other digital pianos for those, such as musicians on tour, who need to move their instruments frequently.

"**Stage Piano**" was also the model name of a range of electromechanical stringless pianos (not digital pianos) produced by Rhodes from 1970 to about 1985. Unlike the company's earlier Suitcase Piano, the Stage Piano had no built-in amplification or loudspeakers and was a completely passive instrument, analogous to an [electric guitar](#). Models produced were the "Mk I", "Mk II", "Mk III EK-10" and "Mk V" Stage Pianos.

## The keys

All stage pianos have weighted keys, like all digital pianos. If a stage piano has semi weighted keys, it is generally referred to as a keyboard. The number of keys is usually 88, which is standard for all modern acoustic pianos, but that is not mandatory. For instance, The Kurzweil SP76 has only 76 weighted keys, but is still called a stage piano because of its layout and weighted keys.

## The sounds

The sound spectrum of stage pianos is often wider than that of other digital pianos. The standard digital piano often has no more than a few acoustic and electric piano sounds, and some strings, [organs](#) or harpsichords. Stage pianos, on the other hand, often have a wider variety of sounds, like drum sounds, [woodwinds](#), brass, [electronic synthesizer](#), vocal sounds, strings ([guitar](#), [violin](#) etc) and so on.

## Popular stage pianos

Stoner doom

**Stoner rock** and **stoner metal** are interchangeable terms describing sub-genres of [rock](#) and [metal](#) music. Stoner rock often fuses slow-to-mid tempo, bassy guitar riffs, psychedelic jams, melodic, often slightly raspy vocals and stripped down 'raw' production to figuratively melt "a hundredweight of hot desert sand into metal". (NME about showcase stoner rockers Kyuss .)

## The Stoners

The progenitors of stoner rock, just like stoner rockers today, often share the characteristic that they and their audiences are stoners (i.e. recreational users of marijuana). While it would be grossly inaccurate to describe all fans and performers of the styles and bands listed on this page as marijuana users, it is certainly accepted that the effects of marijuana and the often low or psychedelic riffs of stoner music complement each other — which eventually lead to the common usage of the term "stoner rock" to define the genre.

There are synonyms to stoner rock, some of them in part created to separate the art itself from stoner-clichés, e.g. the term "desert rock", which is so called primarily because of Palm Desert stoner pioneers Kyuss. While desert rock is so closely related to stoner metal as to be synonymous, other related but not identical genres include [sludge metal](#) and [doom metal](#).

The kind of connection between stoner rock and the use of marijuana is not unique in music culture. Similar comparisons can be made between [dance music](#) and recreational drugs such as ecstasy. Various bands and artists who identify themselves as marijuana users, notably Pantera (who have included cannabis leaves on their t-shirts and other promotional items) and Green Day (whose band name is a reference for a day spent smoking marijuana) do not qualify as "stoner music" as the style of their musical output is largely outwith the genre.

# History

## The origins

Like most subgenres of music, the origins of stoner rock are hard to trace and pinpoint. Nevertheless, stoner rock has its known progenitors and signature songs that helped shape the genre. The notoriously influencing metal idols of Black Sabbath — especially due to their song "Sweet Leaf" — were a significant force in the evolution of stoner music.

As noted above, Black Sabbath were one of the first bands to popularize this type of music, although they were not the first to produce it, nor can they be accurately described as a stoner band. Various 60's and 70's bands experimented with guitar sounds that inspired future generations, with Jimi Hendrix, Pink Floyd and Led Zeppelin firmly among them. Hendrix's "Band of Gypsies" pumped out riff-laden, jam session type tunes with obvious psychedelic overtones, while Led Zep's "Physical Graffiti" displayed a lighter side to the emerging genre. However, it wasn't until after the [electropop](#) of the 80's and eventually [grunge](#) of the early 90's had taken the stage that people noticed that a new style of music was being created... out in the desert, where different styles of rock would be melted into something new, that is nowadays known as stoner rock. AllMusic summarizes this fusion as follows:

*"Stoner metal bands updated the long, mind-bending jams and ultra-heavy riffs of bands like Black Sabbath, Blue Cheer, Blue Öyster Cult, and Hawkwind by filtering their psychedelia-tinged metal and acid rock through the buzzing sound of early Sub Pop-style grunge."*

## The Palm Desert Scene

If any one band has become synonymous with a particular style or genre, Kyuss and stoner music are probably it. After a couple of EP releases they came rumbling out of Palm Desert with 1992's Blues for the Red Sun and a generation of kids who just didn't click with the [grunge](#) sound of Seattle (whose mainstream popularity peaked during that time) instantly knew they had found the answer. Kyuss were throughout their existence a rare thing in music - a band whose fans worshipped them, who received critical praise from all the right sources but never became over-exposed or pressured to conform - exactly what their fans wanted them to be.

Since their break-up, the success of Queens of the Stone Age and various other bands in the Kyuss family tree combined with internet file-sharing has seen the Kyuss back catalogue become more widely listened to and their fanbase has inevitably swelled. Their sound has also been continued on by descendant bands Unida, Hermano and Fu Manchu. Former Kyuss vocalist John Garcia appeared with old partner Josh Homme at a QOTSA gig in 2005 where they performed three Kyuss songs together. While rumours of a reunion may well be wide of the mark, stoners everywhere rejoiced that the chance to see Kyuss in the flesh might not have disappeared forever.

## The New Era

Debate abounds today about who qualifies as stoner music, and indeed if "stoner metal", "stoner rock" and "stoner music" are interchangeable or distinct. In a world confused by the myriad of genres, sub-genres, overlaps, collaborations and general eclecticism of the modern music scene, the question of attitude has become an important one in the minds of stoner music fans - which bands were jamming to Kyuss CD's in their garages and getting high after school 10 years ago? Commercial success has clearly visited QOTSA and Monster Magnet while Fireball Ministry are currently turning heads in stoner music circles

## List of stoner rock bands

The bands mentioned so far represent a fraction of those who are significant acts in the genre. Others include, but are not limited to:

*(note: This is a list of **qualified bands**, please check the talk page before making additions.)*

# Stradivarius

A **Stradivarius** (or "Strad") is a [stringed instrument](#) built by members of the Stradivari family, especially by Antonio Stradivari.

The playable instruments are highly prized by world-class musicians, and others who can afford them. Their individual qualities are considered worth distinguishing, and a Strad is often identified by the name of someone (often a famous musician) who formerly owned it, or regularly performed on it.

## Instrument quality

A Stradivarius made in the 1680s or during Stradivari's Brescian period (1690-1700) could be worth several hundred thousand dollars or more at today's prices in auction. If it was made during Stradivari's "golden period" (1700 to 1720), depending on condition, the instrument can be worth several million. They rarely come up for sale and the highest price paid for a Stradivarius (or any musical instrument) at public auction was 'The Lady Tennant', made in 1699 which sold for US \$2,032,000 in 2005. Private sales of Stradivari instruments have exceeded this price.

The world's only complete set of Stradivarius instruments (string quintet) belongs to the Spanish Government and consists of two violins, two cellos, and a viola. They are exhibited in the Music Museum at the Royal Palace (Palacio Real) of Madrid. Another important collection is the collection of the Royal Academy of Music (York Gate Collections) in London.

Many people find violins labeled or branded as "Stradivarius," and believe them to be genuine. It is believed that there are fewer than 700 genuine Strads left in existence, very few of which are unaccounted for.

These instruments are famous for the quality of their sound. There have been many failed attempts to explain and reproduce the sound quality. One theory stated that Stradivari used wood from an old cathedral to build his instruments, but tree-ring dating has shown this to be false. Another theory is that the density of the wood grown during the little ice age and used to build the instruments is responsible, and yet another theory states that the glue Stradivari used had a great effect on the sound. Modern research tools haven't solved the mystery, but devices such as the scanning laser vibrometer are aiding researchers in testing the theory that the careful shaping of belly and back plate, in order to "tune" their resonant frequencies, may be an important factor.

The fame of Stradivarius Violins is not a modern phenomenon; the fictional detective Sherlock Holmes is supposed to have owned one. Another famous story is about a Stradivarius Cello, known as the "Duport" which has the spur marks of Emperor Napoleon, who scratched the cello when he tried to play it. They also played an important role in the James Bond film *The Living Daylights*.

The reputation of the Stradivarius is such that its name is frequently invoked as a standard of excellence in other, unrelated fields (such as ships and cars); for example, the Bath Iron Works' unofficial motto is "A Bath boat is the Stradivarius of destroyers!".

# Named Strads and their Namesakes

## Violins

Aranyi 1667  
ex Captain Saville 1667 - currently played by Andre Rieu  
Amatense 1668  
Oistrakh 1671 - David Oistrakh. Stolen in 1996, it is still missing. [1]  
Spanish 1677  
Paganini-Desaint (Paganini Quartet) 1680 - currently owned by the Nippon Music Foundation, on extended loan to Kikuei Ikeda of the Tokyo String Quartet  
Fleming 1681 - currently owned by the Stradivari Society, on extended loan to Cecily Ward [2]  
Bucher 1683  
Cipriani Potter 1683  
Cobbett ex Holloway 1683  
ex Arma Senkrah 1685  
ex Castelbarco 1685  
"Mercur-Avery" 1687 - currently played by Jonathan Carney, concertmaster of the Baltimore Symphony Orchestra starting 2002.  
Auer 1689 - currently owned by the Stradivari Society, on extended loan to Vadim Gluzman [3]  
Arditi 1689  
Baumgartner 1689 - currently played by Alexandre Da Costa, courtesy of The Canada Council for the Arts [4]  
Bingham 1690  
Bennet 1692  
Falmouth 1692 - currently played by Leonidas Kavakos  
Baillot-Pommerau 1694  
Fetzer 1694 - currently owned by the Stradivari Society, on extended loan to Ruggero Alliffranchini [5]

Joachim 1698 Currently owned by the Royal Academy of Music  
The Lady Tennant 1699 [6]  
Longuet 1699  
Countess Polignac 1699 - Currently played by Gil Shaham.  
Castelbarco 1699  
Cristiani 1700  
Taft ex Emil Heermann 1700  
Dushkin 1701 - currently owned by the Stradivari Society, on extended loan to Frank Almond [7]  
The Irish 1702 - currently owned by the Finnish OKO Bank, currently on loan to Réka Szilvay.  
Conte di Fontana 1702 - David Oistrakh's first violin. Currently owned by Massimo Quarta.  
King Maximilian Joseph c. 1702 - currently owned by the Stradivari Society [8], on extended loan to Berent Korfker [9].  
Lyll 1702 - currently owned by the Stradivari Society, on extended loan to Stefan Milenkovich [10]

La Rouse Boughton 1703 – currently owned by the Austrian National Bank, on loan to Boris Kuschnir of the Kopelman Quartet  
Allegretti 1703  
Alsager 1703  
Emiliani 1703 - currently owned by Anne-Sophie Mutter  
Betts 1704 - part of the collection of the Library of Congress  
ex Brüstlein 1707 – currently owned by the Austrian National Bank [11]  
La Cathédrale 1707 - currently owned by the Stradivari Society, on extended loan to Tamaki Kawakubo [12]  
Hammer 1707 - currently owned by Kyoko Takezawa  
Burstein, Bagshawe 1708 - currently owned by the Stradivari Society, on extended loan to Janice Martin. [13]  
Duc de Camposelice 1708  
Ruby 1708 - currently owned by the Stradivari Society, occasionally used by Leila Josefowicz; currently played by Vadim Repin [14]  
Berlin Hochschule 1709  
Ernst 1709  
Viotti 1709 Currently owned by the Royal Academy of Music  
Lord Dunn-Raven 1710 - currently owned by Anne-Sophie Mutter  
ex Roederer 1710 - currently played by David Grimal  
ex Vieuxtemps 1710  
Liegnitz 1711  
Boissier 1713  
Gibson ex Huberman 1713 - currently owned by Joshua Bell  
Cremonese ex Joachim 1714 currently owned by the Royal Academy of Music  
Dolphin 1714 - currently owned by the Nippon Music Foundation, formerly owned by Jascha Heifetz  
Soil 1714 - currently owned by Itzhak Perlman  
ex Berou ex Thibaud 1714  
Le Maurien 1714 - Stolen in 2002, it is still missing. [15]  
Leonora Jackson 1714  
Lipinski 1715 - Missing since 1962.  
Titian 1715  
Alard 1715  
ex Bazzini 1715  
Cessole 1715  
ex Marsick 1715 - currently played by James Ehnes  
Berthier 1716  
Booth 1716 - Currently played by Julia Fischer  
Colossus 1716 - Stolen in 1998, it is still missing. [16]  
Monasterio 1716  
Provigny 1716  
Messiah 1716  
ex Wieniawski 1717  
Gariel 1717  
Windsor-Weinstein 1716 - currently owned by The Canada Council for the Arts Musical Instrument Bank  
Firebird ex Saint-Exupéry 1718 - currently owned by Salvatore Accardo  
Madrileño 1720  
ex Beckerath 1720  
Red Mendelssohn 1720 - currently played by Elizabeth Pitcairn and inspired the Red Violin movie.  
Artot 1722  
Jupiter 1722 - currently owned by the Nippon Music Foundation, formerly used by Midori Goto  
Laub-Petschnikoff 1722

Jules Falk 1723 - currently owned by Viktoria Mullova  
Kiesewetter 1723 - currently owned by the Stradivari Society, currently on loan to Stefan Jackiw [17]  
Le Saraste 1724 - currently owned by the Real Conservatorio Superior de Música in Madrid, Spain  
Earl Spencer 1723 - formerly played by Emmy Verhey  
Brancaccio 1725  
Barrere 1727 - currently owned by the Stradivari Society, on extended loan to Janine Jansen. [18]  
Davidov-Morini 1727 - Stolen in 1995, it is still missing. [19]  
ex General Dupont 1727  
Holroyd 1727  
Kreutzer 1727 - currently played by Maxim Vengerov  
Hart ex Francescatti 1727 – currently owned by Salvatore Accardo  
Paganini-Comte Cozio di Salabue (Paganini Quartet) 1727 - currently owned by the Nippon Music Foundation, on extended loan to Martin Beaver of the Tokyo String Quartet  
Benny 1729 - Jack Benny, bequeathed to the Los Angeles Philharmonic  
Lady Jeanne 1731 - Currently owned by the Donald Kahn Foundation, on extended loan to Benjamin Schmid [20]  
Herkules 1732 - belonged to Eugène Ysaye. Stolen in 1908, it is still missing. [21]  
Des Rosiers 1733 currently owned by Angèle Dubeau  
Khevenhüller 1733 - belonged to Yehudi Menuhin.  
Rode 1733  
Ames 1734 - Stolen, still missing. [22]  
ex Baron von Feilitzsch 1734  
Habeneck 1734 currently owned by the Royal Academy of Music  
Lamoureux 1735 - Stolen, still missing. [23]  
Muntz 1736 - currently owned by the Nippon Music Foundation.  
Comte D'Armaille 1737  
Lord Norton 1737  
Chant du Cygne - Swansong 1737

## Violas

There are 13 extant Antonio Stradivari violas.

Archinto 1696 Currently owned by the Royal Academy of Music  
Paganini-Mendelssohn (Paganini Quartet) 1731 - owned by the Nippon Music Foundation, on extended loan to Kazuhide Isomura of the Tokyo String Quartet

## Cellos

Antonio Stradivari built between 70 and 80 cellos in his lifetime , 63 of which are extant.

General Kyd ex Leo Stern 1684- left on driveway and \*Lord Aylesford 1696 - owned by the Nippon Music Foundation. Played by Janos Starker from 1950-1965.  
Castelbarco 1697  
Servais 1701  
Paganini-Countess of Stanlein 1707 - owned by Bernard Greenhouse. Not to be confused with the Paganini-Ladenburg cello of the Paganini Quartet.  
Gore-Booth 1710  
Duport 1711 - currently owned by Mstislav Rostropovich  
Davidov 1712 - Karl Davidov, Russian "Czar of Cellists" (as described by

Tchaikovsky). Formerly owned by Jacqueline du Pré. Currently played by Yo-Yo Ma.  
Batta 1709 - Currently owned by the Royal Academy of Music  
Batta 1714 - formerly owned by Gregor Piatigorsky  
Becker 1719  
Piatti 1720, Chelo Prieto. Owned and played by Carlos Prieto, [27]  
Baudiot 1725 - formerly owned by Gregor Piatigorsky  
Marquis 1726 - owned by the Royal Academy of Music  
De Munck ex Feuermann 1730 - Emmanuel Feuermann. Owned by the Nippon Music Foundation, on extended loan to Steven Isserlis  
Braga 1731  
Paganini-Ladenburg (Paganini Quartet) 1736 - owned by the Nippon Music Foundation, on extended loan to Clive Greensmith of the Tokyo String Quartet

## Harp

Antonio Stradivari made a single [harp](#) during his lifetime.

## Mandolins

There are two known surviving mandolins by Stradivari.

- *The Cutler-Challen Choral Mandolino*, 1680, in the collection of the National Music Museum at the University of South Dakota in Vermillion, South Dakota, United States of America.
- As of 2006 the other was privately owned in London.

Category: [Violins](#)

## Straight edge

**Straight edge** (sometimes abbreviated to **sXe** or **SxE**) is a lifestyle and (counter cultural) subculture, closely associated with punk, hardcore punk, and—more recently—heavy metal music. It advocates total, lifelong abstinence from tobacco, alcohol, and recreational drug use—especially psychoactive and stimulant drug use. Some straight edgers also abstain from promiscuous sexual behavior.

Originally inspired by the hardcore band Minor Threat, it has spread around the world, but is most popular in industrialized Western countries with a large middle-class—such as United States, Canada, United Kingdom, Australia, and much of Western Europe. Although straight edgers—or "edge kids"—do not necessarily identify with a particular worldview on social or political issues, many do subscribe to precepts associated with anarchism, vegetarianism—veganism, socialism, environmentalism, and the deep ecology movement. Some straight edgers are Christians or Hare Krishnas, as well as other religions.

## Origins

In the book *Our Band Could Be Your Life*, Ian MacKaye reports that during the mid- and late 1970s, he and his friends often missed musical performances by their favorite groups because they were held in clubs in and around Washington, D.C. that served alcoholic drinks and banned anyone under 21 years of age from entering.

Rock musician, Ted Nugent, was an early inspiration for MacKaye and his close friend Henry Rollins. In an era when most popular rockers were known for their copious drug and alcohol use, Nugent made a point of proclaiming his teetotaler status.

MacKaye's group, The Teen Idles, made a brief west-coast tour in 1980. At San Francisco's Mabuhay Gardens, club owners were sympathetic to youngsters wanting to see musicians perform, and had begun writing a large 'X' on teenagers hands with a permanent marker as a warning to bartenders that such persons should not be served alcohol.

Upon returning to Washington, D.C., MacKaye suggested this same notion to various area club owners as a means to allow teenagers into the clubs, while preventing them from being served alcohol. Several clubs began doing so, and the "X" drawn on one's hand eventually became a symbol of a stand against alcohol and drugs. The Teen Idles's "Minor Disturbance" EP—released on the highly influential DIY label Dischord Records in 1980—featured two X'd up hands on the cover. This EP also marked the beginning of what would become the straight edge scene within hardcore and punk.

There are differing views on the origins of the actual term "straight edge". The usual explanation is that it was coined by MacKaye's second hardcore punk band, Minor Threat, in the early-mid 1980s. The straight edge lifestyle that began soon afterwards is in fact largely defined by the lyrics to Minor Threat's songs, specifically "Out of Step" and "Straight Edge".

The term was first used in song form in the song by Minor Threat called "Straight Edge," which simply tied together many of the concepts that had been floating around in the Washington, D.C. music scene for a while. Just as many underground movements have done, the straight edge scene has diversified. There are some who preach complete "militant" purity, while there are others who—while still remaining straight—refuse to label themselves as having "the edge." Many straight edgers no longer wear the trademark black 'X' on the back of their hands.

The subsequent straight edge *movement*, however, was never advocated by singer Ian MacKaye—who thought of it as more the personal choices that he had made in his life. After some tension with the other members, Mackaye noted that some of Minor Threat's personnel drank (though rarely to excess).

The hardcore punk scene has been viewed by those unfamiliar with it as a mass consensus of angry kids—uniting with the purpose of creating fast and rebellious music in the hopes of reshaping a society that they perceive as bad. Although hardcore bands share some of the same themes, their lyrics, politics and attitudes can range from right to far left, from extremes to moderation, from hostility to hospitality.

While the first wave of the straight edge movement was centered around Washington, D.C. (Minor Threat, G.I.'s, and Faith) and Boston bands (SSD and DYS) from 1981–1983, there is a new wind of bands from around the country and the world calling themselves straight edge. (Seen in the names of not only the bands, such as Bold and Straight Ahead, but even in the names of the record labels, such as New Beginning, Positive Force, and Revelation.)

## Overview

There are various reasons why people may choose to be straight edge, and there are various interpretations of the practice, and various applications of the precepts noted below.

Straight edge can generally be viewed as a counter culture, lifestyle, or simply as a long-term commitment to abstinence from recreational drug use.

Some use the lifestyle as a 'stepping stone' because they believe it will allow them to be more involved with their own mental and physical health. For some, straight edge involves refraining from casual sex. Rather than promoting strict abstinence, many straight edge persons believe in sex within caring relationships rather than one-night stands.

Many straight edgers are vegetarian or vegan—the two movements, however, should not necessarily be linked to straight edge.

The appeal of straight edge has broadened beyond the initial scope of punk culture and has appeal to youth of many cultures who eschew recreational drug use. Many people who are straight edge became attracted to it as a counter culture option to what they see as a widespread drug culture.

Straight edge is considered to be by many of its followers a choice. In this sense, no one is born Straight edge or has been Straight edge their entire lives. Labeling oneself Straight edge is a cognitive decision that someone makes for themselves and is generally not seen as a label that is obtained by default. No one is Straight edge simply because they don't drink, smoke, or do drugs.

## Attitudes towards spirituality

Some straight edgers feel that having a clear mind is a better way to approach life and/or spirituality. They tend to be atheistic or agnostic, often believing in self-responsibility and rejecting the idea of a deity or any divine moral law. In many circles, the lifestyle has associations with spirituality—there were at one time significant Hare Krishna straight edge movements.

Recently, some in the straight edge movement have strived to separate itself from the ties with religion. With the respects they have to all races, religions, and any other specific group, straight edgers—more recently—try to step away from spiritual binds. There are, however, a portion of straight edgers who align themselves with buddhist practices, such as Good Clean Fun.

Christians involved in the punk/hardcore subculture sometimes consider themselves straight edge; indeed, the rejection of illicit substances, alcohol consumption (particularly underage), and premarital sex, is commonly encouraged by many mainstream churches and their youth groups. It should not be, however, assumed that the self-identification as straight edge is a casual replacement of one label with another. Prominent self-identified Christian straight edgers include the bassist for Throwdown, at least one member of Comeback Kid, and at least one member of Stretch Arm Strong.

## The 'X'

At punk rock shows, it became common practice to mark an X on the hands of under-aged concert goers to ensure that the bouncers would recognize a minor attempting to drink alcohol. Some people interpret this as a symbol of Ian MacKaye's "don't smoke, don't drink,

don't fuck" ethos. Some interpret the three Xs as representing "Body", "Mind", and "Soul"—although three Xs have also been used as an abbreviation for hardcore punk in general.

Many adopters of the "straight edge" lifestyle voluntarily marked their hands in the same way to show their commitment to refusing alcohol. Also widespread is the tattooing of the X symbol on other parts of the body or wearing it on clothing, pins, et cetera. Three Xs (XXX) have their origin in artwork created by Minor Threat's drummer Jeff Nelson in which he replaced the three stars in the band's hometown Washington D.C. flag with Xs.

The X is considered both a mark of negation and a mark of identity. Attaching the X to one's name or band name is common practice for straight edgers. For example, 'John Smith' would become 'XjohnXsmithX', or 'xxxjohnxxx'. "Straight edge" is sometimes abbreviated sXe (S.E. plus an X) following much the same logic. Note that sXe is pronounced 'straight edge' or 'es-ee': not 'es-ex-ee' since the X is silent.

## **Backlash and criticisms**

A subset of straight edge, often called hardline, has been involved in physical assaults in the U.S. Police in some communities—such as Salt Lake City and Reno—have classified straight edge as a gang due to violence associated with hardliners, and due to links some straight edgers have with the Animal Liberation Front.

# Streetpunk

**Streetpunk**, **street punk** (also known as **reality punk**) is both a subgenre of [punk rock](#) and a word that describes punk rockers who are working class and/or from the inner city. Their appearance includes items such as studded customized leather jackets, jeans, bondage trousers, bullet belts, studded belts, spiked or mohawk hairstyles (often dyed), and piercings. The musical genre streetpunk is favoured by skinheads, [punks](#) and Herbets.

## Streetpunk Music

The street punk music genre started as the [Oi!](#) music scene in the late 1970s and early 1980s in Great Britain. Musical influences include the original wave of punk bands, as well as late '70s British pub rock and glam. It was seen as a reaction against middle and upper class punk bands like Generation X, and trendy people who embraced the punk lifestyle in a superficial way. It was developed by bands such as Cock Sparrer, The Business, 4-Skins and The Cockney Rejects. It started as a youth music style with songs about tales of the street, police brutality, working class politics and drunk mayhem, and gradually was intertwined with UK 82 and other punk subgenres as time went on. Streetpunk bands of the mid '80s include Exploited, Abrasive Wheels, and Attak.

Although street punk and [Oi!](#) sometimes have similar music, street punk bands today are generally less identified with Oi-like pride or football themes, and more identified with themes condemning society, rejecting authority, or drinking. Today street punk bands can be found all over the world.

Street punk bands are often at odds with more liberal, "pop-punk" elements of the punk community. A song by Chicago pop-punk band Screeching Weasel, entitled Tightrope, takes aim at the "resurgence of tough-guy, so-called working class or street punk bands". Little Rich Working Class Oi-Boy by The Queers is another song which criticizes those in the Street Punk and Oi! segments of the punk scene.

## Streetpunk Bands

The following list of musicians and bands are identified with the streetpunk subculture, but not all of them label themselves as [Oi!](#) or streetpunk bands.

- 4-Skins
- A Global Threat
- Abrasive Wheels
- The Analogs
- Anti-Flag
- Blitz (band)
- Career Soldiers
- The Casualties
- Cheap Sex
- Clit 45
- Cock Sparrer
- The Cockney Rejects
- The Devotchkas
- Dropkick Murphys
- Lower Class Brats
- Nuts and Bolts
- The Scarred
- Swingin' Utters
- The Unseen
- USA Waste
- The Varukers
- The Virus

# Stride piano

**Stride** is a type of [piano](#) playing, used primarily in [jazz](#). The distinctive technique was originated in Harlem in or about 1919 by Luckey Roberts and James P. Johnson. It is influenced by [ragtime](#) but features more improvisation, blue notes, and swing rhythms than its predecessor.

The pianist's left hand plays a four-beat pulse with a bass note on the first and third beats, and a [chord](#) on the second and fourth beats, while the right hand plays melodies and chords. The name "stride" comes from the "striding" left-hand movement. This technique is one of the most difficult styles of jazz piano playing.

Noted stride players include:

- James P. Johnson
- Luckey Roberts
- Willie The Lion Smith
- Art Tatum
- Fats Waller
- Pete Johnson
- Count Basie
- Duke Ellington
- Thelonius Monk

# String band

The **string band** originated as a subgenre of [old-time music](#). It spotlights a group of acoustic string instruments, sometimes even to the exclusion of vocals.

During the 19th and early 20th centuries, other stringed instruments began to be added to the fiddle-banjo duo that was essential to dance music of the early 19th century United States. These other instruments included the [guitar](#), mandolin, and double bass (or washtub bass), which provided chordal and bass line accompaniment (or occasionally melody also). Such an assemblage, of whatever instrumentation, became known simply as a "string band."

The genre gave way to [country music](#) in the 1930s and [bluegrass music](#) in the 1940s. String bands continue to perform in events such as the Mummers Parade in Philadelphia and the Appalachian String Band Festival in Charleston, West Virginia.

# String instruments

A **string instrument** (or **stringed instrument**) is a [musical instrument](#) that produces sound by means of vibrating strings. In the [Hornbostel-Sachs](#) scheme of [musical instrument classification](#), used in organology, they are called [chordophones](#).

# Types of string instruments

For a full list, see [List of string instruments](#).

String instruments are usually categorized by the technique used to produce sound. In order for a string instrument to produce sound, its string or strings must vibrate. There are three common ways to initiate vibration.

## Plucked

Instruments such as the [guitar](#), kora and [sitar](#) are plucked, either by a finger or thumb, or by some type of plectrum. This category includes the keyboard instrument the harpsichord, in which feather quills (now plastic plectra) pluck the strings.

## Bowed

Instruments like the [cello](#) and rebec are usually played by drawing a bow across the strings. All instruments in the viol and [violin families](#) fall into this category. Occasionally instruments which are normally bowed are plucked (this is known as pizzicato) instead, and instruments normally plucked are also bowed (for example, Jimmy Page of Led Zeppelin sometimes played the [electric guitar](#) this way using a [violin](#) bow, and more recently Jón Þór (Jónsi) Birgisson, singer and guitar player of the Icelandic band Sigur Rós has made use of the technique).

## Struck

The third common method of sound production in stringed instruments is to strike the string with a hammer. By far the most well-known instrument to use this method is the [piano](#), where the hammers are controlled by a mechanical action; another example is the hammered dulcimer, where the player herself wields the hammers. It should be noted that the piano is often considered a [percussion instrument](#), since sound production through struck blows defines this instrument family; the proclamation that the piano is a percussion instrument has at times served as rhetoric for composers who relished sharp percussive effects.

A variant of the hammering method is found in the clavichord: a brass tangent touches the string and presses it to a hard surface, inducing vibration. This is a very inefficient method of sound production, thus clavichords have a very soft tone. The maneuver can also be executed with a finger on plucked and bowed instruments, where it gives equally soft results.

## Other methods

The aeolian harp employs a very unusual method of sound production: the strings are excited by the movement of the air.

Some string instruments have keyboards attached which are manipulated by the player, meaning they do not have to pay attention to the strings directly. The most familiar example is

the [piano](#), where the keys control the felt hammers by means of a complex mechanical action. Other string instruments with a keyboard include the clavichord (where the strings are struck by tangents), and the harpsichord (where the strings are plucked by tiny plectra).

With these [keyboard instruments](#) too, the strings are occasionally plucked or bowed by hand. [Composers](#) such as Henry Cowell wrote music which asks for the player to reach inside the piano and pluck the strings directly, or to "bow" them with bow hair wrapped around the strings, or play them by rolling the bell of a [brass instrument](#) such as a [trombone](#) on the array of strings.

Other keyed string instruments, small enough to be held by a strolling player, include the plucked autoharp, the bowed nyckelharpa, and the hurdy gurdy, which is played by cranking a rosined wheel.

## String length or scale length

This is the length of the string from nut to [bridge](#) on bowed or plucked instruments and ultimately determines the distance between different notes on the instrument. For example, a double bass with its low range needs a scale length of around 42 inches, whilst a violin scale is only about 13 inches. On the shorter scale of the violin, the left hand may easily reach a range of slightly more than two octaves without shifting position, while on the bass' longer scale, a single octave or a ninth is reachable in lower positions.

## Contact points along the string

In bowed instruments, the bow is normally placed perpendicularly to the string, at a point half way between the end of the fingerboard and the bridge. However, different bow placements can be selected to change [timbre](#). Application of the bow close to the bridge (known as *sul ponticello*) produces an intense, sometimes harsh sound, which acoustically emphasizes the upper harmonics. Bowing above the fingerboard (*sul tasto*) produces a purer tone with less overtone strength, emphasizing the fundamental, also known as *flautando*, since it sounds less reedy and more flute-like.

Similar timbral distinctions are also possible with plucked string instruments by selecting an appropriate plucking point, although the difference is perhaps more subtle.

In keyboard instruments, the contact point along the string (whether this be hammer, tangent, or plectrum) is a choice made by the instrument designer. Builders use a combination of experience and acoustic theory to establish the right set of contact points.

In harpsichords, often there are two sets of strings of equal length. These "choirs" usually differ in their plucking points. One choir has a "normal" plucking point, producing a canonical harpsichord sound; the other has a plucking point close to the bridge, producing a reedier "nasal" sound rich in upper harmonics.

## Production of multiple notes

A single string at a certain tension will only produce one note, so to obtain further notes string instruments employ two methods. Most instruments have more than one string; in the case of the harp or piano, for example, this is the only way in which extra notes are obtained. With instruments such as the violin or guitar the player may press down on the strings with their fingers or some other device in order to effectively shorten the length of it which vibrates. This is known as *stopping* the string. In such instruments, a *fingerboard* is often attached to the neck of the instrument; the string is stopped against the fingerboard by the player's fingers. On some string instruments, the fingerboard has *frets*, raised ridges perpendicular to the strings that stop the string at precise intervals, in which case the fingerboard is called a *fretboard*.

# Sound production

## Through resonance

A vibrating string on its own makes only a very quiet sound, so string instruments are usually constructed in such a way that this sound is coupled to a hollow resonating chamber, a soundboard, or both. On the violin, for example, the taut strings pass over a *bridge* resting on a hollow box. The strings' vibrations are distributed via the bridge to all surfaces of the instrument, and thus matched better to the acoustic impedance of the air.

Technically speaking, no amplification occurs, since all of the energy to produce sound comes from the vibrating string. What really happens is that the soundboard of the instrument provides a larger **surface area** to create sound waves than that of the string. A larger vibrating surface moves more air, hence produces a [louder](#) sound.

Achieving a tonal characteristic that is effective and pleasing to the player's and listener's ear is something of an art, and the makers of string instruments often seek very high quality woods to this end, particularly spruce (chosen for its lightness, strength and flexibility) and maple (a very hard wood). Spruce is used for the soundboards of instruments from the violin to the piano.

In the early 20th century, the Stroh violin used a diaphragm-type resonator and a metal horn to amplify the string sound, much like early mechanical gramophones. Its use declined beginning about 1920, as electronic amplification came into use.

## Electric amplification

Electric string instruments use pick-ups to convert the string's vibrations into electrical waves which are amplified and then converted into sound by loudspeakers. Such instruments are often solid bodied, which makes them barely audible with the amplifier switched off, and reduces the chance of unwanted feedback howls or squeals. When the amplifier is switched on, they can be much louder than their acoustic counterparts. An advantage of this method is that it allows electronic manipulation of the sound; the guitar overdrive is a classic example.

# String orchestra

A **string orchestra** is an [orchestra](#) composed solely of bowed [string instruments](#). These instruments are the [violin](#), the [viola](#), the [violoncello](#) and the double bass. String orchestras can be of chamber orchestra size ranging from between 12 and 21 musicians (6,5,4,4,2 = 21) sometimes performing without a conductor, or consist of the entire string section of a large symphony orchestra which could have 60 musicians (16,14,12,10,8 = 60). String orchestras often play classical music, and important 20th century works have been written for string orchestra by Béla Bartók (Divertimento), Stravinsky (Apollon Musagète), and Benjamin Britten (Simple Symphony). Sir Michael Tippett has written a Concerto for Double String Orchestra. Composers that have written a "Serenade for Strings" for string orchestra include Tchaikovsky, Antonín Dvořák, and Elgar. Mendelssohn also wrote a number of symphonies for string orchestra. Sometimes works originally written for string quartet are arranged for string orchestra. Samuel Barber's Adagio for Strings is one such example.

Categories: [Musical groups](#)

# String quartet

A **string quartet** is a [musical ensemble](#) of four [string instruments](#)—usually two violins, a viola and cello—or a piece written to be performed by such a group.

## Background

Although any combination of four string instruments can literally be called a "string quartet", in practice the term refers to a group consisting of two [violins](#) (the "first", which usually plays the melody line in the higher register of notes, and the "second" violin, which plays lower notes in harmony), one [viola](#) and one [cello](#). Should a composer create music for four other string instruments — for instance, three violins and a bass, or violin, viola, cello and guitar — the instrumentation is indicated specifically. The standard string quartet is widely seen as one of the most important forms in [chamber music](#), with most major composers, from the late 18th century onwards, writing string quartets.

A piece of music for four players of stringed instruments may be in any form, but if it is simply a *String Quartet* (with or without a subtitle) it is usually in four movements, with a large-scale structure similar to that of a [symphony](#). The outer movements are typically fast, the inner movements in classical quartet form are a slow movement and a dance movement of some sort (e.g., minuet, scherzo, furiant), in either order.

Many other chamber groups can be seen as modifications of the string quartet, such as the [piano quintet](#), which is a string quartet with an added [piano](#); the [string quintet](#), which is a string quartet with an extra viola, cello or double bass; the [string trio](#), which contains one violin, a viola, and a cello; and the [piano quartet](#), a string quartet with one of the violins replaced by a piano.

## History

The form first came to be used after the middle of the 18th century. Joseph Haydn's first works for string quartet have five movements and resemble the divertimento (a title which they carried in some editions) or serenade, but the opus 9 quartets of 1769–70 are in the form which was to become standard both for Haydn and for other composers: four movements, a fast movement, a slow movement, a minuet and trio and a fast finale. Because his example helped codify a form that originated in the Baroque [suite](#), Haydn is often referred to as "the father of the string quartet." Haydn occasionally played his quartets on social occasions in an impromptu quartet ensemble of which Mozart was also a member.

Ever since Haydn's day, the string quartet has been prestigious, and considered a true test of the classical composer's art. This may be partly due to the fact that the palette of sound is more restricted than with [orchestral](#) music, forcing the music to stand more on its own rather than relying on tonal color; or from the inherently [contrapuntal](#) tendency in music written for four equal instruments.

Quartet composition flourished in the [Classical](#) era, with both Mozart and Beethoven writing famous series of quartets to set alongside Haydn's. A - very slight - slackening in the pace of quartet composition occurred in the 19th century; here, a curious phenomenon was seen in composers who wrote only one quartet, perhaps to show that they could fully command this hallowed genre. With the onset of the Modern era of classical music, the quartet returned to full popularity among composers, as the extensive listings below document.

## Popular string quartets

Some of the most popular or widely acclaimed works for string quartet written between the 18th century and the 1980s, include:

Joseph Haydn's 68 string quartets, especially the late Erdody Quartets, Op. 76.

Wolfgang Amadeus Mozart's 23 string quartets: the six he dedicated to Haydn in particular (K. 387, 421, 428, 458, 464, 465, Opus 10) are generally considered to be the pinnacle of the classical quartet form. String Quartet No. 19 in C major ("Dissonance"), K. 465 is still surprising for its dissonant opening.

The sixteen quartets of Ludwig van Beethoven are highly acclaimed. The String Quartets Nos. 1-6, Opus 18 are thought to demonstrate his total mastery of the classical string quartet as developed by Haydn and Mozart. The next three, or the Razumovsky Quartets are extremely popular even today, as they greatly expanded the form and incorporated a new degree of emotional sensitivity and drama. These were followed by String Quartets Nos. 10 - 11, Opus 74 "Harp" and 95 "Serioso" (Beethoven). Finally, the Late Beethoven String Quartets, which group includes his last five quartets and the Große Fuge, are the composer's last completed works. Though these works are widely considered to be among the greatest musical compositions ever written, their uncompromising intellectual complexity and their apparent rejection of the romantic pathos which pervades Beethoven's middle period both ensure that they remain considerably less popular than the Razumovsky quartets.

Franz Schubert's String Quartet No. 14 in D Minor "Death and the Maiden". Also his String Quartet No. 13 in A Minor "Rosamunde" and his final String Quartet No. 15 in G Major

The six string quartets of Felix Mendelssohn

Bedřich Smetana's String Quartet No. 1 in E Minor "From my Life"

The three quartets by Johannes Brahms

Antonín Dvořák's "American" String Quartet No. 12 in F Major

Peter Tchaikovsky's String Quartet No. 1 in D Major, Op. 11, especially the second movement "Andante cantabile."

Alexander Borodin's String Quartet No. 2 in D Major, especially the third movement "Notturmo."

Claude Debussy's String Quartet in G Minor, op. 10

The four string quartets by Arnold Schoenberg

Maurice Ravel's String Quartet in F Major

Leoš Janáček's String Quartet No. 1 "Kreutzer", inspired by Tolstoy's The Kreutzer Sonata, which in turn was inspired by Beethoven's Violin Sonata No. 9, the "Kreutzer Sonata."

Frank Bridge's String Quartet No. 3

The six string quartets by Béla Bartók

Alban Berg's Lyric Suite, originally composed for string quartet

Bohuslav Martinů's Concerto for String Quartet and Orchestra

The fifteen string quartets of Dmitri Shostakovich, especially String Quartet No. 8 in C Minor, Op. 110

Elliott Carter's five string quartets are among the most widely acclaimed series in recent years

Toru Takemitsu's Quartet No. 1 for Strings "A Way a Lone"

# String quintet

A **string quintet** is an ensemble of five [string instrument](#) players or a piece written for such a combination. The most common combinations in [classical music](#) are two [violins](#), two [violas](#) and [cello](#) or two violins, viola and two cellos. The second cello is occasionally replaced by a double bass, as in Antonín Dvořák's quintet Op.77. Wolfgang Amadeus Mozart pioneered writing for a [string quartet](#) augmented by a second viola, and one outstanding masterpiece for the two-cello [quintet](#) is Franz Schubert's Quintet in C major. Closely related [chamber music](#) genres include the [string trio](#), the [string quartet](#), and the [string sextet](#).

By convention, the string quintet with an extra viola is called a "viola quintet" and a string quintet with an extra cello is called a "cello quintet." While a naïve concert-goer might expect five violas on the stage when a "viola quintet" appears on a chamber music program, such a quintet would most likely be called a "quintet for five violas."

String quintets have been written by many composers, as can be seen from the following list. It is interesting to note that some composers who wrote well-known series of string quartets, such as Joseph Haydn, Béla Bartók, Paul Hindemith, and Dmitri Shostakovich, never composed a string quintet.

The term *string quintet* can also refer to the standard orchestral string section consisting of two violin, one viola, one cello, and one bass part, even though in this case there are multiple musicians playing each part.

## List of string quintet composers

Arnold Bax - one Cello Quintet in G major (1908), whose second movement was rescored by the composer for Viola Quintet and published as the Lyrical Interlude (1923)

Ludwig van Beethoven - one original work for Viola Quintet, Op.29, sometimes called the Storm Quintet; an arrangement of his Wind Octet for Viola Quintet, Op.4 (the original Octet was later published as Op.103); an arrangement of his Piano Trio Op.1 No.3 for Viola Quintet, Op.104

Luigi Boccherini - one hundred ten Cello Quintets, twelve original Viola Quintets, arrangements of all twelve of his Piano Quintets (Op.56 and Op.57) for Viola Quintet, and three Double Bass Quintets. The third movement Minuet of the Cello Quintet Op.11 No.5 is extremely well-known.

Alexander Borodin - one Cello Quintet

Johannes Brahms - two Viola Quintets, Op.88 and Op.111; the Clarinet Quintet Op.115 may be performed with a viola substituting for the clarinet

Max Bruch - one Viola Quintet in A minor

Anton Bruckner - one Viola Quintet (1879)

Luigi Cherubini - one Viola Quintet in E minor (1837)

Felix Draeseke - one Quintet in A for Two Violins, Viola, Violotta, and Cello (the Stelzner-Quintett; 1897) ; one Cello Quintet in F (1901)

Antonín Dvořák - two Viola Quintets, Op.1 and Op.97 (the American Quintet), and a Double Bass Quintet Op.77

Alexander Glazunov - one Cello Quintet, Op.39

Karl Goldmark - one Cello Quintet, Op.9 (1862)

Bohuslav Martino - one Viola Quintet (1927)

Felix Mendelssohn - two Viola Quintets: No. 1 in A major, Op.18 (1826, revised 1832) and No. 2 in B-flat major, Op.87 (1845)

Darius Milhaud - one Double Bass Quintet Op.316; one Viola Quintet Op.325; one Cello Quintet Op.350

Wolfgang Amadeus Mozart - six Viola Quintets: K174, K516b, K515, K516, K593, K614

Carl Nielsen - one Viola Quintet (1888)

Ottorino Respighi - one Viola Quintet (1901)

Franz Schubert - one Cello Quintet, Op.post.163, D956, and a "Quintet-Overture" for Viola Quintet, D8

Ethel Smyth - one Cello Quintet in E major, Op.1

Louis Spohr - seven Viola Quintets

Ralph Vaughan Williams - one Viola Quintet (the Phantasy Quintet;1912)

## String sextet

In [classical music](#), a **string sextet** is a composition written for six [string instruments](#), or a group of six musicians who perform such a composition. Most string sextets have been written for an ensemble consisting of two [violins](#), two [violas](#), and two [cellos](#). Among the earliest works in this form are the six string sextets op. 23 of Luigi Boccherini, written in 1776. Other notable string sextets include the op. 18 and op. 36 of Johannes Brahms, the Souvenir de Florence op. 70 of Pyotr Ilyich Tchaikovsky, and the Verklärte Nacht op. 4 of Arnold Schoenberg.

# String trio

A **string trio** is a group of three [string instruments](#) or a piece written for such a group. The most usual such group in [classical chamber music](#) is made up of a [violin](#), a [viola](#) and a [cello](#).

The earliest string trio form consisted of two violins and cello, a grouping which had grown out of the [baroque](#) trio sonata. Joseph Haydn is thought to have been the first to have written for violin, viola and cello, and Ludwig van Beethoven and Franz Schubert also wrote music in that form, although they are not generally reckoned to be amongst their better pieces. A great masterwork for string trio is the Divertimento, K.563, by Wolfgang Amadeus Mozart.

A number of composers wrote string trios throughout the 19th century, and in the 20th century, string trios by Arnold Schoenberg, Anton Webern and La Monte Young were produced.

Examples of more unusual string trio groups include Wolfgang Amadeus Mozart's trio for two violins and double bass, and Antonín Dvořák's trio for two violins and viola. This sort of trio is known as a terzet or terzetto, and others who have written trios for this combination include Robert Fuchs (three, two in his opus 61 and one in his opus 107) and Sergei Taneyev (his op. 21.)

## Strip club

A **strip club** is a [nightclub](#) or bar that offers striptease and possibly other related services such as lap dances. High-end establishments tend to call themselves **gentlemen's clubs**. Low-end establishments may be referred to as **titty bars**. **Go-go bar** may imply a greater focus on stage dancing and music. In a **bikini bar** dancers are restricted to wearing bikinis or lingerie.

## Clubs

Men are the primary consumers of this form of entertainment, at straight clubs and gay clubs, but at least one chain, Chippendales, caters mainly to straight women.

Gentlemen's and strip clubs, are a \$5-billion dollar (U.S.) industry, generate approximately 22% of the gross revenue in adult entertainment. Such clubs are also found outside the USA.

Sapphire Gentlemen's Club in Las Vegas has been billed as the world's largest and most expensive strip club; in 2006 it was sold at auction for \$80 million. Tampa, Florida is well known for its strip clubs including the famous Mons Venus. Howard Stern makes frequent mention of Scores in New York City. Manila, Bangkok and Pattaya are world famous for their Go-gos offering a variety of extra services. Amsterdam is famous for its live sex shows.

## Performers

Performers are called *strippers*, exotic dancers or just dancers, or entertainers. House dancers work for a particular club or franchise. Feature dancers tend to have their own celebrity, touring a club circuit making appearances. Porn stars will often become feature dancers to earn extra income and build their fan base. New dancers will often come to have working auditions on slow nights.

Dancers collect tips from customers either while on stage or after the dancer has finished a set and is mingling with the audience. Dancers may offer additional services such as lap dances or a trip to the champagne room.

## Legal issues

In several regions of the US, primarily due to the local legal restrictions, strip clubs often fall into one of two categories: *topless* and *all/fully nude*. Fully nude clubs may be subject to additional requirements such as restrictions on beer or alcohol sales or *no-touch* rules between customers and dancers. To get around these rules two "separate" bars -- one topless and one fully-nude -- may open adjacent to one another. It is rare, but not unheard of, for a club to allow customers to bring their own beverages.

In the U.S., strip tease dancers are generally classified as independent contractors. All their income derives from tips and other fees they may collect from customers, and a portion of that money is often to be handed over to the house. There have been successful lawsuits against Déjà Vu, a major chain of strip clubs, challenging this classification and winning back payment of minimum wages.

Touching of strippers is illegal in most states. However, some dancers and some strip clubs condone touching of dancers during private dances. This touching often includes the fondling of breasts and buttocks. Dancers may give a customer a "friction dance" whereby the dancer grinds against the customer's crotch while he is fully clothed in an attempt to arouse him or bring him to climax. The amount of physical contact between customer and stripper is often referred to as "mileage". The phrase "YMMV" stands for "your mileage may vary", which means that not all dancers allow touching, so your experience will vary.

# Studio album

A **studio album** is an [album](#) of regular studio recordings. It usually does not have live recordings or [remixes](#), and if it does, those tracks do not make a majority of the album. Studio albums, unlike live albums and compilations, can be home to segues, in-studio sound effects, found sound, orchestral contributions, and a generally cleaner sound.

In the music industry, studio albums are usually contrasted with compilations and [live albums](#). They are generally considered to be albums 'proper', containing material that is, in the majority, previously unreleased. They tend to be the highest selling albums - in the United Kingdom, for example, eighteen of the twenty four [albums that have sold over 2.5million copies](#) are studio albums.

# Styles of house music

[House music](#) has many sub-divisions:

- [Acid house](#): A Chicago derivative built around the Roland TB-303 bassline machine. Hard, uncompromising, tweaking samples produce a hypnotic effect. ex: Adonis, L.A. Williams
- [Afro house](#): A South African form of house which developed out of Kwaito. Closely resembles [Deep house](#) but often features African loops and instruments. Artists include Revolution and Oskido.
- [Ambient house](#) (see [ambient music](#)): Mixing the moody atmospheric sounds of [New Age](#) and ambient music with pulsating house beats.
- [Chicago house](#): Simple basslines, driving four-on-the-floor percussion and textured keyboard lines are the elements of the original house sound. ex: Larry Heard, Steve Poindexter
- [Deep house](#): A slower variant of house (around 120 BPM) with warm sometimes hypnotic melodies. ex: Gemini, Glenn Underground, Kevin Yost.
- [Disco house](#): A more upfront variant of house that relies heavily on looped disco samples. ex: DJ Sneak, Paul Johnson, and Stardust.
- [Electro house](#): Sometimes resembles tech house, but often influenced by the "[electro](#)" sound of the early 1980's, aka breakdancing music, via samples or just synthesizer usage. ex: Green Velvet
- [Epic house](#): A variant of [progressive house](#) featuring lush synth-fills and dramatic (some would say the legendary Shep Pettibone and Tony Humphries at Zanzibar in Newark, NJ. Not to be confused with speed garage or the British style nowadays called UKG pronounced "garridje". See [garage](#).
- [Freestyle house](#): A Latin variant of NY house music, which began development in the early 1980s by producers like John Jellybean Benitez. Seen by some as an evolution of electro funk.
- [French house](#): A late 1990s house sound developed in France. Inspired by the '70s and '80s [funk](#) and [disco](#) sounds. Mostly features a typical sound "filter" effect. ex: Daft Punk, Alan Braxe, Le Knight Club
- [Funky house](#): Funky house as it sounds today first started to develop during the late 1990's. It can again be sub-divided into many other types of house music. French house, Italian house, Disco house, Latin house and many other types of house have all contributed greatly to what is today known as Funky house. It is recognizable by it's often very catchy bassline, swooshes, swirls and other synthesized sounds which give the music a bouncy tempo. It often relies heavily on black female vocals or disco samples and has a recognizable tiered structure in which every track has more than one build-up which usually reaches a climax before the process is repeated with the next track. ex: Derrick Carter, Axwell, Seamus Haji and ATFC to name but a few.
- [Garage](#): This term has changed meaning several times over the years. The UK definition relates to New York's version of deep house, originally named after a certain style of soulful disco played at legendary club the Paradise Garage, although the original Garage sound was much more of an eclectic mix of many different kinds of records. The UK version is pronounced "ga-ridge". May also be called the Jersey Sound due to the close connection many of its artists and producers have with New Jersey such as unds. The style was generally fast tempo.
- [Ghetto house](#): A derivative of [Chicago House](#) with TR-808 and 909 driven drum tracks. Usually contains call-and-response lyrics, similar to the Booty Music of Florida. ex: DJ Deon, DJ Milton, DJ Funk, DJ D-Man

- *Hard house*: a harder, more aggressive form of [Chicago House](#). Sometimes contains elements of [Ghetto House](#), Hip House. ex: CZR, DJ Bam Bam, Abstract Beating System
- *Hi-NRG*: Called "high energy". Derived from Dance music and Happy hardcore, you could say what happyhard is to techno, is what HI-NRG is to dance, it usually has female voices with natural pitch, its tempo is also around the same as techno, eg: DJ Nick Skitz.
- *Hip house*: The simple fusion of rap with house beats. Popular for a brief moment in the late 80s. Most famous record is Jungle Brothers "Girl I'll House You."
- *Italo house*: Slick production techniques, catchy melodies, rousing piano lines and American vocal styling typifies the Italian ("Italo") house sound. A modulating Giorgio Moroder style bassline is also a trademark of this style.
- *Kwaito*: House music that originated in Johannesburg, South Africa in the mid 90's. It is characterised by slow beats, accompanied by (mostly male) vocals - often shouted and not sung - set against melodic African loops.
- *Latin house*: Borrows heavily from Latin dance music -- Salsa, Brazilian beats, Latin Jazz, etc.
- *Merenhouse*
- *Microhouse*: (or [Minimal House](#)) A derivative of [Tech House](#) with sparse composition and production. ex: Akufen, Todd Sines, Alton Miller
- *New York house*: New York's uptempo dance music, referred to simply as club music by some.
- *Progressive house*: Progressive house is typified by accelerating peaks and troughs throughout a track's duration, and are, in general, less obvious than in hard house. Layering different sound on top of each other and slowly bringing them in and out of the mix is a key idea behind the progressive movement. Some of this kind of music sounds like a cousin of [trance music](#).
- *Tech house*: House music with elements of techno in its arrangement and instrumentation. ex: Rino Cerrone, Dave Angel
- *Track house*: A drum-oriented variant of [Chicago house](#) built around compact drum machines of the late '80s and early '90s. ex: Trackhead Steve, DJ Rush, Paul Johnson
- *Tribal house*: Popularized by remixer/DJ Junior Vasquez in New York, characterized by lots of percussion and world music rhythms.

## Suicide song

**Suicide songs** are [songs](#) in which the most prominent [lyrical](#) sentiment is the conveying of the singer's intentions on taking their life (committing suicide). The songs often relate sorrow, madness, or grief from an unrequited love affair that occasionally plagues the afflicted one beyond the pale of physical death.

The most famous suicide song is "Gloomy Sunday", known alternatively as the "Hungarian Suicide Song". Much urban myth has shrouded the song upon its creation in the early 1920's. It is credited with causing a rash of copycat suicides amongst its lovelorn audience when it was first released. Also famous is Fade to Black (song) by Metallica.

On the other hand, Billy Joel and R.E.M. each wrote a hit song "You're Only Human (Second Wind)" and "Everybody Hurts" respectively which were specifically written to dissuade people from contemplating suicide.

# Suite

In [music](#), a **suite** is an organized set of [instrumental](#) or [orchestral](#) pieces normally performed at a single sitting. In the [Baroque](#) era, the pieces are all in the same key, and generally modelled after dance music. The suite was also known as *Suite de danses*, or *Ordre* (for example by Francois Couperin) or *Partita*. In the eighteenth century suites were also known as [overtures](#) or [ouvertures](#).

Estienne du Tertre published *suyttes de bransles* in 1557, giving us the first use of the term, although the usual form of the time was as pairs of dances. The first recognizable suite is Peuerl's *Newe Padouan, Intrada, Dantz, and Galliarda* of 1611, in which the four dances of the title appear repeatedly in ten suites. The *Banchetto musicale* by Johann Schein (1617) contains 20 sequences of five different dances.

The "classical" suite consisted of allemande, courante, sarabande, and gigue, in that order, and developed during the 17th century in France, the gigue appearing later than the others. Johann Jakob Froberger is usually credited with establishing the classical suite through his compositions in this form, which were widely published and copied.

Many later suites included other movements placed between sarabande and gigue. These optional movements were known as galanteries: common examples are the minuet, gavotte, passepied, and bourree. Often there would be two contrasting *galanteries* with the same name, e.g. Minuet I and II, to be played *alternativement*, meaning that the first dance is played again after the second, thus I, II, I.

The later addition of an [overture](#) to make up an "overture-suite" was extremely popular with German composers; Telemann claimed to have written over 200, J.S. Bach had his four orchestral suites, and George Frideric Handel put his Water Music and Music for the Royal Fireworks in this form.

Handel wrote 22 keyboard suites, while Bach produced multiple suites for [cello](#), [violin](#), [flute](#), and other instruments, as well as his English suites, French suites and Partitas for keyboard. For Bach especially, the suite form was a base on which to spin more elaborate sequences. Francois Couperin's later suites often dispensed entirely with the standard dances and consisted entirely of character pieces with fanciful names.

By the 1750s, the suite had come to be seen as old-fashioned, superseded by the [symphony](#) and [concerto](#), and we see few composers still writing suites. In the 19th century the term made a comeback, but now meaning either an instrumental selection from a larger work such as an [opera](#) or [ballet](#), a sequence of smaller pieces tied together by a common theme, such as the nationalistically inflected suites of Grieg, Sibelius, or Tchaikovsky, or a work deliberately referential of Baroque themes, as in the mischievous Suite for Piano by Arnold Schoenberg. Another famous example of an early 20th century suite is The Planets Suite by Gustav Holst, in which a different piece was written to represent each planet in the solar system (except Earth and Pluto).

## Summer hit

A **summer hit** is a song which gains huge popularity during the summer and then almost completely disappears when the summer is over. Some things that many summer hits have in common is that they are [dance music](#) with lyrics in some non-English language (e.g. Spanish).

Summer hits are quite cheerful and upbeat and their main success is due to the catchy rhyme and not the lyrics, which are sometimes repetitive, playful and generally hollow. The music is often criticised for being "forced" on the audience while lacking talent or deeper meaning.

The term is typically used with a negative connotation, where it implies temporal [one-hit wonders](#) without an actual value. Fans of summer hits (who are by definition occasional) are 'accused' of lack of sophisticated musical taste with connotations of conformity, implying that those persons will listen to whatever is popular at the time rather than making their own choice.

## Origin

This popularity usually comes from people hearing the song whilst clubbing in the Balearic Islands, where Spanish is widely spoken, and requesting them once they return home, usually to the UK or Germany. Once the song has received club and radio play there, it passes into other European countries.

Not all summer hits are from the European market however, as shown by the track *Summer Jam* by the Underdog Project.

A track can also be a summer hit solely in one country. In Ireland, the summer of 2000 had the track *Maniac 2000* by Mark McCabe played almost constantly. This led to the track being requested in clubs in Spain by Irish tourists. This might have started the cycle by which it would become a hit across all of Europe, but licensing problems meant that the song was only available commercially in Ireland, and hence the returning clubbers could not purchase it or get it played on the radio.

## Popular Summer Hits

1987

"Heart and Soul" by T'Pau

"Living in a Box" by Living In A Box

1989

"Lambada" by Kaoma

1991

"Rico Suave" by Gerardo

1996

"Macarena" by Los del Río

1997

"Bailando" by Paradisio

1999

"Steal My Sunshine" by Len

"Sun Is Shining" by Funkstar De Luxe vs. Bob Marley

"Livin' La Vida Loca" by Ricky Martin

"Bailamos" by Enrique Iglesias

2000

"Purest of Pain" by Son By Four

"Thong Song" by Sisqó

"Who Let The Dogs Out?" by Baha Men

2002

"The Ketchup Song" by Las Ketchup

2004

"Babycakes" by Three of a Kind

"Dragostea din Tei" by O-Zone

"Obsesion" by Aventura

# Suomisaundi

**Suomisaundi** (sometimes called *suomistyge*, *suomisoundi*, *spugedelic trance*) is a style of freeform [psychedelic trance](#), originating from Finland. Suomisaundi literally means in Finnish slang "Finnish sound". The term "spugedelic" is humoristically derived from [psychedelic](#), *spuge* means "an alcoholic" or generally *a bum* in Finnish slang language. The term spugedelic was likely first used by suomisaundi artist Huopatossu Mononen. It seems "suomisaundi" might be the most commonly used term for Finnish psychedelic trance, since there's also a popular chat room in Souseek that has the same name.

## Genre

The "suomi" style of trance music is also produced in Australia and New Zealand, where there's a steady fan base of both Finnish and Australian style psy-trance music - however only Finns usually refer their style as "suomisaundi" whereas abroad the term to this type of music is usually something like "freeform" psy-trance. The genre knows of no limits and isn't usually anywhere near as "strict" as most current (full-on) psy-trance songs are. Most recognizable element of this style is that it has no set definition of styles or rules apart from basic trance elements such as the four-on-the-floor base drum. The songs are usually very melodic, including a lot of influences from early [Goa](#) and [acid trance](#) tracks, as well as funky guitar/organ loops and sounds from or reminiscent of 1980's video and computer games.

The songs might also include some sort weird sampling and effects, tricky drum fills and breaks, as well as speech samples in Finnish or in English. In many occasions there's also some sort of strange humor or self-irony in the music or in the track titles. Some even describe the Suomi-style of psy-trance as anarchistic and almost [punk](#) in the trance music scene, because the songs are usually very different and progressive compared to the "more mainstream" European/Israeli psy-trance tracks. Some criticise suomisaundi because it sometimes lacks production quality and tracks may not offer such high-fidelity sound as central European trance tracks. The fans and friends of the style defend suomisaundi by saying that the tracks are usually "more organic" than most popular psy-trance tracks. This view could be partly explained by the fact that there's a very steady forest party scene in southern Finland where suomisaundi is played almost exclusively throughout the night.

Finnish acid, goa and psy-trance has been produced in Finland throughout it's existence, starting from the early 90's right when the goa/acid trance culture itself started to form. There are many artists in Finland producing suomisaundi style of music, but one of the main characters that started the "suomisaundi-fuzz" is considered to be Texas Faggott. Their debut album Texas Faggott, released by Australian Psy-Harmonics label in 1999, is considered by many as one of the early relics of the weirder-edge suomisaundi. The popularity of Texas Faggott grew amongst the Finnish trance scene with their second release, Petoman's Peflett in 2001. Especially groupmember Tim Thick has been an active promoter of Finnish psy-trance, as he established and operated Thixx'n'Dixx in 2000, a site offering free MP3 downloads from almost all the existing Finnish psy-trance artists, including tracks from his own groups. After its initial opening, the Thixx'n'Dixx site grew, offering new mp3 albums from different suomi-style artists and eventually became so popular that it was even mentioned in a pop music program aired on Finnish national TV.

## 2000's

Since 2000, the global interest towards Finnish trance has grown a lot and many Finnish groups have performed abroad. However, usually outside Finland, the Suomi-style is still considered a weird delicacy. Most notable suomisaundi audiences outside Finland are in Russia and Japan. The Japanese 6-Dimension Soundz concentrates almost only in releasing suomi-style trance. Two of the most notable record labels in Finland releasing suomisaundi albums are Exogenic Records and Freakdance Records, but many of the popular Finnish trance-artists might not have recorded ever, making their music only available as MP3's on the Internet. After site-hosting problems and excessive bandwidth usage, the Thixx'n'Dixx site operates nowadays merely as a suomisaundi link catalogue, offering links to individual suomisaundi artist pages at mikseri.net, which is a Finnish MP3 community for unsigned/independent artists. Another popular MP3 download site for suomisaundi songs is the Antiscarp-website, hosted by members of the Finnish psy-trance group Salakavala.

# Super Audio CD

**Super Audio CD** (SACD) is a read-only optical audio disc aimed at providing higher fidelity digital audio reproduction than the compact disc. Introduced in 1999, it was developed by Sony and Philips Electronics, the same companies that created the CD.

## Overview

SACD uses a very different technology from CD and DVD-Audio to encode its audio data, a 1-bit delta-sigma modulation process known as Direct Stream Digital at the very high sampling rate of 2.8224 megahertz.

SACDs must always contain a 2-channel stereo mix and may optionally contain a surround mix (usually the 5.1 layout) as well. To be precise, the so-called surround mix does not have to be in the 5.1 format. The old quadraphonic 4.0 format will do as well, most noticeably on the 2001 SACD release of Mike Oldfield's Tubular Bells. The correct designation for the surround part of a SACD is "multi-channel", and usually has its own "Multi-Ch" logo on the back cover.

There are three types of SACDs:

- Hybrid: The most popular of the three types, hybrid discs include an audio CD "Red Book" layer compatible with Compact Disc players, dubbed the "CD layer," and a 4.7 GB SACD layer, dubbed the "HD layer."
- Single layer: Physically a DVD-5 DVD, a single layer SACD includes a 4.7 GB SACD layer with no CD layer (i.e. one HD layer only). This type was often used by Sony Music Entertainment.
- Dual layer: Physically a DVD-9 DVD, a dual layer SACD includes two SACD layers with no CD layer (i.e. two HD layers). This type is rarely used.

## Integration

Indeed there is a format war between Super Audio CD and DVD-Audio. Another challenger is the [DualDisc](#) format. At present, these advanced formats have mainly taken the interest of audiophiles, with relatively little mass market acceptance.

As of May 2005, there have been approximately 3,000 SACD releases, about 40% of which are classical music (source: <http://www.sa-cd.net>). However, some more popular albums have been made as SACDs, including most of Peter Gabriel's catalogue, most of Bob Dylan's catalogue, Pink Floyd's seminal album Dark Side of the Moon (the 30th anniversary edition of 2003) and Roxy Music's Avalon (the 21st anniversary edition, 2003). The two latter albums were released on SACD to take advantage of the format's multi-channel capability. Both were remixed in 5.1 surround (leaving the original stereo mix intact), and released as Hybrid SACD's, but not on the competing Multi-Channel compliant DVD-Audio as an incentive for record buyers to switch from CD to SACD. The competing DVD-Audio had its own incentive albums not released on SACD for the same purpose, including Queen's The Game and A Night at The Opera.

Because some discs are issued in a hybrid format only, such as the remastered Rolling Stones albums released in 2002, many music buyers are building an SACD collection even if they have no SACD playback equipment and don't especially care about SACDs. This is bound to give the SACD format an advantage over DVD-Audio now that SACD playback equipment, in the form of "Universal" players, is inexpensive and readily available. At the same time, buyers who are looking for SACDs find hybrid discs attractive if they also play music on conventional CD players.

One issue in favour of DVD-Audio is the current lack of algorithms and hardware for dealing directly with DSD or Direct-Stream Digital audio (see below), the audio encoding method used by SACDs. Most surround sound/AV receivers can do some processing on multi-channel audio in order to improve the speaker matching and account for the room acoustics. However, currently this cannot be done on DSD audio without first converting it to PCM audio like that used in DVD-Audio. Better quality surround receivers can convert the DSD bitstream to 192 kHz LPCM (linear Pulse-code modulation) for digital signal processing at high fidelity.

However, many more buyers are choosing lower fidelity and convenience, in the form of MP3s and similar lossy compressed formats, than are upgrading to get higher fidelity with SACD or DVD-Audio. This is no doubt because most people listen to music outside their house and couldn't hear the difference on their portable playback equipment anyway. Another reason is that people want to download music, which requires download times or file sizes well below what SACD or DVD-Audio streams would demand.

The Sony PlayStation 3, currently expected by November 2006, will include SACD support.

## Disc reading

Objective lenses in conventional CD players have a longer working distance, or focal length, than lenses designed for SACD players. This means that when a hybrid SACD is placed into a conventional CD player, the laser beam passes the high-resolution layer and gets reflected by the conventional layer at the regular 1.2 mm distance, and the high-density layer is out of focus. When the disc is placed into an SACD player, the laser is reflected by the high-resolution layer (at 600  $\mu\text{m}$  distance) before it can reach the conventional layer. To the same point, if a conventional CD is placed into an SACD player, the laser will read the disc with no problem since there is no high-resolution layer.

## DSD

SACD audio is stored in a format called Direct Stream Digital (DSD), very different from the conventional PCM used by the compact disc or conventional computer audio systems.

DSD is 1-bit, has a sampling rate of 2.8224 megahertz, and makes use of noise shaping quantization techniques in order to push 1-bit quantization noise up to ultrasonic frequencies. This gives the format a greater dynamic range and wider frequency response than the CD. Promotional materials about SACD supplied by Philips and Sony suggest that the system is capable of delivering a dynamic range of 120 dB from 20 Hz to 20 kHz and an extended frequency response up to 100 kHz, although most players list an upper limit of 80-90 kHz.

Because of the nature of sigma-delta converters, one cannot make a direct comparison of the dynamic range and the frequency response between DSD and PCM. An approximation is possible, though, and would place DSD in some aspects comparable to a PCM format that has a bitdepth of 20 bits and a sampling frequency of 88 kHz, effectively making DSD a contender against the highest-resolution format among DVD-Audio PCM types, i.e. 24-bit sampled at 192 kHz.

Note that the two formats may still differ in terms of fidelity at high-frequency sounds since DSD, thanks to its high sampling frequency, does not show the typical ringing effects of reconstruction filters used with PCM. On the other side, DSD's dynamic range decreases quickly at frequencies over 20 kHz due to the use of strong noise shaping techniques, while PCM's dynamic range is the same at all frequencies. (Some high-end SACD players employ an optional low-pass filter set at 30 kHz for compatibility and safety reasons, suitable for situations where amplifiers or loudspeakers can't deliver an undistorted output if harmonics above 30 kHz are present in the signal.)

Although Sony and Philips claim 1-bit DSD processing is superior to PCM, almost all units present on the market (including Sony's top SACD players) convert DSD stream to 88 kHz PCM before outputting to DA converters.

## Comparison of SACD, DVD-Audio, and CD

There is no evidence that human beings are sensitive to audio frequencies above 20 kHz, and most people over the age of 35 are unable to hear sounds above 15–16 kHz at 72 dB. There is consensus among some hi-fi experts that the ability of an audio system to reproduce sounds above 20 kHz is not needed strictly for reproduction of the amplitude aspect of musical content.

Within the limits of typical human hearing capabilities, the common digital audio formats, including CD, SACD and DVD-Audio, appear to be equivalent for typical listeners using low quality equipment. While some independent double-blind tests have failed to show distinguishable differences between SACD/DVD-Audio and the same audio stream downsampled to CD-Audio's sample rate and dynamic range, many people (usually the weakest link in objective quality assessment) do insist that a simple A/B comparison on even a moderately good system should reveal a stunning difference between SACD and either CD or DVD-Audio. The late film composer Jerry Goldsmith, for example, fiercely backed SACD.

Few home audio systems can accurately reproduce sounds above 20 kHz, and most recording chains are designed around this limit. Modern pop music is typically compressed to a small percentage of the maximum available dynamic range, and thus would not benefit from the extended dynamic range available in SACD or DVD-Audio. In comparison, acoustic performances of jazz, folk, classical and alternative music can definitely benefit from the lack of amplitude compression that extended dynamic range afford.

Increasingly, home audio playback systems are multichannel and this single feature is the most important when considering the differences between Compact Discs and the newer distribution formats. CDs are stereo and both SACD and DVD are multichannel-capable. In addition, SACDs can be authored to be both forward and backward compatible with existing CD players while DVD-Audio titles can be authored to be both forward and backward compatible with existing DVD-Video players.

It has been argued that SACD and DVD-Audio are merely attempts to add copy-protection features rather than representing actual improvements in recording and listening technology. However, in the hands of a competent engineer and producer, the SACD and DVD-Audio formats provide several additional features that can create an engaging and compelling listening experience.

## Copy protection

SACD has several copy prevention features at the physical level which, for the moment, appears to make this format nearly impossible to perfectly copy. These include physical pit modulation and 80 bit encryption of the audio data, with a key encoded on a special area of the disk that is only readable by a licensed SACD device. SACD can't be played on a computer, nor can SACDs be created except by a licensed disc replication facility. Copying the music may still be done via an analogue stage (for example, line-out of the SACD player to the line-in of a CD recorder), but doing so is imperfect since the conversion to and from analogue is lossy.

There has been speculation it may be possible to capture the digital signal after the decryption stage but before the digital to analog conversion stage of an SACD player, which would make it possible to create a bit perfect copy of the SACD. Because most of existing SACD players convert DSD directly to 88 kHz PCM, there exist add-on boards for several players on the market that allow to capture SACD music (only stereo though) through S/PDIF port. Also, since a number of new SACD players have encrypted IEEE 1394 (also called FireWire or i. Link) digital outputs carrying DSD data, it may be possible to get the raw DSD data from the link. The protection mechanism used is Digital Transmission Content Protection (DTCP), which can be used in "Copy Once" or "Copy Never" modes. It is unlikely, however, that the SACD license agreement rules permit anything but the "Copy Never" mode to be used.

# Superclub

**Superclub** is a term used to refer to a [nightclub](#) owned and managed by an electronic dance music record label. Following on from Factory Records ownership of The Hacienda, superclubs became increasingly popular in the early to mid 1990s, and examples include Gatecrasher, Godskitchen and The End.

More recently, the term has also been used to describe large, multistory, high-capacity high-profile nightclubs. Notable superclubs include Crobar (Chicago & NY), Vision (Chicago), Sound-Bar (Chicago), The Government (Toronto), Avalon (Boston), 1015 (San Francisco), the Syndicate (U.K.) and others.

Categories: [Nightclubs](#)

# Supergroup

In the late 1960s, the term **supergroup** was coined to describe music groups comprising members who had already achieved fame or respect in other groups or as individual artists. The term took its name from the 1968 album *Super Session* with Al Kooper, Mike Bloomfield, and Stephen Stills. The coalition of Crosby, Stills and Nash (later Crosby, Stills, Nash and Young) is another early example. Led Zeppelin can also be termed as an early supergroup, as it was originally meant to act as a replacement for The Yardbirds, and the members were chosen by Jimmy Page (already a much sought after guitarist) by virtue of their already impressive catalogue of work (except for Robert Plant, who was chosen because of his very distinct voice).

With the success of Cream (only two of the band's three members had previously achieved significant fame), the term also came to include groups that sold huge numbers of albums and headlined massive concerts, regardless of the previous fame of the individual members. However, the term as correctly applied refers to the architecture, not the achievements, of the group. By any standards, it is not a rigidly defined category and has become, more than anything, a marketing term.

Supergroups tend to be short-lived (often lasting only for an album or two), perhaps because of the natural conflict of egos between established stars. Also, some supergroups were formed as side-projects that were never intended to be permanent.

## Notable supergroups

- Asia  
Geoff Downes (Yes and Buggles), John Wetton (King Crimson and UK), Steve Howe (Yes), and Carl Palmer (Emerson Lake and Palmer)
- Audioslave  
Chris Cornell (Soundgarden); Tom Morello, Tim Commerford, and Brad Wilk (Rage Against The Machine).
- Bad Company  
Paul Rodgers and Simon Kirke from Free, Mott The Hoople's Mick Ralphs, and Boz Burrell from King Crimson.
- Blind Faith  
Eric Clapton and Ginger Baker (Cream); Steve Winwood (Traffic); Ric Grech (Family).  
Crosby, Stills, Nash and Young
- David Crosby (The Byrds); Stephen Stills (Buffalo Springfield); Graham Nash (The Hollies); Neil Young (Buffalo Springfield)
- Cream  
Eric Clapton; Jack Bruce; Ginger Baker
- Damn Yankees  
Ted Nugent; Jack Blades (Night Ranger) Tommy Shaw (Styx)
- Emerson, Lake & Palmer  
Keith Emerson (The Nice); Greg Lake (King Crimson); Carl Palmer (Atomic Rooster).
- Power Station  
Robert Palmer; John Taylor and Andy Taylor (Duran Duran); Tony Thompson (CHIC).
- Traveling Wilburys  
Roy Orbison; Tom Petty; George Harrison; Bob Dylan; Jeff Lynne.
- Velvet Revolver  
Scott Weiland (Stone Temple Pilots); Slash, Duff McKagan and Matt Sorum (Guns N' Roses); Dave Kushner (Wasted Youth)

## Charity supergroups

Artists United Against Apartheid

Band Aid: Three groups of British artists who released "Do They Know It's Christmas?" firstly in 1984, then in 1989 and finally in 2004 as part of Live Aid

Dreamtime Christmas All-Stars

Hear 'n Aid, a heavy metal charity organized by Ronnie James Dio

Northern Lights: Canadian supergroup, recorded "Tears Are Not Enough" in 1984 to combat famine in Ethiopia (song was later included in the USA for Africa album).

One World Project

Rockestra: large group led by Paul McCartney and featuring Pete Townshend, David Gilmour, John Paul Jones and John Bonham; recorded "Let It Be", "Lucille", "Rockestra Theme", and "So Glad to See You Here" to benefit people of Cambodia suffering from Pol Pot's reign. Released as a promotional EP and film.

Supergroup TV show - UK Supergroup vs USA Supergroup in a charity battle of the bands reality show concept

USA for Africa: 45 American recording artists who recorded "We Are the World" in 1984 to combat famine in Ethiopia as the American part of Live Aid

Voices That Care: a group of musicians, entertainers and athletes who recorded the song with the same name for the U.S. troops in Operation Desert Storm.

# Surf music

**Surf music** is a genre of [popular music](#) associated with surf culture.

It has three main streams or subgenres:

- [Instrumental](#) dance music in which [electric guitars](#) with a distinctive sustained but undistorted sound predominate.
- Surf pop music, including both surf ballads and dance music that includes a vocal line.
- [Surf rock](#), which overlaps both the other streams, sometimes even to the point of being used as a synonym for surf music generally.

Many notable surf bands have been equally noted for both surf instrumental and surf pop music, so surf music is generally considered as a single genre despite the variety of these styles.

Recordings in all three traditional subgenres are normally attributed to the bands that performed them, rather than to individual artists. A more recent development is the singer songwriter subgenre, which includes artists like Australian Beau Young, Jack Johnson, Donavon Frankenreiter, and Matt Costa, and overlaps the others in style.

# Surf instrumental

This is mainly [dance music](#) of medium to fast tempo, with [electric guitars](#) dominating the sound, and almost always in straight 4/4 common time.

Surf guitarists produce a distinctive tone colour not unlike a hawaiian guitar by use of the bridge pickup, lots of treble boost, much distinctive use of the tremolo arm, and medium to extreme sustain. However, it is rare to use any distortion, instead sustain is produced by use of the sorts of spring reverb and vibrato units built into the guitar amplifiers of the late 1950s and 1960s. Reverb is also commonly added to the rhythm and lead guitars by use of an external spring reverberation unit.

The basic surf instrumental band consists of:

- Lead guitar.
- Rhythm guitar.
- [Bass guitar](#).
- [Drum kit](#).
- percussion.

There are many variations, particularly adding other guitars or instruments, or using [hand drums](#) or other percussion as well as or instead of the drum kit.

This basic configuration is identical to that adopted in the early development of [rock and roll](#) music, and the two styles developed in parallel, with some bands clearly in both genres. Both styles influenced the development of the electric guitar, electric bass and drum kit, and in the process affecting each other.

Surf music was the first genre to universally adopt the [electric bass](#); The upright or string bass has never been used to any great extent, as the more sustained and trebly sounds favoured by surf bands are not easily produced on it. The promotion of more creative uses of electric bass as part of surf music influenced both rock and [jazz](#) music.

Surf music also shared with rock and roll and jazz in the development of [drum kit](#) technique. Both surf and rock music (and some jazz styles) adopted a back beat as standard at about the same time, and using similar fills and rhythms. Both surf and rock styles were predominantly 4/4 common time.

Examples:

- Dick Dale, 1960s to present.
- Walk Don't Run, The Ventures, 1960.
- Apache, The Shadows, 1960. (British group)
- Bombora (single), The Atlantics, 1962.
- Wipeout, The Surfaris, 1962.

## Surf pop

Surf pop music is in turn in two styles.

## Surf ballads

Surf ballads tend to be slow and dominated by male vocal harmonies, often including a falsetto descant part and sometimes also a falsetto lead. They may be in any time signature. Themes tend to be romantic and linked to surf culture.

Examples:

- Surfer Girl (single), The Beach Boys, 1963.

## Surf dance music with vocals

This is medium to fast dance music which adds a male or female vocal line and often harmonies, and is otherwise very similar to surf instrumental music. Themes of the lyrics come from surf culture, teenage issues, and are often lighthearted or even humorous.

Examples:

- Surf City, Jan and Dean, 1963.
- Surfer Joe, The Surfaris, 1963.
- He's my blonde headed stompie-wompie real gone surfer boy, Little Pattie, 1963.
- Fun Fun Fun, The Beach Boys, 1964.

## Surf rock

Historically, [surf rock](#) is a contradiction in terms. In the 1960s when surf music was developing as a genre, surf culture and [rock and roll](#) culture were competing youth cultures, similarly to mod culture and [rocker](#) culture in the United Kingdom in the same period.

The dances closely associated with early surf and rock music were similarly in contrast. Surf music was associated with the Stomp, the Frug, the Watusi and similar dances suitable for beach parties, but in which the partners never touched. All these were danced to straight 4/4 common time. Early rock music was of course associated with rock and roll, which had heavy emphasis on leading and partnering and movements adapted from the Jive, Jitterbug and Lindy Hop. Although rock and roll is officially also a common time dance, its immediate ancestors were all danced to swing or shuffle 6/8 rhythm, and some early rock classics such as Bill Haley's Shake, Rattle and Roll and Rock Around the Clock, Buddy Holly's That'll Be The Day, and Elvis Presley's Jailhouse Rock were also in swing rhythm.

Musically there has always been a great deal of common ground between surf and rock music. The classic lead, rhythm, and bass guitar plus drums combo developed at the same time in both genres, using similar instruments and both contributing to the development of the instruments themselves. Some pieces of surf music have been an integral part of the sound of the rock bands that created them, and so are in both genres (see *examples*, below).

In that *surf rock* simply means surf music played by rock bands, with the ever broadening scope of the term [rock music](#) since the 1960s, in a sense surf music has become a subgenre of rock music. This is seen for example in the induction of classic surf band The Beach Boys into the Rock and Roll Hall of Fame. A similar process has seen much country and western and even [jazz](#) music retrospectively termed *rock*. So, *surf rock* is not a new style of music, but rather a new name by which new fans know an old style and even the old music.

While known as a genre that developed on the west coast of the United States, a recent revival has sparked an insurgence of East Coast Surf bands. Some of these include The Howlin' Thurstons and Strange But Surf based on NY's Long Island. Which is also the home of a growing surfing scene.

Examples:

Look Through Any Window, The Hollies, 1966.  
Wedding Cake Island, Midnight Oil, 1975.

# Surf rock

**Surf rock** is a style of music that originated in the USA that mixes elements of [surf music](#) and [rock music](#). While in the 1960s surf music and [rock n' roll](#) were distinct styles, associated with competing dance styles and representing distinct and competing youth cultures, the development of rock music since then has built upon both styles. Many authorities now retrospectively classify all surf bands as rock bands, and surf music therefore as a subgenre of rock music.

A typical surf amplifier setup consists of a Fender Reverb spring reverberation unit used with a Fender blackface Twin Reverb amplifier. For a guitar, a Fender Jazzmaster, Mosrite, Teisco, or Danelectro are standard choices. Fender, Danelectro, Mosrite bass guitars are common as well. Surf drum kits tend to be Rogers, Ludwig, or Slingerland.

Duane Eddy's instrumental "Movin' and Groovin'" is thought by many to be the main contender for laying the groundwork as the first surf rock record, while others claim the genre was invented by Dick Dale on "Let's Go Trippin'", an instrumental which became a hit throughout California.

Dale's influence on the surf genre was profound. He was a surfer himself and sought to transfer the excitement and adrenaline of the sport through his guitar playing. He often drew on his Lebanese heritage, incorporating modal tonalities and instruments such as finger cymbals and reeds. Many surf bands that followed him incorporated Eastern influences, as well as Dale's generous use of reverb. His fast staccato playing was also very influential and an important part of the early surf sound, perhaps even more so than the reverb, which was only introduced years after Dale had already released his first albums. In Australia, which has always had a strong beach culture, the genre was strongly embraced in the 1960's, although Australian surf rock bands such as The Atlantics took their influences more from the famed British instrumental band The Shadows.

Instrumental rock band The Ventures also had a number of surf hits, their most widely known being "Walk Don't Run". The Chantays recorded a top single with "Pipeline". Probably the most widely known surf melody, however, is from a song "Wipe Out" by The Surfaris.

During the mid- to late 1990s, surf rock experienced a revival in the works of such artists as The Blue Stingrays, Bomboras, Man... or Astro-Man?, and The Aqua Velvets. The popularity of the movie "Pulp Fiction" which featured surf music fuelled the revival well into this century.

While known as a genre that developed on the west coast of the United States, the recent revival has sparked an insurgence of East Coast Surf bands. Some of these include The Howlin' Thurstons and Strange But Surf based on NY's Long Island. Which is also the home of a growing surfing scene.

## Subgenres

Spy Rock is a subgenre of surf rock featuring similarly complex melodies, usually set in minor keys, evocative of film noir. Examples include the bands Double Naught Spy Car and the Twenty-Twos.

Surfabilly is a subgenre often featuring traditional surf melodies played over [rockabilly](#) chord structures. Examples include the bands The Red Elvises, Southern Culture on the Skids, and The Young Werewolves.

Hot Rod Rock (also called Drag Rock) is also a subgenre of surf rock. Traditional surf rock sounds are applied to lyrics about the also rising hot rod culture. For a few years it gained mass popularity. The Rip-Chords, Ronny and the Daytonas, and The Hondells are good

examples of this subgenre. The Beach Boys and Dick Dale produced songs in this subgenre such as "Little Deuce Coupe" and "Mag Wheels".

Space Rock is a subgenre of surf rock. It contains many of the characteristics of the "true" surf rock sound, but it also contains many elements from pop and rockabilly. The lyrics also deal instead of surf with the space race. The album *The Ventures in Space* is a good example.

Surf Punk is a highly inclusive subgenre of surf rock that incorporates many of the styles and attitudes of punk music with traditional vocal and instrumental surf. The Ramones experimented with surf and numerous small bands of the midwest currently perform this style. Aggressive drumming, distortion coupled with reverb, fast chord changes, and intense vocal stylings are the trademark. The Amino Acids of Detroit, Michigan and The Deformities of Omaha, Nebraska, and others like Estrume'n'tal, build on this genre, while bringing in other influences such as heavy metal and/or psychobilly.

# Surrealism

**Surrealist music** is [music](#) which uses unexpected juxtapositions and other surrealist techniques. Anne LeBaron (2002, p.27) cites automatism, including improvisation, and collage as the primary techniques of musical surrealism. Discussing Adorno, Max Paddison (1993, p.90) defines surrealist music as that which "juxtaposes its historically devalued fragments in a montage-like manner which enables them to yield up new meanings within a new aesthetic unity," though Lloyd Whitesell calls this a gloss. According to Theodor Adorno (1930), "Insofar as surrealist composing makes use of devalued means, it uses these as devalued means, and wins its form from the 'scandal' produced when the dead suddenly spring up among the living." (Whitesell 2004, p.107 and 118n18).

## Early surrealist music

In the 1920s several composers were influenced by Surrealism, or by individuals in the Surrealist movement. Among these were Bohuslav Martino, Andre Souris, and Edgard Varèse, who stated that his work *Arcana* was drawn from a dream sequence. Souris in particular was associated with the movement: he had a long, if sometimes spotty, relationship with Magritte, and worked on Paul Nougé's publication *Adieu Marie*. The two composers most associated with surrealism during this period were Erik Satie, who wrote the score for the ballet *Parade* which caused Guillaume Apollinaire to coin the term surrealism, and George Antheil who wrote that "The Surrealist movement had, from the very beginning, been my friend. In one of its manifestos it had been declared that all music was unbearable--excepting, possibly, mine--a beautiful and appreciated condescension" (LeBaron 2002, p.30-31). Later French composer Pierre Boulez wrote a piece called *explosante-fixe* (1972), inspired by Breton's collection of poems *Mad Love*. Germaine Tailleferre of the Group des Six wrote several works which could be considered to be inspired by Surrealism, including the 1948 Ballet "Paris-Magie" (scenario by Lise Delarme, who was closely linked to Breton), the Operas "La Petite Sirène" (book by Philippe Soupault) and "Le Maître" (book by Eugène Ionesco). Tailleferre also wrote popular songs to texts by Claude Marci, the wife of Henri Jeanson, whose portrait had been painted by Magritte in the 1930s.

Early surrealists shared a negative opinion of music. Giorgio de Chirico claimed in his 1913 article "No Music" that a painting has a "music of its own", implying that music is unnecessary. In 1928's "Le Surréalisme et la peinture" Breton dismisses music, "the most deeply confusing of all art forms", as providing a lesser degree of sensation and "spiritual realizations" than the plastic arts, saying that "auditive images, in fact, are inferior to visual images not only in clarity but also in strictness, and with all due respect to a few megalomaniacs, they are not destined to strengthen the idea of human greatness. So may night continue to descend upon the orchestra, and may I, who am still searching for something in this world, be left with open eyes, or with closed eyes in broad daylight, to my silent contemplation." In 1944's essay on music "Silence is Golden" Breton confesses his ignorance of music and even suggests the fusing of music and poetry: "for the first audible diamond to be obtained, it is evident that the fusion of the two elements--music and poetry--into one, could only be accomplished at a very high emotional temperature. And it seems to me that it is in the expression of the passion of love that both music and poetry are most likely to reach this supreme point of incandescence." (ibid, p.29-30)

Despite all this, later Surrealists have been interested in, and found parallels to Surrealism in, the improvisation of [jazz](#) (as alluded to above), and the [blues](#) (Surrealists such as Paul Garon have written articles and full-length books on the subject). Jazz and blues musicians have occasionally reciprocated this interest; for example, the 1976 World Surrealist Exhibition included such performances by Honeyboy Edwards.

## Later surrealist music

Readers of the Surrealists have also analysed [reggae](#) and, later, [rap](#), and some rock bands such as The Psychedelic Furs. In addition to musicians who have been influenced by Surrealism (including some influence in rock — the title of the 1967 psychedelic Jefferson Airplane album Surrealistic Pillow was obviously inspired by the movement), such as the experimental group Nurse With Wound (whose album title Chance meeting on a dissecting table of a sewing machine and umbrella is taken from a line in Lautreamont's Maldoror), Surrealist music has included such explorations as those of Hal Rammel. Many ambient musicians (most notably Robert Rich) use complex arrangements of textural sounds to evoke surrealist imagery. Many goth artists like Rozz Williams have been influenced by surrealism.

In a February 2003 interview, [breakcore](#) musician Aaron Funk (aka Venetian Snares) was asked a question regarding the diverse mix of genres he draws upon in his music, a property which the interviewer labelled "eclecticism". Funk replied: "I prefer to call it Surrealism."

# Swamp blues

The **swamp blues** is a form of [blues](#) music that is highly evolved and specialized. It arose from the [Louisiana blues](#) and is known for its laidback rhythms which dominate a music that is simultaneously funky and often lighthearted — for a blues sub-genre. Influences from Cajun music (such as zydeco) can also be heard in the sound, which has long been based out of Baton Rouge, Louisiana. Jay Miller's Crowley, Louisiana-based Excello Records was perhaps the best-acknowledged label supporting swamp blues.

# Swamp rock

**Swamp rock**, also called [Roots rock](#) is a classic American sound distinct in early 70s bands, such as Creedence Clearwater Revival and Three Dog Night. This sound may consist of [electric guitar](#) and [bass guitar](#) behind a vocal track. The music places emphasis on the [guitar](#) and [piano](#) style.

The finished sound produces a clear tune with a distinct Southern guitar.

## Swede-core

**Swede-core** (aka Gothencore) is a nickname for the most common style of [metalcore](#) music today, which combines the [melodies](#) and guitar [harmonies](#) of Swedish [melodic death metal](#) bands such as In Flames and At the Gates with the aggressiveness and breakdowns of American [hardcore punk](#). This style is most commonly played by North American bands, though it has been made popular in Europe as well by bands like Caliban and Heaven Shall Burn.

## Origins

While death metal and hardcore had always intermingled to an extent, the first clearly identifiable instances of melodic Swedish metal being combined with hardcore seem to have sprung almost simultaneously, with Undying's *This Day All Gods Die*, Darkest Hour's *The Prophecy Fulfilled*, Prayer for Cleansing's *The Rain in Endless Fall*, Shadows Fall's *With Somber Eyes to the Sky*, and Unearth's *Above the Fall of Man* all being released within a year of each other (1998-99). It is unclear who first got the idea to combine the two styles. Darkest Hour had released an EP called *The Misanthrope* in 1996 which arguably contained elements of their later sound but was for the most part aggro-hardcore in the vein of *Damnation a.d.* On the other hand, Day of Suffering's 1997 album *The Eternal Jihad* is cited as an influence for many of the North Carolina bands that followed, such as Undying and Overcast is seen as having started the genre in Massachusetts.

From the above list of bands one can see that the two main points of origin for Swedecore were the Washington D.C./North Carolina and Boston area hardcore scenes, though Florida's Morning Again may have been influential as well. However, it can be argued that strides to bridge the gap between the two styles were being made in the European metal scene as well. In the early 90's, the band Entombed began to incorporate elements of hardcore punk, and it can be argued that Carcass, who are considered to be one of the inventors of melodic death metal, had a strong hardcore element to begin with. The band that brought the Swedish metal sound closest to hardcore, however, was At the Gates, whose landmark 1995 album *Slaughter of the Soul* eschewed the layered melodies and folk-style acoustic guitars used by their peers Dark Tranquillity and In Flames in favor of a much more raw and energetic sound. In the liner notes of the album's re-released version, vocalist Tomas Lindberg recalls that many of the band's American fans consisted of "straight edge kids". Though they broke up shortly after, At the Gates is one of the bands that are most imitated by today's metalcore artists, particularly Darkest Hour. Soilwork followed a similar pattern, bringing in even more hardcore influences, though in recent years their sound has shifted more towards Nu-metal.

## Characteristics

There is a great deal of variation within the subgenre itself. More popular bands such as Killswitch Engage and Atreyu tend to rely on a thicker, better-produced sound, conspicuous breakdowns, and clean-vocal passages, while smaller-label bands such as Undying or Beyond the Sixth Seal tend to have a faster, more raw sound that is often virtually indistinguishable from traditional melodic death metal. The main distinction lies in the drumming, which is much more hollow-sounding (and usually sharper and more precise) than the standard double-bass roll found in most European death metal. If breakdowns are used, they are generally more 'brutal' than those of the bands in the first category.

The lyrics of Swede-core bands are generally more intelligent and complex than those of standard Swedish-style melodic death metal bands, if for no other reason than that English is usually not the latter's first language. Often, they reflect hardcore rather than metal themes; for example, Darkest Hour focuses on socio-political commentary, while Undying focuses on veganism and environmentalism. Other bands such as The Black Dahlia Murder use more standard death metal themes, though this is probably done in a somewhat self-conscious, tongue-in-cheek fashion. Oddly enough, the apocalyptic nature of the music also suits it to Christian themes, and [Christian metalcore](#) is nearly a genre unto itself.

## Popularity

Swede-core became unexpectedly popular around the year 2000 along with [emo](#), probably due to its overlap with some of the heavier [emo-hardcore](#) bands. Among the bands that helped popularize it and are considered its foremost representatives today are Shadows Fall, Killswitch Engage, God Forbid, and Unearth. Because of its popularity, it is often criticized as a 'sell-out' genre, being called "the new [Nu-metal](#)". The validity of this argument is supported by the fact that Ozzfest lineups in recent years have begun to consist mainly of metalcore bands, whereas the festival had been dominated by Nu-metal in the late nineties. Defenders of the genre say that the style has simply become more popular, while critics counter that the music itself has become watered-down and stale.

Currently Swede-core possesses a sort of second-degree popularity, prevalent among fans of heavy music in general, but lacking the mainstream appeal of emo. However, its influence is visible in the mainstream, as many popular emo bands such as Alexisonfire or Silverstein often conspicuously incorporate Swedish metal riffs into their sound.

# Swing

**Swing music**, also known as **swing jazz**, is a form of [jazz](#) music that developed during the 1920s and solidified as a distinctive style during the 1930s in the United States. Swing is distinguished primarily by a strong rhythm section, usually including double bass and [drums](#), medium to fast tempo, and the distinctive swing time rhythm that is common to many forms of jazz.

# History

The first recordings labelled **swing style** date from the 1920s, and come from both the United States and the United Kingdom. They are characterised by the swing rhythm already at that time common in [jazz](#) music, and a lively style which is harder to define but distinctive. Although swing evolved out of the lively jazz experimentation that began in New Orleans and that developed further (and in varying forms) in Kansas City and New York City, what is now called *swing* diverged from other jazz music in ways that distinguished it as a form in its own right.

Swing bands tended to be bigger and more crowded than other jazz bands, necessitating a slightly more detailed and organized type of composition and notation than was then the norm. Band leaders put more energy into developing arrangements, perhaps reducing the chaos that might result from as many as 12 or 16 musicians spontaneously improvising. But the best swing bands at the height of the era explored the full gamut of possibilities from spontaneous ensemble playing to highly orchestrated music in the vein of European art music.

A typical song played in swing style would feature a strong, anchoring [rhythm section](#) in support of more loosely tied wind, brass, string, and vocal sections. The level of improvisation that the audience might expect at any one time varied depending on the arrangement, the band, the song, and the band-leader. The most common style consisted of having one soloist at a time taking center stage, and take up an improvised routine, with her/his bandmates playing support. As a song progressed, multiple soloists might be expected to pick up the baton, and then pass it on. That said, it was far from uncommon to have two or three band members improvising at any one time.

As jazz in general, and swing jazz in particular, began to grow in popularity throughout the States, a number of changes occurred in the culture that surrounded the music. For one, the introduction of swing in the early 1930s (during the Great Depression), with its strong rhythms, loud tunes, and "swinging" style led to an explosion of creative [dance](#) in the black community. The various rowdy, energetic, creative, and improvisational dances that came into effect during that time came to be known, collectively, as [swing dance](#).

The second change that occurred as swing music increased in popularity outside the black community, was, to some extent, an increasing pressure on musicians and band leaders to soften (some would say dumb-down) the music to cater to a more staid and conservative, Anglo-American audience.

Similar conflicts arose when Swing spread to other countries. In Germany, it conflicted with Nazi ideology (see Swing Kids) and was declared officially forbidden by the Nazi regime. And, while jazz music was initially embraced during the early years of the Soviet Union, it was soon forbidden as a result of being deemed politically unacceptable. After a long hiatus, though, jazz music was eventually readmitted to Soviet audiences.

In later decades, the popular, sterilized, mass-market form of swing music would often, and unfortunately, be the first taste that younger generations might be exposed to, which often led to it begin labeled something akin to 'old fogey big-band dance music'.

Ironically, early swing musicians were often in fact annoyed by the young people who would throw a room into chaos by seemingly tossing each other across the floor at random — thus somewhat nullifying the idea that swing was developed as dance music, when in fact, swing dancing evolved among young aficionados to complement the energy of the music.

# Famous Swing Musicians

**Band leaders:**

Duke Ellington, Count Basie, Fletcher Henderson, The Dorsey Brothers, Benny Goodman, Artie Shaw, Gene Krupa, Glenn Miller, Chick Webb

**Clarinet:**

Benny Goodman, Artie Shaw

**Trumpet:**

Louis Armstrong, Roy Eldridge, Harry Edison

**Piano:**

Count Basie, Earl Hines, Art Tatum, Teddy Wilson, Jelly Roll Morton

# Swing dance

The term "**swing dance**" is commonly used to refer either to a group of dances developing during the swing era (late 1920s to 1940s) or to the current dances and dance scenes centred on swing dancing. Historical swing dances as a family are usually situated within an African American vernacular dance tradition, though there are some exceptions which developed within the white or mainstream American community. Almost all of the former feature the syncopated timing associated with African American and West African music and dance, and with jazz dances of the jazz era (late 19th century to the 1940s). Most swing dances developed in response to swing (genre) music, though many of these styles and their descendents are danced today to modern music. There are swing dance scenes in many developed Western and Asian countries throughout the world, though each city and country varies in the popularity of specific dances, local culture and definitions of "swing dance" and "appropriate" dance music.

## Forms of swing

In many scenes outside the United States the term "swing dancing" is used to refer generically to one or all of the following swing era dances: [Lindy Hop](#), Charleston, Shag, Balboa and [Blues \(dance move\)](#). This group is often extended to include Jive, [rock and roll](#), Western Swing, ceroc, and other dances developing in the 1940s and later. Within the United States, swing dancing is often expanded to include many other social dances, including [West Coast Swing](#), [East Coast Swing](#), Hand dancing and so on. A strong tradition of social and competitive boogie woogie and acrobatic rock and roll in Europe add these dances to their local swing dance cultures. In Singapore and other scenes, latin dances such as salsa and [tango](#) are often taught and danced within the "swing scene", and for many scenes tap dancing and a range of other jazz dances are considered key, as are hip hop and other contemporary African American street dances. The variations continue, dictated by local dance community interests.

Many swing dancers today argue that it is important to dance many styles of partner dance to improve technique, but also to reflect the historical relationship between these dances in the swing era of the 20s and 30s. In the Savoy Ballroom, for example, bands would often play waltzes, latin songs and so on, as well as swinging jazz. Dancers were often familiar with a wide range of popular and traditional dances. There are a number of hybrid forms which combine swing dances with other styles, including swango, a combination of Argentinian [tango](#) and swing.

Swing dance communities and dancers are often interested in and dance:

### Early Jazz forms of the 1920s and earlier

- Black Bottom (dance)
- Rhythm Tap Dance
- Texas Tommy The first mention of Swing dancing was in the San Francisco Tribune in 1911 to describe dancers performing the Texas Tommy in the Fairmount Hotel. The Texas Tommy involved partners breaking away from each other (instead of dancing in a closed position holding each other) and in which the leader "swung out" his follower, adding many forms of free improvisation and acrobatic movement. The term "acrobatic" was used repeatedly to describe this dance. Texas Tommy was the basis for Lindy Hop. When the original Texas Tommy dancers were asked to describe their dance they said it was "exactly like the Lindy Hop, just the first couple of steps were different." They continued to say that the "Lindy basic was like the Texas Tommy basic." Through time, Texas Tommy, through its open framework (meaning its allowing integration of improvisation and free movement) had evolved into the Breakaway, and absorbed along the way a host of other partner dances - namely the animal dances such as the Grizzly Bear, Bunny Hop, Eagle Rock and Turkey Trot.
- Shim Sham Shimmy was a popular dance of the 1920s and 30s.
- Apache was an old french dance from the suburbs of Paris, popular from the mid-1800s. The essence of the dance was the performance of a scene in which a man, or a pimp, subjects or punishes a woman, or a prostitute. The dance consisted of the woman dragging from the man in close position and the man throwing her around. This is the only known early dance other than Texas Tommy in which the couple "break away". The move "Apache Spin" or "Texas Tommy Spin" came from this dance, and it is easy to visualize how it would fit within the theme of the dance.

- Charleston is a classic 8-count dance that predates Lindy Hop and is often incorporated into Lindy dances. The Charleston originally developed in African American communities in the 1920s, though it reached wider audiences through stage performances. It was danced alone or with partners, and is often identified today as belonging either to the 1920s style or to 1930s and 'swinging' or "Lindy Hop" styles.
- Breakaway developed from Charleston in the late 1920s and is often associated with dancers such as George Snowden. Dancers 'breaking away' from each other into open is often seen both as a development of dances such as the Texas Tommy, but also as an important developmental step in the history of Lindy Hop. It is popular with dancers with an interest in the history of Lindy Hop.

## Later forms from the 1930s and 1940s

- [Lindy Hop](#) evolved in the late 1920s and early 1930s as the original swing dance. It is characterised by an emphasis on improvisation and the ability to easily adapt to include steps from other 8-count and 6-count Swing styles. It has been danced to most every conceivable form of [jazz music](#), as well as to the [blues](#), and any other type of music with a blues or jazz rhythm.
- Balboa is an 8-count dance that emphasizes a strong partner connection and quick footwork. Balboa (sometimes referred to simply as "Bal") is primarily danced in a tight, closed position with the follow and lead adopting a firm chest-to-chest posture. This dance is particularly popular in settings with fast [jazz](#) (usually anything from 180 to 320 beats per minute) and/or limited floor space, though it is also danced to slower tempos.
- [Blues](#) dancing today is an informal type of swing dancing with no fixed patterns and a heavy focus on connection, sensuality and improvisation, often with strong body contact. Although usually done to blues music, it can be done to any slow tempoed 4/4 music, including rock ballads and "club" music. Historically, there are many different types of blues dancing, including the slow drag. Blues is occasionally danced alone in swing dance communities, though almost never outside the United States. There are only small (if any) blues dancing communities within the wider swing dancing communities outside the United States and Europe.
- Carolina Shag
- Collegiate Shag is a simple 6-count dance that is typically done to faster music.
- St. Louis Shag

## Forms from the 1940s, 50s and later

- Boogie Woogie developed originally in the 1940s with the rise of boogie woogie music. It is popular today in Europe, and is considered by some to be the European counterpart to [East Coast Swing](#), danced to rock music of various kinds, blues or boogie woogie music but usually not to jazz.
- Country Swing, also called Western Swing or Country/Western Swing (C/W Swing) is a form with a distinct culture. It resembles East Coast Swing, but adds variations from other country dances. It is danced to [country and western music](#).
- [East Coast Swing](#) is a simpler 6-count variation. It is also known as Single-Time Swing, Triple-Step Swing, 6-Count Swing, Rock-a-billy, or Jitterbug. East Coast Swing has very simple structure and footwork along with basic moves and styling. It is popular for its forgiving yet elegant nature, and it is often danced to slow, medium, or fast tempo [jazz](#), blues, or rock and roll.
- Washington Hand Dancing
- Jitterbug is often described as a subset or development of [Lindy Hop](#).

- Jive is a dance of International Style Ballroom dancing. It diverged from Swing still further.
- Push and Whip are Texas forms of swing dance.
- Skip Jive A British variant, popular in the 50s and 60s danced to [trad jazz](#).
- [West Coast Swing](#) was developed in the 1940s and 1950s as a stylistic variation on Lindy Hop. Followers stay in a slot, which reduces their ability to move left and right but improves their ability to spin left and right. West Coast Swing is often danced with [blues](#) and [rock and roll](#) music, as well as to [smooth](#) and [cool jazz](#). It is popular throughout the United States and Canada but is uncommon in Australia, New Zealand and much of Asia, though it is often compared to Ceroc or Dirty Latin Jive in these countries.
- Acrobatic Rock and Roll Popular in Europe, acrobatic rock and roll is popularly associated with Russian gymnasts who took up the dance, though it is popular throughout Europe today. It is more a performance dance and sport than a social dance.
- [Rock and Roll](#) Developing in the 1950s in response to [rock and roll music](#), rock and roll is very popular in Australia and danced socially as well as competitively and in performances. The style has a long association with Lindy Hop in that country, as many of the earliest lindy hoppers in the early 1990s moved to Lindy Hop from a rock and roll tradition. There are ongoing debates about whether rock and roll constitutes swing dancing, particularly in reference to the music to which it is danced: there is some debate as to whether or not it [swings](#). Despite these discussions, many of the older lindy hoppers are also keen rock and roll dancers, with rock and roll characterised by an older dancer (30s and older) than Lindy Hop (25 and under).

# Performance, social dancing and competition

## Competition/performance styles

Traditionally, distinctions are made between "Ballroom Swing" and "Street Swing" styles. Ballroom Swing is a part of American style [Ballroom dancing](#). Street Swing and Ballroom Swing are different in appearance. Ballroom Swing is danced in competition and is done strictly in patterns (a series of interlocking moves). Street Swing is danced in many different styles and places with thousands of differences and is very open to interpretation.

## Social swing dancing

Many, if not most, of the swing dances listed above are popular as [social dance](#), with vibrant local communities holding dances with [DJs](#) and live bands playing music most appropriate for the preferred dance style. There are frequently active local clubs and associations, classes with independent or studio/school-affiliated teachers and workshops with visiting or local teachers. Most of these dance styles - as with many other styles - also feature special events such as camps or the lindy exchange.

## Music

The historical development of particular swing dance styles was often in response to trends in popular music. Charleston, for example, was - and is - usually danced to [ragtime](#) music, [Lindy Hop](#) was danced to [swing music](#), which is a kind of swinging [jazz](#). West Coast Swing is usually danced to blues or rock and roll or to virtually any 4/4 music that is not too fast. Country Swing is often danced to country and western music. Hip hop lindy is danced to [hip hop music](#), and blues dancing either to historical blues music forms, or to slower music from a range of genres (though most frequently to jazz or blues). There are local variations on these associations in each scene, often informed by the local [DJs](#), dance teachers and bands.

# Swing Era

The **Swing Era** was the period of time (1935-1946) when [big band swing music](#) was the most popular music in America. Though the music has been around since the late 1920s - early 1930s, bringing played by Black bands like Duke Ellington, Louis Armstrong, & Fletcher Henderson, most historians believe that the Swing Era started with Benny Goodman's performance at the Palomar Ballroom on August 21, 1935, bringing the music to the rest of the country. Other musicians who would rise during this time include Jimmy Dorsey, his baby brother Tommy Dorsey, Glenn Miller, Count Basie, & Goodman's future rival Artie Shaw. Several factors left to the demise of the swing era; the recording ban from August 1942 to November 1944 (The union that most jazz musicians belong to told its members not to record until the record companies agree to paid them each time their music is played on the radio), the earlier ban of ASCAP songs from radio stations, World War II which made it harder for bands to travel around as well as the "cabaret tax", which was as high as 20%, the change in music taste & the rise of bebop. Though Ellington & Basie were able to keep their bands together. (the later did briefly downsize his band; from 1950-1952), by the end of 1946, most of their competitors were forced to disband, bringing the swing era to a close.

## Songs From the Swing Era

The Swing Era has left behind a lot of songs that are now classics. Some of those are:

- "Sing, Sing, Sing" by Benny Goodman
- "Begin the Beguine" by Artie Shaw
- "It Don't Mean a Thing (If It Aint' Got That Swing)" by Duke Ellington
- "Body and Soul" by Coleman Hawkins
- "In the Mood" by Glenn Miller
- "Song of India" by Tommy Dorsey
- "Jumpin' at the Woodside" by Count Basie
- "Stardust", which has been recorded by everyone from Armstrong, to Miller to Shaw.
- "Cherokee" by Charlie Barnett
- "I Can't Get Started" by Bunny Berigan

## Other Meanings

The general culture of the times between and during the Spanish Civil War and World War II was often called the swing era.

Category: [Swing](#)

# Swing Revival

The **Swing Revival** was a cultural phenomenon of the 1990s and early 2000s which featured renewed popular interest in music in the style of the [Swing](#) period of the 1930s and 1940s. Most of the popular groups of this genre had a basic rock'n'roll instrumentation of Guitar, Bass, and Drums with an additional 3 to 4 instrument horn section. The most popular Wind instrumentation featured a Trumpet, Saxophone, and Trombone. Bands with this instrumentation include Big Bad Voodoo Daddy, and The Cherry Poppin' Daddies. The Brian Setzer Orchestra was exceptional in that its instrumentation was closer to that of the original Swing Era with 13 Wind Instruments in addition to the Guitar/Bass/Drums combo. The style of Louis Prima was especially influential on the style of the Swing Revival. The Brian Setzer Orchestra recorded covers of several of Prima's pieces.

Bands of the period tended more toward the sweet style (highly rehearsed) than the hot style (more improvisational, with focus on instrumentalist virtuosity).

Many consider the Swing Revival to now be dead. It is at least on the decline. Several performers are still recording and touring for a cache of fans who are genuinely interested in the music, though the genre is out of the national spotlight.

# Performers

- Primary
  - Big Bad Voodoo Daddy
  - Brian Setzer Orchestra
  - Cherry Poppin' Daddies
  - Squirrel Nut Zippers
  
- Secondary
  - Hipster Daddy-O and the Handgrenades
  - Atomic Fireballs
  - Big Rude Jake
  - Mighty Blue Kings
  - Royal Crown Revue
  - Katharine Whalen
  
- Tertiary
  - 8 1/2 Souvenirs
  - Andrew Bird
  - Bill Elliott Swing Orchestra
  - Lavay Smith and Her Red Hot Skillet Lickers
  - Lee Press-on and the Nails
  - Indigo Swing
  - Steve Lucky & Rhumba Bums
  - The Deluxtone Rockets
  - The W's
  - The Don Miller Orchestra

## Cultural Effects

The Swing Revival was visible in more than just music. [Swing dancing](#) returned as a popular dance form, accompanying the music. Films such as *Swingers* and the earlier *Swing Kids* (film) increased interest in the Swinging lifestyle. Gap featured Louis Prima's *Jump Jive 'n Wail* in one of their advertising campaigns. *Big Bad Voodoo Daddy* made a notable appearance at the Superbowl Halftime Show in 2000. Some have also conjectured that the swing revival is at least partly responsible for the reinvigoration of the Hipster movement, many of whose members were also involved in and cross-influenced by the swing revival scene. Paradoxically, this new generation of hipsters seems to have lost much of the musical association with jazz of their predecessors.

Categories: [Swing](#)

## Swung note

In [music](#), a **swung note** or **shuffle note** is the [rhythmic](#) device in which the duration of the initial [note](#) in a pair is augmented and that of the second is diminished. A **swing** or **shuffle rhythm** is the [rhythm](#) produced by playing repeated pairs of notes in this way. *Lilting* can refer to swinging, but might also indicate syncopation or other subtle ways of interpreting and shaping musical time.

In [jazz](#), especially of the [big band](#) era, there is a convention that pairs of written beats are not played equally, as the notation is otherwise understood, but with the first longer than the second and the shorter second note having an accent. The first note of each of these pairs is often understood to be twice as long as the second, implying a triplet feel, but in practice the difference is rarely that pronounced (see "amount of swing," below). This is an assumed convention of notation in many styles of jazz, but does not apply to all early jazz (before 1930), [latin jazz](#), bebop, or to the work of composers writing in the 1950s or later, unless "swing" is specified in the score.

Notes which are not swung, that is played without a shuffle, are known as **straight notes**.

In [dance](#), **swing** or **shuffle time** or **rhythm** is music whose [metre](#) is that of common time played with a swing. It may be written as simple time and played with a swing, or as compound time and played as written.

## Amount of swing

Composers sometimes indicate swing rhythms by marking their scores with an indication that pairs of eighth notes should be treated as a quarter and an eighth in a triplet bracket. In actuality, swing rhythms range anywhere from slightly asymmetrical pairs to imbalances of a more pronounced sort. The subtler end of the range involves treating written pairs of eighth notes as slightly asymmetrical pairs of similar values. On the other end of the spectrum, the "dotted eighth - sixteenth" rhythm, consists of a long note three times as long as the short. Prevalent "dotted rhythms" such as these in the rhythm section of dance bands in the mid 20th century are more accurately described as a "shuffle"; they are also an important feature of baroque dance and many other styles. Rhythms identified as swung notes most commonly fall somewhere between straight eighths and a quarter-eighth triplet pattern.

The following points of reference are reliable only as approximations of musical practice:

- 1:1 = eighth note + eighth note, "straight eighths."
- ~ 1.5:1 = long eighth + short eighth, "swing"
- 2:1 = triplet quarter note + triplet eighth, triple [meter](#).
- 2.5:1 = long eighth + short sixteenth, "hard swing" or "shuffle."
- 3:1 = dotted eighth note + sixteenth note = "hard shuffle."

Since a swung note is actually not a note of the named length (a swung eighth note is not an eighth note), some musicians consider this term a misnomer.

# Swing rhythm

In [jazz](#), this interpretive device is assumed in most written music other than [latin jazz](#), but may also be indicated. For example, *Satin Doll*, a [swing era](#) jazz standard with a pronounced swing rhythm, was published written in 4/4 time, but at least some versions also note *medium swing*.

In [dance](#) music, **swing rhythm** generally refers to the [metre](#) of the music, rather than to this convention of notation, so any music played with the triplet timing and swing accent will be referred to as *swing rhythm* however it is written, see below.

## Styles

*Main article: [swing\\_\(genre\)](#).*

Swing is commonly used in [blues](#), [country](#), [jazz](#), [Swing\\_\(genre\)](#), and often in many other styles. Except for very fast jazz, slow ballads and [latin jazz](#), all written jazz music is assumed to be performed with a swing rhythm, although publishers sometimes specify "with a swing".

In [jazz](#) and [big band](#) music, a shuffle is almost always accompanied by a distinctive *cooking* rhythm played on the ride cymbal or hi hat.

Styles that always use traditional (triplet) swing rhythms include:

- Music for foxtrot, quickstep and some other [ballroom dances](#).
- [Swing\\_\(genre\)](#).

Styles that sometimes use swing rhythms include:

- Early [rock and roll](#) such as Bill Haley's Shake, Rattle and Roll and Rock Around the Clock, Buddy Holly's That'll Be The Day, and Elvis Presley's Jailhouse Rock. In later rock and roll music it is unusual but not unknown.
- Country and western
- [Blues](#)
- [Big band](#)

## Transcribing swing rhythms

In the [swing era](#), *swing* meant accented triplets (**shuffle rhythm**), suitable for dancing. With the development of [bebop](#) and later [jazz](#) styles independent of dancing, the term was used for far more general timings. There is much debate over use of other ratios than 2:1 in swing rhythms.

Some publishers of jazz music, especially those whose intended audience is people unfamiliar with jazz styles, transcribe the swing either:

- As compound time, such as 6/8, 9/8, or 12/8. When played with the swing accent, these time signatures may be grouped together and called **swing time**, or **swing time** can also mean a simple time played with the swing convention.

- As triplets within a duple meter.

In general, where music with a swing [metre](#) is required, musicians in the jazz tradition will prefer to read music written in common time and played with a swing, while musicians in the classical tradition will prefer to read music written in compound time and played as written.

# Symphonic metal

**Symphonic metal** is a term used to describe [metal](#) music that has [symphonic](#) elements; that is, elements that sound similar to a [classical](#) symphony.

Symphonic metal is both a [genre](#) of metal and a name given to several subgenres of other metal genres, and as such, both forms of usage have slightly varying definitions.

The genre refers to bands that combine aspects of varying metal genres, with signature female-led vocals and [operatic](#)/classical themes to give the music a feeling of being a symphony.

When referring to bands from other genres, it refers to bands who use minor classical and operatic themes in the bands music similar as to what is found in the symphonic metal genre, to show they are more "symphonic" than normal bands of their genre.

"Symphonic" can also describe metal with elements resembling non-symphonic classical music, although this usage is not frequently used.

# The genre

## Musical characteristics

Symphonic metal as a genre (sometimes called orchestral metal/opera metal) is generally the same in the way it sounds between bands, because the genre is pretty typical of itself and the features it uses and easily depicts between itself and other genres. It takes a lot of its musical basis from early [Gothic metal](#), [power metal](#), and [classical music](#).

The guitar and bassline work in the genre often follows the pattern of its originator, Gothic metal, by synthesizing other metal styles of guitar. Genres commonly synthesized in this way include [black metal](#), [death metal](#) and power metal, sometimes with the addition of elements from [rock music](#). The genre typically combines elements of these genres with those of classical music, creating songs with a strong "symphonic" feel. Bands that use elements of rock music typically take a simpler approach to the genre, using simplified and catchy melodies, leading to a more easily accessible and widely accepted version of the genre. Another key ingredient to the mixture is the lighter feel of the music, typically created by higher, more melodic guitar lines; this characteristic is usually attributed to power metal as well.

Keyboards in symphonic metal as a genre play the most important role in the music, and are the focal point of the genre that the rest of the music centers around. While most of the instruments play relatively simple parts, the keyboards tend to have the most complex and technically difficult parts. The keyboards alone are used to play the "classical" parts of the music which the genre is renowned for, and covers all forms of classical music. Bands sometimes use orchestras when playing live to play the parts that the keyboardist would play, and at times feature real instruments in recording instead of using digital samples with a keyboard.

Atmosphere is commonly tailored to fit the song, although even songs with morbid themes tend to keep an upbeat sense. The atmosphere is particularly denoted by the keyboards and the instruments that it mimics, with the other instruments supporting the landscape evoked by the keyboards.

The lyrics of symphonic metal are highly expansive and cover a broad range of topics. Lyrics often borrow heavily from power metal, encompassing various forms of fantasy themes, or use themes typical of [opera](#). Lyrics in symphonic metal, like those of Gothic metal, often are arranged into [concept albums](#), styled after epics.

Bands in the symphonic metal genre are mainly female led in both their images and vocals. The vocalists of symphonic metal bands have consistently been female, and tend to sing soprano melodies in the operatic style. Sometimes symphonic metal artists use a male vocalist for backing vocals, similar to Gothic metal's dual vocalists. Other forms of vocals are also sometimes found in songs, but are normally only used as an effect within the song.

## Origins and evolution

The first origins of Symphonic metal as a genre begins with early bands in the [Gothic metal](#) genre, which heavily made use of orchestral elements in their music. Of such bands, Therion was the first to feature a fully live orchestra and write their music with the symphonic elements of [classical music](#) as an essential inclusion into their musical style. Over time Therion grew further away from the Gothic metal genre utilising more orchestral elements and becoming more based around the symphony aspects they were fast growing known for.

In 1997, Nightwish and Within Temptation released their first albums. Both bands followed heavily in the trend of Therion's orchestrally symphonic nature. Within Temptation, using influence from Gothic metal's synthesizing of other genres, used simpler aspects of the genres in their synthesis. Centering their music around the abilities of their female singer, Sharon den Adel, and the symphonic nature of their use of keyboards, the band reduced the use of male vocals to sparse backing vocals. Nightwish followed a similar trend, following a style similar to power metal and using a female vocalist with heavy use of classically influenced keyboarding. Considered by many to be a power metal band, they contributed heavily to the genre, introducing variety into the genre with their keyboards and female vocals.

In the early 2000s a surge of symphonic metal occurred, with many bands seemingly releasing albums from nowhere. Rain Fell Within, After Forever, Epica, and Edenbridge all released albums around this time, displaying prominently the characteristic keyboards and female vocals. These bands also emphasized the upbeat nature of the music. This boon of symphonic metal bands also began to take more influence from power metal, borrowing from the lyrical theme of fantasy and the stylized, epic-like keyboards of that genre.

Symphonic metal currently doesn't have a centralized scene in any particular part of the world, as its fan base is wide-spread and numerous. However, symphonic metal is more prolific where power metal and Gothic metal are commonly found due to the similarities between itself and these similar genres.

## List of symphonic-metal bands

- Aesma Daeva
- After Forever
- Autumn (Netherlands)
- Edenbridge
- Epica
- Haggard
- Nemesea
- Nightwish
- Offertorium
- Rain Fell Within
- Seraphim
- Therion
- Within Temptation

# Symphonic subgenres

## Overview

Symphonic metal, in regard to other genres of metal, encompasses any band that makes use of orchestral, classical, or keyboarding akin to symphonic metal or Gothic metal. The use of symphonic aspects in varying forms of metal has been around for many years; however, symphonic metal is centered around the usage of symphonic elements, where bands in other genres use them as backing themes and thus are usually listed under other genres.

## Symphonic black metal

Symphonic black metal has the same components as melodic black metal but makes extensive usage of keyboarding, or instruments normally found in classical music similar to symphonic metal. It also features black metal bands that use atmospheric keyboarding in the music akin to [doom metal](#) or [Gothic metal](#). These additional elements are often used as backing parts in the music when compared to the more prominent black metal elements. The symphonic aspects of symphonic black metal are normally integral parts of a band, and as such are commonly used throughout the whole duration of a song.

Sometimes symphonic black metal is confused with Gothic metal due to heavy similarities between the two. Cradle of Filth and Summoning have both been subjects of this claim.

Bands of this subgenre include:

- Anorexia Nervosa
- Arcturus (Earlier Works)
- Bal-Sagoth
- Chthonic
- Cradle of Filth
- Dimmu Borgir
- Emperor
- Graveworm
- Hecate Enthroned
- Limbonic Art
- Lux Occulta
- Morgul
- Moonsorrow
- Satyricon (Earlier Works)
- Summoning
- Susperia
- Tiamat

## Symphonic power metal

Symphonic power metal refers to [power metal](#) bands that make extensive usage of keyboards, or instruments normally found in classical music similar to symphonic metal. These additional elements are often used as key elements of the music when compared to

normal power metal, contributing not only an extra layer to the music, but a greater variety of sound.

Sometimes symphonic power metal is considered to be both symphonic metal and power metal, due to some debate about the usage of the term "symphonic power metal" by fans. For example, Nightwish features more symphonic metal elements, while Sonata Arctica features more power metal elements.

Bands of this subgenre include:

- Angra
- At The Lake
- Blind Guardian (later albums only)
- Bride Adorned
- Control Denied
- Fairyland
- Enslavement of Beauty
- Excalion
- Freedom Call
- Isengard
- Kamelot
- Luca Turilli
- Lunatica
- Nightwish
- Operatika
- Rhapsody
- Sonata Arctica
- Stratovarius
- Visions of Atlantis

## Other symphonic subgenres

Symphonic death metal, is a small but rising form, most commonly with bands located in the Gothenburg region. Symphonic thrash metal is almost unheard of, consisting only of bands who have done single performances with orchestras. Most bands within the [doom metal](#) scene can be considered symphonic.

Some bands that play symphonic variations of their genres include:

- Arcturus
- Charon
- Dark Lunacy
- Eternal Tears of Sorrow
- Kalmah
- Rotting Christ
- Skyfire
- Symphony X
- Virgin Steele

## Indirect symphonic variations

These artists and bands do not typically play symphonic variations of their genre, but have indirectly done so on specific occasions.

- Deep Purple (Concerto For Group and Orchestra album only)
- KISS (KISS Symphony: Alive 4 album only)
- Metallica (S&M album only)

Rage ("classic trilogy" only)  
Xandria (India album only)

# Symphonic poem

A **symphonic poem** or **tone poem** is a piece of [orchestral music](#), in one movement, in which some extra-musical programme provides a narrative or illustrative element. This programme could come from a poem, a novel, a painting or some other source. Music based on extra-musical sources is often known as [program music](#), while music which has no other associations is known as [absolute music](#). A series of tone poems may be combined in a [suite](#), in the romantic rather than the baroque sense: "The Swan of Tuonela" (1895) is a tone poem from Sibelius' *Lemminkäinen Suite*.

Franz Liszt largely invented the symphonic poem, in a series of single-movement orchestral works composed in the 1840s and 1850s. The immediate predecessors of the Lisztian tone poem were concert overtures, theatrical, colorful and evocative orchestral movements that were created for performance independent of any opera or theater-piece: for example, Felix Mendelssohn's Fingal's Cave or Hector Berlioz's Roman Carnival Overture. An early such independent overture is Carl Maria von Weber's Der Beherrscher der Geister ("The Ruler of the Spirits", 1811), a highly atmospheric overture without an opera. These concert pieces in turn sprung from the overtures by Ludwig van Beethoven such as those for Egmont, Coriolanus, and the Leonore No. 3, which in their musical content anticipates the story of the stage work which they introduce (plays in the case of Egmont and Coriolanus, the opera Fidelio in the case of Leonore). Even earlier orchestral mood pieces are exemplified by the 'storm' set-pieces that were an established genre that went back to the summer storm in Antonio Vivaldi's The Four Seasons, and some moody *entr'actes* between scenes of Baroque French operas.

Other composers who took up the symphonic poem:

- Sergei Rachmaninoff - The Isle of the Dead
- Camille Saint-Saëns - Danse macabre
- Claude Debussy - Prélude à l'après-midi d'un faune
- Jean Sibelius - Finlandia
- Bedrich Smetana - Má Vlast
- Dvorák - The Golden Spinning Wheel and The Wood Dove, among others
- Modest Mussorgsky - Night on Bald Mountain
- Nikolai Rimsky-Korsakov - Sadko
- Pyotr Tchaikovsky - Fatum, Romeo and Juliet (labeled "fantasy-overture")
- César Franck - Le Chasseur Maudit ("The Accursed Huntsman")
- Alexander Borodin - In the Steppes of Central Asia
- Paul Dukas - L'apprenti-sorcier ("The Sorcerer's Apprentice")
- Sergei Taneyev - Oresteia (labeled "overture", but really a symphonic poem based on themes from his opera of the same name)
- Ottorino Respighi - the trilogy of Roman symphonic poems (The Pines of Rome, The Fountains of Rome, and Roman Festivals)
- George Gershwin An American in Paris,
- Geirr Tveitt Nykken
- Arnold Bax Tintagel, and The Garden of Fand.
- Nigel Keay - Ritual Dance of the Unappeasable Shadow.
- Nick Peros - Northern Lights

From the above one can understand that the freedom of the genre of the symphonic poem allows other appellations, such as "musical picture," "overture," "fantasy," etc.

Richard Strauss (who preferred the term "tone poem" to "symphonic poem") was one of the most prolific late Romantic composers in the genre, with his works including Don Juan, Till Eulenspiegel, Also sprach Zarathustra, Don Quichote, and Ein Heldenleben. Strauss subtitled Don Quichote 'Introduction, Theme with Variations, and Finale' and 'Fantastic

Variations for Large Orchestra on a Theme of Knightly Character.' The work could as easily be called a rhapsody as a tone poem.

William Lloyd Webber, the father of theatrical composer/impresario Andrew Lloyd Webber, composed a symphonic poem *Aurora*, which has experienced a resurgence in popularity in recent years. However, some of this interest can be attributed to his association with the popularity of his son's works.

There are also a number of one-movement works not written for orchestra, but for some [chamber](#) ensemble or solo instrument, based on some extra-musical source. Because of their non-orchestral nature, these are not considered to be "symphonic poems", although in all aspects other than instrumentation, they resemble one. One of the best known such pieces is Arnold Schoenberg's *Verklärte Nacht* ("*Transfigured Night*"), based on a poem, originally written for string sextet (though later arranged for a larger ensemble).

# Symphonic rock

**Symphonic rock** is a subgenre of [rock music](#). The term is almost literally interchangeable with "[progressive](#)" rock. Early in progressive rock's history the term most certainly was synonymous with it.

In more recent years, symphonic rock has been recognized as more of a subgenre of progressive rock itself, although the lines within that particular genre are very thin and the term "progressive rock" is used to encompass a very large and varied amount of rock music.

Symphonic rock can be said to be prog rock with a much more strict adherence to [classical music](#) influences than other forms of prog. These influences vary in their manifestation as well. For instance, they can include:

- use of classical instruments
- musical themes from classical music
- classical composition schemes
- higher complexity than other types of rock and [popular music](#)
- elaborate compositions, resulting in long songs and [concept albums](#)
- prominent use of the [synthesizer](#)

The first wave of progressive rock bands that most people recognise as being "prog" rock bands can be considered to be symphonic rock bands. They include bands such as,

The Moody Blues  
King Crimson  
Yes  
Genesis  
Camel  
Emerson, Lake and Palmer  
Gentle Giant
