# Counting Functions 

FRED JOHNSON

Abstract Counting functions are shown to be closed under composition.

The proof by Pelletier and Martin [1] of Post's Functional Completeness Theorem contains a very complex argument that shows in effect that counting functions are closed under composition. The purpose of this note is to give a simple proof of this result.

A function $f^{n}$ is an $n$-ary truth function iff the domain of $f^{n}$ consists of the set of $n$-tuples of truth values ( $t$ and $f$ ) and $f^{n}$ assigns $t$ or $f$ to each member of the domain. Let $R_{n}$ be an $n$-tuple of truth values. $O_{n, i}$, for $1 \leq i \leq n$, is an operator iff, for every $R_{n}, O_{n, i} R_{n}$ is an $n$-tuple of truth values that differs from $R_{n}$ in and only in the $i$ th place. A function $f^{n}$ is counting iff $f^{n}$ is an $n$-ary truth function and for every operator $O_{n, i}$ either $f^{n}\left(R_{n}\right)=f^{n}\left(O_{n, i} R_{n}\right)$ for every $R_{n}$ or $f^{n}\left(R_{n}\right) \neq f^{n}\left(O_{n, i} R_{n}\right)$ for every $R_{n}$. (Suppose $f^{2}=\{\langle\langle t\rangle, f\rangle,\langle\langle t f\rangle, t\rangle,\langle\langle f t\rangle, f\rangle$, $\langle\langle f\rangle, t\rangle\} \cdot f^{2}$ is counting since $f^{2}\left(R_{2}\right)=f^{2}\left(O_{2,1} R_{2}\right)$ for every $R_{2}$ and $f^{2}\left(R_{2}\right) \neq$ $f^{2}\left(O_{2,2} R_{2}\right)$ for every $R_{2}$.)

Theorem 1 If function $f^{n}$ is counting and $\left\langle O_{n, i_{1}}, \ldots, O_{n, i_{m}}\right\rangle$ is a sequence of operators then either $f^{n}\left(R_{n}\right)=f^{n}\left(O_{n, i_{1}} \ldots O_{n, i_{m}} R_{n}\right)$ for every $R_{n}$ or $f^{n}\left(R_{n}\right) \neq$ $f^{n}\left(O_{n, i_{1}} \ldots O_{n, i_{m}} R_{n}\right)$ for every $R_{n}$.

Proof: Assume the antecedent. We use induction on the length $m$ of the sequence of operators. Basis step: $m=1$. Immediate. Induction step: $m>1$. By the induction hypothesis either $f^{n}\left(R_{n}\right)=f^{n}\left(O_{n, i_{2}} \ldots O_{n, i_{m+1}} R_{n}\right)$ for every $R_{n}$ or $f^{n}\left(R_{n}\right) \neq$ $f^{n}\left(O_{n, i_{2}} \ldots O_{n, i_{m+1}} R_{n}\right)$ for every $R_{n}$. So either $f^{n}\left(O_{n, i_{1}} R_{n}\right)=f^{n}\left(O_{n, i_{1}} O_{n, i_{2}} \ldots\right.$ $\left.O_{n, i_{m+1}} R_{n}\right)$ for every $R_{n}$ or $f^{n}\left(O_{n, i_{1}} R_{n}\right) \neq f^{n}\left(O_{n, i_{1}} O_{n, i_{2}} \ldots O_{n, i_{m+1}} R_{n}\right)$ for every $R_{n}$. Since either $f^{n}\left(R_{n}\right)=f^{n}\left(O_{n, i_{1}} R_{n}\right)$ for every $R_{n}$ or $f^{n}\left(R_{n}\right) \neq f^{n}\left(O_{n, i_{1}} R_{n}\right)$ for every $R_{n}$, either $f^{n}\left(R_{n}\right)=f^{n}\left(O_{n, i_{1}} \ldots O_{n, i_{m+1}} R_{n}\right)$ for every $R_{n}$ or $f^{n}\left(R_{n}\right) \neq$ $f^{n}\left(O_{n, i_{1}} \ldots O_{n, i_{m+1}} R_{n}\right)$ for every $R_{n}$.

Theorem 2 If functions $g^{m}, h_{1}^{n}, \ldots h_{m}^{n}$ are counting and $f^{n}=g^{m}\left(h_{1}^{n}, \ldots h_{m}^{n}\right)$ then $f^{n}$ is counting.

Proof: Assume the antecedent. Then $f^{n}$ is an $n$-ary truth function. Suppose $O_{n, i}$ is an operator. Let $y \in X$ iff $h_{y}^{n}\left(R_{n}\right) \neq h_{y}^{n}\left(O_{n, i} R_{n}\right)$ for every $R_{n}$. If $X$ is empty then $g^{m}\left(h_{1}^{n}\left(R_{n}\right), \ldots h_{m}^{n}\left(R_{n}\right)\right)=g^{m}\left(h_{1}^{n}\left(O_{n, i} R_{n}\right), \ldots h_{m}^{n}\left(O_{n, i} R_{n}\right)\right)$ for every $R_{n}$. So $f^{n}\left(R_{n}\right)=f^{n}\left(O_{n, i} R_{n}\right)$ for every $R_{n}$. So $f^{n}$ is counting. If $X$ is nonempty then $X=\left\{k_{1}, \ldots k_{r}\right\}$ (for $\left.r \leq m\right)$. Then $g^{m}\left(O_{m, k_{1}} \ldots O_{m, k_{r}}\left(h_{1}^{n}\left(R_{n}\right), \ldots\right.\right.$ $\left.h_{m}^{n}\left(R_{n}\right)\right)=g^{m}\left(h_{1}^{n}\left(O_{n, i} R_{n}\right), \ldots h_{m}^{n}\left(O_{n, i} R_{n}\right)\right)$ for every $R_{n}$. By Theorem 1, $g^{m}\left(h_{1}^{n}\left(R_{n}\right), \ldots h_{m}^{n}\left(R_{n}\right)\right)=g^{m}\left(O_{m, k_{1}} \ldots O_{m, k_{r}}\left(h_{1}^{n}\left(R_{n}\right), \ldots h_{m}^{n}\left(R_{n}\right)\right)\right)$ for every $R_{n}$ or $g^{m}\left(h_{1}^{n}\left(R_{n}\right), \ldots h_{m}^{n}\left(R_{n}\right)\right) \neq g^{m}\left(O_{m, k_{1}} \ldots O_{m, k_{r}}\left(h_{1}^{n}\left(R_{n}\right), \ldots h_{m}^{n}\left(R_{n}\right)\right)\right)$ for every $R_{n}$. So $f^{n}\left(R_{n}\right)=f^{n}\left(O_{n, i} R_{n}\right)$ for every $R_{n}$ or $f^{n}\left(R_{n}\right) \neq f^{n}\left(O_{n, i} R_{n}\right)$ for every $R_{n}$. So $f^{n}$ is counting.

Acknowledgment I am grateful to an anonymous referee for refinements of the argument.
