# Dancing with Nine Colours: The Nine Emotional States of Indian *Rasa* Theory

Dyutiman Mukhopadhyay MSc, AdvDipFA, PhD

Faculty in Information Art and Information Design Practices; Visual Communication,
Srishti Manipal Institute of Art, Design & Technology, Bangalore, India.
Adjunct Professor in Consciousness Studies Programme (CSP),
National Institute of Advanced Studies (NIAS), India.
Former British Academy Newton International Fellow, UK (University College London).
Former Research Fellows — DST & ICMR, India (IIT Gandhinagar; Calcutta University).
Email: dyutimanm@gmail.com

[Dated: December 2021, October 2022 (edited)]

'I see you not from your face I see You, from - Me.'

#### Abstract:

This is a brief review of the Rasa theory of Indian aesthetics and the works I have done on the same. A major source of the Indian system of classification of emotional states comes from the 'Natyasastra', the ancient Indian treatise on the performing arts, which dates back to the 2nd Century AD (or much earlier, pg. LXXXVI: Natyasastra, Ghosh, 1951). The 'Natyasastra' speaks about 'sentiments' or 'Rasas' (pg.102: Natyasastra, Ghosh, 1951) which are produced when certain 'dominant states' (sthayi Bhava), 'transitory states' (vyabhicari Bhava) and 'temperamental states' (sattvika Bhava) of emotions come together (pgs.102, 105: Natyasastra, Ghosh, 1951). This Rasa theory, which is still widely followed in classical Indian performing arts, classifies eight Rasas or sentiments which are: Sringara (erotic), Hasya (comic), Karuna (pathetic), Raudra (furious), Vira (heroic), Bhayanaka (terrible), Bibhatsa (odious) and Adbhuta (marvellous). There was a later addition of the ninth sentiment or Rasa called Santa (peace) in later Sanskrit poetics (pg.102: Natyasastra, Ghosh, 1951). According to ancient Indian aesthetics (especially in the context of Bharatas' 'Natyasastra', Anandavardhana's 'Dhvanyaloka' and Abhinavagupta's 'Abhinavabharati'), 'Rasa' is the relishable state of elemental human emotions called 'Bhavas'. Bharata's 'Natyasastra' originally spoke of eight Rasas. The concept of the 9th Rasa was a later interpolation by the Kashmiri Shaivist Abhinavagupta (10th Century AD) and also his predecessor Anandavardhana (9th Century AD). Abhinavagupta extends the eight Rasas by adding the concept of the Santa Rasa which he regards as the essence of all Rasas. It is this 9th Rasa which according to Abhinavagupta lets the Rasika attain the aesthetic detachment and sayour the essences of all other Rasas and therefore the true aesthetic delight. The introduction of 9th Rasa integrates the concepts of Bharata's Rasasutra and Patanjali's Yoga theory - the detachment necessary to introspect inwards into the inherent state of freedom and bliss (aesthetic consciousness).

#### Indian system of classification of emotional 'states' (not emotions):

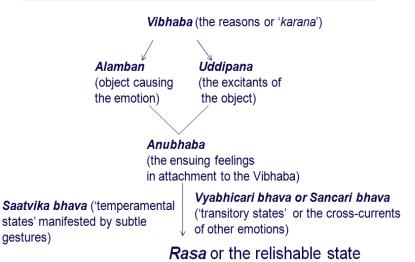

A major source of the Indian system of classification of emotional states comes from the 'Natyasastra', the ancient Indian treatise on the performing arts, which dates back to the 2nd Century AD (or much earlier, pg. LXXXVI: Natyasastra, Ghosh, 1951). The 'Natyasastra' speaks about 'sentiments' or 'Rasas' (pg.102: Natyasastra, Ghosh, 1951) which are produced when certain 'dominant states' (sthayi Bhava), 'transitory states' (vyabhicari Bhava) and 'temperamental states' (sattvika Bhava) of emotions come together (pgs.102, 105: Natyasastra, Ghosh, 1951). This Rasa theory, which is still widely followed in classical Indian performing arts, classifies eight Rasas or sentiments which are: Sringara (erotic), Hasya (comic), Karuna (pathetic), Raudra (furious), Vira (heroic), Bhayanaka (terrible), Bibhatsa (odious) and Adbhuta (marvellous). There was a later addition of the ninth sentiment or Rasa called Santa (peace) in later Sanskrit poetics (pg.102: Natyasastra, Ghosh, 1951).

#### The Eight Rasas (Ghosh, 1951; Raghavan, 1940; Barlingay, 1981):

According to ancient Indian aesthetics (especially in the context of Bharatas' 'Natyasastra', Anandavardhana's 'Dhvanyaloka' and Abhinavagupta's 'Abhinavabharati'), 'Rasa' is the relishable state of elemental human emotions called 'Bhavas'. Bharata's 'Natyasastra' originally spoke of eight Rasas. The conversion of Bhava to Rasa as explained in Indian aesthetics is as follows:

## RASA Theory according to Natyasastra

#### From Dominant state (Sthayi Bhava) to Relishable state (Rasa):

# The Ninth *Rasa* or *Santa Rasa* and aesthetic consciousness: is it just another *Rasa*?

[Partly taken from author's 2022 concept note: Mukhopadhyay, D. (2022). *Musings: Why I study aesthetics: an unwritten essay*]

द्वा सुपर्णा सयुजा सखाया समानं वृक्षं परिषस्वजाते। तयोरन्यः पिप्पलं स्वाद्वत्त्यनश्रन्नन्यो अभिचाकशीति॥

'Two birds with shining wings, Always intertwined—deepest of friends, Cling on the same tree. One eats the sweet fruit. The other, without eating—watches'

—The *Rig Veda Samhita* 1.164.20-22, later incorporated in *Mundaka Upanishad* 3.1.1-2, and *Svetasvatara Upanishad* 4.6-7. Adapted from the translations of JL Masson, MV Patwardhan, and Swamini Svatmavidyananda.

Too idle am I—
To talk, or write, or even to think—
So I float—and drift—and soar,
To explode in bits of joy
In a dreamless sleep.

—Dyutiman Mukhopadhyay, 2022.

The concept of the ninth *Rasa* was a later interpolation by the Kashmiri Shaivist Abhinavagupta (10th Century AD) and also his predecessor Anandavardhana (9th Century AD). In *Abhinavabharati*, Abhinavagupta explains the essence of the *Rasa* theory of Bharata in addition to the theory of *Abhivyakti* propounded in Anandavardhana's *Dhvanyaloka*.

Abhinavagupta extends the eight *Rasa*s by adding the concept of the *Santa Rasa* which he regards as the essence of all *Rasa*s. It is this 9th *Rasa* which according to Abhinavagupta lets the *Rasika* attain the aesthetic detachment and savour the essences of all other *Rasa*s and therefore the true aesthetic delight. The introduction of 9th *Rasa* integrates the concepts of Bharata's *Rasasutra* and Patanjali's *Yoga* theory – the detachment necessary to introspect inwards into the inherent state of freedom and bliss (aesthetic consciousness).

Aesthetic delight is thus at once an emotional exaltation and a state of serenity (Chaudhury, 1964). It has a different quality or flavour from that aroused in life. Ordinary emotions are sublimed into *Rasa* through aesthetic delight. It is generated when the *sahrdaya* (the sensitive experiencer):

01. Undergoes suspension of disbelief.

- 02. Dissociate work of art from surroundings.
- 03. Dissociate character from the actor.

The secret of aesthetic delight is thus detached contemplation and it is not felt as a personal psychical affection (Chaudhury, 1964).

Abhinavagupta was a prodigious philosopher, aesthete, and literary critic who singlehandedly 'alamkārasástrām tenaiva śāstratvam prāpitam—alone turned poetics into a science.'(Masson & Patwardhan, 1969). Abhinavagupta extends the eight Rasas by adding the concept of the Santa Rasa which he regards as the essence of all Rasas. It is this 9th Rasa which according to Abhinavagupta lets the Rasika (sahrdaya) attain the metacognitive aesthetic detachment and savour the essences of all other Rasas and therefore the true aesthetic delight. The introduction of the 9th Rasa integrates the concepts of Bharata's Rasasutra and Patanjali's Yoga theory - the detachment necessary to introspect inwards into the inherent state of freedom and bliss (aesthetic consciousness). Abhinavagupta felt it necessary to provide a unified theory of Rasa since the Kashmiri Shaivists thought of integrating aesthetic experience with states of religious ecstasy as well as transcendental *Tantric* sexual ecstasy. It is therefore not at all surprising that the Indian Rasasutra, Kamasutra and Yogasutra all strive for the same transcendental eternal where the transcendence of the self is the primary goal obtained through detached passion - although the three methods are different altogether. Through this detached passion, the world is viewed with the dual detachment and involvement, through the access of imaginative experience (hrdayànupraveśa) and empathic response (hrdayasamvāda) of the perfect spectator (Masson & Patwardhan, 1969), who is both moved and yet distanced from the object he contemplates.

The essence of Abhinavagupta's *Santa Rasa* had been wonderfully summarized through the translations of J.L. Masson and M.V. Patwardhan in their influential book '*Santarasa* and Abinavagupta's theory of aesthetics' (1969) as follows:

'Reduced to its bare essentials the theory is as follows: watching a play or reading a poem for the sensitive reader (sahrdaya) entails a loss of the sense of present time and space. All worldly considerations for the time being cease. Since we are not indifferent (tatastha) to what is taking place, our involvement must be of a purer variety than we normally experience. We are not directly and personally involved, so the usual medley of desires and anxieties dissolve. Our hearts respond sympathetically (hrdayasamvāda) but not selfishly. Finally the response becomes total, all-engrossing, and we identify with the situation depicted (tanmayibhavana). The ego is transcended, and for the duration of the aesthetic experience, the normal waking "I" is suspended. Once this actually happens, we suddenly find that our responses are not like anything we have hitherto experienced, for now that all normal emotions are gone, now that the hard knot of "selfness" has been untied, we find ourselves in an unprecedented state of mental and emotional calm. The purity of our emotion and the intensity of it take us to a higher

level of pleasure than we could know before — we experience sheer undifferentiated bliss (ānandaikaghana) for we have come into direct contact with the deepest recesses of our own unconscious where the memory of a primaeval unity between man and the universe is still strong. Inadvertently, says Abhinavagupta, we have arrived at the same inner terrain as that occupied by the mystic, though our aim was very different from his. Such an experience cannot but make us impatient with the ordinary turmoil of emotions that is our inner life, and though Abhinava never explicitly says so, one cannot help feeling that he expects the reader to search out now these experiences on a more permanent basis.'

[For a detailed overview of Abinavagupta's aesthetics, the following work can be consulted: Masson J. L. & Patwardhan M.V. (1969) *Santarasa and Abhnivagupta's Theory Of Aesthetics*, Bhandarkar Oriental Series No. 9. For an updated overview of the *Rasa* theory and the neuroscience, psychology and the principles of dual detachment and involvement my following papers might be consulted: Mukhopadhyay, D. (2014). Understanding the neuropsychology of aesthetic paradox: the dual-phase oscillation hypothesis. Review of General Psychology (USA), 18(3), 237-248. ISSN: 1089- 2680, <a href="https://doi.org/10.1037%2Fgpr00000009">https://doi.org/10.1037%2Fgpr00000009</a>].

#### The Facial Action Units of Indian performing arts:

Current facial emotion research is hugely influenced by the Facial Action Coding System (FACS) manual as formulated by the Paul Ekman research group. This is a research tool that explains how to categorize facial behaviours based on the muscles that produce them. The *Natyasastra* by Bharata and the *Abhinaya Darpana* by Nandikesvara (Coomaraswamy & Duggirala, 1917) are two of the most reliable treatise which elaborates a categorization of facial action units for facial behaviour and emotion according to the Indian context. Apart from clearly elaborating the facial zones for each emotion, there has also been an extensive analysis of the various eye glances for different facial behaviours. Table 1 gives a short, summarized description of the different facial action units for the nine different emotional states as well as the role of specific eye glances for each emotion. It is evident from the texts that a significant amount of attention was placed on the eyes. This summary is adapted from the *Natyasastra* (Ghosh, 1951) as well as *Abhinaya Darpana* (Coomaraswamy & Duggirala, 1917).

Table 1 [Adapted from the translations of *Natyasastra* (Ghosh, 1951) & *Abhinaya Darpana* (Coomaraswamy & Duggirala, 1917)]:

The emotional states	Facial Zones	Eye Glance type
<i>Sringara</i> (erotic, dominant state: love)	Eye, Eyebrows (clever movements), Mouth (smiling).	Raising the eyebrows and looking out of the corners of the eyes.

Hasya (comic, dominant state: mirth)	Lips, Nose, Cheeks, Eyes, Teeth conveying smile, moderate laughter or excessive laughter.	Fluttering, pleasant, twinkling eyes.
Karuna (pathetic, dominant state: sorrow)	Eyes (with/without shedding tears), Mouth.	A downcast glance, half-revealed, with tears, benevolent, the black pupil slowly moving, regarding the tip of the nose.
Raudra (furious, dominant state: anger)	Eyes (red), Eyebrows (knitting of eyebrows), Lips (biting of lips), Cheeks.	The pupils fixed and the lids not moved, the brows contracted and raised.
<i>Vira</i> (heroic, dominant state: energy)	Eyes (radiant, direct, open, rather majestic, self-controlled).	The pupils at rest.
Bhayanaka (terrible, dominant state: terror)	Mouth (drooping), Eyes.	The eyelids raised and fixed, the pupil bright and fluttering.
<i>Bibhatsa</i> (odious, dominant state: disgust)	Mouth and Eyes (narrowing down).	No specific glance mentioned.
Adbhuta (marvellous, dominant state: astonishment)	Eyes (wide open).	Quickly raised, straight-staring.
Santa (peace)	Eyes (the peaceful glance of dispassion). Not mentioned by Bharata but mentioned in Abhinaya Darpana.	Gradually closing the lids, the eyes slightly moving, the pupils moving to the comers.

### Linking *Rasa* theory with Western studies: rationale for studying *Rasa*s:

According to Westernized versions of emotion classification, there are Basic or Universal emotions (Paul Ekman, 1971, 1984, 1992) which are happiness, sadness, fear, anger, surprise, disgust (later addition: contempt; Paul Ekman, 1971, 1984, 1992). However, there are also Background emotions sets which are: well-being-malaise; calmtense; pain-pleasure; Antonio Damasio, 1999), as well as Self-referential social emotions which, are embarrassment, guilt, shame, jealousy, envy, empathy, pride,

admiration; (Bennett & Gillingham, 1991; Hareli et al., 2002, 2006; Oatley & Johnson-Laird, 1987; Tangney & Fischer, 1995). Also, there are pioneering works of scientists like Lisa Feldman Barrett (Barrett, 2006) who questions Ekman's concepts of discreetness of emotions.

Apart from defining the boundaries of universal emotions, research in emotion science also places equal emphasis on trying to understand the interplay of the different orchestrated processes that give rise to a basic emotion (Barrett, 2006; Panksepp, 1994; Kagan, 1997). For example, Jaak Panksepp (1994, 2010), defined primary processes of emotion (not the basic or universal emotions of Ekman) as primary sub-neocortical processes of emotion having their corresponding affective states which can be artificially generated by brain stimulation in animals. Also, the four-step cascade process proposed by Jerome Kagan (1997) defines a provocative event that leads to brain change and subsequently leads to a feeling and the interpretation of the feeling gives rise to an emotion.

We can find startling similarities between the *Rasa* theory (its concepts of the generation of *Rasa*s from the *Bhava*s) with the works of Panksepp, (1994, 2010) and Kagan (1997). However, there had been very little previous work done on the perception or brain science of emotional states based on *Rasa* theory mostly due to the lack of awareness regarding the science of the *Rasa* theory among the scientific community. One behavioural study was conducted by Hejmadi et al., (2000) which investigated the identification of these emotions across cultures. An image processing study was conducted by Srimani and Hegde (2012) for investigating the variations in facial features based on nine *Rasa*s. The study proposes a tool for the design of an intelligent emotion recognition system but does not offer a psychophysical or brain-based perspective on how these individual emotions differ in the way they affect our perceptual process.

#### Natyasastra and Popular Indian Cinema:

[Based on the theoretical propositions by Mukhopadhyay, D. (2021) – Rethinking the psychology of film melodrama: A theoretical framework integrating social appraisal and cultural psychology. *PsychArchives*. https://doi.org/10.23668/psycharchives.5282 (Full paper link)]

As an avid film watcher from a very young age of both world and Indian cinema, I was intrigued by the distinctive melodramatic style of popular Hindi cinema of India (commonly known as Bollywood, Joshi., 2015). and the overwhelming effect that it has on the Indian public in general often in sharp contrast to the lukewarm and cynical critical response that it generates from European/American audience/critics (by the term 'melodramatic' I am currently referring to the definition and meaning as implied by Ben Singer in the context of film studies: 'a set of subgenres that remain close to the heart and hearth and emphasize a register of heightened emotionalism and sentimentality.'

The history of cinema and the history of melodrama studies tell us how the use of film melodrama across cultures had its distinctive versions and transformations [Brooks & James (1976), Hays & Nikolopoulou (1999), Hadley (1997)].

They also show how the use of melodramatic techniques in popular cinema across different cultures resulted in the development of indigenous film styles. These film styles conform to the aesthetic and emotional experiences and preferences of the audience of a particular culture. I was fascinated by this remarkable inter-cultural difference in taste (regardless of intra-cultural variability and cross-cultural influences) when it comes to appreciating a particular cinematic style. I believed that this variability of preference across cultures might not solely be an obvious phenomenon of changing tastes due to different socio-political-historical upbringing (as explained in most existing discourses on film studies [Vasudevan (2011), Matusitz & Payano (2012)] but might be driven by a strong, inherent behavioural-psychological predisposition deep-rooted in the emotion system of a specific culture.

Cinema is an artistic medium that can evoke a wide range of emotional states in the audience. One of the ways it can do so is by establishing an inter-personal relationship between the film-actor and the audience following the social-appraisal theory - the distinctive feature in film being, the actor does not have a live presence. In the film, the dynamics of social appraisal is felt between an actor and the audience albeit unidirectionally. A unique form of the social appraisal process might occur between multiple actors in a film which in turn can influence the social appraisal mechanism of the audience over time (bi-directionally between actors and uni-directionally between the actors and audience). Here the dynamics of emotion elicitation has a triangular relationship between the actors and the audience.

Film-acting itself varies with the general style of film-making across different cultures. For example, though the divisions and demarcations are not set in concrete and there is often an overlap of styles, still, two distinct styles of film-acting can be seen in popular Euro-American and popular Asian cinema. Popular American (Hollywood) filmacting is often characterized by the famous Lee Strasberg's individualistic methodacting which is based upon the idea that the character's context with his own real-life experience [Hull, 1985]. On the contrary, popular mainstream Indian cinema since its beginning has been heavily influenced by the Rasa theory of 'Natyasastra' - which is predominantly inter-personal and based on conveying the emotion to a spectator as externally and evidently as possible [Ibkar, 2015]. The extraordinary popularity of mainstream Indian cinema among the Indian audience is undeniable and cannot be simply explained by the lack of exposure of a class of Indian audience to world cinema. The inter-personal relationship that the Indian audience experience with the Indian actor in a popular Indian movie while getting emotionally overwhelmed cannot be simply ignored by undermining the intellectual standards of the audience at least when comparing between two equally good (or equally bad) Hollywood and Indian films.

#### Work by the author:

I have previously proposed the 'dual-phase oscillation hypothesis' (Mukhopadhyay, 2014) to answer the problem of the 'aesthetic paradox'. The hypothesis proposes that aesthetic delight is the dynamic, oscillatory balance between Suspension of Disbelief (SD) and Introspective Detached Contemplation (IDC). SD is whereby the person experiencing art temporarily suspends the belief of surface reality and the phenomenon of Introspective Detached Contemplation (IDC) is whereby the same person while experiencing the same art, reflects on the artistic phenomenon and is simultaneously aware of the surface reality. The hypothesis is primarily based on two previous neuroscientific findings (Mukhopadhyay, 2014) which uses two separate neuro-imaging techniques (MEG and fMRI respectively) to find that art appreciation consists of two separate temporal phases. My paper (Mukhopadhyay, 2014) highlighted how these works could be integrated with my proposed hypothesis to attain a complete picture. The DPO hypothesis is based upon the fact that there is temporal segregation of phases in art appreciation. The temporal transition between two phases exists although the transition may be unperceived due to indiscernible temporal difference (a difference of milliseconds, as found in the neuro-imaging studies) such that the feeling of aesthetic delight may appear as a uniform non-transitional activity (hence the apparent paradox is generated). My research domain at the Centre for Cognitive science, IIT Gandhinagar, India, included behavioural, EEG and Eye-tracking based study of human emotions using complex naturalistic stimuli like films and studying the visual scans of facial close-ups of paintings and face-database. As a part of my cognitive science training in India, I conducted an EEG study examining emotional states and expressiveness in popular Bollywood and Hollywood movies which were accepted as a talk at the Biennial Conference of the International Association of Empirical Aesthetics at the University of Vienna, 2016. In that study, we characterized functional brain networks and emotional centres based on Rasa theory of Indian aesthetics (Papers: i) Tripathi R., Mukhopadhyay D., Singh C.K., Miyapuram K.P., Jolad S. (2020). Characterization of Functional Brain Networks and Emotional Centers Using the Complex Networks Techniques, Complex Networks 2019, SCI 882, pp. 854-867, 2020, in: H. Cherifi et al. (Eds.): Complex Networks and Their Applications VIII. © Springer Nature Switzerland AG, https://doi.org/10.1007/978-3-030-36683-4\_68 and ii) Sonawane D., Pandey P., Mukopadhyay D., Miyapuram K.P. (2021). Movie Identification from Electroencephalography Response Using Convolutional Neural Network. In: Mahmud M., Kaiser M.S., Vassanelli S., Dai Q., Zhong N. (eds) Brain Informatics. BI 2021. Lecture Notes in Computer Science, vol 12960. Springer, Cham. <a href="https://doi.org/10.1007/978-3-030-86993-9\_25">https://doi.org/10.1007/978-3-030-86993-9\_25</a>). This study subsequently gave me the idea to collaborate with Dr Jeremy Skipper at University College London - Experimental Psychology, Faculty of Brain Sciences. My research proposal on the same theory was awarded the Newton International Fellowship by the British Academy in 2017.

#### Supplementary Material:

#### Dancing with Nine Colours: the Nava Rasa Roller-Coaster:

This is an experiment in progress to develop an immersive film-viewing experience where a viewer is exposed to a barrage of nine emotional states based on the Rasa theory of Indian aesthetics (to see the audiovisual please follow the link: <a href="https://youtu.be/rAgW7fW\_W60">https://youtu.be/rAgW7fW\_W60</a>).
